ABSTRACT

The main goal of this study is to analyze the influence of entrepreneurial orientation on reputational resources. Therefore, a quantitative methodological approach was used, conducting a descriptive, exploratory and transversal empirical study, having applied a questionnaire to a sample of Portuguese small and medium enterprises (SMEs).

Based on survey data from 42 firms, our empirical results indicate that globally entrepreneurial orientation have a positive and significant influence on reputational resources, and that the entrepreneurial orientation's dimension that most contribute to this is innovativeness.

Keywords: *entrepreneurial orientation, reputational resources, SMEs, Portuguese footwear industry.*

INTRODUCTION

Entrepreneurial orientation is a strategic orientation of a company that encompasses specific entrepreneurs aspects such as style, methods and decision-making practices (Frank, Kessler and Fink, 2010), constituting a capacity that can attract resources to exploit opportunities (Alvarez and Busenitz, 2001). On the other hand, literature in the field of strategic management has focused on the intangible assets of firms have attracted considerable interest in organizational and strategy research (Barney, 1991). In particular, scholars have focused a great deal of attention on a subclass of intangible assets that is called "social approval assets" because they develop their value from favorable collective perceptions (Pfarrer, Pollock and Rindova, 2010).

The important intangible resources studied in this research are the reputational resources, since it helps distinguish firms from competitors (Peteraf, 1993), reduces information asymmetry, consumer uncertainty and substitutes expensive governance mechanisms. Moreover, reputation has been linked to organizational performance. Therefore, it appears to be a key variable to understand why some organizations outperform others (Boyd, Bergh and Ketchen Jr, 2010).

Building on well established theories, our research aims at exploring the influence of entrepreneurial orientation in reputational resources of Portuguese SMEs exporting footwear.

THEORETICAL FRAMEWORK AND HYPOTHESES

Entrepreneurial orientation

Entrepreneurial orientation emerged from entrepreneurship definition which suggests that a company's entrepreneurial degree can be measured by how it take risks, innovate and act proactively (Miller, 1983). Entrepreneurship is connected to new business and entrepreneurial orientation relates to the process of undertaking, namely, methods, practices and decision-making styles used to act entrepreneurially. Thus, the focus is not on the person but in the process of undertake (Wiklund, 2006).

Companies can be regarded as entrepreneurial entities and entrepreneurial behaviour can be part of its activities (Covin and Slevin, 1991). Entrepreneurial orientation emerges from a deliberate strategic choice, where new business opportunities can be successfully undertaken (Lumpkin and Dess, 1996). Thus, there is an entrepreneurial attitude mediating the vision and operations of an organization (Covin and Miles, 1999).

Several empirical studies indicate a positive correlation between entrepreneurial orientation and organizational growth (e.g. Miller, 1983; Covin and Slevin, 1991; Lumpkin and Dess, 1996; Wiklund, 2006; Davis, Bell, Payne and Kreiser, 2010; Frank, Kessler and Fink, 2010). Similarly, other studies also confirm that entrepreneurial orientation has a positive correlation with export's performance, enhancing business growth (e.g. Zahra and Garvis, 2000; Okpara, 2009).

The underlying theory of entrepreneurial orientation scale is based on the assumption that the entrepreneurial companies are different from the remaining (Kreiser, Marino and Weaver, 2002), since such are likely to take more risks, act more proactive in seeking new businesses and opportunities (Khandwalla, 1977; Mintzberg, 1973).

Entrepreneurial orientation has been characterized by certain constructs that represent organization's behaviour. Starting from the Miller (1983) definition, three dimensions were identified: innovativeness, proactiveness and risk-taking, which collectively increase companies' capacity to recognize and exploit market opportunities well ahead of competitors (Zahra and Garvis, 2000). However, Lumpkin and Dess (1996) propose two more dimensions to characterize and distinguish entrepreneurial process: competitive aggressiveness and autonomy. In this study only innovation, risk-taking and proactiveness will be considered, as they are the most consensual and used dimensions to measure entrepreneurial orientation (e.g. Covin and Miller, 2014; Covin and Slevin, 2014).

Reputational resources

The new paradigm of today's world economy is characterized by the mobility of production resources and the ability to combine them in an efficient way. The strategic management research has recognized the importance of studying the companies' resources and capabilities and its usefulness to achieve competitive advantage. This perspective is consistent with the Resource-Based View (RBV).

Scholars argue that resources form the basis of firm strategies (Barney, 1991). Therefore, firm resources and strategy cooperate to create positive returns. Firms employ both tangible resources (such as physical infrastructures and financial resources) and intangible resources (like knowledge and brand equity) in the development and implementation of strategies. However, intangible resources are more likely than tangible resources to produce a competitive advantage, since they are often rare and socially complex, thereby making them difficult to imitate (Hitt, Bierman, Shimizu and Kochhar, 2001). Thus, intangible resources are considered strategic resources (Amit and Schoemaker, 1993).

Intangibles resources have three intrinsic characteristics that distinguish them from tangible resources (Molloy et al., 2011). First, intangibles do not deteriorate with use, since these resources are expected to confer benefits for an indeterminate period of time (Cohen, 2005). Secondly, multiple managers can use the intangibles resources simultaneously, for example, the use of a brand is available for all managers. Finally, the intangibles resources are immaterial, making them difficult to exchange, as they often cannot be separated from its' owner (Marr and Roos, 2005).

The existing literature suggests six types of resources that are particularly important sources of export venture competitive advantage: reputational resources; access to financial resources; human resources; cultural resources; relational resources; and, informational resources (Morgan et al., 2006).

The RBV describes reputation as an intangible resource that is consequent from combinations of internal investments and external evaluations (Shamsie, 2003). This "social approval assets" can positively impact customer behavior, loyalty and consumption experience (Cretu and Brodie, 2007; Pfarrer et al., 2010).

Reputational resources concern intangible image-based assets available to the firm and can be a differentiation factor in the target market (Hall, 1992). These resources must be understood as a source of competitive advantage, since they are rare, difficult to imitate and transfer and permeate the company's activity (Barney, 1991).

The most important reputational asset relevant to export performance identified in the literature is brand equity. This concept is associated to a set of assets linked to the name and symbol of the brand that adds value to the initial value of the product or service, such brand name awareness, distinctiveness of brand image, appeal of brand 'personality' and strength of brand image (Morgan et al., 2006). This valuable intangible resource allows the company to build and protect its market share, enhance marketing investments and introduce new products in the export target market more easily (Aaker, 2010).

Aaker (1991) identifies brand awareness as the potential customer ability to recognize that a brand has certain category. This recognition helps a brand to distinguish from others. Brand associations consist of brand-related thoughts, feelings, perceptions, smells, colors, music, images, experiences, beliefs and attitudes (Kotler and Keller, 2011). Brand loyalty is defined as the attachment that a customer has to a brand. Perceived quality can be defined as customers' judgment about a product's overall excellence or superiority. Consequently, perceived quality is a overall feeling about a brand and does not imply the actual quality of a product (Aaker, 1991).

Resources that are valuable, unique, and difficult to imitate can provide competitive advantages (Amit and Schoemaker 1993; Barney 1991). In turn, these advantages provide positive returns (Peteraf 1993). Thus, firms need to continually analyze and interpret changing market trends and quickly recognize new opportunities in order to create competitive products (Tzokas, Kim, Akbar and Al-Dajani, 2015), since it increases the engagement with innovation, which contributes, for example, to creating new products and services, seeking new opportunities and new markets (Miller 1983; Lumpkin and Dess, 1996). Ultimately, the following hypotheses is tested:

H1: Entrepreneurial orientation influences positively reputational resources.

METHODOLOGY

Setting and Data Collection

To test the hypothesis a sample of Portuguese footwear companies was used, that meet the following criteria: companies in which at least 50% of income comes from exports of goods, or companies in which at least 10% of income comes from exports of goods and the export value is higher than 150.000 Euros (INE, 2011).

Data collection was implemented through electronic questionnaire, associating a link to the survey that was online. To reduce misunderstandings, the questionnaire was validated by the research department of Portuguese Footwear, Components and Leather Goods Association (APICCAPS).

We were provided with a database of 231 companies (company name, telephone contact, email, economic activity classification, export markets, export intensity and capital origin). Only 167 companies fulfilled the parameters, and were contacted by email by APICCAPS to respond to the questionnaire. Subsequently, all companies were contacted by the authors via e-mail and telephone, to ensure a higher rate of valid responses. The questionnaires began on April 22, 2014 and ended on July 22, 2014. After finishing the data collection period, 42 valid questionnaires were received, representing a 25% response rate (Table 1). This response rate is considered quite satisfactory, given that the average of top management survey response rates are in the range of 15%-20% (Menon, Bharadwaj, Adidam and Edison, 1999).

Universe of analysis - Portuguese SMEs of footwear
Sample - a non-probabilistic and convenient
Population - 367 firms
Sample - 167 firms
Response rate - 25%
Valid responses - 42
Time period - April 22 to July 22 of 2014

Table 1. *Data summary*

In this investigation we chose a non-probabilistic and convenient sample since its respondents were chosen for being members of APICCAPS.

Measures

For assessment of entrepreneurial orientation was used Covin and Slevin's scale (1989), that consists in nine items: three for innovativeness, three for proactiveness and three for risk-taking, having been used a five point Likert scale, where 1 means "strongly disagree" and 5 "strongly agree".

To measure the reputational resources this study used the four items scale proposed by Morgan, Vorhies and Schlegelmilch (2006). A five point Likert scale was used to measure each item, where 1 means "strongly disagree" and 5 "strongly agree".

RESULTS

Reliability analysis

In order to verify the reliability of overall variables we estimated the stability and internal consistency through Cronbach's alpha (α). Generally, an instrument or test is classified with appropriate reliability when α is higher or equal to 0.70 (Nunnally, 1978). However, in some research scenarios in social sciences an α of 0.60 is considered acceptable, as long as the results are interpreted with caution and the context is taken into account (DeVellis, 2012). For the present study we used the scale proposed by Pestana and Gageiro (2008).

The result of 0.801 achieved for all of variables is considered very good, confirming the sample's internal consistency. It was also conducted an internal consistency test for all variables in each construct to assess their reliability (Table 2).

Construct	Cronbach's α	Items Nr.	N	Analysis
Entrepreneurial orientation	.739	9	42	Good
Reputational resources	.905	4	42	Excellent

Table 2. *Internal consistency test by construct (Cronbach's Alpha)*

We found that entrepreneurial orientation has good consistency and that reputational resources presents excellent reliability.

Exploratory factor analysis

We performed a factor analysis, with Varimax rotation, of entrepreneurial orientation construct items that comprise the scale, with the purpose of finding a solution that was more easily interpretable. Three factors were extracted and there was no need to delete items. Thus, we obtained a scale composed of 9 items, distributed over three factors that explain 77.09% of total variance, with 35.52% of variance explained by the first factor, *Proactiveness*, 27.48% for the second factor, *Innovativeness*, and 14.09% by the third factor, *Risk-taking*. Analyzing the internal consistency of the three factors, we found that Cronbach's Alphas have a good internal consistency. KMO test indicates that there is a reasonable correlation between the variables (0.695). Bartlett's sphericity test registered a value of $\chi^2(36, N=42)=171.176$, $p<0.05$, therefore is confirmed that $\chi^2 > \chi_{0.95}^2$, so the null hypothesis is rejected, i.e. the variables are correlated.

We performed a factor analysis, with Varimax rotation, of entrepreneurial orientation construct items that comprise the scale, with the purpose of finding a solution that was more easily interpretable. Three factors were extracted and there was no need to delete items. Thus, we obtained a scale composed of 4 items, distributed over one factor that explain 87.71% of total variance. The saturation of this factor varies between 0.695 e 0.819. Analyzing the internal consistency of these factor, we found that Cronbach's Alpha have an excellent internal consistency ($\alpha=0.931$). KMO test indicates that there is a reasonable correlation between the variables (0.796). Bartlett's

sphericity test registered a value of $\chi^2(210, N=42)=630.742$, $p<0.05$, therefore is confirmed that $\chi^2>\chi_{0.95}^2$, so the null hypothesis is rejected, i.e. the variables are correlated.

Multiple regression analysis

Multiple regression analysis is a statistical technique that is used to analyze the relationship between a single dependent (criterion) variable and several independent (predictor) variables. The objective of multiple regression analysis is to use the independent variables whose values are known to predict the single dependent value selected by the researcher. Each independent variable is weighted by the regression analysis procedure to ensure maximal prediction from the set of independent variables.

The most commonly used measure of predictive accuracy for the regression model is the coefficient of determination (R^2). This coefficient measures the proportion of total variability that can be explained by regression ($0 \leq R \leq 1$), measuring the effect of independent variables on the dependent variable. When $R^2=0$ the model clearly does not adjust to data and when $R^2=1$ the adjustment is perfect. In social sciences when $R^2>0.500$ the adjustment is considered acceptable (Marôco, 2011). In the Table 3 we present the results of the multiple regression analysis of our model.

Model	R	R2	Adj. R2	Standard Error	F	Sig.
1	.533a	.284	.227	.87902684	5.021	.005*

a. Predictors: (Constante), Entrepreneurial orientation.

b. Dependent variable: Reputational resources.

* $p<0.05$.

Table 3. *Summary and ANOVA of multiple regression analysis*^b

The previous table presents for model 1 a value of $F=5.021$, with $q\text{-value}<0.05$ (Sig.), so H_0 is rejected in favour of H_1 . Thus, this hypotheses is supported.

A mere comparison of the regression coefficients is not valid to evaluate the importance of each independent variable models, since these variables have different magnitudes. Thus, it is essential to use standard variables, known as Beta (β) coefficients, in the models adjustment so that the independent variables can be compared.

Variables	Beta	Sig.
ENTREPRENEURIAL ORIENTATION		
Proactiveness	.120	n.s.
Innovativeness	.489	.000*
Risk-taking	.174	n.s.

* $p < 0.001$.

n.s. – non significant.

a. Dependent variable: Reputational resources.

Table 4. *Standardized beta coefficient*^a

Beta coefficient allows a direct comparison between coefficients as to their relative explanatory power of the dependent variable. Table 4 shows that the variables that have higher contribution to reputational resources is *Innovativeness* ($\beta=0.489$).

DISCUSSION AND CONCLUSION

The main purpose of this study is to analyze the influence of entrepreneurial orientation on reputational resources. We conducted an empirical research based on a sample of 42 companies, which were applied a questionnaire in order to exploit data to test hypotheses, using proceedings and statistical techniques. It is important to note that companies evaluated entrepreneurial orientation and reputational resources relative to their major competitors in the export market(s), so the results should be interpreted based on these two aspects.

The Portuguese footwear industry faces considerable challenges, not only concerning the international markets crisis, but also regarding consumption patterns. The reduction of shoe design lifecycles has consequences on the offer. On one hand, the products have to be adapted to different segments specific needs and tastes (custom design, new models in small series, etc.), on the other hand, manufacture processes must be increasingly flexible, adopt just-in-time production, invest in the brand, qualified personnel, technology and innovation (APICCAPS, 2013).

This study demonstrated that the company's entrepreneurial orientation have a positive and significant influence on reputational resources, enhancing brand's notoriety, image distinctiveness, attractiveness of "personality" and image strength. These strong differentiation factors facilitate the development of existing products and/or introduce new products in foreign markets, thus following the market trends.

Theoretical and practical implications

It is known that strategy includes deliberate and emergent initiatives adopted by management, comprising resource and capabilities use to improve business performance (Nag, Hambrick and Chen, 2007). The findings are a contribution to clarify the influence of entrepreneurial orientation on the company's reputational resources. This study also enabled a thorough analysis of a highly important

industry for national exports, such as footwear industry, allowing understanding that entrepreneurial orientation, as an industry strategic determinant, enhancing reputational resources.

In addition, the results provide guidance to business practitioners; because they indicate entrepreneurial orientation as a predictor for reputational resources. Companies are a bundle of resources and capabilities (Peteraf, 1993), it is essential to understand and identify which resources are relevant to gain competitive advantage and superior performance. In this study it is obvious the importance of entrepreneurial orientation to the firms' reputational resources. Business owners must be able to interpret, integrate and apply external knowledge in order to systematically analyze the changes that arise in their target market(s) and to incorporate this knowledge into their processes, to identify the present and future needs and market trends, anticipate changes in demand and seek new business opportunities.

By building on the literature of entrepreneurial orientation, absorptive capacity and reputational resources, this study aims to support the strategic development of business management policies designed to increase firms' performance in foreign markets and add value to the current context of change.

Research limitations

The main limitation of this study is related to the sample size, since it was difficult to find companies with the willingness to collaborate in this type of research. The sample is non-probabilistic and convenience and cannot be used to infer to the general population. The study findings should therefore be analyzed with caution.

The fact that the research does not consider the effect of control variables such as size, age, location and target market of the respondents can be seen as a limitation.

Finally, the fact that this study considered only reputational resources as an intangible resources can also be appointed as a limitation.

Future Lines of Research

In future work, we suggest that the model is used in a sample with a higher number of observations to confirm these results.

We further suggest pursuing with the investigation of strategic management in Portugal, focusing in other sectors of national economy, so that in the future one can make a comparison with similar studies, allowing realizing and finding new factors that enhance absorptive capacity.

Finally, the moderating effect of strategic variables (e.g. competitive advantage) in the relationship between entrepreneurial orientation and reputational resources should be studied.

ABSTRACT

This paper is devoted to the problem of corporate entrepreneurship and intrapreneurship implementation in Russia in order to increase efficiency and labor productivity after the country's transition to the market economy. Existing definitions of corporate entrepreneurship and intrapreneurship, including Russian scientists' points of view, are systematized. New definitions and attitudes such as entrepreneurial potential and intrapreneurial unit (CI-unit) are offered. We assume that traditional business activity forms (with a high level of centralization in the former USSR) were not adequate to market economy conditions (with competitiveness, innovations, etc.). The purpose of the paper is to resolve this contradiction. In accordance with the author's concept the methodology of corporate intrapreneurship system (CI-system) formation (for building construction industry enterprises) under the market conditions is developed. The CI-system consists of some blocs, among them the mechanism of CI-unit creation, method of planning (balancing plan) between a head company and CI-units. The novelty of the methodology includes not only the general concept of internal corporate entrepreneurship system forming, but also such elements as analysis of entrepreneurial potential, formation of the economic, organizational and contractual relationship between a base company and the CI-units and some others. Its implementation will provide the gradual transformation of traditional enterprises into enterprises of an innovative-entrepreneurial type under the market conditions. Such system improves the efficiency of business activities and the level of competitiveness of enterprise and structural units within the enterprise. The Russian building construction business sector is taken as an example.

Keywords: *corporate entrepreneurship, intrapreneurship system, intrapreneurial unit (CI-unit), market economy, organizational structure transformation, competitiveness, Russian construction industry enterprises*

INTRODUCTION

At the end of XX and early XXI century the Russian economy became a market one. Significant changes occurred in the national economy after the disintegration of the USSR. One of the peculiarities of the market economy system is the emergence of global competitors and innovative forms of business activities. But as for Russian companies the forms of their business activity remain as they were before (Bagiev G. L. & Asaul A. N., 2001; Frolova, E. & Kuprina T., 2013; Gerchikova, I., 2002). The contradiction between modern market conditions on the one hand and old (Soviet system of total planning) forms of business activities on the other hand has to be eliminated. Conditions of market transformation of the country' economy required rapid creation (accelerated formation) and introduction of the newest methods and forms of management including at the intercompany' or corporation' level.

Our hypothesis is as follows. In the conditions of increasing competition the efficiency of the enterprise' activity depends on its organizational structure which corresponds to changing external market conditions. As we know, the main element of the market economy mechanism is competition. This mechanism operates at the level of global and national markets (outside the business). Customers choose competitive products, services. To be competitive means the ability to offer new products, services, new quality. This new product is primarily based on innovation. We have proposed to move the system of competition inside enterprises where internal units (sometimes with the same specialization) compete with each other. We developed to use the system of corporate entrepreneurship (CE-system) to be used in Russian companies.

However, we come to the following conclusions in this article. Features of the market economy development are due to the necessity of the corporate entrepreneurship system application. Corporate entrepreneurship is the initiative activity for the production and sale of products, goods and services based on innovation. But it is not enough. In management literature, scientists are paying increased attention to the topic of «corporate entrepreneurship» (CE) but not «corporate (firm') intrapreneurship» (CI). CI-system is based on the integration of the resources of head (parent) company, on one hand, and leadership and innovative ideas of an entrepreneur, on the other hand. The CI-system objective is to increase the level of competition and efficiency within the enterprise. At the same time, the CI-system will function effectively only under certain conditions: the presence of a contract and balanced (coordinated) plan, allocation of resources, responsibility, etc. For the development of new forms of corporate entrepreneurship it is necessary to rethink and systematize the existing approaches to corporate entrepreneurship through the prism of creating an internal competitive environment within an enterprise.

The purpose of this article is to clarify the interpretation of the term "corporate intrapreneurship" and compare with the term «corporate entrepreneurship» and offer a new methodology of the CI-system formation and demonstrate national experience. As for practical applications it is necessary to develop an algorithm of CI-system and CI-units creation and offer recommendations for companies.

CORPORATE ENTREPRENEURSHIP AND INTRAPRENEURSHIP: THEORETICAL ASPECT

Entrepreneurship is a global complex phenomenon and paradox. The Schumpeter' definition is well known but there is no universally acceptable definition of entrepreneurship yet. In wide essence, it is understood as any attempt of starting-up a new business in the form of self-employment, the expansion of an existing business by an individual, teams or existing company, etc.

This paper focuses on the corporate entrepreneurship (CE). Corporate entrepreneurship is a developing area of research and there are many definitions of CE (Baierl, R. & Gross, U. (2015); Ferreira, J. (2002); Satle, V. (2003); Suhartanto, E.; Shukla, S. etc.). Ferreira J. (2002) emphasizes that authors use many terms such as: «intrapreneurship», «internal corporate entrepreneurship», «corporate ventures», «venture management», «internal corporate venturing». A lot of scientific articles (Branchet, B. & Kruzikova, A., 2015; SME in Russia, 2013; Ferreira, J., 2002; Mirzanti, R. & Simatupang, T. & Larso D., 2015; Poorva, R., 2010 Ration, J. etc.) focus on the different aspects of corporate entrepreneurship, among them: relationship between corporate entrepreneurship and strategic management; distinction between the concepts of corporate entrepreneurship and an entrepreneurial strategy; magnitude of entrepreneurship influence across countries and regions; small and medium-sized enterprise (SME) sector; entrepreneurship capital; entrepreneurship policy implementation model in different countries, including Russia; financial aspect etc.

After literature analysis we can conclude that there are a lot of types of CE. Some of new definitions contradict with each other but we do not consider some of them as incorrect. All proposals reflect the author's concept and clarify the essence of corporate entrepreneurship from new perspectives under the new market conditions.

For example, corporate entrepreneurship activities can be internally¹ or externally²

¹ Internal activities are typified as the development within a large organization of internal markets and relatively small and independent units designed to create internal test-markets or expand improved or innovative staff services, technologies, or production methods within the organization (Ferreira, J., 2002)

² External entrepreneurship can be defined as the first phenomenon that consists of the process of combining resources dispersed in the environment by individual entrepreneurs with his/her own unique resources to create a new resource combination independent of all others. External efforts entail mergers, joint ventures, corporate venture, venture nurturing, venture spin-off and others (Ferreira, J., 2002)

oriented, independent (Satle, V., 2003). According to Ferreira, J. (2002); there are three types of corporate entrepreneurship:

- first is the creation of new business within an existing organization (intrapreneurship);
- second is the more pervasive activity associated with the transformation or renewal of existing organizations;
- third is the enterprise changing the rules of competition for its industry.

It is important for us to understand any differences between different types of entrepreneurship because Russia has revived the system of entrepreneurship at the beginning of XXI century (table 1), but old methods do not contribute to the further development of the country.

Table 1 – Small business in Russia (fragment)

	1999	2000	2001	2009	2011
Number of small business, thousand units	868,0	890,6	879,3	1602,5	1836,4
Average number of employees, thousand people	6485,8	6596,8	6483,5	11192,9	11480,5
Revenues, bln rubles	423,7	613,7	852,7	22546,4	22617,1

Cit. by (Frolova, E. & Kuprina T., 2013)

Russia is in the process of transition to a postindustrial society. The strategy of the socio-economic development of Russia until 2020 provides the transition of the country's economy based on the raw materials trend to the development innovation. We have to develop new competitive sectors. We need new methods for further development of entrepreneurship and business (Bagiev G. L. & Asaul A. N. , 2001; Frolova, E. et al., 2004). As we could see, CE includes the actions of internal entrepreneurs (intrapreneurship). Especially, we are interested in «corporate entrepreneurship» and «corporate intrapreneurship». We have accumulated the scholars' opinions in table 2.

Table 2 – The key characteristics of definitions «corporate entrepreneurship» and «corporate intrapreneurship»: comparative analysis (fragment)

Notion	Corporate entrepreneurship and managers	Corporate intrapreneurship and intrapreneur
Essence of notion and skills of managers	It can be describes as any attempt to implement innovation and refers to the process of creating new business within established firms to improve organizational profitability and enhance a firm's competitive position or the strategic renewal of existing business (redefinition of the	It is integration of entrepreneurial skills (local initiative) and firm' recourses' opportunity (central synthesis) Interpreneurial managers. Intrapreneur: - is a person who focuses on innovation and who transforms a dream or an idea into a profitable venture within the existing company; - is both employee, valuable worker and leader;

	business concept, reorganization, introduction of system-wide changes for innovation, refocusing a business competitiveness). Traditional managers. Managers consider more risks than uncertainty and often work within established patterns	- is also dreamer, thinker, doer, planner; - focuses on innovation and creativity, and transforms an idea into a profitable venture; - is who take hands-on responsibility for creating innovation of any kind, within a business; -is a person within a large corporation who takes direct responsibility for turning an idea into a profitable finished product through assertive risk-taking and innovation (according to the American Heritage Dictionary) Strong leadership skills are needed to strengthen teams and execute their ideas. Leadership skills are also important to support rapid decision making under uncertainty
Organizational aspect of implementation	New business (firm, venture, department) creation as usual	It is a project which operates within established organizations (organizational environment) as well as having a certain economic independence. Analogue to new business creation by individual entrepreneurs,
Recourses	Special equipment	Intrapreneur typically finds a ready source of «free» recourses and capabilities within the organization
Limits	It acts according to legislation and law (external limits)	Intrapreneur should ask for permission before acting according to internal rules (internal limits)
Competition	External competition	Internal competition
Common peculiarities	Companies support intrapreneurs with finance and access to corporate resources, while he/she creates innovation for companies. The basis of development is innovations of different kinds. It is transformation of the firm from the old to the new one. It is integration of risk-taking and innovation approaches	

Compiled by authors according to: Sekliuckiene, J. & Morkertaite, R. & Kumpikaite, V., 2015; Shukla, S., 2013; Suhartanto, E.; Satle, V., 2003; Ramachandran, K. & Devarajan, T. & Ray. S; Raheel, A., 2009; Ration, J., 2009; Poorva, R., 2010;

Thus, internal entrepreneurship is an activity for the production and sale of goods and services through the integration of entrepreneurial opportunities and the individual resources of the enterprise. Based on the above-mentioned, we offer the author's interpretation of basic concepts (Frolova, E. et al., 2004; Vlasova, M. et al., 2014).

1. Intrapreneurship is a special form of corporate entrepreneurial activity which operates in the framework of the existing enterprise (small or large) and its resource base, on the one hand, and actively uses the initiative and creative potential of employees, on the other hand. Intrapreneurship aims to accelerate the implementation of innovation, the creation of an internal competitive environment, generating additional revenue, the creation and effective usage of intellectual property. It allows us to increase the value and competitiveness of the enterprise.

2. The enterprise in which the entrepreneurial activity takes place is the base or head company (HC) to the inner intrapreneur and is the innovative one in the relation to the external environment
3. CI-unit is a structural subdivision of an enterprise, temporary or permanent, acting on the basis of internal regulations of the unit and performing a specific entrepreneurial idea, as well as having a certain economic independence
4. Entrepreneurial potential is a complex of resource, organizational, methodological, socio-psychological and economic prerequisites and conditions for the formation of the system of entrepreneurship in the company

METHODOLOGY OF THE CORPORATE INTRAPRENEURSHIP SYSTEM FORMATION IN THE MARKET CONDITIONS FOR THE CONSTRUCTION INDUSTRY ENTERPRISES

The author's algorithm of the corporate intrapreneurship system (CI-system) formation is shown in figure 1. Its implementation in the enterprises will provide the gradual transformation of traditional enterprises into the enterprise of innovative-entrepreneurial type under the market conditions. Such system improves the efficiency of business activities and the level of competitiveness of enterprise and structural units within the enterprise. The methodology includes not only the general concept of internal corporate entrepreneurship system forming, but also such elements as analysis of the entrepreneurial potential, formation of the economic, organizational and contractual relationship between the base company and the internal corporate intrapreneurial units (CI-units) and some others.

Phase 1: intrapreneurial potential analysis of enterprise	Step 1.1: to analyze recourses' prerequisites and conditions (labor recourses, information recourses, financial recourses etc.) in the market conditions
	Step 1.2: to analyze economic and organizational prerequisites and conditions
	Step 1.3: to analyze methodical prerequisites and conditions
	Step 1.4: to analyze socio-psychological prerequisites and conditions
Phase 2: formation of economic, organizational and contractual relationship between intrapreneurial units (CI-units) and head company (HC)	Step 2.1: to establish the procedure of recourses providing and payment between CI-units and HC for their using
	Step 2.2: to determine the prices of products, services manufactured by CI-units
	Step 2.3: to determine the price for management and administrative services, accounting, engineering etc., providing by HC' departments
	Step 2.4: to develop the (re)distribution of revenue, profit, payment of taxes of CI-units
	Step 2.5: to develop a stimulation system of HC' managers for the support of CI-units activities, innovative ideas and results
Phase 3: realization	Step 3.1: to improve the organizational structure of HC
	Step 3.2: to establish the centre of internal entrepreneurship (for consulting and

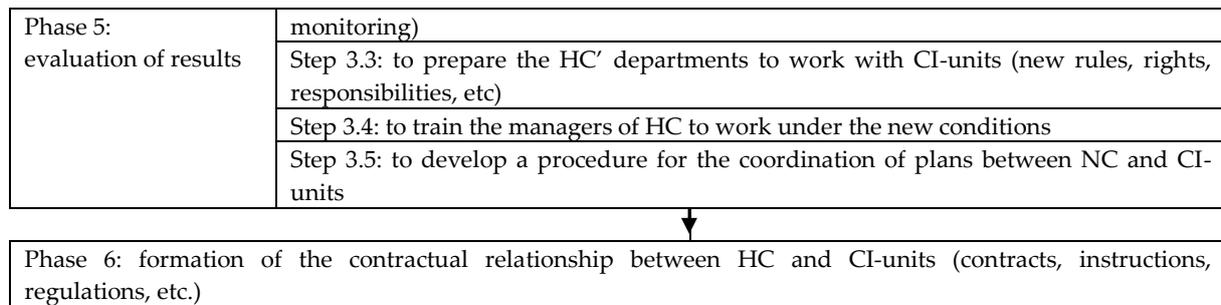

Fig. 1. Algorithm of internal corporate entrepreneurship system formation for construction industry enterprises

There is a necessity to clarify some phases (Vlasova, M. et al., 2014). *Firstly*, according to the model of recourses providing there are three options of CI-unit (step 2.1): autonomous organization (resources belong only to the CI-unit); joint organization (HC and CI-unit use resources together according to the contract); the lack of fixed resources on a permanent basis in constant use (an entrepreneur is a single permanent element of an CI-unit and he/she sells labor recourses with «know-how»). *Secondly*, as for the stimulation system of HC' managers (step 2.5) it depends on additional hours or performs additional functions and is determined in percentage from the amount of income of the company and contribution from the manager. *Thirdly*, the main objectives of ICE-units activities are accelerated development, introduction of innovations, strengthening the competitive advantages of the company, in these conditions the most suitable organizational structures (step 3.1) are matrix or project management ones. In addition, it is proposed to establish a special engineering and consulting unit - the centre of intrapreneurship which will assist in the organization of the entrepreneurial process, business planning, etc. *Fourthly*, some words about the methods of the CI-units creation. It consists of several steps (fig. 2), including generation of the innovative entrepreneurial idea, analysis of the possibility of its realization, development of organizational and business plans.

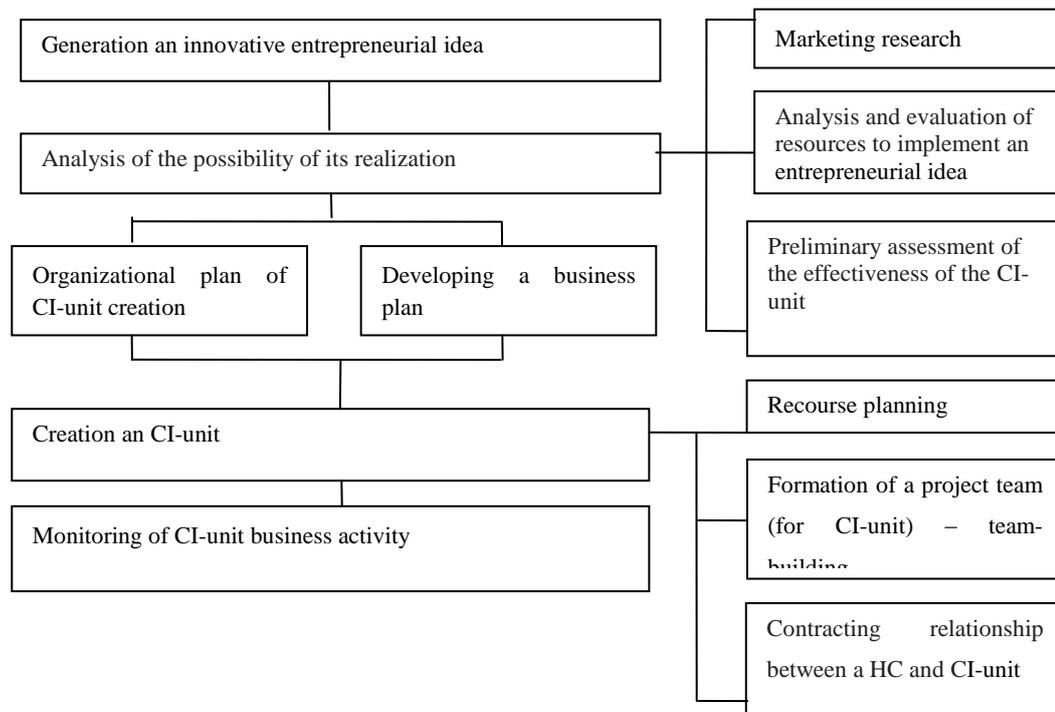

Fig. 2. Mechanism of CE-unit) creation

Finally, about planning between HC and CI-units. The plans of the HC and each CI-unit must be aligned with each other (as well as the plans between CI-units). Methodical difficulty lies in the fact that, on the one hand, each CI-unit must have operational independence, and, on the other hand, be coordinated with all decisions taken by the HC. There is a need to design a two-level system. The upper level is the level of HC (general management, overall allocation of resources). The lower level is the level of individual CI-units (planning business activities). For optimal planning model we propose to use the Kornai-Liptak (Cit. by Vlasova, M. et al. 2014) decomposition method. It allows us to link the particular solutions (CI-unit level) with the overall optimum position

THE RESULTS OF IMPLEMENTATION OF CI-UNITS CREATION METHODOLOGY

The author's methodology of CI-system creation was implemented in building construction company "Premier-Stroy" (HC). On the base of HC' recourses there was established two CI-units. In accordance with the main stages of the methodology the following results were obtained (on example of one CI-unit).

Analysis of an entrepreneurial idea. The essence of an entrepreneurial idea is to produce new building construction materials.

Analysis and assessment of the resources needed to implement this idea. The analysis showed that HC has the equipment, workers and managers' staff, office, warehouses, etc. However, these resources are not used at maximum capacity or are not used, including a reserve of 400 sq. m.

Resources providing. In order to give resources to the CI-units a combined method was approved:

- during the first year some resources were provided to HC free of charge;
- HC provided the CI-unit a loan of 1,5 mln. rubles for the purchase of equipment;
- as for machinery complex HC and CI-units used it together on the basis of the lease contract.

Team-building:

- the number of full-time employees (staff) of the CI-unit was 18;
- annual Wage Fund of the CI-unit' staff was 3,3 mln. Rubles;
- head of the CI-unit is entrepreneur himself

Organizational design. For the contractual relationship between HC and CI-unit the following model was adopted:

- project management (matrix) organizational structure;
- CI-unit is an independent entity with a stable staff;
- HC' departments of supply and sales of the company performed supply and sales function

for the CI-unit

Finally, a business plan was developed. The results and planned indicators were identical (table. 3). In accordance with the signed contracts the CI-unit paid for HC' managerial services and a part of the profits (as dividends)

Table 3 - Final financial results of CI-unit's activity

Indicators	Indicators (prices of 2005)
Output per year without VAT (RBL, mln)	50,1
Costs of production (RBL, mln)	37,9
Profit (RBL, mln)	12,2
Tax on profit (RBL, mln)	2,9
Net profit (RBL, mln)	9,3

The company has received the following results (table. 3) by CI-system' creating (табл. 4).

Table 4 - Economic indicators of activity at the enterprise after the CI-system' implementation

Indicators	HC	CI-unit
Capital productivity (rbl/rbl)	16,4	20,1
Labor productivity (RBL per employee)	2,205	2,780
Profitability of output (%)	19,0	32,1
Profitability of sales (%)	16,0	24,3
Employee turnover	0.334	0.055
Average annual wage (RBL per employee)	157,2	182,3

In addition to these indicators, the increase of the production volume of the HC through the establishment of two CI-units was 32.9%, a reduction of the material was 17%. In this case, both quantitative and qualitative indicators have changed (table.5).

Table 5 - The main effects of the CI-system' implementation

Effect	HC	CI-unit
Social effect	<ul style="list-style-type: none"> - consolidation of staff with creative potential - improvement of socio-psychological climate at the enterprise - improvement of the external image of the company 	<ul style="list-style-type: none"> Improvement of the social status of the entrepreneur Improvement of the social status of the entrepreneurial team
Economic effect	<ul style="list-style-type: none"> - growth of business value - generation of additional profit - emergence and usage of intellectual property 	Revenue from innovations and an entrepreneurial idea

CONCLUSIONS

In the post-Soviet era Russian enterprises began to operate under the market conditions. Old methods of business were not suitable for new conditions. In spite of world economy decreasing large corporations and small firms demonstrated the new strategy of business development: they said «innovation or death» and called new methodology as an entrepreneurship. Much has been written about entrepreneurship, new business creation, «new business product» orientation, competitiveness, etc. A lot of types of corporate entrepreneurship were offered by scholars and managers.

In this article we have clarified the essence of the term "corporate intrapreneurship" and «corporate entrepreneurship». It could be concluded that some small and large companies used and use just now in transition economy such type of entrepreneurship as corporate intrapreneurship. We conclude that the CI-system is based on the integration of the resources of head company, on the one hand, and leadership and innovative ideas of an entrepreneur, on the other hand.

Intrapreneurship is a special form of corporate entrepreneurial activity which operates in the framework of the existing enterprise (small or large) and its resource base, on the one hand, and actively uses the initiative and creative potential of employees, on the other hand. Intrapreneurship aims to accelerate the implementation of innovation, the creation of an internal competitive environment, generating additional revenue, the creation and effective usage of intellectual property. The author's methodology of CI-system creation for building construction business consists of some blocs, among them the mechanism of CI-unit creation, method of planning (balanced plan) between a HC company and CI-units, method of motivation. Our methodology includes general concept of internal corporate entrepreneurship (intrapreneurship) system forming, analysis of entrepreneurial

potential, formation of the economic, organizational and contractual relationships between a HC and the CI-unit and some others.

Implementation of this methodology will provide the gradual transformation of traditional enterprises into enterprises of an innovative-entrepreneurial type under the market conditions. As for practical applications the two Russian building construction companies improved the efficiency of their business activities and the level of competitiveness of the enterprise due to implementation of the CI-system.

PROFITABILITY OF ITALIAN COOPERATIVES: THE IMPACT OF GEOGRAPHICAL AREA AND BUSINESS SECTORS¹

Fusco, Floriana; Migliaccio, Guido

Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

ABSTRACT

This paper focuses on the situation in Italy with specific reference to cooperatives. It aims to analyse their economic situation - represented by two profitability ratios (ROI, ROE) - during the decade 2004-2013, that is before, during and after the crisis. Specifically, after an exploratory study, it wants to verify if there are statistically significant differences caused by geographical area and/or belonging business sector. With these aims and starting from secondary data on AIDA database (at the end 1,446 cooperatives), the trend analysis and analysis of variance (ANOVA) have been used. The findings show, at first, that the profitability of cooperatives has a very negative trend in any geographic area and business sector. So it is strongly affected by crisis. Secondly, only the business sector affects the level of profitability. The analysis is interesting because income, in cooperatives, has a special meaning: it should in fact be added to benefiting members that are accounted for as “peculiar” management costs.

Keywords: *Italian Cooperatives; Global Crisis; Return on equity; Return on investment; Profitability ratios.*

INTRODUCTION AND MOTIVATION: AIMS AND STRUCTURE OF THE PAPER

The study aims to analyse the economic situation - represented by two profitability ratios (ROI, ROE) - of the Italian cooperatives during the decade 2004-2013. The choice of period is not accidental, nor is irrelevant, given that it includes the previous years, concurrent or subsequent to the 2008 crisis. Although there are significant and widespread signs of economic recovery, the global crisis still affects many geographical areas. For this reason, a large number of studies are still related to the general economic crisis and its implications on companies. Using an extensive data set on corporate bond defaults in the US from 1866 to 2010, Giesecke et al. (2014) study the macroeconomic effects of bond market crises and contrast them with those resulting from banking crises. Even Gonzalez (2015) study

¹The paper is the result of a collaborative work. However it is possible to attribute to Floriana Fusco: research methodology, results and discussion. The other sections are of Guido Migliaccio.

the financial crisis and corporate debt maturity. De Fiore and Uhlig (2015) present a model explaining the evolving composition of corporate debt during the financial crisis of 2008-09. The topic of CSR and ethics in the economy is tackled by Simola (2014), Pirson and Turnbull (2015), Janssen et al. (2015). With regard to crisis management issue, Morel and Chauvin (2016) identify four methodological challenges. Topper and Lagadec (2013) aim to clarify why the crisis management world has profoundly changed and how the current understanding of crises and theoretical frameworks is becoming increasingly less adequate.

The crisis has had diversified effects, accordingly studies of business administration must necessarily orient themselves with analysis about individual geographical contexts, specific production sectors and different social forms (see, for example, Iwasaki, 2014; Jim and Shinde, 2015; Apostol et al., 2015; Cimini, 2015; Yang and Jiang, 2015). Looking at cooperatives, recent literature has stressed their higher resilience rather than others enterprise (Birchall and Ketilson, 2009; Allen and Maghimbi, 2009; Bajo and Roelants, 2011; Boone and Özcan, 2014; Roelants et al., 2012; Carini and Carpita, 2014).

As said, this study focuses on Italian cooperatives, first investigating, with an exploratory study, the trend, then verifying if there are statistically significant differences caused by geographical area and/or belonging business sector. In summary, two are the main research questions:

- 1) What was the trend of profitability in the last decade in the various Italian geographic areas and business sectors?
- 2) Are there differences statistically significant between groups? Or, in other terms, geographical areas and/or business sectors can affect the level of profitability?

In the following sections is presented a review of literature on cooperatives, highlighting especially the typical problems of management resulting from cooperative principles. Thereafter the methodology, results and implications are discussed.

THEORETICAL BACKGROUND

Cooperative is a company tending to profit, albeit with 'social' objectives (Tessitore, 1968, 1973 and 1998; Zan, 1990).

Some authors emphasize above all the features of sociability of cooperative company that is preferable to the capitalist company (Matacena, 1990; Jossa, 2008).

Members cooperate if they have affordability that adds up to extra economic opportunities that have characterized the history of the Italian cooperative movement.

A recent line of research, still little explored and where this study fits, focuses on the resilience of cooperatives business model to the crisis (Birchall and Ketilson, 2009; Allen and Maghimbi, 2009;

Accornero and Marini, 2011; Bajo and Roelants, 2011; Boone and Özcan, 2014; Roelants et al., 2012; Carini and Carpita, 2014).

The principles on cooperative and their effects on the management. Hint about Italian laws.

The first principles were established in 1844 in Rochdale cooperative. Subsequently they were updated. The current principles were set up by the International Cooperative Alliance in 1995 (Vella, 2012; Migliaccio, 2012; Fusco and Migliaccio, 2015): free and voluntary membership, open to all individuals (principle of “open door”); democratic control of the members, who actively participate in decisions with equal rights, regardless of the capital injection and / or contribution (principle: one head, one vote) (Matacena, 1990; Jossa, 2008); member economic participation, contributing equally to the capital with a share that must be compensated with a limited interest (Pacciani, 1979 and 1982¹⁻²); autonomy and independence of the organization; cooperation among cooperatives, to strengthen the movement (Panati, 1984; Roncaccioli, 1984; Zan, 1990; Rosa, 1982); interest in the local community (localism) (Percoco, 2012). The annual financial statements of cooperative societies has unique characteristics, especially because it must clearly indicate the relationship between members and society (Melis, 1983 and 1990; Mari, 1994; Congiu, 2009; Giordano, 2011; Belbello and Dili, 2010; Benni et al., 2005). Even the analysis of their financial statements must be conducted with specific criteria and indexes derived must be interpreted wisely (Matacena, 1991; Krasachat and Chimkul, 2009; Hong and Dong-Hyun, 2012; Chalomklang, 2010; Arimany, 2014; Kyriakopoulos et al., 2004).

General principles of cooperative societies have greatly influenced the civil and tax law of individual countries that, together with the possible availability of soft loans, have affected directly or indirectly the management of cooperatives.

Art. 45, first paragraph, of Italian constitution state: “the Republic recognizes the social function of cooperation of a mutuality nature and without purposes of private speculation. The law promotes and encourages them through the appropriate means and secures, through appropriate controls, the character and purposes”.

Numerous special laws encourage the formation of cooperatives.

The civil law is in the legislative decree No. 6 of 01.17.2003. The rationale of the law characterizes the “management service” to members who get better conditions than those of the market, eliminating the intermediary of other entrepreneurs and its profit.

Art. 2511 state that the definition of cooperative company is such only if with variable capital and mutual purpose (Ferri, 2011). In the law, the distinction between “mutually prevalent cooperatives” and other cooperatives: first enjoy all the facilities, with the remainder being excluded from tax advantages (Di Sabato, 2011)

The prevalent mutuality is characterized (art. 2512) to operate mainly to members (consumers or users) and using mainly the work performance of members and / or their contributions of goods or services. Companies must provide in the statutes (art. 2524) prohibiting the distribution of dividends and remuneration of financial instruments offered to the co-operators beyond certain limits. It is also enshrined in prohibiting the distribution of reserves between the shareholders and the obligation to devolution, the dissolution, the assets to mutual benefit funds for the promotion and development of cooperation.

THE ECONOMIC DYNAMIC OF COOPERATIVES: REBATES AND PROFIT

The cooperative carries out an economic activity to satisfy the needs of its entrepreneur.

The entrepreneur can be any stakeholder.

The different nature of the entrepreneur changes the system cost-benefit: what is an “external” cost in the capitalist companies, in the cooperative is often the contribution of a member.

In it, there are distinctions between values obtained by customary exchanges and mutual. Among the items characteristics: the rebates, indivisible reserves and social loans.

First, the rebates that assume different characteristics (Bagnoli, 2008) the consumer cooperatives is the repayment of part of the price paid; in the productive integration is the remuneration the conferment. The cooperative acquires the goods/services of the member liquidating a deposit, unless the price paid to integrate with an adjustment payment at year end. The rebate is an economic benefit to the members who deliver. It is proportional to the contribution and not the paid-up capital. It is paid only when there is distributable income.

The distribution of income is therefore limited by one of the fundamental principles of cooperation which also prohibits the distribution of self-financing at the time of dissolution.

The laws of various states apply this general principle by reducing the supply of profits. They often state that a portion must be allocated to a reserve and also to a dedicated mutual fund to be disbursed to other cooperatives. special tax breaks are also sometimes obtained only by limiting the distribution of current profits and reserves at the time of dissolution.

Laws that prevent the subscription of capital are elements of discrimination between members. The richest members may prevail: the capital must instead keep the same instrumental function of external funding. Then the capital must be paid as loans: the profit has to be almost equal to the interest on the current market. The members then subscribe little capital. Financial contributions to public entities are therefore required to start up. Passed the start-up phase, unfortunately, the cooperative is often financially weak because the members do not want self-financing for the obligation to allocate the company's assets to third parties, once the company will be dissolved. This ban was imposed because

the interest of the shareholders must be linked exclusively to the use of cooperative's services and not to its assets.

In capitalist societies the annual income is considered the first indicator of the economy of the company and therefore of its concrete ability to last over time. In cooperative societies, however, income in the financial statements provides very different guidance. In capitalist society the ROE is a key index often compared with that of fair remuneration in order to establish the convenience to start or to prolong the life of a company. In cooperative societies, the Roe, however, may not have the same indicative power: Net income is not the actual profit, because a part of it may have been already attributed to members and therefore accounted for as cost. properly, It has much more to deal with the current cost of borrowing in the market because many laws engage the cooperative income at that level.

The Roi has a very different indicative function in various types of society: in the cooperative, in fact, the cost of acquisition of goods, materials and / or services from members includes part of the profit. Its interpretation must therefore also consider the odds added that rebate to members.

Aware of these limits, however, it is advisable to check the earnings performance of the Italian cooperatives in the period considered. Further research will facilitate, in the future, a more complete interpretation of the phenomenon.

RESEARCH METHODOLOGY

Data collection and sample characteristics

The study fits into quantitative research, based on secondary data sourced by AIDA database. It replies the methodology of a previous work on financial structure of Italian cooperatives (Fusco and Migliaccio, 2015), with the aim to assessing if the discriminating factors chosen also affect the economic performance. The economic situation is represented by two ratios, Return On Investment (ROI) - that is *operating income/investment* - and Return On Equity (ROE), i.e. *net income/equity*. The choice is because they surely are the most relevant and widespread economic, or better profitability, ratios. Initially, the entire population of Italian cooperatives in the AIDA database (14,065 cooperative firms) was considered.

The period considered was the last decade, i.e. 2004-2013.

Therefore, the subsequent analysis was restricted to the cooperatives where both ratios over ten-year period were available.

The final sample was therefore made up of 1,446 cooperatives.

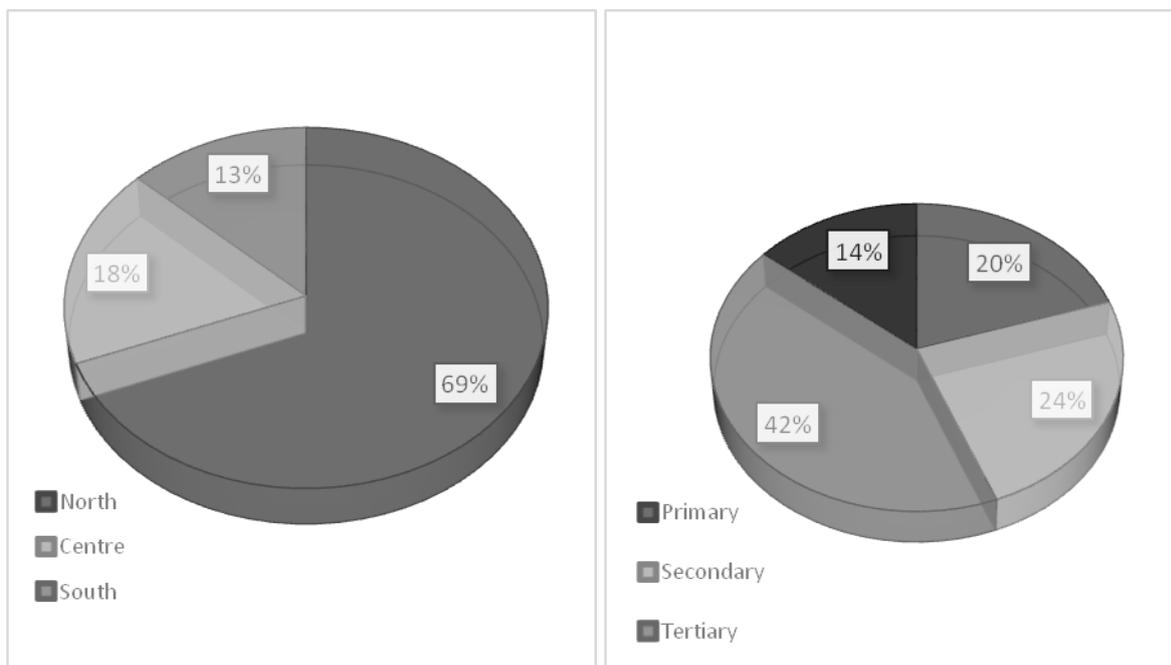

The geographic site of headquarters has been used as proxy to represent the belonging geographic area; while the statistical classification of economic activities in the European Community (NACE Rev.

2 codes) has been used to identifying the belonging business sector. Then three groups (North, Centre and South) are identified according to first factor and four groups (Primary, Secondary, Tertiary and Advanced tertiary) according to the second one. According to conventional classification, the northern Italian regions are Valle d'Aosta, Piemonte, Liguria, Emilia-Romagna, Lombardia, Trentino-Alto Adige, Veneto and Friuli-Venezia Giulia; the central ones are Toscana, Umbria, Marche and Lazio and the southern ones are Campania, Abruzzo, Molise, Puglia, Basilica and the islands Sicilia and Sardegna. With The regard to business sectors, this allocation is used:

- Primary sector: agriculture, forestry and fishing; Mining and quarrying;
- Secondary sector: manufacturing and construction;
- Tertiary sector: Electricity, gas, steam and air conditioning supply; Water supply, sewerage, waste management and remediation activities; Wholesale and retail trade; repair of motor vehicles and motorcycles; Accommodation and food service activities; Transportation and storage; Education; Human health and social work activities; Arts, entertainment and recreation; Other service activities.
- Advanced Tertiary sector: Information and communication; Financial and insurance activities; Real estate activities; Professional, scientific and technical activities; Administrative and support service activities.

The characteristics of the sample are shown in Figures 1a and 1b.

Figures 1a and 1b: sample characteristics

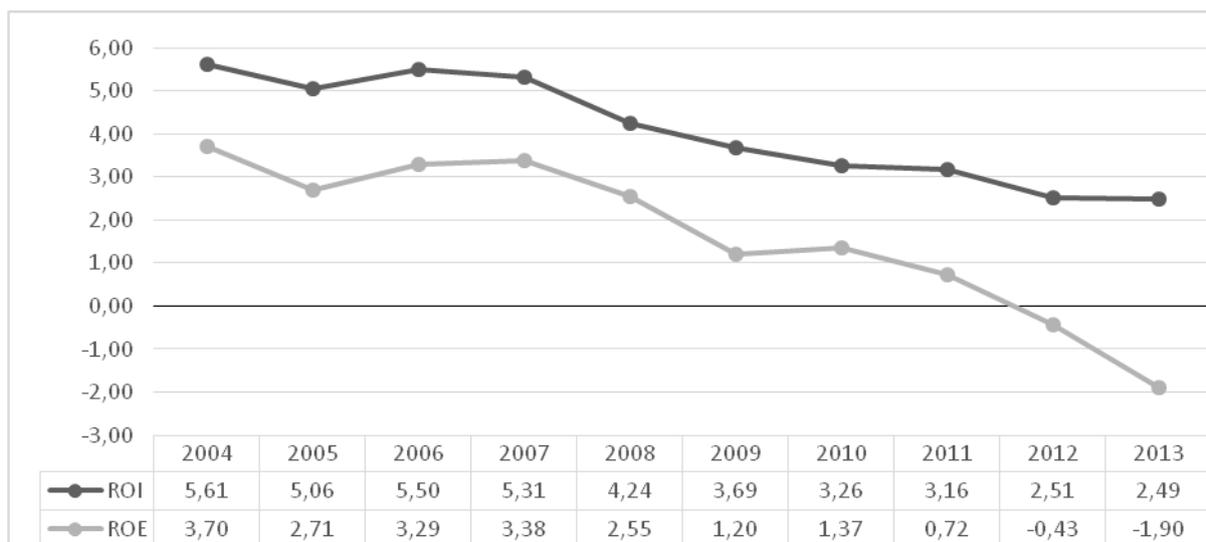

Method

First, ratios trends are analysed, according to descriptive and exploratory approach. Successfully the analysis of variance (ANOVA) is used to verify how the two discriminating factor affect the profitability or, in other words, if the observed differences are statistically significant. In fact, ANOVA tests hypothesis that the means of two or more populations are equal. ANOVAs assess the importance of one or more factors by comparing the response variable means at the different factor levels. The null hypothesis states that all population means (factor level means) are equal while the alternative hypothesis states that at least one is different. In our case, the dependent variables were the ratios considered and factors or independent variables were the geographic localization and the business sector. In this work, the two factors are considered separately, so ANOVA one-way has been chosen.

RESULTS AND DISCUSSION

The analysis of the overall trend - which takes into account the annual average of the sample - reveals a rather negative situation. Both ratios have a declining path and almost parallel with the ROI is always kept at about + 2 percentage points above the ROE. The gap is expanding in the last period in which the return on equity falls to peak and becomes negative, while the ROI, although with modest values, try a slight recovery. The smaller ROE as well as its largest decrease could be found among the leading causes partial ban on the distribution of profits established by law (art. 2524 cc) of profits.

Figure 2: Overall ratios trend between 2004 and 2013

A similar situation can be found in the figures relating to different groups (see fig. 3-6). The trend is for each one falling, albeit with different intensities. However, it is not surprising, given that in the decade considered there was (and it is not totally finished) a global economic and financial crisis. With regard to the ROI, it is possible to verify that the groups with a higher rate have suffered, generally, a larger decline in the decade. Table 3, indeed, marks a clear decrease for the North and for the Centre (respectively 63% and 45%) and a smaller reduction for the South (26%), with the obvious

consequence of a thinning of the gap between groups. The first two groups are similar trends, with strong peaks downward since 2008 as a result of the crisis and the subsequent recession. Only in the last two years, the gap is more evident because of an abnormal reduction of 30% in the North. A more "independent" and fluctuating trend is to the third group, the South, marked by different peaks, both positive and negative.

Looking at the different businesses, table 4 shows an almost constant trend of ROI relative to the primary sector, with a decrease of about 12%, while there is a decrease of 62% in the advanced tertiary. Disaggregate data highlight that the businesses mainly negatively affect the trend are the financial and insurance activities and construction sector, with a decrease of 80% and 83%, but also the ICT sector, usually considering one of the most profitability, has a strong reduction (about 48%). Anyway, the downward trend is widespread, only the accommodation and food service business and utilities record an increase.

Figure 3: Trend of Return on Investment (ROI) according to geographic localization

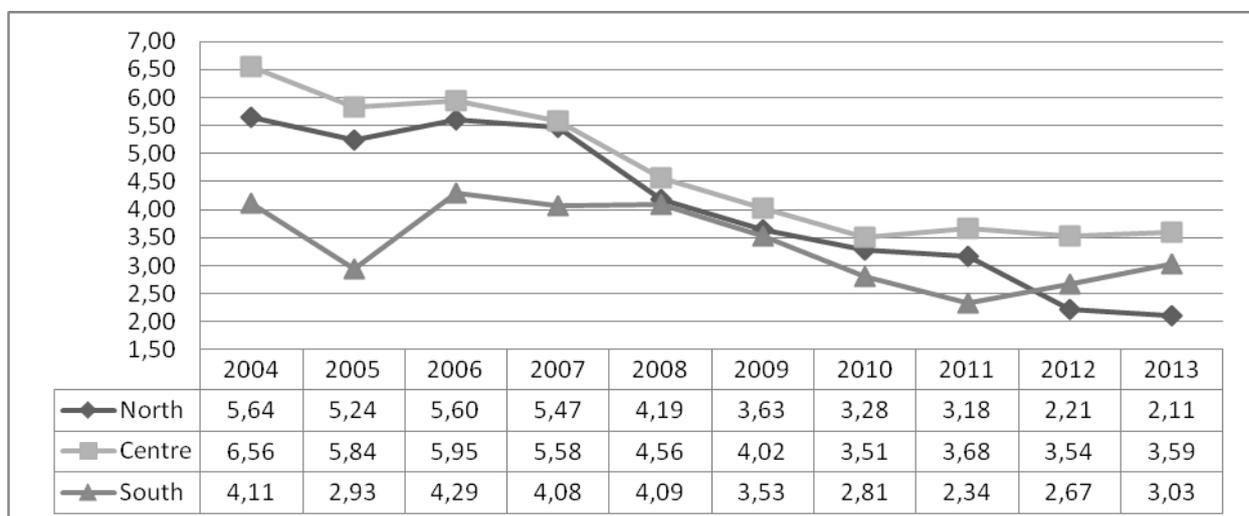

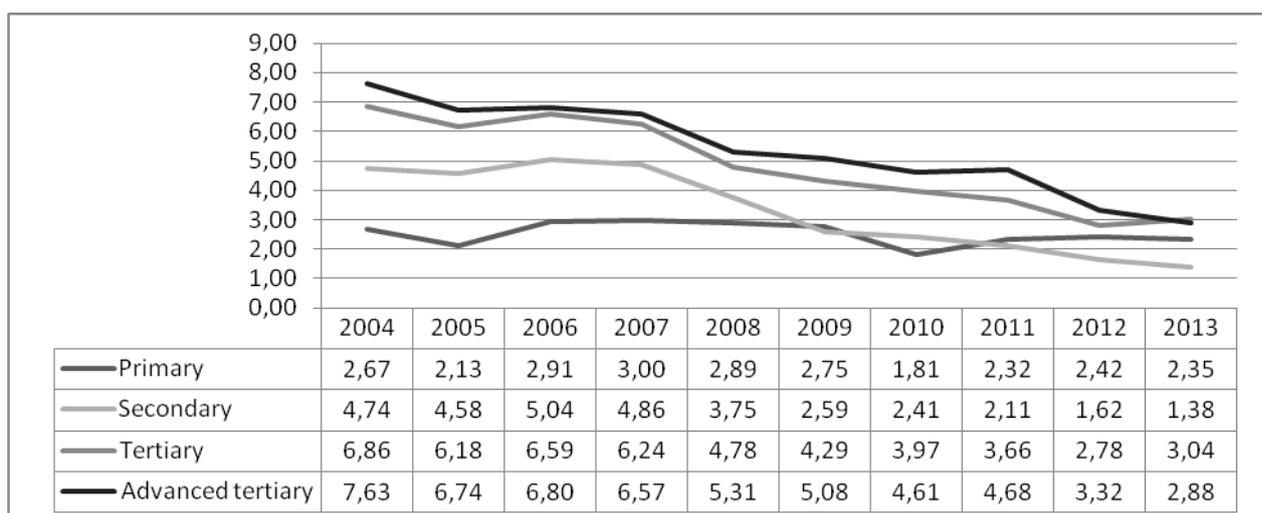

Figure 4: Trend of Return on Investment per business sector

With regard to the ROE, the condition is even more dramatic. Starting with lower rates compared to the ROI and a steady descent, the values are negative for all groups. Looking at the figure 5, all three groups have a negative percentage variation of more than 100%. Even in this case, the gaps between the different groups attenuate, namely those who had a higher profitability, they have, in absolute values, suffered a greater loss. The South, with an already very low rate, has decreased by 268%, that is -3.8 percentage points, while the North and the Centre each have lost about 5 percentage points (that is, respectively, -146% and -144%).

Figure 5: Trend of Return on Equity (ROE) according to geographic localization

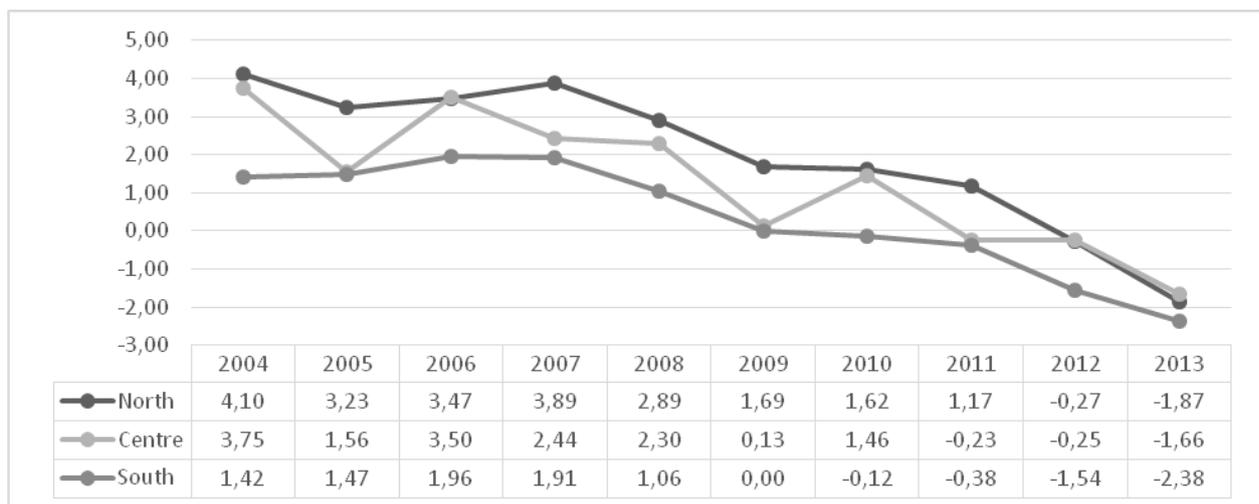

Figure 6: Trend of Return on Equity (ROE) according to business sector

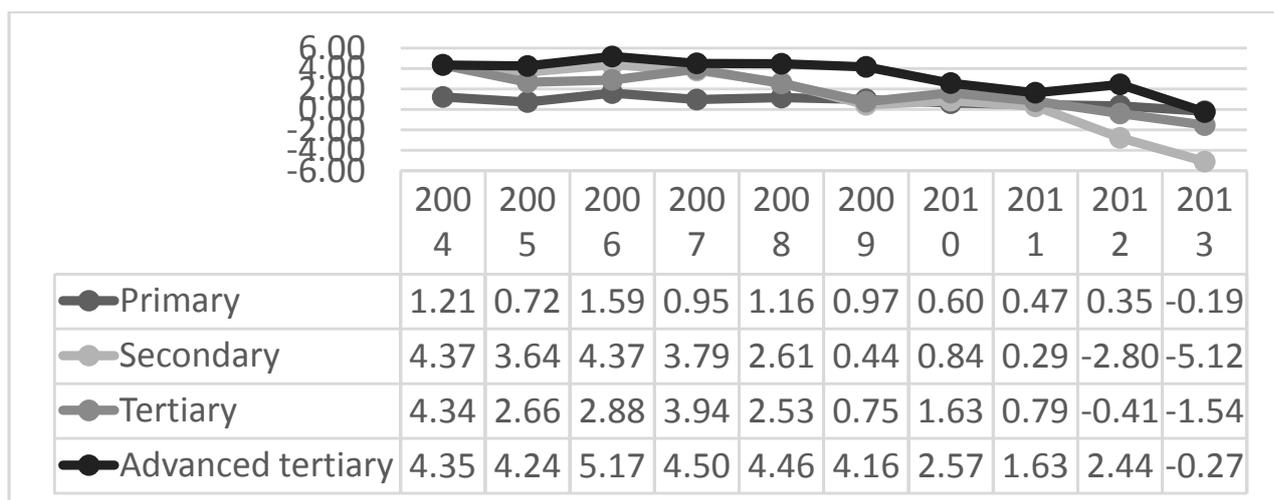

Table 6 shows the trend of different businesses. Consistently with Roi trends, the business with the worst performance is the secondary, with a decrease of 217% (more than 9 percentage point, in absolute), while the primary one maintains more constant values (however, considering the very low values, constancy should be defined stagnation). It is interesting to underline that, as expected, the major collapse of the Roe value is in 2008/2009 for all groups, except for the advanced tertiary, which has the major reduction in 2010. As said, the study wants not only to explore the economic situation of Italian cooperatives, but also to check if the found differences between independent groups, Innovation, Entrepreneurship and Digital Ecosystems

discriminating according to belonging geographical area and business sector, are statistically significant. In other words, if these factors affect the profitability of cooperatives. At this end, ANOVA has been used. Specifically, the one-way ANOVA compares the means between groups discriminating by one factor (or independent variable) and determines whether any of those means are significantly different from each other. It is important to underline, again, that this method only indicates that at least two groups are different, but not which groups are significantly different from each other. The results show that the null hypothesis must be accepted when geographical localization is taken as discriminating factor for both ROI and ROE. In fact, as reported in tables 1 and 2, ($F(2,27) = 3.29$, $p = 0.52304$), with $F < F_{crit}$ ($p \text{ value} > 0.05$), if ROI is the dependent variable and ($F(2,27) = 2.28$, $p = 0.12171$), with $F < F_{crit}$ ($p \text{ value} > 0.05$), if ROE is the dependent variable. It means that belonging to a geographical area or to another does not involve any significant differences in the level of profitability.

Table 1: ROI - Analysis of variance with geographical localization as independent variable

<i>Source of variation</i>	<i>SQ</i>	<i>gf</i>	<i>MQ</i>	<i>F</i>	<i>Sig</i>	<i>F crit</i>
Between groups	8.37662115	2	4.18831058	3.29798586	0.05230383	3.35413083
Within groups	34.2889238	27	1.26996014			
Total	42.6655449	29				

Significant level at 0.05

Table 2: ROE - Analysis of variance with geographical localization as independent variable

<i>Source of variation</i>	<i>SQ</i>	<i>gf</i>	<i>MQ</i>	<i>F</i>	<i>Sig</i>	<i>F crit</i>
Between groups	13.7658738	2	6.88293692	2.27924402	0.12171449	3.35413083
Within groups	81.5354983	27	3.01983327			
Total	95.3013721	29				

Significant level at 0.05

The situation is the opposite if the business sector is considered as discriminating factor. Table 3 shows that $F(3,36) = 9.97$, $p = 6.3464E-05$, with $F > F_{crit}$ ($p \text{ value} < 0.05$), so the null hypothesis must be rejected and the alternative one must be accepted. In other words, the groups are statistically different. The same if ROE is taken into account (see table 4), the alternative hypothesis is accepted because $F(3,36) = 2.90$, $p = 0.04836619$, with $F > F_{crit}$ ($p \text{ value} < 0.05$). Therefore, the business sector seems to affect the level of ROI and ROE.

Table 3: ROI - Analysis of variance with business sector as independent variable

<i>Source of variation</i>	<i>SQ</i>	<i>gf</i>	<i>MQ</i>	<i>F</i>	<i>Sig</i>	<i>F crit</i>
Between groups	52.1375831	3	17.3791944	9.97108325	6.3464E-05	2.86626556

Total	188.579532	39				

Significant level at 0.05

CONCLUSIVE REMARKS, LIMITATIONS AND FUTURE RESEARCH

The trend of all indices is downward. The tendency of Roe and Roi is similar. The differences between North, Central and Southern Italy, though present, does not express statistically significant differences. On the contrary, there are significant differences between the sectors of the Italian economy. Therefore, it is possible to assume that only the latter is able to affect the cooperatives profitability. The result shown by analysis are consistent with the whole economy. Specifically, there are negative peaks in correspondence of the two periods of recession, that are 2008 and 2011 and the most affected businesses appear to be those of the secondary and, as part of the advanced tertiary, the financial and insurance business. Indeed, the crisis started in 2007 as a financial has had especially economic repercussions.

Therefore, the study reveals that the crisis has had a general impact and has substantially eroded the profitability of the cooperatives located anywhere regardless of their activity. "Resilience" that should characterize the Italian and international mutual societies (Fontanari and Borzaga, 2014; Fusco and Migliaccio, 2015) and that would take more resistant than the capitalist enterprises, especially in times of crisis, unfortunately, is not evident from the trend in profitability indicators.

However, the search result must necessarily consider the different area code power of the profit indicators of cooperatives: the Italian legislation imposes limits to the profits for the reasons described that characterize these companies.

It is, therefore, possible to conclude definitively on their lower profitability, without considering the trend of benefiting members who also represent part of the accrued profit. Future investigations on the same budgets will, therefore, find a different dimension of the profit that is not limited to the final income shown in the annual accounts. To it, you must add the greater value accorded to cooperative members compared to the market prices of what they have given to the society of which they are members.

From these additional future investigations the findings could also be the opposite of those seemingly obvious from this research. If, in fact, the members had held constant a rebate worth more than the market price, the smaller company's profitability could also be caused only by a lower average interest intended to remunerate external funding. In some laws, in fact, the income in the financial statements

relates to the cost of money. During the years of the crisis, European monetary authorities have progressively reduced the applicable interest rates as a necessary measure to tackle the crisis and to boost the economy, encouraging investment.

HOW THE EUROPEAN FUNDING HELPS PUSHING FORWARD THE RESEARCH AND ENVIRONMENT SECTORS

Gabroveanu, (Vladoi) Janina

Economic Studies University of Bucharest, Romania

ABSTRACT

The European Union's main objectives are focused on reducing the disparities between the member states, to support them to reach a level of development that will allow them to obtain a high rate of employment, productivity and not at last a high level of social cohesion. In order to become a smart, sustainable and favorable economy for the inclusion, the EU has set targets for the coming years, leading to economic growth.

Although the European Union has financed each member state to reach its assumed targets and attain its foreseen indicators, these have not been entirely achieved. A comparative analysis of the way in which the European funds have been spent during the 2007-2013 programming period revealed that the member states with the higher rate of absorption were Estonia, Portugal, Lithuania, Finland, Sweden, Poland, Romania occupying the 27th place. Nevertheless, analysing the country report for each member state and the level of targets achievement on every area of interest, Romania takes the 4th place in IT&C sector. Seeking to improve the current state of facts, Europe 2020 Strategy comes with immediate measures and sets new initiatives for a 10 years period.

The present paper gives some understandings based on a comparative analysis of the influence of the European funds allocated over the 2007-2013 programming period in the area of research and innovation and how it changed the public institutions, business and the society as a whole, as well as the new trends and opportunities emerged for the next programming period and the measures assigned by the Europe 2020 Strategy.

Keywords: *European funds, comparative analysis, targets, indicators, research and innovation, society.*

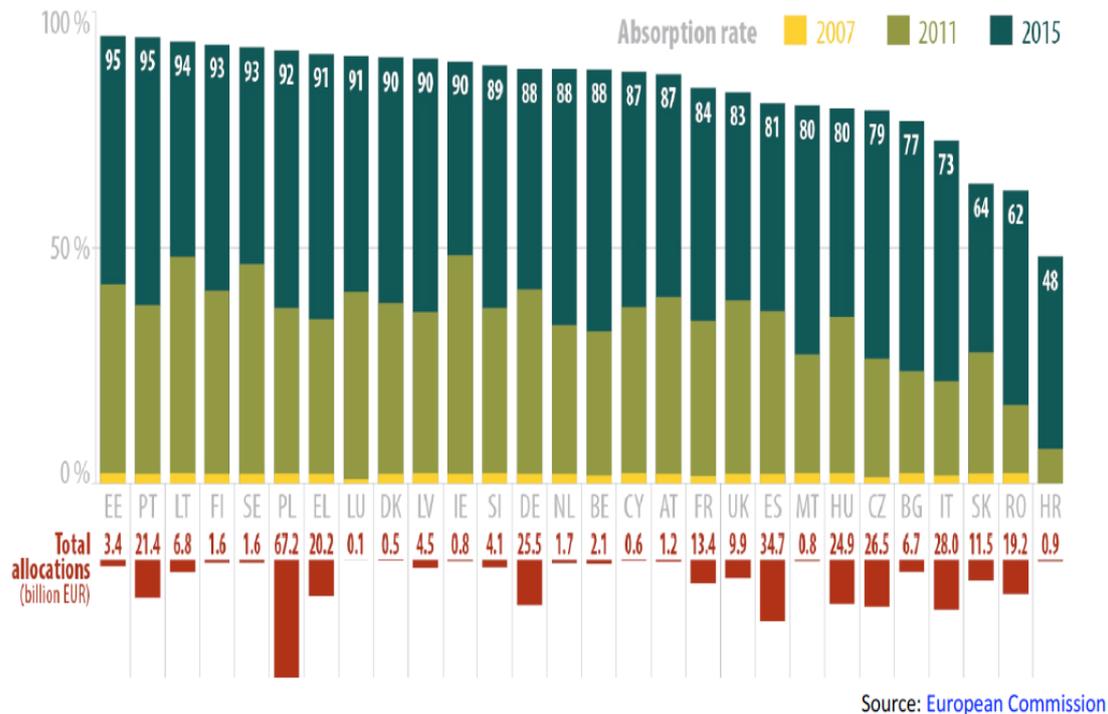

INTRODUCING THE EUROPEAN UNION POLITICAL CONCERNS AND ECONOMIC TARGETS

The European Union aims to reduce the disparities between the member states, to support them to reach a level of development that will allow them to obtain a high rate of employment, productivity and not, at last, a high level of social cohesion. For the next years to come, important objectives have

been set by the European Union in order to become smart, sustainable and open to inclusion economy that could achieve a steady growth.

Although the European Union financed each member state to reach its assumed targets and attain its foreseen indicators, these have not been entirely achieved.

A comparative analysis of the way in which the European funds have been spent during the 2007-2013 programming period revealed that the member states with the higher rate of absorption were Estonia, Portugal, Lithuania, Finland, Sweden, Poland, Romania occupying the 27th place.

Scheme 1. The Evolution of EU Funds Absorption Rate during 2007-2015

Nevertheless, analysing the country report for each member state and the level of targets achievement on every area of interest, Romania takes the 4th place in IT&C sector.

The country report analyses the evolution of Romania during the last 3 years, both in terms of economic growth, fluctuation of public finances due to rising costs and a reduction of certain taxes and the VAT, labour market development, legislative initiatives, efficiency and effectiveness of public administration, social protection system and health system, the evolution of the business environment and R & D.

In this respect, a comparative analysis of the indicators achieved by Romania (RO), Portugal (PT), and Poland (PL), during 2014, in key areas, is presented below, namely:

Table 1 The Macroeconomic Imbalance Procedure (MIP) for Romania, Portugal and Poland in 2014

			Thresholds	PT 2014	PL 2014	RO2014
External imbalances and competitiveness	Current account balance (% of GDP)	3 years average	-4 %/6 %	0.0	-2,3	-2,1
	Net international investment position (% of GDP)		-35 %	-113.3	-68,3	-57,2
	The real effective exchange rate – 42 trading partners, HICP deflator	3 years % variation	±5 % and ±11 %	-1.8	-1,3	-1,1
	Market share of exports – % in world exports	5 years % variation	-6 %	-4.7	4,8	21,5
	Nominal unit labour cost index (2010=100)	3 years % variation	9 % and 12 %	-2,3 e	2,5 w	2,3 p
Internal imbalances	Housing prices which have been subject to inflation (% variation from year to year)		6 %	3.6	1,1	-3,6 p
	Credit flow to the private sector % of GDP, consolidated data		14 %	-8.7	4,7	-2,4
	Private sector debt as % of GDP, consolidated data		133 %	189.6	77,9	62,2
	Public sector debt as % of GDP		60 %	130.2	50,4	39,9
	Unemployment rate	3 years average	10 %	15.4	9,8	6,9
	Total liabilities of the financial sector (% variation from year to year)		16,5 %	-6.1	0,6	1,1
New indicators on employment	Activity rate – % of total population aged 15 to 64 years (3 years variation in percentage points)		-0,2 %	-0.4	2,2	1,6
	Long-term unemployment rate – % of total population aged 15 to 74 years (3 years variation in percentage points)		0,5 %	2.2	0,2	-0,1
	Unemployment rate for youth – % of the active population aged between 15 and 24 years (3 years variation in percentage points)		2 %	4.5	-1,9	0,1

Source: European Commission

Analysing the thresholds, it appears that Romania enjoyed a significant economic growth these past 3 years, the current account balance was improved in the last three years. It is estimated that it will record a slight increase in 2016 but will remain under control standing at 3% of GDP.

“The significantly negative Net International Investment Position (NIIP) has improved since 2012 and is expected to maintain this trend in the coming years. The main drivers of this improvement were a strong growth in nominal GDP and a reduction in current account deficits. In the future, the net international investment position should improve further.”

It was also noted an increase in exports and an increase in domestic consumption. Housing prices have been declining in recent years but 2014 saw a slight increase. After several years of decline, we see a

recovery in credit flow. This was caused by "a decrease of interest rates for consumer loans and a certain relaxation of credit standards."

"Conditions on the labour market were generally stable, but the employment rate is still below target objectives. Increasing employment is particularly focused in sectors with high added value. "

"The potential for long-term employment of the unemployed, older workers, Rom(any) and people with disabilities is largely unmined. Long-term unemployment rate is 2.8%, about half of the EU average. "

Table 2. The Financial Market Indicators

	PT 2015	PL 2015	RO 2015
Total assets of the banking sector (% of GDP)	253.7	92,6	58,5
Financial soundness indicators:			
– non-performing loans (% of total loans)1)	12.6	4,7	12,8
– capital adequacy ratio (%)1)	12.4	15,3	18,1
– ROE (%)1)	6.0	11,2	6,4
Bank loans to the private sector (% variation from year to year)	-2.5	5,8	4,5
Loans to purchase dwellings ((% variation from year to year)	-3.8	4,3	15,5
Loans/deposits ratio	99.6	97,2	85,4
Central bank liquidity as % of debt 2)	7.1	0,0	0,0
Private debt (% of GDP)	-	-	-
Gross foreign debt (% of GDP)3)	93.0	29,0	19,1
– public	45.8	28,9	27,6
– private			
Long-term interest rates versus Bund margin (basic points)	192.8	220,6	297,8
Swaps margins on credit risk of sovereign debts (5 years)	137.4	61,1	110,0

Source: IMF (financial soundness indicators); European Commission (long-term interest rates; private debt); World Bank (gross external debt); ECB (all other indicators).

"Implementation of the National Bank of Romania's 2014 Plan on the resolution of bad loans led to a significant decrease in the rate of bad loans at system level, that rate decreased from 22.6% in February 2014 to 11.6% in November 2015. After the unfavourable developments in 2014, banking sector profitability was restored in 2015. It shows a decrease in the share of foreign currency loans. New legislative changes may have an adverse influence on the banking sector and consequently on economic stability. Loans to households returned to growth rates being supported by consumer loans in local currency and an increase in housing loans."

"The growth rate of housing loans, which currently represent about 47% of total loans to households, also recorded a steady growth since the second half of 2014 (16.5% in nominal terms for the full year 2015). Approximately 60% of total mortgage loans in local currency were guaranteed under the state guarantee scheme "first house" to support first home purchases. The increase of loans to non-financial companies remains negative. Lending activity of enterprises began to fall from mid-2013 and since then it has not recovered."

Table 3. The Labour Market and Social Indicators¹

	PT 2015	PL 2015	RO 2015
Employment rate (% of population aged between 20 and 64 years)	69.0	67,5	66,0
Employment rate increase (% variation compared to the previous year)	1.2	1,3	-0,6
Employment rate among women (% of female population aged between 20 and 64 years)	65.8	60,7	57,3
Employment rate among men (%of male population aged between 20 and 64 years)	72.4	74,4	74,6
Employment rate of older workers (%of population aged between 55 and 64 years)	49.7	43,7	41,0
Part-time employment rate (% of total employment, aged at least 15 years)	12.5	7,4	10,1
Employment rate for fixed-term labour contracts (% of employees with fixed-term contracts, aged at least 15 years)	21.9	28,0	1,5
In transition from fixed-term contracts to permanent contracts	-	-	-
Unemployment rate (1) (% of active population, age range 15-74 years)	12.7	7,6	6,8
Long-term unemployment rate (2) (% of labour force)	7.3	3,1	3,0
Unemployment rate for youth (% of active population aged between 15 and 24 years)	31.9	20,9	22,3
People at risk of poverty or social exclusion (1) (% of total population)	27.5	24,7	40,2
Children at risk of poverty or social exclusion (% of people aged 0 to 17 years)	31.4	28,2	51,0
Poverty risk rate (2) (% of total population)	19.5	17,0	25,4
Severe material deprivation rate (3) (%of total population)	10.6	10,4	26,3
Percentage of population living in households with low labour intensity (4) (% of population aged 0 to 59 years)	12.2	7,3	6,4
Risk of poverty rate of people employed (% of people employed)	10.7	10,6	19,6
Social transfers impact (excluding pensions) on poverty reduction	27.0	26,4	10,9
Poverty threshold expressed in local currency at constant prices(5)	4372	10848	4067
Gross income available (households; increase %)	0.8	3,8	-0,2
Inequality od income distribution (ratio between the top and bottom quintile S80/S20)	6.2	4,9	7,2

¹ [(1) People at risk of poverty or social exclusion (AROPE): persons who are at risk of poverty (AROP) and / or are affected by extremely poor material condition and / or living in households with labor intensity equal to zero or very low. (2) Poverty risk rate (AROP): the proportion of people with available income per adult -equivalent of less than 60% of median national income per adult-equivalent. (3) The proportion of people who are in at least four of the following forms of insecurity: cannot afford i) to pay their rent r bills for utilities, ii) to maintain the dwelling at an appropriate heating level, iii) to face unexpected expenses, iv) to eat meat, fish or equivalent protein more often than every two days, v) to spend a week from the annual vacation away from home, vi) to have a car, vii) to have a washing machine, viii) to have a color TV or ix) to have a telephone. (4) Percentage of population living in households with low labor intensity: the proportion of people aged between 0 and 59 years who live in households where adults (except for dependent children) worked less than 20% of their total work potential during the preceding 12 months. (5) For EE, CY, MT, SI, SK, thresholds represent nominal values expressed in euro; Harmonized Index of Consumer Prices (HICP) = 100 in 2006 (2007 survey refers to revenue from 2006)]

Source: for expenditure for social protection benefits - SESPROS; for social inclusion - EU-SILC.

ⁱ [(1) People at risk of poverty or social exclusion (AROPE): people who are at risk of poverty (AROP) and / or are affected by extremely poor material condition and / or living in households with labor intensity equal to zero or very low. (2) Poverty risk rate (AROP): the proportion of people with available income per adult -equivalent of less than 60% of median national income per adult-equivalent. (3) The proportion of people who are in at least four of the following forms of insecurity: cannot afford i) to pay their rent or bills for utilities, ii) to maintain the dwelling at an appropriate heating level, iii) to face unexpected expenses, iv) to eat meat, fish or equivalent protein more often than every two days, v) to spend a week from the annual vacation away from home, vi) to have a car, vii) to have a washing machine, viii) to have a color TV or ix) to have a telephone. (4) Percentage of population living in households with low labor intensity: the proportion of people aged between 0 and 59 years who live in households where adults (except for dependent children) worked less than 20% of their total work potential during the preceding 12 months. (5) For EE, CY, MT, SI, SK, thresholds represent nominal values expressed in euro; Harmonized Index of Consumer Prices (HICP) = 100 in 2006 (2007 survey refers to revenue from 2006)]

The employment rate experienced an increasing trend in the last 3 years, but remains below the EU average and below the stability target objective of Europe 2020 Strategy. The employment occupancy has increased in sectors with high added value such as: ICT, professional, scientific and technical activities, as well as in industry and construction. It is estimated that the share of highly skilled people in the workforce will experience considerable growth.

“The integration of young people into the labour market remains a challenge. In 2015, youth unemployment decreased to 22%, but the level remains slightly above the EU average. The proportion of unemployed young people or not attending any education or training program (NEET) (Chart 3.2.3) is well above the EU average (17% vs. 12%). A more integrated approach that provides opportunities to young people who are not employed or attending any education or training program, and which focuses on employment in public services, is being developed with support from EU funds. The potential for long-term employment of the unemployed, older workers, Roms and people with disabilities is largely unmined. Long-term unemployment rate is 2.8%, about half the EU average. Its share in total unemployment fell from 45% in 2013 to 41% in 2014. However, only 15% of the people who have been unemployed between one and two years found a job in 2014. The unemployment rate among older workers has increased gradually in 2011-2014. It has reached the level of 43% before the crisis due to the adoption of support measures, but remains below the EU average of 52%. The law to equalize retirement ages for men and women has reached the Parliament since 2013. Without this law, the participation of older women in the labour market will continue to fall significantly, contributing to differences between the pensions of men and women and increasing women’s risk of being affected by poverty in old age. The employment rate of Roms is estimated at 30% (57). Discrimination, limited employment opportunities, reduced physical accessibility and deterrence of fiscal measures (58) affect the employment rate of people with disabilities (38.8% in 2013).”

Table 4. Indicators of Structural Policy and Business Environment¹

Key performance indicators	PT 2014	PL 2014	RO 2014
Labour productivity (real, per person employed, yoy)			
Labour productivity in industry	-1.58	2,71	-5,69
Labour productivity in the construction sector	2.73	5,78	-8,49
Labour productivity in market services	-2.29	-0,51	2,21
Unit labour costs (whole economy, yoy)			
Unit labour costs in industry	3.07	-0,12	11,32
Unit labour costs in the construction sector	-3.00	-16,41	4,39
Unit labour costs in market services	1.20	3,87	-1,31
Business environment

"The shortcomings of the governance structure and weak business environment in Romania create a climate of insecurity, hamper competitiveness and represent obstacles to investment. Romania made progress in several areas of interaction between businesses and public administration. Despite this progress, the burden of government regulation and legal uncertainty still affects competitiveness. Romania's business environment is negatively affected by the lack of a rescue culture in case of companies' insolvency.

The insufficient investment in research and development (R & D), the weak business environment and the limited number of highly qualified workers are among the factors contributing to the low share of exports of high technology products.

Romania lags far behind other EU countries in terms of resources invested in research and development. The insufficient funding and fragmented institutional framework affect the public policy on innovation and R&D. The basic transport infrastructure, which is underdeveloped, an unfavourable business environment, unstable regulatory framework, inefficient public administration and a shortage of highly qualified workers play a significant role in this context.

Table 5 The Green Growth

Green growth performance		PT 2014	PL 2014	RO 2014
Energy intensity	kgep / EURO	-	-	-
CO2 emissions intensity	kg / EURO	-	-	-

Since Romania is still confronting with a low absorption rate of EU funds, a business environment still in development, the need to intervene in the public investment and research – development sectors, the measures and interventions to mitigate the effects of these deficiencies are still a priority in the next programming period.

During the 2014-2020 programming period the funds granted by operational programs approved in Romania (OPLI, ROP, COP, HCOP, ACOP, TAOP) will support the revival of investments, continuation of reforms and economic stability by adopting responsible fiscal policies as follows:

- Operational Program for Large Infrastructure (OPLI) will mainly fund: the mobility improvement through the development of the TEN-T network, environmental infrastructure development under effective management conditions of resources and energy efficiency,
- Regional Operational Program (ROP) will fund: the technology transfer promotion, sustainable development of cultural heritage, tourism, health, social and educational infrastructure development,
- Competitiveness Operational Program (COP) will fund: investing in C&I, economic competitiveness, business development, ICT technology,
- Human Capital Operational Program (HCOP) will fund: the initiative "Jobs for Youth", improvement of the situation of young people under NEET, social inclusion and combating poverty, local development, education and skills,
- Administrative Capacity Operational Program (ACOP) shall fund: efficient, accessible and transparent initiatives for public administration and judicial system,
- Technical Assistance Operational Program (TAOP) will fund initiatives to: "strengthen the capacity of beneficiaries to prepare and implement projects financed by FESI and disseminating

information regarding these funds, support in coordination, management and control of FESI, increase efficiency of human resources involved in the coordination, management and control system of FESI in Romania."

CONCLUSION

This material comparatively presented the influence of forgivable funds allocated during the 2007-2014 programming period on key sectors, how they influenced the public institutions and society in general. In Romania, through the 2007-2013 programming period, there have been seven operational programs: Technical Assistance, Administrative Capacity Development, Transport, Environment, Human Resources Development, Economic Competitiveness Improvement, and Regional Operational Program [1,2,3]. It also presented the new trends and opportunities for the next 2014-2021 programming period. The analysis on the effect records, as a result of financial funds allocated in the main sectors of activity, shows that:

- Romania enjoyed an economic growth in the last 3 years. This was due to export growth, import growth, domestic consumption growth, increased wages, reduced inflation, increased investment achievement rates,
- unemployment rate fell and the employment rate increased
- it was tried a stabilization of public finances so that Romania has achieved its target of a deficit of 1% of GDP
- there has been limited progress in the area of tax compliance, equalizing the retirement age between men and women, reducing the phenomenon of early school leaving,
- there has been progress in terms of increasing the quality of education, in the field of greenhouse effect, gas emissions, energy efficiency in the social field by reducing the number of people at risk of poverty or social exclusion,
- there has been limited progress as regards the public administration, legislation, but the absorption rate of EU funds remains low,
- rural areas still face a low rate of employment, poverty, social exclusion, active aging, and health.

To improve the actual situation through financial support from the EU budget through European structural and investment funds, Romania, as an EU member state, can benefit from a grant of up to 3 billion EURO during the 2014-2020 programming period.

The granted funds focus on priorities identified in accordance with specific recommendations and are allocated as follows:

- ERDF – 34,8%,
- EAFRD – 26,4%,

- CF – 22,5%,
- ESF – 15,5%,
- EMFF - 0,5%
- YEI - 0,3%

and they will respond to the following fields: Environment Protection & Resource Efficiency, Low-Carbon Economy, Social Inclusion, Competitiveness of SMEs, Sustainable & Quality Employment, Educational & Vocational Training, Climate Change Adaptation & Risk Prevention, Research & Innovation, Technical Assistance, Efficient Public Administration, Information & Communication Technologies, Network Infrastructures in Transport and Energy.

THE VERSATILITY OF THE SUSTAINABLE DEVELOPMENT: A CONTINUING CHALLENGE

Gabroveanu, (Vlădoi) Janina¹; Bica, Gheorghe²

¹Bucharest University of Economic Studies Romania

²Spiru Haret University, Bucharest Romania

ABSTRACT

Sustainable development remains a topic of global concern. No matter the field - economic, social or environment - the sustainable development concept and issues represent the core of the European Commission preoccupations. Romanian Government is always concerned about the best way to implement the European policy so that market and society on one hand and all individuals on the other hand benefit of extra funds for build a more sustainable economy, a better society.

In this paper it will be highlighted progress recorded by each activity sector compared to the absorption degree of the funds as well as the main factors that can lead to imbalances maintenance during the next programming period (2014-2020).

Due to socio-economic context that has affected the entire Europe during the 2010-2012 periods, Romania has not been the only Member State failing to fulfil its entire assumed targets. The causes are multiple and systemically complex. Therefore the EU considered necessary and appropriate to initiate immediate and corrective measures, adapted to the individual needs of each Member State. The Europe 2020 strategy is the framework document governing priorities and corrective actions per activity sectors for the next 10 years.

Keywords: *Sustainable development, absorption rate, sectors, progress, European funds*

INTRODUCING THE SUSTAINABLE DEVELOPMENT, EUROPEAN UNION POLITICAL CONCERNS AND ECONOMIC TARGETS

Sustainable development remains a topic of global concern. No matter the field - economic, social or environment - the sustainable development concept and issues represent the core of the European Commission preoccupations.

From this perspective, the development is perceived and analysed as an aggregate demand to implement environmental protection, pollution prevention, and society changes improvement. Romania's intention is to benefit of a higher ratio of allotted funds through the operational programs. Unfortunately the real situation is not as optimistic as the intentions. According to Country Report for Innovation, Entrepreneurship and Digital Ecosystems

ISBN: 978-9963-711-43-7

2016 that was including an *In-Depth Review on the prevention and correction of macroeconomic imbalances on the achieved indicators due to the use of allocated funds in the 2007-2014 programming period*, Romania has made some progresses in most sectors; however, the risk of maintaining medium term imbalances still persist.

Sustainable development can be seen as an overall goal of EU member countries, which can be achieved through international cooperation that aims at economic growth, social development and environmental protection. These targets have been assumed by all EU member states in proportion to the degree of development of each country.

Regarding the economic situation, Romania has recorded economic growth in the last 3 years, being one of the highest in the EU and it is estimated that this will continue in 2016 and 2017 as well. The increase was due, to strong exports due to massive industrial production on the one hand, and to domestic demand who gradually recovered on the other hand. GDP increased by 3.6% in 2015 due to increased consumption and investment recovery. In 2016, it is estimated that GDP will be 4.2% due to tax cuts and wage increases.

Private consumption grew by 4.8% in 2015, due to increased revenues and to value added tax reduction (VAT), which led to a sharp increase in imports. Investments increased in 2015 by 6.5% from the level in 2013.

Inflation has gradually declined in recent years, reaching a negative value of minus 1.7% at the end of 2015.

The labour market started to recover in recent years. In this regard, unemployment rate remained stable hovering at 6.7% in 2015 and it is estimated that it will reach 6.5% in 2017. Employment has experienced significant growth in ICT and professional, scientific and technical sector and in the industry and the construction sector. Youth unemployment has dropped to 22%. Nevertheless, the integration of young people not attending any training program (NEET), of long-term unemployed, older workers, Roma, persons with disabilities on the labour market remains a challenge. Key measures in order to ensure internships, professional development, certification of skills, are part of the employment strategy and of the national strategy for competitiveness to be largely financed by EU funds.

In terms of education, Romania is still confronted with the phenomenon of school dropout, especially in rural areas among vulnerable groups such as Roma and students from poor families. In addition, the rate of persons at risk of poverty or social exclusion in 2014 was one of the highest in the EU (40%).

Sustainable development aims distinctly the R&D sector, this area being insufficiently exploited in Romania. In this regard, expenditure in R & D and innovation has been reduced and experienced a reduced efficiency reaching a value of 0.38% of GDP in 2014. Europe 2020 strategy's objective is that

expenditure on R & D and innovation to reach 2% of GDP. EU structural funds accounted for 20% of public expenditure on R & D. Company's investment in R&D are developing; the share of company's expenditure on R & D was 0.16% of GDP in 2014. The low rate of attracting of investment in R & D and innovation affects the cooperation between the public and private sector on innovation research.

Information and communication technology sector (ICT) has made progress in recent years. ICT sector's share in GDP of 6% ranks Romania on the 4th place among the Member States and on the first place in the EU in relation to the use of ultrafast broadband access.

Europe 2020 strategy places the focus on the innovation research sector (I&R) as this sector plays an essential role in stimulating economic growth, in creating smart and sustainable jobs by acquiring new knowledge, in developing innovative and more environmentally friendly new products, in providing competitive and efficient services. Analysing the degree of exploitation of this sector, it was concluded that each Member State might face some obstacles that may impede full achievement of performance indicators proposed. Therefore, it is essential, on the one hand, to identify obstacles that impede R & D's full contribution to a sustainable, smart and inclusion friendly development, and on the other hand, to assess the adequacy of the policy response to the challenges identified.

Sustainable development mandatory aims the environmental sector. If during 2005-2014 emissions of greenhouse effect gas decreased by 9%, the Europe 2020 Strategy proposed a target of 4% for 2020. Regarding renewable energy, the target for 2020 is 24%. With a 24.9% share of energy from renewable sources in 2014, Romania has already reached its target for 2020. Regarding the share of energy from renewable sources in all means of transport, the goal is 10%. In 2014, the share of renewable energy in transport was 3.8%. In terms of energy efficiency, i.e. reducing the energy consumption, Romania's energy efficiency goal for 2020 is of 43 Mtep, expressed in primary energy consumption (30.3 Mtep expressed in final energy consumption).

Romania is heading towards the target set for 2020 in terms of energy efficiency. This is because the goal has allowed a substantial increase in energy consumption that exceeded both the previous and the current level.

CONCLUSION

According to "Romania's country report for 2016, including an in-depth review on the prevention and correction of macroeconomic imbalances on" EU's budget contribution to structural changes, Romania is a major beneficiary of structural funds and European investment funds (EIF) and may receive up to 31 billion euros over the period 2014-2020. This is equivalent to 2.6% of GDP per year and 53% of national public investments planned in the areas supported by EIF funds."There have been taken measures to accomplish the reforms proposed to ensure investments' success. However, reforms in

sectors like law, healthcare investments, railway transport, waste management and environment sector, employment, social inclusion, educations and public administration could not be accomplished.

Fund programming was distributed as a result of analysing priorities and challenges identified in recent years and transposed also in each country's recommendations. These recommendations are relevant for EIF's funds, including those on: strengthening labour market including specific measures for Roma integration in the labour market, reducing school dropout to increase school enrolment, increasing energy efficiency i.e. to reduce energy consumption, strengthening transport sector, providing an efficient and comprehensive management and control of EU funds.

Romania will also receive other EU funds to fulfil country-specific recommendations, i.e. funding granted by European Fund for Strategic Investment (EFSI) program, Horizon 2020 program and the Connecting Europe Facility. Following the first rounds of projects' applications under the Connecting Europe Facility, Romania has signed agreements worth 715 million euros for transportation projects.

At the same time, Romania shall benefit of support for unemployed young people of 106 million euros from the "Jobs for Youth" initiative for undertaking measures for young people who are unemployed, and who are not attending any education or training program (NEET).

On the Europe 2020 Strategy's objectives and progress made in addressing relevant structural reforms (especially in health, rail transport, research, development and innovation (RDI), employment, education and social inclusion) shall be ensured a regular monitoring of the degree of objectives' achievement, of progress made in order to capitalize EU funds at maximum.

BUSINESS PROCESS MANAGEMENT IN THE PUBLIC SECTOR: EXPLORED AND FUTURE RESEARCH FIELDS

Gabryelczyk, Renata¹; Jurczuk, Arkadiusz²

¹University of Warsaw, Faculty of Economic Sciences, Digital Economy Lab, Poland

²Bialystok University of Technology, Faculty of Management, Poland

ABSTRACT

The main aims of this paper are to identify trends and main issues of research conducted on Business Process Management (BPM) in the public sector, and, to recognize the common insights of the research development on BPM in this area. Business Process Management is an approach dedicated to process-centric organizations and focused on analyzing, improving and controlling processes, with the objective of integrating people, processes, and technology. Although BPM is frequently applied and verified in the private sector, it is still uncommon in the public sector.

Public administration institutions of today need to enhance effectiveness and to raise customer satisfaction. They are therefore turning to methods and techniques that have been used in the management of profit-based organizations. Effective process management not only reduces costs, but also translates into high quality of services provided to citizens, and the efficient use of resources, including information and communication systems supporting government operations.

To assess the scope of practical application of BPM in the public sector we conducted the first (to the best of our knowledge) literature review in this area. Findings of our research confirms that the use of BPM in the public sector is undergoing a similar evolution that has taken place in the private sector. Improving internal structures and processes of public institutions have become dominant issues in the discussion of BPM. However, we recognized the growing importance of BPM use in the implementation of t-Government, which is focussed on a technology-driven change of business process with the main aim of delivering innovating services for citizens and radical organizational changes.

Keywords: *Business Process Management, Business Process Reengineering, Public Sector, Public Administration, t-Government, Literature Review*

INTRODUCTION

Process approach and related management concepts such as Business Process Management (BPM) or Business Process Reengineering (BPR) have become dominant topics in management literature in the last twenty-five years. The creation of the process-oriented organization intensively raised in the early '90s with radical and fundamental reengineering of the organization's processes and technologies, and as a result of the evolution of process approach, BPR is considered as phase in the development of the BPM. Business Process Management focuses on analyzing, improving and controlling processes (Elzinga et al., 1995), emphasizes the transition from functional to process oriented organizational structures (Hammer and Champy, 1993), underlines the link between process and team-oriented structures and other management systems (DeToro and McCabe, 1997), and, involves employees, customers, and partners within and beyond enterprise boundaries (Swenson and von Rosing, 2015).

Research on methodologies, techniques and tools of BPR and BPM received much attention predominantly from the private sector. Little has been written about the use of these concepts in the public sector, although the requirement to continually improve performance and enhance effectiveness is imposed on public administration policies. Today's public administration institutions are seeking solutions that have thus far been used in the management of profit-based organizations. New public management requires public administration to use management methods and techniques typical of business, and introduces performance and effectiveness indicators as the public sector evaluation criteria (Kickert, 1997; Krukowski 2011). Improving performance for public administrations can be designed, modelled and measured with the help of BPM. Effective process management translates into a high quality of services provided to citizens, efficient use of human and other resources capacity, including existing IT systems supporting management. For these reasons, the literature mentions the BPM not only as a concept for reducing costs and improving the overall efficiency of public sector institutions, but also in the context of the digitization of this sector and the introduction of e-Government or t-Government (Weerakkody and Dhillon, 2008; Weerakkody et al., 2011; Janssen and Estevez, 2013).

Research on BPM is still uncommon in the public sector and has a limited degree of practical application. Thus it is perhaps unsurprising that we were unable to find literature reviews on BPR or BPM dedicated to research in this area. According to Fink (2014) a research literature review is a systematic, explicit and reproducible method for identifying, evaluating, and synthesizing the existing state of research works results. There are two main aims of literature reviews, first mapping, consolidating and evaluating research results in a certain field and second to identify knowledge gaps in an analysed knowledge domain. Thus, a literature review, allows both an evaluation of the current state of knowledge and the verification of trends, uncovering of gaps and opportunities for future

research (Webster and Watson, 2002, Schwarz et al., 2007). A literature review can also provide collective insights into the analyzed knowledge field through theoretical synthesis (Tranfield et al., 2003).

In this paper we acknowledged the gap in research and choose to develop a preliminary literature review on BPM (including BPR) in the public sector. The research questions we plan to address relating to this sector, are:

RQ1: What trends can be identified within BPM in the public sector?

RQ2: What are the main issues of the research conducted on BPM in the public sector?

RQ3: What are the common insights of research development on BPM in the public sector?

The paper has been structured as follows: the background provides the theoretical foundation, explains the evolution of Business Process Management, the need of managerial approach and development usage of ICT in the public sector. Afterwards, we describe the methodology of the research and analysis framework. In the next section, we summarize and discuss the findings. In the final part the limitations of the study and plans for future research are presented

BACKGROUND

The common ground for Business Process Reengineering and Business Process Management is a comprehensive, holistic, process-based management approach in an organization that uses information technology, and aligns with the needs and requirements of customers through the processes organizational objectives (Elzinga et al., 1995; Zairi and Sinclair, 1995; DeToro and McCabe, 1997; Smith and Fingar, 2003). BPR initiate a radical change in the entire organization or its processes, and is a methodical approach to radically overhaul and redesign a process, and to achieve business goals (Hammer and Champy, 1993). BPM has evolved from a scientific approach to one of management and BPR ideas (Smith and Fingar, 2003). BPM is a successor of BPR, focusing on a management-style “dedicated to a process-centric, customer-focused organization with goals of integrating management, people, process, and technology for both operational and strategic activities” (Antonucci and Goeke, 2011). Process-based management concepts are usually equated with the development of enterprises, but a number of private sector “countermeasures” such as BPR and BPM have also been applied in the public sector over the years (Macintosh, 2003).

Since the early 90's the public sector has been faced with new challenges and expectations. Increasing consumer demands, IT development, growing competitiveness of economies, which requires the effective and efficient operation of the state, and support for entrepreneurship are change drivers of public sector (Becker et al., 2006). The implementation of business practices is perceived by public administration as an opportunity to adapt to changing **patterns** and **economic tendencies**. Nutt and

Backoff (1993) argue that the public sector has obscure goals and operates based on the control of authority and management, while the private sector's goals are clear and based on market forces. Moreover, public organizations are tied to different kinds of regulatory connections (policies or legislation), budgetary rules, and represent "the culture of bureaucracy". Although there are differences, the field experiences from the implementation of BPM in the private sector could be perceived as a frame of reference for management changes in the public sector (Saxena, 1996, Halachmi and Bovaird, 1997; Rainey and Bozeman, 2000).

The common reform movement in the public sector has observed in recent years a focus on minimising administrative borders for citizens, increasing customer-centricity, reducing the cost of public administration, and improving efficiency and effectiveness (Weerakkody and Dhillon, 2008; Weerakkody et al., 2011). In order to achieve these objectives, examples of the most commonly implemented practices, models, and tools can point out: process modelling, improvements and standardization, the delivering of services online, open data, and general use of information and communication technologies (ICT). From the three main waves identified by Janssen and Estevez (2013) in the evolution of the usage ICT in the public sector: e-Government, t-Government, and l-Government, the second is strictly correlated to the processes of an organization. E-Government focused on providing online services and was often discussed solely from the technological perspective, ignoring the need for structural change (Nam, 2014). L-Government, with the leading slogan "doing more with less", is focused on reducing government complexity using the network of citizens (Janssen and Estevez, 2013). Transformational Government is the result of the evolution of e-Government and is defined as "ICT-enabled and organization-led transformation of government operations, internal and external processes and structures to enable the realization of citizen-centric services that are cost effective and efficient" (Weerakkody et al., 2011). Process reengineering in management is therefore an essential and integral part of t-Government implementation in the public sector. This is the leading reason why in the review of the literature on BPM in the public sector we took into account the relationship between BPR, BPM and e- and t-Government. Based on the literature, we conclude that there are two main fields of application of BPM in the public sector: the internal structures and processes of government institutions, and, the processes of service delivery to citizens and the interaction with them.

METHODOLOGY USED IN THE STUDY

Literature retrieval process

In the literature retrieval process we conducted a search of papers for our sample using the electronically accessible scientific databases which included: ACM Digital Library, EbscoHost, Google Innovation, Entrepreneurship and Digital Ecosystems

Scholar, Emerald, IEEE *Xplore* Digital Library, ProQuest, ScienceDirect, and Web of Science. We used multiple combinations of the following search term: ("Business Process Management" or "Business Process Reengineering" or "Process Management" or "BPR" or "BPM"), AND, ("Public Sector" or "Public Administration" or "e-Government" or "t-Government"). Indicated terms and/or acronyms should appear in the title, and/or abstract, and/or keywords of the paper. We searched only journal peer-reviewed articles. This method of formulating selection criteria was adopted from Roztocki and Weistroffer (2015). As a result, we collected a sample of 32 papers from our literature retrieval process.

Literature classification process

We classified articles according to three perspectives: meta-perspective, content-based perspective, and methodical perspective. This approach has been adapted from Houy et al. (2010), and Roeser and Kern (2015). Within the meta-perspective we analyzed the year of publication to observe trends in the evolution of the examined BPM-related concepts. We assigned any article containing the keywords "process management" to the group of articles on BPR or BPM, depending on its content. The meta-perspective also includes review of the names of journals in order to observe their main focus. The content-based perspective includes an analysis of the research issues in the examined papers and has been carried out to identify the main focus of the research conducted on BPM in the public sector. The methodical perspective contains research methods used in the papers, countries and units of the public sector where the research was conducted. The characteristics of the collected papers will allow for systematic analysis and classification in order to answer the research questions.

ANALYSIS AND FINDINGS

Findings from the meta-perspective

The meta-perspective includes descriptive aspects concerning research on Business Process Management in the public sector. An overview of the 32 papers collected in our sample are classified according to the year of publication and presented in Table1. The complete list of 32 papers with references is available from the authors upon request.

Year	Number of publications	Papers on BPM in public sector
1996	1	Saxena (1996)
1997	1	Halachmi and Bovaird (1997)
1999	1	McAdam and Donaghy (1999)
2000	1	Thong et al. (2000)
2002	1	Gulledge and Sommer (2002)
2003	2	MacInstosh (2003); Papavassiliou et al. (2003)
2004	1	Ongaro (2004)
2006	1	Proctor and Grey (2006)
2007	3	Hesson and Al-Ameed (2007); Stemberger and Jaklic (2007); Stemberger et al. (2007)
2008	2	Sentanin et al. (2008); Weerakkody and Dhillon (2008)
2009	1	Helfert (2009)
2010	2	Niehaves (2010); Vuksic et al. (2010)
2011	1	Weerakkody et al. (2011)
2012	4	Candiello et al. (2012); Kassahun and Molla (2012); Ruzevicius et al. (2012); Sundberg (2012)
2013	5	Akkoyun and Erkan (2013); Niehaves et al. (2013); Polak (2013); Salkic and Bosnjovic (2013); Ziemba and Oblak (2013)
2014	3	de Waal and Batenburg (2014); Kamukama (2014); van Beest et al. (2014)
2015	2	Corradoni et al. (2015); Rinaldi et al. (2015)

Table 1. Year classification of BPM in public sector related publications

Publications on BPR in the public sector began in 1996, three years later than the beginnings of the reengineering revolution launched by Hammer and Champy (1993). Taking into account the keywords from literature retrieval process and publication years we have can clearly see the evolution of the concept of BPM (Figure 1).

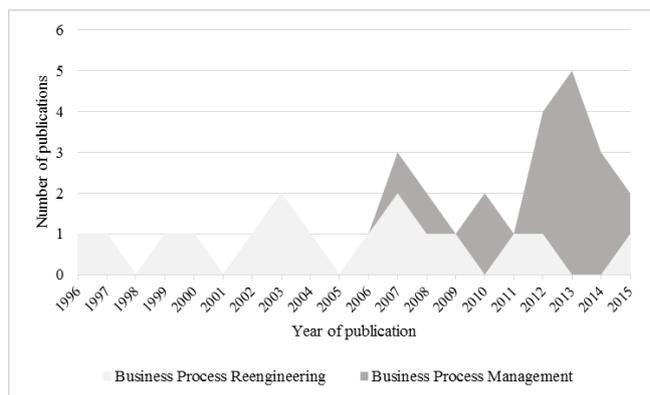

Figure 1. Number of published papers on BPR and BPM in public sector per year (from the sample)

We emphasize that BPR is treated as an initial development phase of BPM, its most radical. The first paper about BPR in public sector was published in 1996 (Saxena, 1996), and with the term BPM in 2007 (Stemberger et al., 2007).

Table 2 contains the classification of the journals where the papers from our sample were published. We checked indexing of journals to have an objective assessment of the quality of the publications

(Elsevier Science, 2016; Thomson Reuters, 2016).

Indexed	Number of journals	Number of publications	Journal name (Number of publications in the journal)
Web of Science	7	18	Business Process Management Journal (11), Government Information Quarterly (2), EuroMed Journal of Business (1), Information Systems (1), International Journal of Operations & Production Management (1), Long Range Planning (1), Technovation (1)
Scopus	12	24	Business Process Management Journal (11), Government Information Quarterly (2), Interdisciplinary Journal of Information, Knowledge, and Management (2), EuroMed Journal of Business (1), Information Systems (1), International Journal of Electronic Government Research (1), International Journal of Information Management (1), International Journal of Operations & Production Management (1), Journal of Management Information Systems (1), Knowledge and Process Management (1), Technovation (1), Transforming Government: People, Process and Policy (1)
Non indexed	7	7	Business Systems Research (1), Current Issues of Business and Law (1), Procedia - Social and Behavioral Sciences (1), The International Journal of Public Sector Management (1), Uporabna Informatika (1), World Journal of Entrepreneurship, Management and Sustainable Development (1), Zarządzanie i Finanse (1)

Table 2. *Journal classification of BPM in public sector related publications*

Findings from a content-based perspective

By summarizing papers according to their content, particularly the research aim and conclusions, we recognized six main research issues undertaken in the analyzed sample. They are presented in Table 3 with reference to the relevant papers.

The vast majority of reviewed papers concern the issues of process modelling and frameworks for BPM implementation. Furthermore, the articles present the role and results of BPM usage for increasing the efficiency of public organizations. The critical success factors of BPM implementation are also widely discussed.

Subsequently, in examining of the content-based perspective we have analyzed the focus of research on BPM in the public sector and the contribution of research in our sample. The research focus is divided into two main topics related to the objectives of BPM implementation in the public sector. The first research focus is the use of BPM to improve the efficiency effectiveness of operations inside an organization and to reengineer internal structures and processes. This approach advocates a comprehensive, market-oriented system of public administration transformation towards a cost-effective organization. The second involves the use of BPM to improve internal and external processes and structures to enable the realization of citizen-centric services that are cost effective and efficient as a result of increased consumer satisfaction.

Research issues	Number of papers	Papers
Business Process Modelling	8	Corradoni et al. (2015); Gulledge and Sommer (2002); Kamukama (2014); MacIntosh (2003); Niehaves (2010); Papavassiliou et al. (2003); Sundberg (2012); van Beest et al. (2014)
Framework for BPM implementation	7	Helfert (2009); Kassahun and Molla (2012); Niehaves et al. (2013); Saxena (1996); Sentanin et al. (2008); Stemberger and Jaklic (2007); Stemberger et al. (2007)
Increasing the efficiency of an organization	6	Akkoyun and Erkan (2013); Hesson and Al-Ameed (2007); Ongaro (2004); Proctor and Grey (2006); Rinaldi et al. (2015); Salkic and Bosnjovic (2013)
Critical Success Factors of BPM implementation	5	Halachmi and Bovaird (1997); McAdam and Donaghy (1999); Ruzevicius et al. (2012); Thong et al. (2000); Vuksic et al. (2010)
BPM in IT systems implementation	3	de Waal and Batenburg (2014); Polak (2013); Ziemba and Oblak (2013)
Applying BPM to implement e-Government or t-Government	3	Candiello et al. (2012); Weerakkody and Dhillon (2008); Weerakkody et al. (2011)

Table 3. *Key research issues classification of BPM in public sector related publications*

Table 4. presents the results of the analysis which, of the two main research focuses of BPM implementations, is more frequent in the papers from our sample.

Research focus	Number of papers	Papers
Use of BPM to introduce a comprehensive, market-oriented system of public administration transformation towards a cost-effective organization	28	Akkoyun and Erkan (2013); de Waal and Batenburg (2014); Gulledge and Sommer (2002); Halachmi and Bovaird (1997); Helfert (2009); Kamukama (2014); Kassahun and Molla (2012); MacIntosh (2003); McAdam and Donaghy (1999); Niehaves (2010); Niehaves et al. (2013); Ongaro (2004); Papavassiliou et al. (2003); Polak (2013); Proctor and Grey (2006); Rinaldi et al. (2015); Ruzevicius et al. (2012); Salkic and Bosnjovic (2013); Saxena (1996); Sentanin et al. (2008); Stemberger and Jaklic (2007); Stemberger et al. (2007); Sundberg (2012); Thong et al. (2000); Vuksic et al. (2010); Weerakkody and Dhillon (2008); Weerakkody et al. (2011); Ziemba and Oblak (2013)
Use of BPM to enable the realization of citizen-centric services that are cost effective and efficient as a result increase the satisfaction of citizens	14	Candiello et al. (2012); Corradoni et al. (2015); Hesson and Al-Ameed (2007); Kassahun and Molla (2012); MacIntosh (2003); Ongaro (2004); Papavassiliou et al. (2003); Polak (2013); Rinaldi et al. (2015); Stemberger and Jaklic (2007); Stemberger et al. (2007); van Beest et al. (2014); Weerakkody and Dhillon (2008); Weerakkody et al. (2011)

Table 4. *Research focus on BPM in public sector related publications*

As can be seen in Table 4, the vast majority of research in the field of BPM in the public sector, covers the issue of reducing costs and improving the overall efficiency of public sector institutions (28 from 32 papers in the sample). We recognized in 14 of 32 investigated papers that the primary reason in using BPM was to deliver cost effective and efficient services to the public. This is more related to the later advent of the e-Government and t-Government concepts than the process-related concepts in the public sector. From another perspective, it is worth mentioning that a *decisive majority* of the articles concern

organizational aspects of BPM implementation (81%). Only 19% of reviewed papers describe issues related to information technology in the public sector.

Findings from methodical perspective

The papers review from the methodical perspective focused on the identification methods used by the researchers. The use of this perspective also allow researchers to indicate whether they concentrate on theoretical or empirical aspects of implementation of BPM in the public sector.

Authors	Methods and unit of public sector	Country
Akkoyun and Erkan (2013)	Case study in the Turkish Social Security Institution	Turkey
Candiello et al. (2012)	Case study in the regional e-Government	Italy
Corradoni et al. (2015)	Case studies of e-government public services	Italy

Table 5. Major research methods and country of investigations used in BPM in public sector related publications

The research methodology in the sample of papers was based on a descriptive and/or a normative approach. A case study is a most frequent research method used in the sample of analyzed papers (62%). This method generally attempts to catch and present the reality of a particular phenomena at a point in time. The multimethod (i.e., a survey and case study, or surveys and interviews) for the analysis of a public sector in the context of BPM was used in six articles. The survey was applied by the authors of four papers. The multimethod was used in the papers which focused mainly on IT systems, frameworks for BPM implementation and Business Process Modelling. The surveys were based on structured or semi-structured questionnaires and were conducted within public administration staff in the context of culture, best practices and an organization's maturity in this sector.

The sample includes studies conducted in 21 countries including developed (56%), developing (24%) and transition countries (21%). The results of the analysis indicate that the most intense work on the BPM in the public sector was conducted in the developed countries: United Kingdom and Italy. The development of the public sector in the context of BPM implementation in the United Kingdom is broadly discussed in the sample of papers.

DISCUSSION AND CONCLUSIONS

This paper is the first systematic literature review on Business Process Management in the public sector. The findings indicate a number of significant contributions to the body of knowledge on this topic. The study shows that the development of research BPM in the public sector is following the same evolution from the BPR-like process-oriented concept implemented in the private sector. The delay in noticing the possibility of utilizing BPM in the public sector was several years in comparison with the private sector: radical BPR started in the early '90s (Davenport and Short, 1990; Hammer and Champy, 1993), the first article with the term "BPM" we noticed in 1995 (Elzinga et al., 1995), the first paper about BPR in the public sector was published in 1996 (Saxena, 1996), and another with the term BPM in 2007 (Stemberger et al., 2007). Over the years, we have observed an increasing number of publications on this research subject, most commonly in the years 2012-13, although this conclusion weakens the small study sample. Based on the analysis of the journal list, we conclude that 11 papers were published in the *Business Process Management Journal* - the most recognized journal in the business process-oriented field. Only four journals of 20 overall focused on research in the public sector, i.e. "*Government Information Quarterly*", "*International Journal of Electronic Government Research*", "*The International Journal of Public Sector Management*", and "*Transforming Government: People, Process and Policy*". Thirteen of 20 journals are high indexed in Web of Science and also in Scopus, which may suggest an elevated quality not only reserved for those publications, but also high ranking issues concerning management in the public sector.

The dominant area of interest in the public sector, owing to the results of the analysis of the content of the reviewed articles, is the business processes modelling. This may suggest that the majority of organizations from the public sector are still in the initial phase of their Business Process Management Life Cycle. On this stage of BPM implementation, organizations are focused on process design, including models used for a better understanding of the organization's operational processes and capabilities (Van der Aalst, 2004). This fact may additionally confirm the strong interest in the framework for BPM implementation. Furthermore, a large number of papers considering this research problem suggest a necessity in developing a BPM framework for the public sector (Niehaves et al., 2013). The initial level of BPM implementation in this sector can sustain a small number of studies on the requirements and implementation of IT systems and tools supporting BPM activity in public administration, particularly those of e-Government and t-Government. Taking into account that the success rate of BPM projects is relatively low (from 50% to 20%) (Iqbal et al., 2015), Critical Success Factors (CSFs) should be identified and evaluated for reducing the failure rate of BPM implementation. The high level of interest in CSFs in the group of reviewed articles highlights the importance of this issue for the process-oriented development of the public sector (Ariyachandra and Frolick, 2008; Ram and Corkindale, 2014). A large number of research issues dedicated to improving the current performance/cost-effectiveness and process-based transformation of a public organizations can attest to the fact that research focuses on the inside of the organization and not on the needs of consumers. BPM is also seen as a method enabling the realization of consumer-centric services that are cost effective and efficient as a result of an increase the customer satisfaction. Linking BPM and e-government and t-government proves this (Weerakkody et al., 2011).

From a methodical perspective, we conclude that almost all analyzed papers are research papers and there is a lack of conceptual papers based on theories. Even those articles that attempt to create a framework do not contain references to any theory. The most commonly are used qualitative research methods, of which is featured case study. According to Yin (2013), this kind of research copes with technically distinctive situations and is aimed at illustrating certain topics in an easy-to-understand way preserving the most important advantage – they present real-life context. However, the case study allows, to a limited extent, the generalization of conclusions. It is also significant that research on BPM in the public sector mainly engages authors from developed countries, which is consistent with the fact that they are the leaders in the development of new management concepts. Finally, the results of this study show that research on BPM in the public sector is not as developed as that of the private sector. The differences between sectors pointed out by the authors in our sample (Saxena, 1996; Halachmi and Bovaird, 1997) require some modifications in BPM ascertained in the private sector before it could be applied to the public sector.

In summary, based on the results of our research, we can undoubtedly conclude that the public sector use of BPM is primarily in the area of improving efficiency within the administration institutions. However, in addition, our research confirms that the use of BPM is becoming increasingly important in improving services for consumers and enhancing their satisfaction.

The results of our study can contribute to the existing body of knowledge on Business Process Management in the public sector by systematizing explored fields in this domain and identifying the well-founded research trends and gaps related to implementation of BPM in this sector. Based on the study we can see an analogy between an implementation of BPM in public institutions and a development of BPR research in the private sector. Moreover, we can conclude that there is a need for research of BPM in the public sector in a context of grounded scientific theories. We contribute to the practice by indicating the key role of Business Process Management in the digital transformation of the public sector. Based on the literature study we indicate, that the process-based approach is able to facilitate efficient and effective e-government.

LIMITATIONS OF THE STUDY AND FUTURE RESEARCH

A small number of revised papers aiming at BPM implementation in the public sector is the main limitation of our research. Taking into account the status of BPM implementation, particularly in developing and transition countries, and the publication frequency of printed and online media, we should extend our sample on papers sourced from indexed conference proceedings. This could provide a wider and more comprehensive analysis of the phenomenon in future research. To improve the quality in the literature retrieval process, we should expand the search terms including additional keywords related to other process-based frameworks and other approaches in management in public organizations (e.g. Business Process Orientation, Business Process Change, Business Process Redesign, Lean Government).

We believe that this initial literature review on BPM in the public sector fills, to some extent, the research gap and will contribute to the development of knowledge concerned with improving the efficiency and effectiveness of public administration.

ABSTRACT

Resource based view approach is proposed as theoretical framework in order to identify the existence of similar organizational models in a sample of firms operating in the Sicilian wine industry, and the key success factors for superior export success. The findings of this research show that managers' age and wineries' export experience in export success are the key organizational capabilities, that explain a firm's strategic advantage over its competitors. The importance of these capabilities is further uncovered through the main characteristics of the clusters. The result informs strategy design at the firm level; wineries need to incorporate significant capabilities associated with managerial experience in exports into their organization.

Keywords: *Resource Based View Approach, Wine industry, Organisational Models, Italy.*

INTRODUCTION

Export is a fundamental strategy from a microeconomic perspective because it represents a firms' traditional way to access foreign markets by helping leverage production capacity, enhance product and operational innovation and improve the bottom line (Piercy et al., 1998), then, ensuring the overall firm's performance and, indeed, longevity (Majocchi et al., 2005; Navarro et al., 2010; Navarro-García et al., 2016). Numerous studies have been carried out in different sectors, regions and countries to explain the main factors affecting the export performance, related both to the business characteristics and to the multiple, diverse, and idiosyncratic nature of foreign environments that affect firms' survival, expansion and their success in export markets (Samiee and Walters, 1990; Czinkota and Ronkainen, 1998). There is growing evidence that internationalization has become a key requirement for small and medium enterprises (SMEs) to gain competitive advantage, which, moreover, results in an increasing effort in managing the companies' internationalization processes (Schweizer, 2012; Dutot et al., 2014).

For wine firms, the internationalization process is sometimes the only option available in order to remain competitive in the market. Wine markets have been deeply transformed, particularly due to the

entry of new producer countries, which has led to an overall geographical reconfiguration of the productive scenario and, at the same time, a growing trend in several key markets toward quality wine consumption (Vrontis et al., 2011; Rossi et al., 2012; Crescimanno and Galati, 2014). Consequently, a number of wine firms realized that they needed to identify effective strategies in order to face severe challenges in all markets (Rastoin et al., 2006).

Research into the main determinants of export success of wine firms has been carried out in different contexts and regions. Some of these studies analyse the effects of internal and external factors on the propensity to export (Suárez-Ortega and Álamo-Vera, 2005; Duarte Alonso, 2009–2010; Parish and Freeman, 2011; Fernandez Olmos, 2011; Serra et al., 2012), on the export intensity (López Rodríguez and García Rodríguez, 2005), and on the export performance (Leonidou et al., 2002; Calantone et al., 2006; Maurel, 2009; Carneiro Zen et al., 2012).

With this in mind, the main objectives of the paper are to identify 1) the existence of similar organizational models in a sample of firms operating in the Sicilian wine industry, and 2) the key success factors for superior export success. Our theoretical framework is based on key insights of the resource-based view of the firm and focuses primarily on key organizational resources. The paper contributes empirical evidence on the export performance by focusing on firms operating in the Sicilian wine industry. The Sicilian wine industry is an economically important sector, in terms of added value it generates and the number of people employed; it represents the main agri-food activity and contributes significantly to the promotion and enhancement of the territory and its resources (D'Amico et al., 2005; Galati et al., 2015; Giacomarra et al., 2016). In fact, it covers 3.4% of the Sicilian agricultural production at basic prices (ISTAT, 2016) and 8.7% of agri-food exports in 2012, ranking among the top four agri-food products exported from the same region (INEA, 2014). This success is due to numerous wineries that have recently implemented modernization processes and are paying increased attention to improving product quality, packaging, and marketing (Galati et al., 2015).

This paper is structured as follows. In section 2, the theoretical framework is presented and the hypotheses are derived. The methodological approach used is described in section 3. Then, the main findings of the empirical research are presented and discussed in section 4. The last section concludes the paper.

THEORETICAL FRAMEWORK

The resource-based view of the firm (RBV) is one of the most widely accepted theoretical perspectives in the strategic management field. According to this approach, the key resources that an organization owns determine its competitive advantage. Such key resources are valuable, rare, imperfectly imitable, and non-substitutable (Barney, 1991). Makadok (2001) makes a distinction between a firm's resources

and its capabilities: a resource is an observable but not necessarily tangible asset that can be independently valued and traded, while a capability is unobservable and hence necessarily intangible, cannot be independently valued, and changes hands only as part of its entire unit. Therefore, the identification of these factors that can affect the performance of firms in export markets can have an immediate impact on marketing strategy decisions. In fact, it is not uncommon, as suggested by Lages and Montgomery (2003), the firms' reactive behaviour to be based on its past results.

In this study we focus our attention on the impact of firms' and managers' characteristics, and of organizational resources on the export performance of wine firms. Concerning the firms' characteristics, Leonidou and Katsikeas (1996) assert that the role played by firms' structural factors is that of background forces facilitating or inhibiting the effective activation of the latent export stimuli. The physical size of the company is one of the main factors that influence firm performance in exports markets. Numerous studies reveal that firms with a higher number of employees and higher sales have a greater ability to expand resources and, consequently, absorb risk and are more likely to export activity than smaller ones (Erramilli and Rao, 1993; Suárez-Ortega and Álamo-Vera, 2005; Maurel, 2009). Majocchi et al. (2005), in their study on the Italian manufacturing firms, and Suárez-Ortega and Álamo-Vera (2005), in the Spanish wine industry, found that a firm's experience can be considered another potent explanatory variables of the export performance since it is related to a firm's maturity in the field of management, international transactions, and business partnerships. Some authors find that the amount of a firm's investments in advertising is, among the main factors that affect a firm's performance in export market, one of the main determinants that can contribute to increase the degree of firms' internationalization (Kotabe et al., 2002; Fernandez Olmos, 2011).

Managerial characteristics also have a relevant influence on the firms' internationalization process and on its choice of organizational model. In particular, the age of the entrepreneurs and their level of education are explanatory variables of the firms' export performance. For example, younger entrepreneurs are more risk-oriented and more associated with policies of corporate growth than older managers (Suárez-Ortega and Álamo-Vera, 2005; Serra et al., 2012). Furthermore, as asserted by Tihanyi et al. (2000) and by Wieserma and Bantel (1992), entrepreneurs with a high degree of education can create the opportunity of exploring new context and tend to favour greater access into new international markets. As suggested by various authors also professional experiences abroad and proficient use of foreign languages, affect a firm's performance in export markets because they facilitate social contacts, assist in understanding the business practices of a market, and improve communication to and from markets (Turnbull and Welham, 1985; Zou and Stan, 1998; Osland et al., 2001; Suárez-Ortega and Álamo-Vera, 2005; Serra et al., 2012; Alaoui and Makrini, 2013).

Concerning the organizational resources, a very important tool is the adoption of quality and environmental management systems. In the last few decades, a multitude of quality and environmental management standards have been developed so that they can be grouped into different categories, depending on their scope, sector coverage, regional application, and potential recognition by others initiative as being equivalent or similar in scope (von Hagen et al., 2014). In the agri-food sector the main quality and environmental management system globally recognized is the International Organization for Standardization (ISO) class, which includes a multitude of voluntary codes. Numerous studies that examine the benefits of voluntary standards show that the implementation of quality and environmental management standards have a positive influence on the firm's performance (He et al., 2015; Heras-Saizarbitoria et al., 2011; Kafel and Sikora, 2012; Sharma, 2005), supporting small farmers to enhance their integration into the global food market (Aggelogiannopoulos et al., 2007; Subervie and Vagneron, 2013).

METHODOLOGICAL APPROACH

Questionnaire

In order to analyse the key factors affecting the export success and the different organisational models of Sicilian wineries a questionnaire was constructed based on the RBV approach. The questionnaire was grouped in four thematic sections, each of which is aimed at capturing information necessary to explain the influence of internal resources to the enterprise internationalization process. The first section collects general information on wineries with specific reference to the starting year of wineries activity and sales in foreign markets, number of employees engaged in the export activity, and presence of qualified figures. The second section includes information about the managers (age, years of experience in the wine sector, education level, proficiency foreign languages, work experience abroad). In the third section we collect information about wine production (in value and in volume) and end market (domestic and foreign markets), sales channels, investments in advertising and promotion, participation to national and international fairs, presence in the web, product and process innovations, and finally, quality aspects related to the production solded.

Sample

The sample used in the empirical research comprises wineries located in Sicily, one of the most important geographical regions of Italy. Our sample was composed of 102 wineries selected using a proportional stratified sampling method on 500 wineries according to the data that have been made available by the Regione Siciliana. The information was collected through personal interviews with the owners or managers that have been contacted by telephone and the questionnaire was sent to each

of them via e-mail. Our sample reflects the distribution of wineries in the region of Sicily. Wineries are mainly investor-oriented firms (IOFs) and farmer-owned cooperatives (69.6%), while sole proprietorship firms account for only 30.4% of the cases. Table 1 shows the main characteristics of the sample in terms of size, year of foundation, volumes commercialized, and export performance.

Table 1 – Sample characteristics

Variables		No. of wineries	%
Years	Until 10	20	19.6
	More than 10	82	80.4
Size (employees)	Less than 10	90	88.2
	More than 10	12	11.8
Number of bottles marketed	Less than 50,000 (small wineries)	35	34.3
	50,000-100,000 (small-medium wineries)	25	24.5
	100,001-200,000 (medium wineries)	11	10.8
	200,000-500,000 (medium-big wineries)	16	15.7
	More than 500,000 (big wineries)	15	14.7
Export performance	Until 10%	28	27.5
	10-25%	12	11.7
	25-50%	31	30.4
	More than 50%	31	30.4

Method

A cluster analysis was performed in order to group the Sicilian wine firms into homogeneous categories, in terms of internal resources, using the software SPSS version 19. The variables considered are export experience, number of employees, age of manager, educational level of the manager, proficiency in the foreign languages, fair's participation, and the adoption both of quality voluntary certification and environmental certifications. Based on the variables identified, we performed a hierarchical cluster analysis in order to group the companies into a number of categories, by maximizing both within-group homogeneity (small within-cluster variance) and among-group heterogeneity (large between-cluster variance). A set of clustering criteria was considered carefully in order to select the most appropriate clustering method. Ward's method was identified as the more effective for differentiation scopes, both in order to maximize within-cluster homogeneity and between-cluster heterogeneity, and taking into account that the number of observations in each cluster was expected to be approximately equal and that no outliers were present among the variables included in the clustering procedures. The distances among clusters were measured using the squared Euclidean distance. The criteria adopted in order to select the most appropriate number of clusters are both statistical and conceptual. First, we analyzed the dendrogram, which graphically illustrated how the Sicilian wineries firms are grouped into the clusters. Second, we performed three iterations of Ward's method with the number of clusters set at two, three, and four. Third, we identified the clusters that provide simple interpretations of the organizational models.

RESULTS AND DISCUSSION

In order to identify similar organisational models among the sample of wineries operating in Sicily and identify key success factors for superior export success we performed a cluster analysis. The abscissa reports the squared Euclidean distance between clusters, while ordinate reports the identification number of each winery grouped to the Ward's linkage method. Cluster analysis has enabled us to identify three clusters, which include 46, 43 and 13 wineries, respectively. Table 2 shows the three clusters and the average values for each variable studied. One-way analysis of variance (ANOVA) was used to test the differences in the variable means among the clusters.

Table 2 - The cluster obtained and average values of variables

Cluster	No. of cases	Export experience	Employees	Age of manager	Educational level of manager	Languages	Fair	QM	EM
1	43	8.65	2.18	40.93	2.55	1.09	2.09	.27	.16
2	13	50.38	15.84	50.15	2.46	1.46	4.30	.30	.46
3	46	12.56	4.63	61.69	2.60	1.06	2.93	.28	.32
Total	102	15.73	5.02	51.47	2.56	1.12	2.75	.28	.27

Table 3 shows the analysis of variance between clusters and within clusters (a cluster refers to square and error mean square), F value and significance. Results show that three clusters are statistically different and most of the variables are statistically significant at the 0.95% level. In particular, as can be seen in Table 3, the variable "Age of manager" is the most influential variable ($F= 85.209$) on the profile of the clusters, while the Quality Management standards is the least influential variable ($F= 0.020$).

Table 3 - Analysis of variance (ANOVA) between and within clusters

	Cluster			Error			F	Sig.
	Mean	square	df	Mean	square	df		
	between groups			within groups				
Export experience	9113.852		2	120.628		99	75.554	.000
Employees	937.995		2	63.363		99	14.804	.000
Age of manager	4804.595		2	56.386		99	85.209	.000
Educational level of manager	.144		2	.331		99	.344	.710
Languages	.840		2	.704		99	1.194	.307
Fair	25.836		2	5.498		99	5.498	.005
QM (Quality Management codes)	.004		2	.210		99	.020	.980
EM (Environmental Management codes)	.557		2	.194		99	2.872	.061

Wineries belonging to cluster 1 are small firms both in terms of size, as emerges from the average number of permanent employees, who are 2.19, both on the economic level, with an average business revenue of 380.6 thousand Euros, the lowest among the three clusters. These wineries, mostly younger

and with limited experience in trading in overseas markets, are managed by younger entrepreneurs, with an average age of just over 40 years, and with limited experience in the wine sector. This result is in contrast with findings by other authors (Serra et al., 2012; Suárez-Ortega and Álamo-Vera, 2005) according to which younger entrepreneurs are more risk-oriented and adopt market-oriented strategies. These characteristics, along with the almost total absence, among these wineries, of internal figures involved in the foreign trade relations, contribute to the low market orientation of the wineries, for which there is an export intensity, which stood at 34% and in any case not greater than 50% for almost all of the cluster wineries. In addition, it comes to wineries to a limited extent adopt quality and environmental management systems, only 12 of them implement quality certifications and 7 adopt certification of environmental management systems..

Wineries in cluster 2 include mainly older wineries with a long experience in the wine sector and in the activity of export. They are large wineries with a high number of permanent employees, which amounted on average to about 16, and average business revenue of more than 5 million of Euros. This result is in line with the findings of Maurel (2009) and Suárez-Ortega and Álamo-Vera (2005) according to which the greater firms size, in terms of number of employee and revenue, is correlated to a greater market orientation. These wineries are managed by entrepreneurs with an average age of just over 50 years and with the highest level of knowledge of foreign languages.

Figure 1. - Dendrogram obtained from the hierarchical cluster analysis using the Whard's linkage's method

As revealed by Turnbull and Welham (1985), Osland et al. (2001), Serra et al. (2012), among others, the employment of personnel with experience in foreign sales, contributes, along with the above features, to the market orientation with an export intensity, which amounted, on average, to around 50% and higher values to 60 % in more than half of the wineries that are part of this cluster. The wineries included in cluster 2 have also the highest number of quality and environmental certifications, also characterized by a high participation in national and international trade fairs. In fact, as shown by He et al. (2015), Kafel and Sikora (2012) adoption of voluntary certifications helps to improve the firms performance.

Cluster 3 has the largest number of wineries which have average values of the characteristics studied than the previous two clusters, both in physical and economic terms, distinguishing itself however to be managed by older entrepreneurs, with an average age above 60 years, with the longest experience in the wine industry, with an higher level of training but a limited knowledge of foreign languages. The limited knowledge of foreign languages, and at the same time, the lack of employees experienced in foreign sales, could explain the modest propensity to export of the wineries included into this cluster. Over 1/3 of the cellars have no employees experienced in foreign sales, which explains the modest propensity to export of the wineries included into his cluster.

CONCLUDING REMARKS

Our paper is one of the few studies that is focused at the same time on the role that internal and organisational resources have on the organizational models in a sample of firms operating in the Sicilian wine industry. The findings of this research confirm the main hypothesis suggested by the resource-based approach, namely, that valuable, rare, imperfectly imitable, and non-substitutable resources and capabilities might explain a firm's strategic advantage over its competitors. This is especially reflected in the importance of the managers' age and wineries' export experience in export success. These two variables represent key organizational capabilities seamlessly incorporated into the everyday life of the studied firms. The importance of these capabilities is further uncovered through the main characteristics of the clusters. It seems that what makes cluster 2 the most successful in exports are the aforementioned organizational capabilities. This result informs strategy design at the firm level; wineries need to incorporate significant capabilities associated with managerial experience in exports into their organization. The originality of this work is to shed some wider light on practical insights addressed to winery managers looking for better assess competitive advantages for wine business, a matter still few analyzed, and that needs a multi-approach effort of resources impact of voluntary certifications on the profitability of those firms operating in one of the most dynamic sectors in the agri-food industry, while providing useful results to allow firms to improve their operational

strategies. The findings of the study need to be interpreted within the context for which this research was designed (Sicilian wineries) and cannot be applied generally to all businesses. Taking into account this limitation, future studies in this field could be focused on testing this model in other wine regions in order to verify the influence of internal and organisational resources on the organizational models in the wine industry.

ABSTRACT

This study examines the evolution in development of Intra-European Union agri-food export during the period 2000-2011. By using Data Envelopment Window Analysis, this paper at first provides a more comprehensive picture on agri-food trade performance of sampled New Member States, focusing the attention on the pre and post phase of the enlargement process. Two specific country case studies will be released, revealing different patterns of performance among New EU Member States. The majority of New EU Member States differed in their approach in benefiting from the opportunity to enter into the EU enlarged market, not only according to their initial agricultural structural conditions, but also as a consequence of pre-and post-accession political and economic trade agreements. A lot of countries preferred to strengthen the established trade relations with past group of partner countries, as defined by already in force agreements. In the future, the increase in the export flows of quality products together with the ability to enter new end-markets within the EU will largely depend on the agri-food sector units' abilities to efficiently compete and sustain competitiveness in the European and global markets. In the years coming, the overall performance could be improved by strengthening the quality side of exported goods, to better comply with EU quality standards and to acquire a more competitive advantage in the single market. A challenge that NMS are able to deal with also thanks to the recent increase in employment and education levels.

Keywords: *Economic efficiency, EU enlargement, Agri-food export.*

INTRODUCTION

One of the most important political and economic challenges faced by the European Union (EU) in the last decade has been the enlargement to the Central and Eastern European Countries (CEECs). Two historical events marked this process: first, in 2004, during which the biggest enlargement took place

with the entry of Czech Republic, Cyprus, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia and Slovenia; and second, after three years, in 2007, with the accession of Romania and Bulgaria.

In the enlargement process as well as in the framework of the EU's bilateral relations with third countries (Crescimanno et al., 2013a, 2013b), the agricultural sector has played a central role, owing to its importance at the EU level and its strategic role in the economic and political life of the Eastern candidate countries (European Commission, Directorate-General for Agriculture, 2002). For these reasons, the bilateral European agreements signed since 1991 between the EU and the candidate countries, as part of the EU's pre-accession strategy, were aimed at eliminating barriers to trade, initially including only part of the agri-foods that would be subject to reciprocal tariff concessions. Later, owing to the double-zero agreement subscribed since 2000, there has been more intense trade liberalization, which affected, at that time, about two-thirds of agricultural products traditionally traded (European Commission, Directorate-General for Agriculture, 2002), to achieve total elimination of tariff protection in 2004.

Numerous studies have attempted to assess the impact of the EU enlargement on the dynamics and changes that occurred in the agri-food trade structure, primarily focusing on the pre-accession period. The results reveal an overall increase in trade between the old and new Member States, which has strengthened the economic role of the EU in the world agri-food market (Gavrilescu, 2013). However, there exists a significant asymmetry of the dynamics individually recorded by each new Member State, with regard to their initial conditions. This study contributes to the enrichment of the existing literature on the impact of EU enlargement on agri-food exports of the new Member States in the European common market, by extending the reference period to twelve years, in order to detect variations in the economic efficiency of agri-food exports during the enlargement process. In particular, it aims to assess the economic gains/losses resulting from the EU adhesion, by comparing the efficiency scores of CEECs during the period 2000-11.

LITERATURE REVIEW

Research on the impact of EU enlargement to the CEECs primarily focused on the pre-accession period. The results suggest that this process has largely been beneficial for the economies of the New Member States (NMS), due to the comparative advantage of candidate countries related to low labor costs and the gradual increase in price level (Rollo, 1995; Forslid et al., 2002; Halkos and Tzeremes, 2009). In particular, as suggested by Bartošová et al. (2008) NMS have gained from free access to the EU market, increasing the exports of dairy products and sugar up to four and eight times, respectively, although the net effect (exports minus imports) has been much lower, particularly for these products.

The impact of EU enlargement has also been studied in relation to the direct effects of the preferential treatments granted to the candidate countries during the pre-accession period. In this regard, results reveal that the process of integration and trade liberalization has contributed to the growing of the agri-food trade between the old and new Member States. On the other hand, this process has had a negative impact, owing to a permanent and significant resistance to the agri-food exports from the CEECs in the European market (Bartošová et al., 2008; Chevassus-Lozza et al., 2008), due to the unsatisfactory level of export quality, insufficient sanitary and phytosanitary arrangements, lack of competitiveness in the food processing industry, insufficient export surplus availability and insufficient marketing are the main constraints to export growth (Frohberg and Hartmann, 1997; Duponcel, 1998; Chevassus-Lozza et al., 2008). As can be seen, a substantial literature exists on the impact of the EU enlargement in the pre-accession phase. However, little attention has been paid to the changes registered during the entire enlargement process (pre- and post-accession phases). With reference to the agricultural sector, some studies show a significant impact of the enlargement on agricultural dynamics (ZemECKIS and DrozdZ, 2009; Csaki and Jambor, 2013). While on one hand, the integration process has led to a reduction in both the contribution of the agricultural sector to GDP and the rate of employment in agriculture, on the other hand, this process has brought about an increase in the income of farmers -related to the increase in prices, production, the EU direct payments, and the financial support of EU structural funds- and agri-food trade. The results, however, show significantly different behaviors of the NMS in relation to the pre-accession conditions and the policies adopted in the post-accession phase (Csaki and Jambor, 2013). With specific reference to the dynamics and changes in the agri-food trade structure, Bojnec and Fertő (2009) analyze the effects of EU enlargement in the pre- and post-accession phases on the level, composition, and differences in the advantages/disadvantages of agri-food trade for eight central European and Balkan countries in the EU market and their implications for food policy. They found that the enlargement has had an overall negative impact on these countries, but this is different in relation to the countries characteristics among which natural factor endowments and agricultural structures, labor input costs for horticultural products, food processing and food supply marketing chains (Bojnec and Fertő, 2009 a). In a more recent study, the same authors (Bojnec and Fertő, 2012) analyze the impact of EU enlargement on the agri-food exports of 12 NMS during the period 1999-2007 and confirm that these countries stood to gain from the EU eastward enlargement, with an increase in exports of primarily higher value-added, consumer-ready, and more competitive niche agri-food products. However, Fogarasi (2008), referring to the dynamics of agri-food exports to Hungary and Romania from the EU market, shows that the improvement in performance should not be viewed in terms of competitiveness, but from the EU market demand side, in this manner, explaining the

improvement in competitiveness of some sectors (meat, fruit, and vegetables and beverages, in particular).

This brief literature review represents the starting point of our work, where the main hypothesis we would like to verify is whether all the new Member States experienced a growth in their exports of agricultural and food products. If so, in what terms, this growth occurred. Namely, did all NMS follow the same trade pattern during the pre-accession and post-adhesion periods? Did specific past trade agreements affect internal dynamic?

DATA AND METHODS

Data

With the final aim to investigate the performance of CEECs, which entered the EU during the enlargement process that occurred in 2004 and 2007, we implemented a DEA window analysis. As reported in Table 1, data originate from different sources and socio-economic indicators were chosen to measure the economic efficiency of agri-food exports. Countries included in the analysis are Bulgaria (BL), Czech Republic (CZ), Estonia (EE), Hungary (HU), Latvia (LV), Lithuania (LT), Poland (PL), Romania (RO), Slovakia (SK), and Slovenia (SI). We had to exclude Cyprus and Malta from our sample because of missing data.

Table 1: Indicators used in the analysis.

Indicator	Unit of measure	Source
Mean Labour cost levels (including Business economy, Industry (except construction), Services of the business economy)	Units of currency, Euro	EUROSTAT - [lc_lci_lev]
Percentage of graduates from tertiary education graduating from Agriculture programmes, Social Sciences, Business and Law programmes, Engineering, Manufacturing and Construction programmes (both sexes)	Percentage (%)	UNESCO – Institute for Statistics – Education (ISCED)
Employment by sex, age and economic activity (1983-2008, NACE Rev. 1 and from 2008 onwards, NACE Rev. 2). From 15 to 64 years. Agriculture, forestry and fishing Manufacturing	1 000	EUROSTAT - [lfsa_egan2]
Employment by sex, age and economic activity (1983-2008, NACE Rev. 1.1 and from 2008 onwards, NACE Rev. 2). From 15 to 64 years All NACE sectors.	1 000	EUROSTAT - [lfsa_egana]
Export flows – n. 24 Commodities	Dollar (\$)	United Nations – Department of Economic and Social Affairs – Statistics Division – Trade Statistics

The time period (2000-11) was motivated by the need to accurately capture the starting points of each country as well as any consequences that occurred after the EU adhesion.

Some preliminary specifications regarding the indicators are necessary. As for labor cost levels, we used the average values of three sectors in our analysis such as Business economy, Industry (except construction), and Services of the business economy. This classification prevented us from excluding important information and made the context description complete. The same procedure was followed for the three International Standard Classification of Education indicators (ISCED) and for the Employment levels. Moreover, as for Employment, after calculating the average values of the three economic sectors of our interest, by using the total employment value of each country (that includes all NACE sectors), we calculated the percentage of employees in Agriculture and Manufacturing sectors in the total number of employees. All these modifications were made to collect a good level of features of the export economic branch, including any satellite activities/skills.

Regarding Export commodities, we followed the classification of the UN Comtrade database, using the codes related to the agri-food products. According to the trade partners of our sample, data on export flows were collected after examining the exports towards the 27 EU partners (excluding Croatia, as it is too recent to adhesion).

The Labor cost input represents a strategic indicator characterizing the labor market of Eastern countries, in particular, since the adhesion moment, as these countries had the lowest labor costs in Europe, such that even if these costs increased during the twelve-year period, they certainly did not reach the average of those of old Member States.

Method

To evaluate the efficiency scores of 10 NMS during the period 2000-11, a DEA window analysis has been applied. DEA is a non-parametric technique, measuring the relative efficiency of Decision-Making Units (DMUs), with multiple inputs and outputs, assuming neither a specific functional form for the production function nor the inefficiency distribution. The method, first proposed by Charnes et al. (1978), aims at measuring the relative efficiency of DMUs that are similar to each other in terms of products and services. As originally developed by Debreu (1951) and Farrell (1957), this method is based on the concept of productivity, defined as the ratio between a single output and a single input. Assuming n DMUs, each with m inputs and s outputs, the efficiency score of a test DMU p is obtained by solving the following model (Charnes et al., 1978):

$$\max h_o = \frac{\sum_{k=1}^s v_k y_{ki}}{\sum_{j=1}^m u_j x_{ji}} \quad k = 1, \dots, s; \quad j = 1, \dots, m; \quad i = 1, \dots, n$$

$$\frac{\sum_{k=1}^S v_k y_{ki}}{\sum_{j=1}^m u_j x_{ji}} \leq 1 \forall i \text{ and}$$

$$u_j, v_k \geq \forall k, i$$

where y_{ki} is the amount of output k of DMU i and x_{ki} is the amount of j -th inputs by the DMU i ; $u_j, v_k \geq 0$ are the weights that are applied to inputs and outputs to maximise the efficiency ratio.

Differently from the DEA basic approach, through which it is possible to carry out analysis by including observations only from one time period, the Window formulation (Charnes and Cooper, 1985) is able to measure efficiency in cross-sectional and time-varying data, allowing a dynamic effects study (Hartman and Storbeck, 1996; Webb, 2003; Asmild et al., 2004; Cooper et al., 2007; Halkos and Tzeremes, 2008; Halkos and Tzeremes, 2009; Adler and Golany, 2011; Halkos and Tzeremes, 2011; Bono and Giacomarra, 2014).

This approach can indicate efficiency trends over a specified period of time, while simultaneously examining the stability and other properties of the efficiency evaluations within the specified windows. It operates on the principle of moving averages (Charnes et al., 1985; Yue, 1992; Charnes et al., 1994a) and establishes efficiency measures by treating each DMU in different years as a separate unit. The performance of a DMU in a period can be compared against its own performance in other periods as well as against the performance of other DMUs (Asmild et al., 2004 through a sequence of overlapping windows (Webb, 2003; Hartman and Storbeck, 1996). Once the window is defined, the observations within that window are viewed in an inter-temporal manner, and therefore, the analysis is better referred to as locally inter-temporal (Tulkens and Vanden Eeckaut, 1995). Adopting the formulation of Asmild et al. (2004), let us consider n DMUs $n=1,2,\dots,N$ observed in T periods of time ($t=1, 2,\dots,T$) producing m outputs and using s inputs. We create a sample of observations, where an observation n in period t () has an s -dimensional input vector and an m -dimensional output vector. Then a window with observations is denoted starting at time $k, 1 < k < T$ with width w . So the matrix of inputs is given as:

$$X_{kw} = (X_k^1, X_k^2, \dots, X_k^N, X_{k+1}^1, X_{k+1}^2, \dots, X_{k+1}^N, \dots, X_{k+w}^1, X_{k+w}^2, \dots, X_{k+w}^N)$$

and the matrix of output is given as

$$Y_{kw} = (Y_k^1, Y_k^2, \dots, Y_k^N, Y_{k+1}^1, Y_{k+1}^2, \dots, Y_{k+1}^N, \dots, Y_{k+w}^1, Y_{k+w}^2, \dots, Y_{k+w}^N)$$

In our case, the DMUs represent the 10 NMS ($n = 10$) over a twelve-year period ($p = 12$), producing m output (Export flows in \$), using s inputs (Labour cost, ISCED, and Employment level). DEA window analysis implicitly assumes that there are no technical changes during the period under analysis within each window (Zhang et al., 2011). Similar to other scientific contributions in this methodological field (Halkos and Tzeremes, 2009; Zhang et al., 2011; Wang et al., 2013), a window width of three years ($w = 3$) has been decided. Starting from the year 2000, it has been possible to include the years 2004 and 2007 in separate windows, respectively, representing the two EU accession years.

RESULTS AND DISCUSSION

Table 2 reports the DEA window results implemented using Frontier Analyst software.

%	BG	RO	CZ	SK	SI	HU	EE	LV	LT	PL
2000	79.7	85.3	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Table 2: DEA Window results (%).

The performance of each DMU during the twelve-year period considered has been quite stable and, on average, characterized by high efficiency scores. This indicates that the EU enlargement to the CEECs has not led to an overall improvement in the latter's economic efficiency of the agri-food exports, despite an increase in absolute value, as already estimated in previous studies (Bartošová et al., 2008; Chevassus-Lozza et al., 2008; Fogarasi, 2008). Through the DEA window analysis, a country-wise comparison is possible, allowing the interpretation of data in terms of the efficiency of a DMU against itself (column view) or against other DMUs (row view). As other studies emphasize (Bojnc and Fertó, 2009; Csaki and Jambor, 2013), the performances vary among the NMS, owing to their pre-accession conditions and post-accession policies. Our sample has been therefore divided in three different groups (Table 3), characterized by different levels of performance (ranged between 93 and 100 per cent) and dissimilar variation coefficients (ranged between 0.0 and 7.5 per cent).

Table 3: Groups of countries according to their average efficiency scores.

	Countries (DMUs)	Average values of efficiency scores (%)	Variation coefficient (%)
Group 1	BG	93.5	7.5
	RO	93.0	7.3
	CZ	97.8	3.3
	HU	97.8	5.1
Group 2	PL	100.0	0.0
	SI	100.0	0.0
	LT	98.9	2.8
	SK	99.0	2.4
	EE	99.5	1.4
Group 3	LV	98.6	3.7

Overall, our results suggest that NMS recorded high performance scores during the period 2000–2011, some of them followed a more constant growth pace (Group 2), while others experienced transition in their trade relationships, translating in wide alternation of peaks and troughs on their exports flows (Groups 1 and 3). An in depth analysis through case study of specific countries belonging to the first and third group allow a further interpretation.

Bulgaria case-study (Group 1)

Bulgaria, during the pre-accession phase (2004–07), registered a decline in the share of its agri-food exports on the total products exported by NMS in the European market, with a recovery after the adhesion. As emphasized by Antimiani et al. (2012), NMS belonging to other trade agreements, like Central European Free Trade Agreement (CEFTA), registered positive trend in the post-accession period, with an agri-food export-oriented preference towards goods whose sophistication is decreasing due to their re-localisation of production process and export flows towards countries with a lower GDP per capita. Figure 1 confirms this finding, providing more interesting insights:

Figure 1: Bulgaria. Agri-food export dynamic towards NMS (2000-2011)

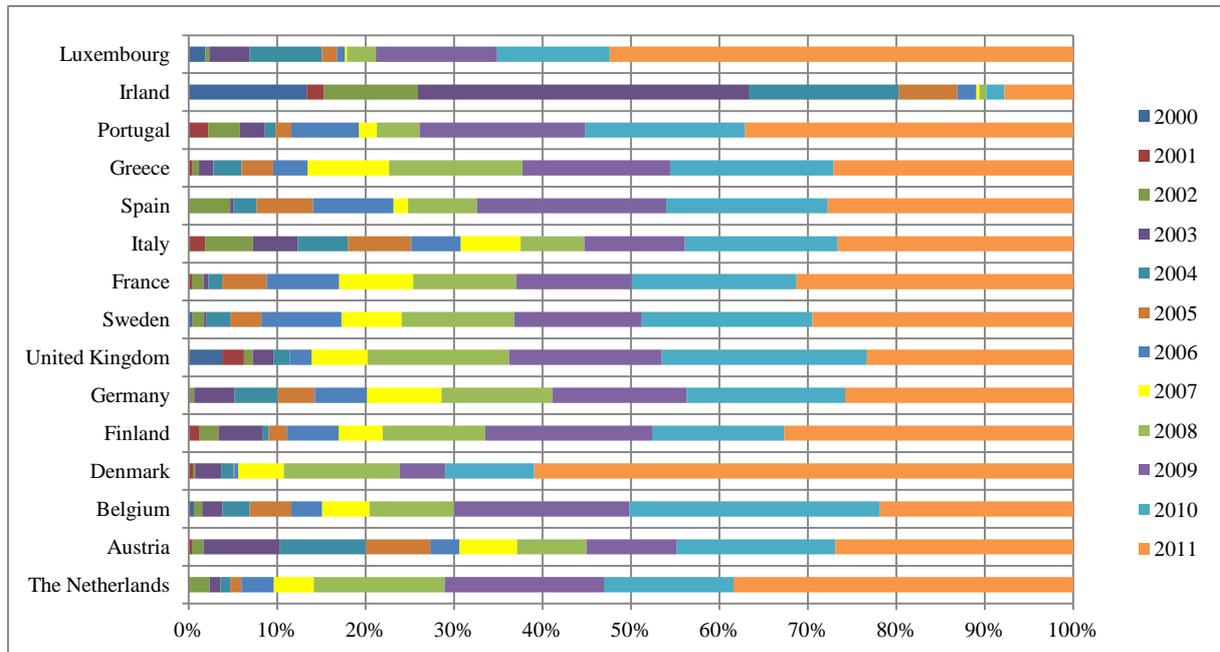

In fact, Bulgaria, immediately after the EU accession, maintained an almost stable agri-food export flow with historical trade partners, such as: Hungary, Czech Republic, Slovakia, Slovenia. This was due to the CEFTA trade agreement (lasting from 1997-2003) that facilitated the increase in trade flows among partner countries. Indeed, in 2004, with the accession to the EU, Czech Republic, Poland, Hungary, Slovenia and Slovakia left CEFTA, but the past trade relations were preserved. As regard the relationship with Romania, the country increased its export flow towards this last, doubling and tripling its economic value (almost inexistent during the 2000-2006 period). In 2007, when Romania and Bulgaria joined the EU, they left as well CEFTA. As regard the Baltic Region, a very particular attitude characterized Bulgaria, above all having a look to the trade relations with Estonia that, after the Innovation, Entrepreneurship and Digital Ecosystems

Bulgarian adhesion, have been widely reduced, together with an instable trade paths also with Lithuania and Latvia.

An interesting export dynamic has been also recorded as regard Old Member States (OMS) (Figure 2)

Figure 2 – Bulgaria. Agri-food export dynamic towards OMS (2000-2011 period)

Since the year 2007 (yellow colour), Bulgaria increased economic relations (following a stable and growing path) with the majority of NMS. In particular, the trade relations with Denmark, Belgium and The Netherlands experimented a significant increase. The singular event translated in a relevant reduction in the agri-food exports recorded from Bulgaria to Estonia, this time has occurred towards Ireland. Indeed, the two countries characterized by historical agri-food intense flows, almost stopped this trend near the adhesion period, with a timid recovery only from 2011.

Latvia case-study (Group 2)

From Group 3, and with the lower efficiency scores of the sample (98.6 per cent), Latvia showed a general and growing trend of its export flows immediately after the adhesion, towards almost the totality of the NMS (Figure 3).

A growing trend only interrupted by the instable flow towards Slovenia and Malta.

A similar growing trend has been identified for Latvia agri-food exports towards the OMS (Figure 4), with an exception for Luxembourg that has seemed to be not so interested in the adhesion added value.

Figure 3 - --Latvia. Agri-food export dynamic towards NMS (2000-2011 period)

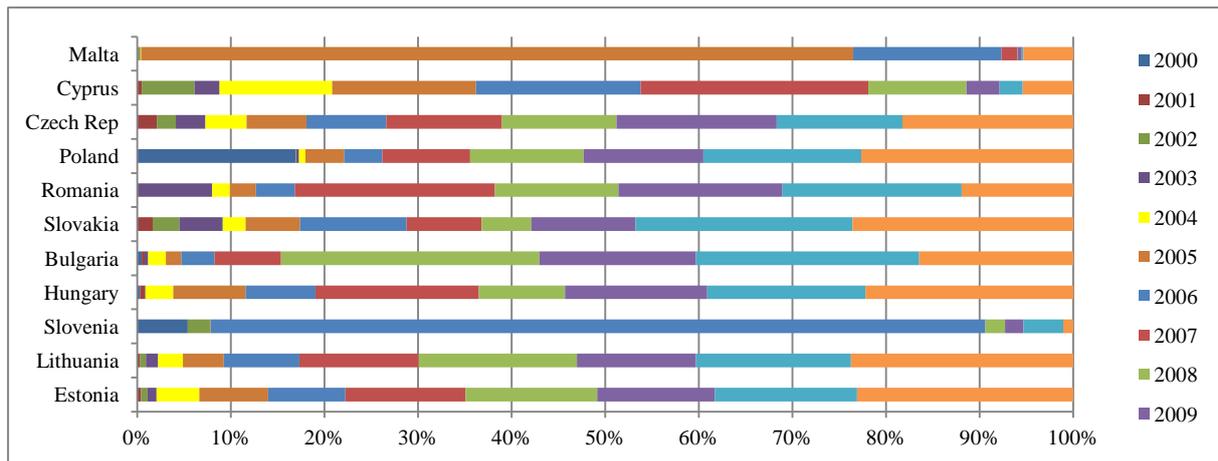

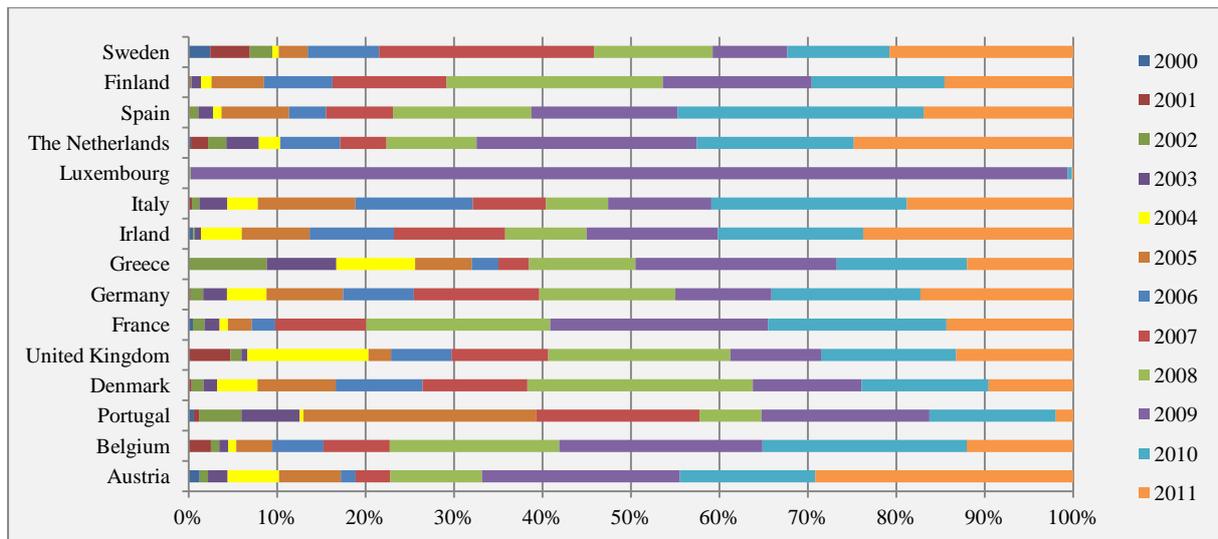

Figure 4 - Latvia. Agri-food export dynamic towards OMS (2000-2011 period)

CONCLUSIONS

This paper provides new insights in the trade dynamics analysis of the agri-food sector for the enlarged EU by expanding the time period to include both pre- and post-accession phases. Results emphasize that, apart from an overall positive performance, NMSs have significantly differed in their approach in utilising the opportunity of entry into the EU enlarged market, as outlined in the country studies for Bulgaria and Latvia. A lot of countries shows differences because they preferred to strengthen the established trade relations with past group of partner countries, as defined by already in force agreements (as Bulgaria with CEFTA). This was partially due to their initial conditions, particularly referring to the structure of the agricultural sector and food industry of each single NMS, as well as to speed of reaction to pre-accession policies and post-adhesion strategies. In particular, many countries have not had the ability to take a net advantage from the EU entry, particularly owing to the pre-accession EU financial support that was specifically addressed to restructure the farming sector and Innovation, Entrepreneurship and Digital Ecosystems

would have made the same even more competitive through investments in agricultural holdings and in the improvements to the processing and marketing of agricultural and fishery products. Financial support was intended to support the creation of greater synergies between the production and processing systems of the EU Member States, contributing, at the same time, to provide growing opportunities in an enlarged market. In the future, the increase in the export flows of quality products together with the ability to enter new end-markets within the EU common framework will largely depend on the agri-food sector units' abilities to efficiently compete and sustain competitiveness in the European and global markets. In the years coming, NMSs overall performance could be improved by strengthening the quality side of exported goods, to better comply with EU quality standards and to acquire a more competitive advantage in the single market. A challenge that NMS are able to deal with also thanks to the recent increase in employment and education levels.

Future research must focus on an in-depth analysis, with specific reference to country study, to investigate changes in the different segments of products marketed, analyzing the trend achieved as regard quality certifications (both voluntary and regulated one), as well as specific country to country trade internal arrangements.

THE LEADERSHIP IN THE MULTICULTURAL CONTEXT

Gheta, Mădălina

Bucharest University of Economic Studies, Romania

ABSTRACT

In the actual context of economic globalization adapting to different cultures is the essential characteristic that not only the leaders must show but also the employees; cultural diversity emits a greater number of ideas than a homogeneous group, generating a larger number of solutions that are coming from different perspectives.

The main challenge for a leader as a coordinator of a mixt team, from a multicultural point of view, is the fast adaptability when interacting with another culture that implies principles, different habits that can be partially or even totally opposite to those considered self-evident. The main factor that can favourably influence the integration of all members of a mixt multicultural team is the open mind attitude of a leader when encountering new elements.

As a coordinator of a mix team it's important not to apply the logic of a single culture but to create a median between them, the leader having the role of protector of each culture. The essential trait that a leader must prove is flexibility and informal communication as being the main element of an open attitude towards the employees.

Keywords: *leadership, multiculturalism, performance, adaptability.*

INTRODUCTION

The success of a business it's conditioned by putting into practice an efficient system of management, leadership being the ability to determine the involvement of other team members in the project itself. Management decision quality and performance of an organization depend on the leaders and the managers of an entity; they are the key pawns in design strategy, defining organizational culture and building the management system of an economic entity. Leaders are those who exercise continuously functions of organization, coordination, forecast and assessment against operational employees.

"The basis of leadership in a mix team is to create the team spirit also known as harmonization strategy that reflects the thinking capacity of individuals, acting and applying the same idea in order to achieve their goals." [Nicolescu O., 2007].

Team spirit is formed by combining four distinct processes: building mutual trust between team members, the exposure of clear goals that need to be achieved, strong motivation both in terms as a group and as an individual and the implementation of participative decision process. Leadership is

regarded as non-existent without the idea of team spirit and its concretization requires the leader to be followed, willingly, by the other team members in order to obtain the best of results. Although the national cultures may be different or even opposing within a mixed team it's important that its own organizational culture to develop which can be represented by all beliefs, values, aspirations prevailing within the group that are accepted by all of the team members, which will influence the performance of the group in a direct manner.

Managers, leaders and employees must be able to realize changes and to implement a long-term process, minimizing as such the idea of "opposition" to change; the availability to continuous learning is again a key element that needs to be applied every time when the company arrives at a situation as "Crisis".

It's important to notice that the companies who have the ability to adjust her standard rules according to employees are able to achieve competitive advantage through performance making added value with the condition of a good management and an open mind attitude when is encouraged the entrance of new elements regarding the different opinions, ideas or values that the employees have.

METHODOLOGY STAGES OF INTEGRATING MEMBERS IN A MIXED TEAM

In the multiculturalism concept adopting a symbiotic leadership style is the concept that favours the most when it comes to the integration of team members bringing many benefits from the increased mutual trust between the coordinator, the team and the other people in the organization, creating and incentive system that implements transparency to employees will avoid problems caused by ethnic, religious and cultural differences, therefore achieving an equitable share of the rewards offered by the entity.

Symbiotic leadership ensures the existence of a strong team spirit aiming to the identification of any member with the group to which it belongs, the trust in the group generating new heights in the levels of effectiveness. According to the concepts of organizational culture there are four addressed categories which include: organizational, economic, national culture and the branching of activities. Particular attention is paid to national culture – the distinct trait of different ways and habits being the key measurement element of each of them.

Organizational culture reflects a new approach on issues related to human resource management. Interest in organizational culture has become one of the braches of modern management, practiced almost in all of the world's organizations, considered a key component in efficient management standards; therefore the organizational culture of a mixed team it's presented like an unitary whole forming an unitary structure with common and divided symbolic and processing elements adopted

by individuals within a group on three levels: beliefs, values but also the type of conduct adopted by individuals within the group.

It's a major impact for a leader of a mixed team the harmonization of the activities first in order to improve teamwork, the great attention is brought to the adaptability capacity to the work environment through efforts submitted by the employee in order to flatten and to fit within the organization, secondly, the leader as the prime holder of responsibility, and thirdly, the team, viewed as a whole, in the position to assimilate one or more newcomers. Redesigning the organization is a common practice in large companies due to certain factors that might threaten its existence: the increasing number of competitive businesses and companies, fewer customer numbers, geopolitical changes etc. Respecting this, the necessity of change interferes within the organization which impacts directly the system the managerial strategy but also the organizational culture of a mixed team. Most often it involves organizational transformation and redesigning the whole organization. In this situation, every coordinator has to lead the team to accept the idea of change as an event that cannot be postponed being the main factor that can transform the company into a more productive organization, generating performance.

CONTINUOUS IMPROVEMENT OF LEADER'S BEHAVIOUR - THE MAIN OBJECTIVE OF A SUCCESSFUL COMPANY

The general objective of a company is to determine accurately the goals, sharing them with the employees that are key elements in grounding the team and its behaviour as a whole, in this situation the team members are no longer focused on cultural differences but to achieve the objectives and the potential differences are regarded as positive elements in finding the best solutions for the entity. The leaders play an essential role because the approach is based on the chemistry between the leader and the team, the mutual trust and also on the collegiality, regardless the hierarchical level at which member is situated on the entity; the client will be seen, first of all, as a person with requirements who needs to be accomplished.

Nowadays it's important to assume leadership in the context of fundamental emphasis on both of the formally and the informally. The informal part will consolidate in time as a direct result of knowing the personality of each team member. The formal fundament it's represented by the knowledge acquired over time and by the default status given to their position obtained when assigned to a management position.

While in the past the emphasis was on the formal fundament, with the passage of time the conception on the leadership style has changed so that the informal fundament linked to the human side began to be placed in the same position with the formal fundament in the characteristics rankings that

determine a successful leader; only together the formal and informal sides can provide the necessary basis of an efficient and effective leadership.

It is considered essential that a leader must possess charisma, being a native trait; charisma is seen as the capacity to determine the involvement of other people in carrying out certain activities. Management training is based on the enhancement of the qualities that the leader was gifted with and the capacity of influence he possesses on other people. "The overall result of these processes is the training of social skills, technical knowledge, communication and the ability of decision making.

The internationalization of economic activity is one of the most current trends in the contemporary economy. In such circumstances the differences between the organizational and the national culture become most spread issues in most of the entities. The main solution is the existence of an organizational culture capable to accept new exogenous cultural elements; the most efficient method is the co-optation of all members through common elements but also a new approach of participative management style.

ESTIMATED RESULTS

Well known variables that any organization has are those such as the company's history - the longer is the history the greater influence has on the company. In a favourable case, the history can be seen as source of continuity, stability and prestige.

Another element that has a high impact is the business owner - it can be represented either by one person or a small group of people either by an organization or a group of members much larger. The main difference is when the owner is unique the general influence on the group has a major impact. If exist a greater number of owners their influence is much lower than the initial case, increasing the direct influence exercised by managers.

The main functions that a leader must adopt in order to harmonize the team are first of all, directing employees in order to achieve common objectives - that is the function with the greatest degree of complexity meant also to generate performing activities in order to achieve the objectives contained in the company's strategies where the decisions taken by the leader are closely related to human resources management.

The company size represented symbolically by turnover, number of employees and capital value has also a major impact on the cultural diversity. A larger organization presents a diversified cultural sphere that is more difficult to coordinate and modelled by the leader. Instead, a smaller company usually does not have a special budget created for team building so it prefer to have employees who come from the same cultural sphere because they are much easier to harmonize .Now the trend is to

reduce the large companies due to the effects of automation, manpower losing more and more ground in front of the technology evolution.

The economic situation of an entity has its own sphere of influence due to the accessibility of financial resources that the company has for its employees. If the resources are restrained and appear certain restrictions on the economic facilities with a direct impact of the professional training is possible to cause stress that doesn't help to integrate all the members of a team.

CONCLUSION

We must start from the premise that there's no successful leader without having a team, meant to follow him, composed of quality members. "The leader's ability to listen, to consider and to put into practice the ideas proposed by the members it presents a multitude of advantages; the first being that it is perceived by the team as interested by their views, giving them feelings such as trust, group affiliation and recognition"[William M., 2005]. The second advantage is represented by the amplification of success generating ideas which reduces the amount of work submitted by the leader in finding the best solutions but also reducing the adjustment period to the new enacted decision, being proposed even within the operational team.

It's important for a leader to be connected of employees and vice versa and if the case of conflicting opinions finding some plausible assumptions that are made for the purpose of persuading the team and not forcing it to apply certain rules that was not supported in the initial phase. Presentations of tasks list that must be performed with the purpose of letting the team come to terms in order to delegate a suitable person for its execution. Also, in the case of process improvement, the purpose of transmitting the information is to raise awareness and not to raise threat.

A mixed team implies a democratic style of leadership with certain dimensions as: cooperation – default teamwork, flexibility given to employees from both of the work program and decision taking as a team point of view. Transparent communication regardless of the hierarchical level both horizontally from employee to employee and vertically, information being propagated from the leading person to the team plus encouraging the vertically upward communication, suggestions coming from employees to managers, leaders encouraging the participative approach.

INNOVATION THROUGH ACQUISITION IN FOOD INDUSTRY: A CASE STUDY

Giacosa, Elisa; Santoro, Gabriele

Department of Management, University of Turin, Italy

ABSTRACT

Recent studies on innovation in food industry have emphasized the importance of external sources of knowledge and collaboration in the innovation development process, in line with the open innovation paradigm. In particular, they highlight the key role of acquiring knowledge and building strategic networks with external sources in order to compete and grow. Nevertheless, literature has not thoroughly investigated the effects of acquiring another firm on firm's innovation structure, and on both product and process innovation, even if management literature recognised its strategic role. Indeed, the effects of acquiring another firm are fairly investigated, but not in the food industry. In this context, the paper aims at filling this gap by studying the effects of an acquisition in food industry with particular emphasis on the benefits and synergies in terms of product and process innovation. To reach this goal, we employ a qualitative methodology, focused on a single case study. The case study is relevant as it indicates that acquisition in food industry can be a strategic path in order to enhance innovativeness and sustaining competitiveness.

Keywords: *innovation, acquisition, external knowledge, food industry.*

INTRODUCTION

The food industry is one of the most important engine for growth in the Italian and European economic environment, with a significant contribution in terms of employment and economic output (Avermaete, 2002; Menrad, 2004; Bigliardi and Galati, 2013; FoodDrinkEurope, 2014). In this context, innovation in food industry is recognized as a key strategy to sustain competitive advantages and satisfy consumer needs, in the current scenario of characterized by uncertainty, globalization and increasing competition.

Literature on the food industry is rich and has deeply investigated the presence of various types of innovation (Capitanio et al., 2010) and the changes taking place in business models (Baregheh et al., 2012). Some recent studies on innovation in food industry have emphasized the importance of external sources of knowledge and technology in the innovation development process (Sarkar and Costa, 2008; Enzing et al., 2011), in line with the open innovation paradigm (Chesbrough, 2003). In

particular, they point out the key role of acquiring knowledge and building strategic networks with market-based and technology-based external sources in order to compete and growth. Nevertheless, literature has not thoroughly investigated the effects of acquiring another firm on firm's innovation structure (Gerpott, 1995), and on both product and process innovation, even if management literature recognised its strategic role (Bower, 2001). Indeed, the effects of acquiring another firm are fairly investigated, but focused on other industry (Ahuja and Katira, 2001).

In this context, the paper aims at filling this gap by studying the effects of an acquisition in food industry with particular emphasis on the benefits and synergies in terms of product and process innovation. To reach this goal, we employ a qualitative methodology, focused on a single case study.

The article is structured as follows: first, we provide a literature review on innovation in food industry and innovation through an acquisition, identifying the gap. The research method is then delineated. Next, the findings of the case study are presented and discussed. Finally, the conclusions and implications of the study are set out, along with the limitations of the research.

LITERATURE REVIEW

Innovation in Food Industry

In many sectors, innovation is the key strategy for the search and development of competitive advantages (Bresciani and Ferraris, 2014). Innovative firms build and maintain competitive advantage by developing products that can allow to achieve a sustainable position on a market that is characterised by international competition and increasing customer demands. In this view, innovation is understood as the activity through which new ideas developed allow to generate output such as new products, new services and new processes (Tidd et al., 2005). Product and process innovations are the result of an interactive process in which actors within the firms together with actors from external organisations translate knowledge and techniques into new products and processes (McKelvey, 1996). Moreover, Damanpour (2009) suggests that innovation is often driven by pressure from external environment, including factors such as competition, deregulation, isomorphism, resource scarcity, and customer demand (Baregheh et al., 2012).

In such a framework, innovation in food industry is deemed particularly important. The food industry is one of the most important engine of growth in the Italian and European economic environment, with a significant contribution in terms of employment and economic output (Avermaete, 2002; Menrad, 2004; Bigliardi and Galati, 2013; FoodDrinkEurope, 2014). Although the food industry is recognized as low R&D intensity, mature and slow growing industry (Sandven and Smith, 1993; Costa and Jongen, 2006; Rama, 2008), products and process innovation are recognized as an important strategic key to sustain competition in the food high-competitive environment and satisfy consumer

needs (Menrad, 2004). In fact, consumers are increasingly demanding products variety, with different tastes and dietary products (Costa and Jongen, 2006). This requires the introduction of new products, more customized, focused to the needs of consumers that are changing rapidly. Furthermore, it encourages firms to develop process innovations in order to reduce costs associated with the development and production of new products and increasing efficiency.

Empirical studies on type of innovation in the food sector show different results. Grunert et al. (1997) propose that successful firms have a mix of process orientation, product orientation and market orientation. In a similar vein, Menrad (2004) noted that two-thirds of their sample were engaged in both product and process innovations and Brewin et al. (2009) identify an interrelationship between product and process innovation. Conversely, Avermaete (2002) points out that food firms are mainly engaged with incremental product and process innovations with a low rate of radical process innovations. Likewise, Capitanio et al. (2010), studying the innovation process on a sample of Italian firms, show that food firms develop more process innovations than product innovations, and that a large part of product innovations are incremental. Finally, some scholar underline the importance of packaging, within product innovation, in the relationship with the final customer (Gellynck and Vermeire, 2009).

Moreover, the food industry has been facing technical and economic changes both in society and in the manufacturing and food processing. This has led to a relevant impact on the food value chain, and forced firms to pay high attention in food products that meet the consumers' demand for a healthy lifestyle (Bigliardi and Galati, 2013).

These factors have changed the innovation approach of firms from the food industry, which must increasingly take into account both internal and external sources for innovation (Chesbrough, 2006; Sarkar and Costa, 2009). Nevertheless, although the literature shows that acquiring knowledge and technology from external sources in the food industry is positively associated with innovation, it has not thoroughly investigated the effects of an acquisition of another firm on innovation of the acquiring firm.

Innovation through acquisition

Innovation is traditionally driven by internal activities and capabilities (Cohen and Levinthal, 1990) and external factors and pressures of the market (Arora et al., 2001). Success and competitive advantage depend on the ability of the company to integrate, build and reconfigure internal and external resources to address rapidly changing environments (Cohen and Levinthal, 1990; Chesbrough, 2003). In fact, innovation and knowledge management literature agree that product and process innovation performance increase with a larger internal knowledge base (Chesbrough, 2003).

For this reason, external knowledge can be seen as complementary of the internal one (Chesbrough and Crowther, 2006).

In this context, the growth of firms is indicated by scholars, experts and policy makers as one of the main strategic levers in order to enhance innovative capacity and to sustain competitive advantages. Often, acquisition of another firm is the more quickly and effective strategy to get firm growth (Ahuja and Katila, 2001). This operation can lead to several advantages including a better propensity for innovation, in terms of process and product (Adner and Levinthal, 2001). As for process innovation, acquisition can help achieving economies of scale and scope by reducing the average cost of production and creating synergies between complementary assets (Singh and Montgomery, 1987). Moreover, it can foster new organizational models and accessing the research and innovation capacity, a greater knowledge base and technology to introduce new products and services. According to Bower (2001), acquisitions occur for five reasons: to deal with overcapacity through consolidation in mature industry; to roll-up competitors in geographically fragmented industries; to extend into new products or markets; as a substitute for R&D; and to exploit industry boundaries by inventing an industry. Thus, the last three highlight that the acquisition of another firm is a strategic key to accelerate innovation, having access to new products, acquiring resource, technology and knowledge (Shuen et al., 2014).

More in particular, obtaining technological know-how and developing technical capabilities are increasingly important motives for acquisitions (Wysocki, 1997).

Some scholar proved evidence of positive effect of an acquisition on firm's innovativeness. In detail, an acquisition of a firm is viewed as an absorption of the acquired firm's knowledge base (Ahuja and Katira, 2001). Furthermore, such a process can potentially expand the acquirer's knowledge base and increase its innovation output by providing economies of scale and scope in research and by enhancing the acquirer's potential for inventive recombination (Fleming, 1999). Conversely, other scholars agree that acquisition can lead to negative effects on firm's innovativeness. Specifically, acquisition involves managerial issues, integration problems and transaction costs (Zollo and Singh, 2004). More specifically, Ahuja and Katira (2001) found that technological acquisitions enhance innovation performance while non-technological acquisition do not have a significant effect on subsequent innovation output. Certainly, the success of an acquisition also depends on the complementarity of the firms, but also on the approach to innovation and state of the firm's culture. In this context, the combination of tradition and innovation often plays a key role (Tushman and Nadler, 1986; Festa et al., 2015). In addition, culture and attachment to the land can foster the integration of two different realities, promoting the values of entrepreneurial tradition of a certain place and the

satisfaction of customers' perceptions about local cultures and natural elements and traditions (Vrontis and Thrassou, 2011).

The combination between tradition and innovation is often moderated by the factor "familiness" (Arregle et al., 2007; Carnes and Ireland, 2013; Sirmon and Hitt, 2003). In particular, family businesses have a strong sense of long-term investment and vision and tend to invest domestic resources in developing new products or improving processes, building competitive advantage based on the strong link between the traditional and innovation (Giacosa, 2012). This combination further enhances the brand identity of firm (De Chernatony, 2001). According to the resource-based view, acquisition helps in redeploying resources into a more productive uses and improve efficiency of the process combining strategic assets (Capron et al., 1998). In particular, the acquisition of another firm helps to promote integration between various tangible and intangible resources (Bruce and Hines, 2007) promoting the brand awareness and the exclusivity of the goods (Kapferer, 2002). In a market-oriented perspective, the intangible elements attract attention of the customers by playing on the five senses (Giacosa, 2012), and allow to involve them more and more in the buying experience (Flynn and Goldsmith, 1993).

Despite this rich background, innovation through acquisitions in the food industry remains neglected.

METHODOLOGY AND CASE STUDY

As the proposed model has to represent best practice behaviour for the company in making innovation, our proposition is the following:

For a full consideration of innovation, the model should be a combination of two critical factors: i) a combination between tradition and innovation; ii) a combination between several skills owned by Boella and Sorrisi before the acquisition.

The methodology has been structured as follows:

- the first phase has been focused on a literature review, paying particular attention on innovation strategy in food sector, as well as a study of innovative strategies through acquisition;
- in the second phase we made a case study. The case study method permits to investigate and understand the phenomenon under investigation, avoiding a purely descriptive approach. In addition, the case study method permits to analyze the theories identified in the literature review in a real-life context (Yin, 2009).

We appreciated the case study method for several reasons. Firstly, the observed phenomenon is rather specific and determined by the specific features of the company and its context (Merriam, 1988). Secondly, the phenomenon under investigation has been analyzed in its real-life context, although a strong theoretical basis doesn't support it (Siggelkow, 2007). Thirdly, innovation in family business is

a phenomenon with a great relevance, in Europe and worldwide (Yin, 1984). Fourthly, thanks to the use of a “variety of lenses” in the case study, the way single variables act within the context could be understood (Eisenhardt, 1989), in addition to the multiple aspects of the phenomenon under investigation (De Massis and Kotlar, 2014). Lastly, the case study method permits to generate and test theories on the given topic (Siggelkow, 2007), creating relevant facts and improving the managerial field with new and interesting intuitions (Amabile et al., 2001).

Several source of information has been used (Eisenhardt, 1989). The main source of information was represented by semi-structured interviews (Corbetta, 2003) with Stefano Silvola (SS), the CEO of the company, in 2015 and 2016. He is involved in innovation-related decisions. We interviewed him two times to clarify some important topics. Each interview lasted about 2 hours and was conducted by two of the authors of the research. The answers were transcribed, and then autonomously analysed by three authors (Jönssön and Lukka, 2005), with the purpose to reduce the subjectivity of data interpretation. A comparison between individual interpretation of the results has been then made.

We used direct observations, for making a data triangulation (Yin, 1984). These were carried out in some shops in which the products are sold. Documentation was lifted from the company website, and interviews in economic, financial, and marketing magazines and websites with other family members (in particular, with Elena Boella (EB)— who represents the third generation of Boella and she’s involved in the management of the company.

The case study: history

Boella & Sorrisi is the result of the marriage between two historic artisan food family businesses: Boella has produced panettone since its beginnings in 1885, when the first **panettone and pastry workshop** was set up and is now in the third generation. Sorrisi was founded in 1960 by the historic Piedmontese family of chocolate makers, who delighted customers with **artisan products**, never compromising their production methods.

In October 2014, Boella stopped trading and Boella & Sorrisi was born after the acquisition of Sorrisi, which owned some excellent machinery.

The merger of the two companies was also marked by the marriage of Elena Boella from the third generation of the Boella family, to Stefano Silvola, master chocolatier and owner of Sorrisi.

Boella & Sorrisi is a small family business operating in the food sector, with about a dozen permanent employees and twenty or so specialised seasonal staff. With sales of around 2.5 million Euros, the company offers a wide and varied selection of Italian-made products and specialities, such as Boella Panettone, Easter eggs, Easter dove cake and various forms of chocolate. Turnover is equal distributed between baked goods, on one side, and chocolate, on the other.

The foreign market accounts for around 30% of the company's overall sales. Its main foreign market is Switzerland, with customers knowledgeable about both chocolate and panettone: a third of the company's panettoni are sold in Switzerland. Other important markets are France, Germany and Ireland, with strong growth in Australia, the United Arab Emirates and other countries.

THE EFFECTS OF ACQUISITION ON INNOVATION

Boella & Sorrisi is the product of the merger of two already established family-owned manufacturers operating within niche segments of the food industry. The companies chose to "combine long-standing traditions to obtain a wide range of products" (EB). "The birth of Boella & Sorrisi has allowed us to achieve significant economies of scale, in terms of both product and process" (SS).

Below, is an analysis of the most salient effects of the birth of Boella & Sorrisi on products and processes. The format has been borrowed from a wealth of literature used to distinguish products from processes.

A) Effects on products

Stemming from the marriage of two historic family-owned artisan food companies, the resulting product range is somewhat varied, "suitable to meet the different needs of consumers in panettoni, Easter dove cakes and chocolate" (EB):

- Boella panettone and Easter dove cakes: our panettoni "are from long-standing Boella family recipes, which are a guarantee of quality and unique flavour" (SS), in keeping with traditional artisan panettone. Panettone begins with a sourdough created from a natural leavening process and the packaged product is absolutely natural. This enables consumers to appreciate the final product. Panettoni are the company's hallmark and are made in an assortment of flavours from gianduja to chocolate and pear, etc. At Easter, traditional Easter dove cakes are another example of goodness available in classic, pear and chocolate, muscat, chocolate, crème pâtissière, sabayon and the uniquely fruity fig and pear. They are "one of the house specials from family recipes dating back to 1885, which are a guarantee of high quality and unique flavour" (SS). In addition to the product, "the handmade packaging is also beautifully detailed" (EB). The resulting product is perfect in every respect. Customers can obtain special packaging on request;
- chocolate: "the experience of our master chocolatiers along with the enthusiasm of our staff are our strengths when it comes to creating artisan products that are perfect in every respect" (SS), in particular, the famous Sorrisi di Torino, Gianduiotti, minigianduiotti, gourmet hand-decorated bars of chocolate, treats, pralines, praline, dragées, cremini, tartufi, hazelnut

creams. Within the production range, the Sorrisi di Torino was the first chocolate created by pastry chef Valerio Basso in 1949: "a delicious praline with rum cream enclosed in two of dark chocolate wafers and further covered with dark chocolate" (SS). The Sorrisi di Torino are produced in several tastes, such as coffee, orange-nut, rum, hazelnut, amaretto and limoncello flavours. Considered an excellent product, it has been awarded as "Artisan Excellence for the Piedmont region" and is available in the best-known cafés, confectionery shops and patisseries in Turin and Milan and in Harrods of London. Chocolate products are offered in all possible varieties, in order to meet different needs of customers: milk, dark chocolate, white chocolate, with Piedmont hazelnuts, spiced, with different compositions of cocoa to meet the demands of connoisseurs, with freeze-dried red fruits, Cyprus salt, Smarties for children, candied 70% to bring out the best in flavour;

- Ice cream: the sales outlet has a corner dedicated to gelato, everyone's favourite treat. It is an artisan product made from high quality, carefully selected raw materials - the same used for the delicious chocolates and Easter eggs, such as **dark chocolate**, **gianduja** and Langa **hazelnuts**. The typical flavours of creams are accompanied by the traditional flavours of fresh fruit, which are combined with semifreddo in winter. Sorrisi di Torino were the first chocolates in the product range to be created by pastry chef Valerio Basso in 1949. They are **delicious pralines** with rum cream enclosed in two dark chocolate wafers in turn **covered in chocolate**
- cosmetic line: the product range includes a line of chocolate-aroma cosmetics for the body. Thanks to its special characteristics and unique aroma, chocolate is great even for use in beauty products and cosmetics, making skin smooth and soft.

"This is a very varied range of products, which has allowed the company to offer customers a wide choice in confectionery: whether its panettone or chocolate. Although this has not doubled turnover, it has enabled customers to receive their supplies from a single source, thus facilitating the purchasing process" (SS).

Even after the birth of Boella & Sorrisi, tradition has been maintained in the selection of raw materials. These are carefully chosen and only the highest quality is selected (e.g. PGI Piedmont hazelnuts are much sought after by all chocolate manufacturers) and emulsifiers are not used. In keeping with standards of high quality, the product is not changed for different target markets (except for customised products). Discounts may be applied to the basic list price, depending on the customer.

Thanks to a highly flexible production structure, the company gives customers the chance to customise their orders. Private label production was created, which, for many years now, has also specialised in third party services for corporate events, weddings and birthdays, created from

customers' own recipes. In this sense, flexibility is a competitive advantage. Even though recipes differ from the brand's own products, private label production in no way tarnishes the company's image" (SS). This is a very interesting business stream, which enables systematic use of machinery for a certain period of time and yields a good turnover.

"We continue to produce for end consumers, even with Boella & Sorrisi" (SS). This is demonstrated by the focus on the choice of raw materials, which is a fundamental aspect that has always characterised the company's activities. This is how products for diabetics and weight-conscious foodies were born, in the shape of sugar-free products (which include innovative ingredients like sevitol).

With a vast assortment of niche products at their disposal, the company's main competitors are themselves niche companies. Competitors in the panettone sector are all Italian. The company has a competitive edge in the fact that Piedmont panettone is the best loved the world over, thanks to a strong presence of Italian immigrants on different continents, especially in Latin America. For example, in Brazil, panettone is eaten all year round, meaning consumption is high for twelve months. Its competitors in the chocolate sector are mainly in Belgium. Belgian companies have been fully industrialised for many years, but their products are still perceived as being handmade. Naturally, there is a big difference in price compared with an artisan company like Boella & Sorrisi, with industrialisation reducing production costs considerably. Swiss manufacturers are also competitors, although the company's products are very popular in Switzerland, which is a major market for it.

B) Effects on processes

After the birth of Boella & Sorrisi, production processes were improved by the reinforcement of skills and by several economies of scale resulting from the combining of the strengths and expertise of the two companies.

Research and development are mainly conducted internally. The encounter between the respective knowhow of Boella and Sorrisi made it possible for research and development to be carried out internally. In particular, the knowledge and skills of Stefano Silvola were boosted by the sales packaging knowhow of Elena Boella. In addition to this, "the production and sales skills of the family members were reinforced by and combined with a series of external stimuli" (SS). These include suppliers of equipment, who are a source of innovation and improvement in productivity, customers, who may suggest an idea related to a new product or to revise of an existing product, consultants, especially on very technical aspects, such as labelling and food safety standards.

In terms of production, the strength of Boella & Sorrisi has been maintaining traditional values, albeit in an industrialised context. Beginning with carefully selected raw materials, "the company has maintained its artisan processing, but has industrialised the more basic stages of production. For

example, chocolate bars are decorated and filled by hand, but are poured by machine. This has led to the mechanisation of production, with a thousand bars produced per hour, while three people decorate by hand"(SS). Furthermore, certain production techniques have been kept, such as the manual processing of chocolate, "by modelling it on the old marble table used by the previous generation, which has been incorporated into a steel frame" (SS). This means that a niche product can be made, with the advantage of a good production capacity (e.g. 80 kg of gianduja are produced per hour). The final result is that of a "hand-produced product where every detail has been considered, which could not be achieved by a confectioner without the aid of a production line" (SS).

Furthermore, by strengthening the soundness of the company, Boella & Sorrisi have been able to create a modern plant of over 1,000 square metres in Turin (a city renowned for its time-honoured production of panettone and chocolate), opened in 2014, where all production takes place and "the traditional techniques are combined with modern machinery" (SS).

Moreover, a sounder organisation has enabled the continuous renewal of production plants. "Continuous study and research into new production methods has required new machinery" (SS). These include investments in machines that produce creams, removing palm oil (not recommended for a healthy diet). For example, through a partnership with a manufacturer of hydrolysed proteins, the company has been able to use casein (which is more readily available to the body and easy to digest) as a viable alternative to emulsifiers.

The heady scent of vanilla, almonds, toasted hazelnuts and chocolate permeate the factory. As you cross the threshold of the workshop you are met by a warm and elegant atmosphere, which seems unchanged since the nineteenth century. The contribution made by human resources is important: "the experience of our Master Chocolatiers along with the enthusiasm of our staff are our strengths when it comes to creating artisan products that are perfect in every respect" (SS). For baked products, too, the specialised staff are critical to ensuring a quality end product and respecting family traditions. Boella & Sorrisi invests heavily in packaging, so that the product is a combination of both tangible and intangible factors. In the past, "Sorrisi did not pay so much attention to packaging: the knowhow of Boella has certainly facilitated this marketing approach" (SS).

The focus on packaging is possible thanks both to the dedication and the contribution of family members (in particular, Elena Boella and Stefano Silvola) and to a series of partnerships with some suppliers of materials, as well as the company's attendance of the most important international packaging fairs. The suppliers in close contact with the family have enabled the creation of a series of packaging alternatives, using new and alternative materials that are safe for the consumer. "Packaging is thus designed to achieve a high level of usability in relation to the consumer's needs" (SS).

The company creates an “attractive product” for packaging-conscious consumers (EB), using colour to convey the image of an event combined with a product for consumption. An example of this is panettone wrapped in gold packaging designed for the Swiss market, where customers can taste and enjoy fine Piedmontese panettone and recognise its value. Or hand-decorated chocolate pralines wrapped in elegant packaging.

The resulting packaging has considerable advantages compared to traditional presentation, in terms of functionality and a reduction in production costs (it is less expensive and is more lightweight for transportation purposes). At the same time, the beauty of the packaging makes it highly appealing to the public, as a result of the feasibility study of the product on different targets: colourful packaging for children's chocolate, practical jars for chocolates to be kept at home and within the reach of children and sophisticated panettone for a more discerning adult target.

In terms of sales, “the birth of Boella & Sorrisi has brought considerable advantages, since all sales channels apply to the entire product range”. Wholesalers, shopkeepers, the company’s own outlets all supply customers with baked goods and chocolate products alike.

After the birth of Boella & Sorrisi, the company shop was expanded. In an area of 180 square metres, customers can taste the company’s products, along with other regional specialties, sweet truffles, Piedmont hazelnut cakes, tarts, artisan croissants, soft and crumbly amaretti biscuits, torcetti, sponge fingers, zwieback rusks, gianduja cri-cri, drop sweets, lollipops, herbal teas and infusions. They can also directly observe the activities of the production workshop. As you walk amongst the shelves, you can watch the careful pastry workers busy in the production and packaging of each product. You can visit the production area in the company of an expert and passionate guide: adults and children alike will be fascinated.

The entire product range is exhibited at trade fairs (both baked goods and chocolate). The choice is highly selective: “requiring a large investment, the company selects a number of important events to increase visibility and growth” (SS). Although the idea is not to sell products during the fair, but to be present, the company has chosen two highly visible international exhibitions: Cibus and Tutto Food.

The sales network is coordinated by family members, each with specific skills. Stefano Silvola is responsible for getting contacting customers after the fairs, while Elena Boella manages the entire sales process. A network of agents and distributors is involved in the marketing and sale of the entire product range, offering customers a wide selection of confectionery. “This makes it easier to supply a wide range of products from a single source, facilitating and simplifying the order process” (SS). Furthermore, when important customers are invited to the company premises, they can learn close-up the art of artisan confectionery for baked goods and chocolate. “The company brand is enhanced thanks to knowhow in many areas brought together by the birth of Boella & Sorrisi”. It certainly

benefits from the reputation of Italian food, which "is well recognised throughout the world, especially by more discerning consumers. This factor increases the interest of foreigners in high quality Italian products, which act as a driver for the sale of our products "(SS).

DISCUSSION AND CONCLUSIONS

The Boella & Sorrisi business model is a combination of several ingredients:

- a strong blend of tradition and innovation;
- a combination of various skills held by Boella and Sorrisi individually.

Even after the set-up of Boella & Sorrisi, the company held on to a strong mix of tradition and innovation (Festa et al., 2015). Its manufacturing is based on traditional methods involving a balance of tradition and innovation. This is seen in the attention devoted to new technologies applied to a traditional approach, with a focus on combining product/process (Adner and Levinthal, 2001):

- tradition comes from the experience of the two families and a brand (Boella) dating back to 1885. Tradition means the respect of family values, for generations (Giacosa, 2012; Tushman and Nadler, 1986): this choice is respectful of its DNA from the beginning (Festa *et al.*, 2015). Tradition is a value that is recognised by consumers, who stayed loyal to the company even after the merger of the two names. Strong local roots are also a key factor in tradition. Turin is renowned for its chocolate heritage (along with Perugia and Modica), and is the birthplace of chocolate. Local roots are a key aspect in the safeguard of a number of values relating to the business tradition of a place, handed down through the generations, and facilitating the satisfaction of customers' perceptions about local culture and natural elements and traditions (Vrontis and Thrassou, 2011);
- innovation is seen in the various stages of the production and distribution chain. In particular, in its selection of raw materials, the company has opted for innovative materials, which can meet the needs of consumers and safeguard their well-being (e.g. by using casein as an emulsifier and steviol instead of sucrose), for a healthy lifestyle (Bigliardi and Galati, 2013). Innovation is seen in the mechanisation of the production process: the most basic stages of the chocolate production process have been industrialised to achieve high productivity. Innovation means a close approach to the dual concept of "product/process" (Giacosa, 2012). The end result is an attention to detail that a traditional confectioner cannot achieve at the same rate of production. Even in commercial choices, innovation is seen in the process of customisation: the adoption of private labels, created from customers' own recipes and requiring good levels of production flexibility, is a competitive advantage, which increases revenue without tarnishing the company brand. Innovative strategy is primarily conducted

internally (Chesbrough, 2003), as usually in small and medium-sized family firms where R&D activities are not typically formalized (Dyer and Handler, 1994): on one side, in carrying out R&D activities, family members respect tradition and corporate values; on the other, a comparison to external individuals helps the company to reach the goal, behind the times. It permits a generation and diffusion of creativity (Bresciani and Ferraris, 2014; Dias and Bresciani, 2006).

The combination between tradition and innovation is typical connected to the “familiness” factor (Arregle et al., 2007; Carnes and Ireland, 2013; Sirmon and Hitt, 2003), which is a set of unique, distinctive and tacit abilities and resources deriving both from the interaction of family members and the family’s involvement in the business. The familiness may be considered as a key factor influencing the competitive advantage.

Secondly, with the birth of Boella & Sorrisi, the combining of various skills possessed individually by the companies brought several benefits:

- significant economies of scale and scope were achieved in production, sales and administration (Fleming, 1999), thanks to the complementariness of Boella and Sorrisi (Ahuja and Katira, 2001; Bower, 2001). These economies of scale and scope have increased their competitiveness on that market. In terms of research and development, the combining of their knowhow has led to a strong degree of internal innovation, albeit with the aid of external outside stimuli (Arora et al., 2001). Indeed, Boella & Sorrisi has shown a certain competitive advantage in integrating, building and reconfiguring the resources previously owned by the two companies (Ahuja and Katira, 2001). This is doubtless due to a great wealth of internal knowhow (Cohen and Levinthal, 1990; Chesbrough, 2003). Of course, the acquisition of Sorrisi by Boella & Sorrisi accelerated the innovation process (Birkinshaw et al., 2000; Shuen et al., 2014). In terms of production, some human resources are able to operate on both the panettone line and on the chocolate line, if needed. In terms of sales, promotion is managed as a whole, with the focus on the entire product range. The leading character is good Italian food in all its varieties and this is enhanced by the brand’s identity (De Chernatony, 2001), which is closely linked to the family identity. In terms of administration, the creation of Boella & Sorrisi has encouraged significant economies of scale, since combined company accounts and the merging of several administrative aspects has led to significant cost reductions;
- the brand and market visibility have been strengthened: the previously held production and commercial knowhow has affected consumer perception, creating the image of a company operating in a broad and competitive manner within the confectionery sector. Consumer perception has certainly been influenced by the combination of tangible and intangible

elements (Bruce and Hines, 2007) which have favoured the success of its product range. The high quality of raw materials is one of these factors and has in no way been compromised. Even when the price of raw materials has increased sharply (e.g. PGI Piedmont hazelnuts and cocoa), the quality of raw materials has remained high and the company has not changed its traditional recipe, at the cost of accepting a smaller profit margin. Hence, the sale price is justified by the intrinsic content of the product and the manual labour involved. Furthermore, the variety of confectionery products is representative of the reputation of the vast range of Italian local products. Intangible elements attract the consumer's attention by playing on the five senses (Giacosa, 2012). This is achieved not only by the historic brand, but also the local factor, which, in the food industry, is synonymous with tradition. The high quality packaging is very appealing to consumers and engages them in the shopping experience (Flynn and Goldsmith, 1993). Intangible elements are, hence, strongly enhanced by a multi-sensorial strategy. The combination of tangible and intangible aspects fosters and enhances long-term authenticity and prestige, as well as brand awareness, thereby increasing the exclusivity of the product and its regional identity (Kapferer, 2002).

This study has some limitations. First, we presented only a single acquisition, thus we are mindful of the representativeness of this case study. Therefore, it could be useful to widen the scope of the research in order to also compare how change the management of innovation strategies through an acquisition. Future development of this research will focus on other representative case studies in the food sector. Second, we focused to only certain aspects, namely product and process innovation. Third, in relation to the interview technique, we would set out to increase the number of interviews, by also questioning managers and employees working in the company, and not only the CEO, even if he gave us relevant and detailed information.

DRIVERS OF CUSTOMER LOYALTY IN FAST FASHION RETAILING: DO THEY VARY ACROSS CUSTOMERS?

Giovanis, Apostolos¹; Athanasopoulou, Pinielopi²

¹Dept. of Business Administration, Technological Educational Institute of Athens, Egaleo, Greece

²Dept. of Sport Management, University of Peloponnese, Sparta, Greece

ABSTRACT

Although consumer behaviour patterns have become very important in retailing, consumer-driven research is still limited in this area. The purpose of this paper is to empirically test the effects of perceived value; satisfaction, and trust on customer loyalty in fast fashion retailing and to investigate the stability of these effects across different customer segments. A total of 700 customers of a fast fashion retail chain were interviewed and PLS-PM was used for data analysis. Results show that customer loyalty is mainly affected by perceived value and satisfaction and to a lesser extent by trust. Perceived value is the main driver of satisfaction and trust, while satisfaction exerts a significant but small effect on trust. Cluster analysis resulted in four specific customer segments with different behaviour, performance-oriented; value-oriented; experience-oriented, and relationship-oriented. Results present important managerial implications for fast fashion retailers.

Keywords: *Perceived value, Customer Loyalty, Consumer Behavior, Fast Fashion Retailing.*

INTRODUCTION

Although fast fashion emerged as a response to changes in customer needs, most relevant literature focuses on supply-chain theory and the consumer-driven approach is still an under-researched area (Bhardwaj and Fairhurst, 2010). As a result, in recent years, a new mainstream approach focuses on the consumer's role in the fast fashion phenomenon (Bhardwaj and Fairhurst, 2010; Choi et al., 2010; Cachon and Swinney, 2011; Joung, 2014). Although there are many studies investigating the drivers of customer loyalty in the general fashion retailing context (e.g. Marzo-Navarro et al. 2004; Carpenter and Fairhurst, 2005), no other study has looked at customer loyalty and its antecedents in fast fashion retailing. Furthermore, previous research has shown that customers differ in their behaviour in fast fashion retailing based on various demographic characteristics (Crewe and Davenport, 1992; Sydney, 2008; Sung and Jeon, 2009). Nevertheless, research is still young in this area and there is no agreement between researchers.

The purpose of this study is to empirically test the effect of perceived value; satisfaction and trust on customer loyalty in a fast fashion retailing context and to explore whether there are any differences in the relationships between perceived value; satisfaction; trust, and loyalty across different customer segments that are formed based on customers' demographic characteristics in Greece.

The paper is structured as follows. First, we review the literature and present the rationale of the study; then we present the conceptual framework and the research hypotheses used; thirdly, we describe the methodology used; fourth we explain the results of the study, and we conclude with managerial and theoretical implications; limitations, and suggestions for future research.

CONCEPTUAL BACKGROUND AND RESEARCH HYPOTHESES

The literature suggests that the phenomenon of fast fashion emerged and has evolved as a response to a change in consumers' fashion product purchase behaviours that expressed the emergence of new needs and requirements (Barnes and Lea-Greenwood, 2006). However, there is little research to analyse consumer behaviour in this context. Cachon and Swinney (2011) focus on the impact of the quick response technique and enhanced design on consumer purchasing behaviour in the store. Also, Choi et al. (2010) examine consumer behaviour and preferences towards different types of extensions in fast fashion brands. Nevertheless, no previous study has analysed customer loyalty and its drivers. Both researchers and practitioners have recognized the importance of customer loyalty for firms since it contributes to increased repurchase volume; better acquisition rates from positive word-of-mouth communication (Aksoy et al., 2013); lower customers' price sensitivity (e.g. Zeithaml et al., 1996); less cost and capital investment requirements (Oliver, 1999), and improved service providers' profitability (Hayes, 2008).

The principal antecedents of customer loyalty that have been identified are customer satisfaction, trust and perceived value (e.g. Forgas et al., 2010; He et al. 2012). Satisfaction is viewed as an affective response that results from a cognitive process of evaluating the extent to which a product/service provides a pleasurable level of fulfilment of customer's needs and wants after a single or multiple transactions (Oliver, 1999). There are many previous studies showing that satisfaction antecedes loyalty in the retailing services context (e.g. Fullerton, 2005; Walsh et al., 2008; Forgas et al., 2010; Krystallis and Chrysochou, 2014; Veloutsou, 2015). Furthermore, trust has been shown to affect the establishment and development of customer relationships; customer loyalty, and brand equity (e.g. Chaudhuri and Holbrook 2001; Delgado-Ballester and Munuera-Alemán, 2005, Albert and Merunka, 2013; Veloutsou, 2015). Also, previous studies have posited that satisfaction is an antecedent of trust (e.g. Delgado-Ballester and Munuera-Alemán, 2005; Aurier and N'Goala, 2010). Therefore, we can hypothesize the following:

H1: Customer satisfaction directly and positively affects customer loyalty

H2: Customer trust directly and positively affects customer loyalty

H3: Customer satisfaction directly and positively affects customer trust

Moreover, various studies have identified a direct relationship between perceived value and customer loyalty, but also a significant influence of perceived value on customer satisfaction (e.g. Marzo-Navarro et al. 2004; Carpenter and Fairhurst, 2005; Forgas et al., 2010; He et al., 2012) and customer trust (Harris and Goode, 2004; He et al., 2012; Aurier and N'Goala, 2010). The value-satisfaction relationship is justified by the fact that when firms provide services with utilitarian and hedonic benefits that exceed customer expectations, customers will experience a pleasurable experience that will be expressed as satisfaction (Marzo-Navarro et al. 2004; Carpenter and Fairhurst, 2005). The value-trust relationship is attributed to the fact that the perceived benefits of a relationship, such as perceived functional quality aspects, precede trust (e.g. Forgas et al., 2010; Athanasopoulou, 2009; Giovanis et al. 2015). Therefore, it might be hypothesized that:

H4: Perceived value directly and positively affects customer loyalty

H5: Perceived value directly and positively affects customer satisfaction

H6: Perceived value directly and positively affects customer trust

Several previous studies have provided empirical evidence that certain demographic variables can be used to define customer typologies in the retail context (e.g. Theodoridis and Chatzipanagiotou, 2009). Nevertheless, it is not clear how and in what extent specific demographic variables affect consumer behaviour in terms of perceived value formulation and in the way that perceived value; satisfaction; trust, and loyalty interact with each other in the retailing context (Kim and Jin, 2001; Sung and Jeon, 2009). Thus, this study further investigates the interaction among perceived value; satisfaction, and trust as they all affect customer loyalty in order to detect how customer demographics such as age; gender; educational background; family cycle, and profession affect these relationships.

RESEARCH METHODOLOGY

A standardized self-administrated questionnaire was used in a survey of 700 randomly selected customers of three different ZARA stores in Athens, Greece. Interviewers randomly selected respondents outside ZARA shops; asked them to participate in the study, and to complete the questionnaire. The fieldwork took place during the first quarter of 2015. Overall, 620 usable questionnaires were collected. Among the 620 respondents, 64% of the respondents were female. Forty percent (40%) were single, 17% were married without children, 28% were married with children at home, 12% were married with no children at home and 3% were widows/widowers. Eleven percent (11%) of the subjects were in the 18-24 age group, 34% were in the 25-34 age group, 25% were in 34-44

age group, 15% were in the 45-54 age, group and 15 were more than 55 years old. In terms of educational background, 43% had at most a high school degree, 10 had vocational training 32% had a graduate degree and 15% had a postgraduate degree. Finally, 39% were private sector employees, 12% were public sector employees, 16% were self-employed/ entrepreneurs, 7% were pensioners, 11% were university students, 7% were housekeepers, and the participation of all other professions was 9%.

The items of the questionnaire were adopted from existing and well tested scales offered by the extant literature. Perceived value is conceptualized with the GLOVAL scale, a multidimensional scale proposed by Sanchez et al. (2006), which considers post-purchase value as a higher-order construct made up by six sub-dimensions reflecting its functional (functional value of the installations of the establishment; functional value of the contact personnel; functional value of the product (Quality); functional value price); emotional, and social benefits. The scales used to measure functional value of the installations of the establishment and personnel were retrieved from the study of Sanchez et al. (2006), while those used to measure functional value of the product, functional value price, and emotional and social benefits were retrieved from the study of Sweeney and Soutar (2001). Following Zeithaml et al. (1996), customer loyalty is also modelled as a multidimensional construct having three different facets of it as its sub-components (i.e. service providers' ability to retain their customers, paying price premiums and spreading positive/negative referrals to other about their service providers' performance). The scales proposed by Sanchez-Franco et al. (2009) were used to measure customers' repurchase intention, spreading of positive referrals, and price sensitivity. Moreover, based on the fact that previous studies confirmed discriminant validity between perceived value dimensions (Sanchez-Franco et al., 2009) and between customer loyalty dimensions (Lin et al., 2005; Leroi-Werelds et al., 2014), these two constructs are measured as second-order formative rather as reflective constructs. Finally, the scales proposed by Han et al. (2008) were used to measure customer satisfaction and trust.

Cluster analysis was used to segment the study participants based on their demographic characteristics (Hair, 2010) and Partial Least Square Path Methodology (PLS-PM) was used to assess the measurement and the structural model, and test the significance of the model for the pool sample and across different customer segments (Hair et al., 2011). PLS-PM with Smart PLS 2.0 M3 (Ringle et al., 2005), was preferred over covariance-based SEM to test the measurement and the structural model because it permits the simultaneous testing of hypotheses and enabling the use of both reflective and formative constructs, while statistical identification with formative models is difficult for covariance-based SEM methodologies (Hair et al., 2011).

RESULTS

Data analysis involved a two-phase approach in order to assess the reliability and validity of the measures before using them in the research model. The first phase includes the analysis of the measurement model, while the second one, examines the relationships between latent constructs.

Measurement Model Assessment

Individual item reliability is adequate when an item has a factor loading greater than 0.7 on its respective construct, which implies more shared variance between the construct and its measures than the error variance (Hair et al., 2011). The factor loadings of all items, as shown in Table 1, exceed the threshold value of 0.7 providing strong support for the item reliability of the latent constructs.

Latent variable	Nbr of items	Loadings range	Cronbach's alpha	Composite reliability	AVE
Functional Value (Personnel professionalism)	3.00	0.87-0.93	0.90	0.94	0.84
Functional Value (Installations quality)	3.00	0.73-0.92	0.83	0.90	0.75
Functional Value (Product quality)	6.00	0.81-0.90	0.93	0.94	0.74
Functional Value (Price)	4.00	0.88-0.93	0.93	0.95	0.84
Emotional Value	4.00	0.91-0.94	0.93	0.95	0.82
Social Value	4.00	0.91-0.94	0.94	0.96	0.85
Satisfaction	3.00	0.80-0.94	0.88	0.93	0.81
Trust	4.00	0.85-0.92	0.93	0.95	0.83
Repurchase intentions	3.00	0.96-0.97	0.96	0.98	0.93
WOM	3.00	0.95-0.97	0.96	0.97	0.92
Price tolerance	3.00	0.95-0.97	0.96	0.97	0.92

Table 1: First-order constructs' psychographic properties

The reliability of all constructs was examined using the Cronbach's Alpha (CA) and Composite Reliability (CR) measures. Hair et al. (2011) suggest that a value of 0.70 provides adequate evidence for internal consistency. As shown in Table 1, CA and CR values of all measures included in the study exceed 0.83 and 0.90 respectively, suggesting that all measures were good indicators of their respective components. The average variance extracted (AVE) was used to assess convergent validity. The AVE value for each construct, as shown in Table 1, is above 0.74, indicating convergent validity, since all AVE values exceed the recommended cut-off value of 0.5 (Hair et al., 2011). Finally, the discriminant validity among first-order constructs is examined by investigating their correlation (Table 2). The inspection of the matrix shows that the AVE extracted from each construct, is higher than its shared standard deviation (Hair et al., 2011). Therefore, all constructs in the proposed model satisfy the discriminant validity criterion.

	1	2	3	4	5	6	7	8	9	10	11

Table 2: Discriminant validity assessment

The measurement quality of perceived value and customer loyalty, conceptualized as a formative second-order factor, was tested following the suggestions of Diamantopoulos and Winklhofer (2001). First, the correlations among the first-order constructs for each second-order construct were examined. The average correlation among the six first-order perceived value related dimensions is 0.59 and among the three first-order loyalty related variables is 0.58. This indicates that perceived value and customer loyalty are better represented as a formative rather than a reflective second-order constructs, since the latter usually exhibits extremely high correlations (≥ 0.80) among first-order factors (Pavlou and El Sawy, 2006). Furthermore, as it is shown in Table 3 (under the column “pool sample”), the first-order value- and loyalty-related components have significant path coefficients in forming customers’ perception about perceived value and loyalty respectively. Also, the variance inflation factors (VIF) were computed for these first-order sub-dimensions to assess multicollinearity. The VIF values for the perceived value dimensions vary from 1.78 to 3.44 and those of customer loyalty from 1.56 to 2.76. Since that all VIF values are less than 10, multicollinearity is not a concern for this two formative specified constructs (Diamantopoulos and Winklhofer, 2001).

Structural model results

The PLS-PM method was also used to confirm the hypothesized relationships between constructs in the proposed model. The significance of the paths included into the proposed model was tested using a bootstrap resample procedure. The PLS analysis results are presented in Table 3 (under the column “pool sample”) that also includes the results from the second-order constructs’ assessment previously analysed.

Criteria	Pool sample	Seg. 1 (performance-oriented)	Seg. 2 (experience-oriented)	Seg. 3 (value-oriented)	Seg. 4 (relationship-oriented)

Table 3: Structural model results for pool sample and across customer segments

The results indicate that in the formation of perceived value, functional value benefits are more significant than emotional and social benefits. Among functional benefits, product quality is the most important determinant of perceived value followed by the benefits related to personnel professionalism; installation quality, and price. Perceived value is the most important influencing variable for customer satisfaction and trust, while satisfaction slightly enhances the impact of perceived value on trust. The variables that most influence customer loyalty are perceived value and customer satisfaction followed by trust. Therefore, hypotheses H1 through H6 are all confirmed. The proposed model accounts for 70% of the variance in satisfaction, 65% of the variance in trust, and 72% of the variance in loyalty.

Furthermore, a hierarchical cluster analysis was implemented using gender; age; educational background, and family cycle. Four customer segments were emerged mostly related with the customers' lifecycle and profession. A one-way ANOVA analysis revealed significantly different loyalty levels among the four segments. Finally a PLS analysis for each segment were conducted aiming to detect the existence of different behaviors among the emerged customer profiles. The results

concerning the customers' type and their related behavior were used to profile the relevant segments as follows: Performance-oriented (11%) - Most loyal customers. Female, singles, aged 18-24, high school degree, do not work. Perceived value is mainly determined by Functional value/product quality. Satisfaction is main determinant of customer loyalty followed by trust. Perceived value only indirectly affects loyalty through satisfaction and trust. Satisfaction affects trust. Relationship-oriented (15.8%) - Very loyal customers. Male and Female, retired, with children not at home, aged 55+, graduate degree. Perceived value is mainly determined by employee professionalism and social value. Trust is the main determinant of loyalty followed by satisfaction. Perceived value only indirectly affects loyalty through satisfaction and trust. Experience-oriented (32.5%) - Rather loyal customers. Female, singles, aged 25-34, graduate or post-graduate degree, private employees. Perceived value is mainly determined by personnel professionalism; installation quality and emotional value. Perceived value and satisfaction determine loyalty, while the effect of trust is not significant. Perceived value is the only determinant of both satisfaction and trust since the impact of satisfaction on trust is insignificant. Value-oriented (40.8%) - Least loyal customers. Female, married with children at home, aged 35-55, high school degree, public and private employees. Perceived value is mainly determined by functional value/product quality and functional value/price. Perceived value and satisfaction determine loyalty, while the effect of trust is not significant. Perceived value is the only determinant of both satisfaction and trust since the Impact of satisfaction on trust is insignificant. The effect of perceived value is stronger than in the experience-oriented segment.

DISCUSSION OF FINDINGS AND IMPLICATIONS

The aim of this study was to identify the drivers of customer loyalty in the fast retailing industry and then investigate their variance across different customer segments. The findings suggest that, in accordance with previous studies in the field of relationship marketing, perceived value, customer satisfaction and trust significantly determine customer loyalty. Moreover, the results show that retail customers in fact differ in their behaviour towards fast fashion retail stores and brands. This means that consumer behaviour towards the fashion product is not trans-generational as previous research has argued (Christopher et al., 2004; Bhardwaj and Fairhurst, 2010). Not all customers look for affordability and variety of alternatives and are willing to sacrifice product quality. Young people differ from middle-aged adults and from older consumers. Therefore, the results of this study pose significant challenges for fast fashion retailers.

As far as the benefits mix formulation and its effect on customer's responses is concerned, although product quality is the most important functional benefit for perceived value, personnel professionalism; installation quality, and price are also important. Therefore, service mix management issues such as the

quality of personnel and the environment of the store should be primary considerations for fast fashion retailers in addition to product quality. The direct effect of perceived value on customer loyalty is lower than its indirect effect through satisfaction and trust. This means that customer loyalty depends highly on whether customers are satisfied by the value of the shop's offer and on whether they trust the provider. Therefore, the development of relationships with customers is beneficial even in the fast fashion context in order to boost trust and satisfaction and consequently affect customer loyalty.

The findings have also shown that it is possible to effectively segment customers in fast fashion retailing based on their demographic characteristics. Such segmentation can help retailers satisfy their customers better; enhance buyer-supplier relationships and increase customer retention that affects profitability. Specifically, the following suggestions can be implemented by retailers to manage effectively the different segments identified: 1) Older customers value employee professionalism and social value and are oriented towards relationships. Therefore, retailers should try to enhance relationships with older customers by releasing a special line for such consumers or involve them in customer loyalty programs. The older consumer segment has been identified as one with great prospects in many industries due to its time availability and high disposable income. It seems that fast fashion retailers should also target this segment because it has a good potential profitability and is made up from both men and women and most importantly because they seem to be very loyal customers. 2) Experience-oriented consumers are mostly females and value employee professionalism and installation quality as well as the emotional value of shopping in the store. They need to like the experience as well as the product. Therefore, retailers that target this segment should enhance the in-store experience in order to increase their loyalty. 3) Young consumers are mostly women that do not work and therefore have limited income to spend on apparel but they are the most loyal customers. They value product quality and are oriented towards product performance. So, if retailers emphasize such quality in their communication with young consumers, customer satisfaction will increase and this will also affect trust and loyalty. 4) Value-oriented consumers represent the largest segment of the sample and look for a good product quality at a good price. However, they are not at all loyal and will switch easily retailer if they find a better deal. So, they are the least suitable segment for developing relationships and therefore may not be very profitable in the future.

Based on the above it is evident that the knowledge of the preferences of distinct consumer groups is useful in the development of appropriate marketing communications and promotional strategies, as well as for designing installations configurations and managing appropriately personnel performance that are likely to generate brand patronage and repatronage due to the value creating potential which is based on customers shopping wants and needs.

LIMITATIONS AND SUGGESTIONS FOR FURTHER RESEARCH

This study looks at consumer behavior patterns of consumers in fast fashion retailing. However, the sample is drawn from the customers of one retailer in one country. Future research can test our conclusions in multiple firms; industries, or countries and with a wider sample.

MANAGING THE ETHICAL DIMENSIONS OF BRAIN-COMPUTER INTERFACES IN EHEALTH: AN SDLC-BASED APPROACH

Gladden, Matthew E.

Institute of Computer Science, Polish Academy of Sciences (IPI PAN), Warsaw, Poland

ABSTRACT

A growing range of brain-computer interface (BCI) technologies is being employed for purposes of therapy and human augmentation. While much thought has been given to the ethical implications of such technologies at the 'macro' level of social policy and 'micro' level of individual users, little attention has been given to the unique ethical issues that arise during the process of incorporating BCIs into eHealth ecosystems. In this text a conceptual framework is developed that enables the operators of eHealth ecosystems to manage the ethical components of such processes in a more comprehensive and systematic way than has previously been possible. The framework's first axis defines five ethical dimensions that must be successfully addressed by eHealth ecosystems: 1) beneficence; 2) consent; 3) privacy; 4) equity; and 5) liability. The second axis describes five stages of the systems development life cycle (SDLC) process whereby new technology is incorporated into an eHealth ecosystem: 1) analysis and planning; 2) design, development, and acquisition; 3) integration and activation; 4) operation and maintenance; and 5) disposal. Known ethical issues relating to the deployment of BCIs are mapped onto this matrix in order to demonstrate how it can be employed by the managers of eHealth ecosystems as a tool for fulfilling ethical requirements established by regulatory standards or stakeholders' expectations. Beyond its immediate application in the case of BCIs, we suggest that this framework may also be utilized beneficially when incorporating other innovative forms of information and communications technology (ICT) into eHealth ecosystems.

Keywords: *eHealth ecosystems; brain-computer interfaces (BCIs); systems development life cycle (SDLC); health care ethics; business ethics; IT management; technological innovation*

INTRODUCTION

A diverse and growing array of brain-computer interface (BCI) technology is being employed for purposes of therapy and, increasingly, human augmentation. Much thought has been given to the ethical aspects of BCIs; however, such ethical analyses typically view BCIs from the perspective of Innovation, Entrepreneurship and Digital Ecosystems

policymakers who must decide whether or not such technologies should be legal or of individual users for whom a BCI creates new opportunities and risks. Relatively little attention has been given to the ethical aspects of BCIs from the perspective of the managers of eHealth ecosystems who are charged with successfully incorporating new forms of information and communications technology (ICT) like BCIs into those environments. Such a lack of research and best practices is problematic, given the fact that managers who handle the practical details of implementing BCIs within eHealth ecosystems may discover ethical issues that were not foreseen by policymakers and which ordinary end users are not able to fully appreciate and resolve due to a lack of technical expertise.

In this text we seek to formulate a tool that can aid such managers in their work of incorporating BCIs and other innovative new forms of ICT into an eHealth ecosystem in a way that systematically diagnoses and addresses the unique ethical questions that are relevant for each stage of such a process. We begin by defining eHealth ecosystems and presenting an overview of BCIs and the roles that they can fill in such ecosystems. The ethical aspects of BCIs are then investigated by means of a novel two-dimensional framework that surfaces and analyzes ethical issues relating to ICT in eHealth ecosystems through the lens of a systems development life cycle (SDLC) approach to technology management.

DEFINING EHEALTH ECOSYSTEMS

It is difficult to identify a single universally accepted definition of 'eHealth.' Pagliari (2005) cites 36 definitions of eHealth found within the scientific literature and other sources. While those definitions differ greatly, many of them include a number of common themes, including an emphasis on the use of Internet-based and other networked ICT (as opposed to standalone technologies such as non-networked scanning equipment); telemedicine; and the creation, transmission, and analysis of digital data to enhance both the provision of medical treatment and the performance of administrative tasks. Having considered many such definitions of eHealth, Whitehouse and Duquenoy (2008) cite as especially useful the definition contained in the European Commission's *Action Plan for a European e-Health Area* (COM (2004) 356 final, p. 4), which states that eHealth "describes the application of information and communications technologies across the whole range of functions that affect the health sector."

An eHealth 'ecosystem' can be understood as a networked environment of actors, devices, and information systems involved in the provisioning of eHealth services that display both autonomy and mutual dependencies and which interact in such complex ways that they can 'evolve' in a manner analogous to that of a natural biological ecosystem (Benedict and Schlieter, 2015; Guedria et al., 2014). Such ecosystems can incorporate actors such as patients, primary care professionals, public hospitals,

private outpatient clinics, diagnostic and imaging facilities, nursing homes, pharmacies, universities, research laboratories, insurers, and national and local government agencies (Nollo et al., 2014). These actors interact through the use of ICT that includes medical devices housed in dedicated facilities (such as fMRI machines), mobile health devices (such as wearable heart monitors), home fitness equipment, cloud-based health care information systems, and general-purpose communication tools such as social media, email, and telephones (Guedria et al., 2014; Nollo et al., 2014). Such tools are used to deliver business outcomes including real-time telemonitoring and teleassistance, patient education, management of patient care, and financial processing (Guedria et al., 2014).

In order to be viable, an eHealth ecosystem must possess legal, organizational, semantic, and technical interoperability among its constituent devices, processes, and systems (Guedria et al., 2014; COM (2010) 744 final, Dec. 2010). When implemented on the smallest scale, it is possible for such an ecosystem to constitute a 'personal' eHealth ecosystem (Harno, 2013) that connects all of the implantable, wearable, mobile, or ambient devices involved with the provision of health care to a single individual. When implemented on a larger scale, such ecosystems may operate at a municipal, national, or international level and include millions of patients as members. Bourquard (2011, p. 84) notes, for example, that the development of pan-European eHealth ecosystems will require successful agreement on international standards such as the EU eHealth Interoperability Framework envisioned by the European Commission (Van Langenhove et al., 2013), development of a consensus implementation roadmap by service providers, creation of testing platforms, and creation of certification regimes to enforce convergence and consistency.

OVERVIEW OF BRAIN-COMPUTER INTERFACES AND THEIR (POTENTIAL) ROLES IN EHEALTH ECOSYSTEMS

Brain-computer interfaces (BCIs) comprise a diverse and expanding range of sophisticated neurotechnologies whose use is expected to increasingly impact spheres of human activity including health care; interpersonal relationships and sociality; creativity and the arts; science, education, and knowledge management; commerce, work and organizational life; and defense, law enforcement, and personal security (Gladden, 2016). BCIs are devices that "involve real-time direct connections between the brain and a computer" (Glannon, 2014, p. 1) and which "provide a direct communication pathway between the human brain and an external device" (Lance et al., 2012, p. 1586). A BCI can be classified as 'invasive,' 'non-invasive,' or 'partially invasive' depending on whether the device physically extends into the tissue of its user's brain (Gasson, 2012, p.14; Panoulas et al., 2010; Gladden, 2015). Non-invasive BCIs (e.g., utilizing EEG or fMRI technology) may involve sensors temporarily affixed to a user's scalp, while invasive BCIs (e.g., for deep brain stimulation) may incorporate hundreds of electrodes or other

stimulators or sensors surgically implanted in a user's brain (Glannon, 2014, p. 1; Bostrom and Sandberg, 2009). BCIs are employed for functions including neurofeedback, neurostimulation, and neural control of remote devices (Haselager et al., 2009, p. 1352).

There is a wide variety of roles that BCIs are already playing or can potentially play within eHealth ecosystems. Perhaps the most obvious role for BCIs is in the direct provision of care to treat a medical condition. For example, some kinds of cochlear implants (Bostrom and Sandberg, 2009, p. 321) and artificial retinas (see Thanos et al., 2007) can interface directly with the brain to provide sense data from the external environment to users who would otherwise be unable to hear or see. Deep brain stimulation (DBS) is used to treat motor disorders such as Parkinson's disease, dystonia, and essential tremor (Clausen, 2011, p. 495). BCIs can also potentially be employed to predict or stop epileptic seizures (Drongelen et al., 2005; Fountas and Smith, 2007). New kinds of BCIs are being envisioned in the form of cognitive neuroprostheses that can support, regulate, modify, or replace neural processes relating to memory, imagination, emotion, identity, and consciousness (Gladden, 2016).

BCIs can also allow patients suffering from particular medical conditions to control computerized systems that are external to their bodies. For example, BCIs can be utilized to control motorized wheelchairs and robotic artificial limbs, which can be used by paralyzed patients for self-feeding and other important tasks (Clausen, 2011, pp. 498-99; Glannon, 2014, p. 1). BCIs can also be directly employed by patients as a means of communication. For example, a BCI can be used by a paralyzed individual to control a cursor on a computer screen (Glannon, 2014, p. 1) in order to compose messages. BCIs can also be employed to communicate with patients suffering from paralysis or locked-in syndrome (LIS) who would otherwise be unable to communicate (Haselager et al., 2009, p. 1353; Glannon, 2014, p. 1).

Increasingly, though, BCIs will be used not for the therapeutic purpose of treating a medical condition but in order to augment and enhance the cognitive and physical capacities of healthy human beings (Gasson, 2012, p. 25). This is expected to create radical new possibilities for incorporating BCIs into the activities of eHealth ecosystems. For example, it is anticipated that in the future, medical personnel could use BCIs as a replacement for smartphones to engage in real-time, hands-free, direct brain-to-brain communication with one another or to check online medical reference texts with a mere thought (Lance et al., 2015; Gladden, 2015). Medical personnel could also use BCIs as a means of authenticating their identity and accessing restricted services and data within eHealth ecosystems – including financial and administrative data, patients' medical histories, and real-time data from monitoring devices, as well as remotely controlling diagnostic equipment, drug delivery systems, implantable medical devices, and robotic surgical systems (Thorpe et al., 2005; Van Erp et al., 2012; Gladden, 2015).

THE LACK OF TOOLS AND APPROACHES FOR MANAGING THE ETHICAL DIMENSIONS OF INCORPORATING BCIS INTO EHEALTH ECOSYSTEMS

The use of BCIs raises many complex ethical and legal questions relating to safety and risk, privacy, personal identity and agency, equity and social justice, and the nature and future direction of the human species. Many works have explored such ethical dimensions of BCIs, including those by Nijboer et al. (2006), McGee and Maguire (2007), Wolpe (2007), Bostrom and Sandberg (2009), Haselager et al. (2009), Tamburrini (2009), Kotchetkov et al. (2010), Clausen (2011), Vlek et al. (2012), Jebari (2013), Nijboer et al. (2013), Glannon (2014), and McCullagh et al. (2014). However, such works typically focus either on the ethical issues that are relevant at a societal level (e.g., evaluating whether certain kinds of BCIs should be banned by the government) or at the personal level (e.g., considering the impact of a BCI on the privacy and autonomy of an individual patient). Significant attention has not yet been given to ethical issues that arise at the organizational level when managing the implementation of BCIs – and in particular, scholars have not yet systematically identified or considered unique ethical issues that might arise when managing the incorporation of BCIs into eHealth ecosystems.

This lack of research and established best practices relating to the ethical management of eHealth technology implementation concerns not only BCIs but innovative forms of ICT more generally. For example, numerous works have explored the ethical aspects of eHealth, including those by Rippen and Risk (2000), Anderson (2007), Whitehouse and Duquenoy (2008), Liang, Mackey, and Lovett (2011), Kluge (2011), Whitehouse, George, and Duquenoy (2012), Duquenoy, Mekawie, and Springett (2013), Miesperä, Ahonen, and Reponen (2013), Wadhwa and Wright (2013), Habib (2014), Jumelle and Ispas (2015), and Rissanen (2015). However, as broad investigations of ethical issues in eHealth, such texts do not provide operators of eHealth ecosystems with comprehensive frameworks for surfacing and managing the spectrum of unique ethical considerations that arise at each stage of the process of incorporating new ICT into such ecosystems.

FORMULATING AN SDLC-BASED ETHICAL FRAMEWORK FOR MANAGING THE INCORPORATION OF INNOVATIVE ICT INTO EHEALTH

In order to address this lacuna in the fields of BCI implementation and eHealth management, we propose a conceptual framework for managing the incorporation of innovative ICT into eHealth that is based on a systems development life cycle (SDLC) approach and which can be applied directly to the case of BCIs. Our two-dimensional framework encompasses: 1) key ethical dimensions relevant to the management of eHealth ecosystems; and 2) stages in the process of incorporating a new kind of ICT into an eHealth ecosystem. This framework is described in more detail below.

First Axis: Ethical Dimensions of Incorporating Innovative ICT into an eHealth Ecosystem

A review was conducted of the two dozen texts cited above that discuss the ethical dimensions of BCIs or of the incorporation of innovative forms of ICT into eHealth ecosystems. Within the constraints of this text, it is not possible to describe and compare in detail the contents of those texts; however, by analyzing and synthesizing such works, it is possible to delineate five key ethical dimensions that must be successfully addressed when incorporating innovative ICT into eHealth ecosystems; these are: 1) *beneficence*, 2) *consent*, 3) *privacy*, 4) *equity*, and 5) *liability*.

Second Axis: SDLC Stages of Incorporating Innovative ICT into an eHealth Ecosystem

Incorporating insights from the systems development life cycle (SDLC) approach to technology management, the second axis of our framework describes five key stages of implementing new ICT in an eHealth ecosystem. Wager et al. (2013) review a range of SDLC frameworks that have been employed to manage the development of health care information systems; they observe that most approaches can be summarized as comprising the four stages of planning and analysis, design, implementation, and support and evaluation. Similarly, Benedict and Schlieter (2015, pp. 236-37) identify four stages in the creation of the infrastructure for an open eHealth ecosystem: analysis, design, implementation and testing, and utilization. Meanwhile, an SDLC developed by the US National Institute of Standards and Technology with an emphasis on information security similarly describes the four phases of initiation, development/acquisition, implementation, and operations/maintenance, along with an additional phase of disposal (*NIST SP 800-100*, 2006, pp. 19-25): information systems do not last forever, and it is important that once they reach the end of their service life their components are disposed of in a manner involving appropriate information preservation and media sanitization. This is especially critical in the case of health care information systems that contain personal medical data subject to stringent legal and ethical requirements (Gladden, 2015, pp. 180-81).

By synthesizing such SDLC frameworks, we can describe the five relevant stages of incorporating ICT into an eHealth ecosystem as comprising: 1) *analysis and planning*; 2) *design, development, and acquisition*; 3) *integration and activation*; 4) *operation and maintenance*; and 5) *disposal*.

ETHICAL DIMENSIONS OF ICT IN EHEALTH ECOSYSTEMS

	Beneficence	Consent	Privacy	Equity	Liability	
SDLC STAGES OF INCORPORATING ICT INTO EHEALTH ECOSYSTEMS	Analysis and planning	Determining whether a BCI is inherently harmful or too risky to be utilized	Developing policies, practices, and roles to ensure consent in all SDLC phases	Developing policies, practices, and roles to ensure privacy in all SDLC phases	Identifying relevant stakeholders and involving them early in the process	Determining liability for the program as a whole
	Design, Development, and Acquisition	Designing BCI-ecosystem integration (e.g., failure modes) to minimize harm	Ensuring consent of test subjects for experimental BCI integration into ecosystem	Building information security safeguards into hardware and software	Ensuring that BCI integration is designed to work well for different types of users	Clarifying liability of BCI designers, manufacturers, providers, and operators
	Integration and Activation	Ensuring that BCI integration does not disrupt existing institutional ICT systems	BCIs may not be installed, integrated, or activated without users' consent	Privacy of BCI users must be safeguarded during BCI integration and activation	Ensuring that provisioning of BCI integration to institutions and individuals is equitable	Clarifying liability for problems during BCI integration or activation
	Operation and Maintenance	BCIs must respond to real-time conditions to optimize service and risk levels	Mechanisms for verifying users' ongoing consent must function effectively	Ensuring privacy of user data generated, sent, received, or stored by BCIs	Ensuring that BCIs do not grant illegal or unjust benefits to users at others' expense	Responsibility to immediately identify and correct harm being caused by BCIs in use
	Disposal	BCIs should not be disconnected if this would result in harm to users	Ensuring users' consent before terminating BCI services, insofar as possible	Permanently maintaining privacy of user data even after termination of BCI services	Fairness and impartiality in deciding which BCI services to discontinue	Liability for harm caused by disconnection of BCIs from eHealth ecosystem

Figure 1. *Figure 1. Our proposed framework for managing the ethical dimensions of incorporating innovative ICT into eHealth ecosystems, as applied to the case of brain-computer interface technologies. Shown are examples of issues relating to all five ethical dimensions at each of the five stages of the system development life cycle (SDLC) when incorporating a new BCI technology into an eHealth ecosystem.*

Combining the Two Axes to Yield a Matrix of Ethical Issues for Each Stage of the SDLC

When combined, the axes described above yield a matrix of the sort reflected in Figure 1. It defines an array onto which can be mapped ethical issues relating to a particular form of ICT. We would suggest that such a framework can potentially be used as an effective management tool for surfacing, classifying, and addressing unique ethical issues that should be considered during each stage of the process of incorporating innovative ICT into an eHealth ecosystem.

APPLYING THE ETHICAL FRAMEWORK TO MANAGING THE EHEALTH IMPLEMENTATION OF BCIS

Having formulated this framework, we can apply it to the particular case of incorporating BCI technology into an eHealth ecosystem. A number of ethical questions that have been raised (sometimes in an *ad hoc* fashion) in the literature on BCIs and eHealth ecosystems; in Figure 1, we have populated our matrix with such issues by assigning them to the relevant location within the two-dimensional space. In the following sections, the ethical issues related to each SDLC stage will be discussed in more detail, illustrating the manner in which this framework might aid eHealth ecosystems' operators in managing in a systematic and comprehensive way the ethical dimensions of integrating BCI technologies into such ecosystems.

SDLC Stage 1: The Analysis and Planning Stage

In this stage, key ethical questions may be addressed by international, national, and local policymakers in consultation with the program managers who would ultimately oversee the incorporation of BCI technologies into an eHealth ecosystem. To begin with, the ethical dimension of *beneficence* is important in this stage: decision-makers must assess whether incorporating BCI technology into an eHealth ecosystem is likely to do significant good (and acceptably minimal harm) for its users. For example, use of an invasive BCI that requires implanted electrodes is inherently risky; it can cause brain trauma and hemorrhage in otherwise healthy patients (Clausen, 2011, p. 499). If the benefits generated by the BCI do not outweigh this risk (perhaps, e.g., in the case of BCIs used to grant enhanced communication capacities to healthy human beings (Clausen, 2011, p. 499)), it may be decided not to endorse, encourage, or allow the use of such BCIs by facilitating their incorporation into an eHealth ecosystem.

The element of users' *consent* is also relevant at a systemic level even in this first stage. Decision-makers must consider the extent to which the incorporation of BCIs into an ecosystem is being driven by users' legitimate needs and desires and to what extent users may have been manipulated by device manufacturers (e.g., through advertising campaigns) to feel as though they 'need' a BCI in order to be happy or successful (Bostrom and Sandberg, 2009, p. 324). If the best and most effective health care systems employ widespread BCIs for the provisioning of care, individuals may feel pressured to utilize such technologies in order to access adequate care. If it is apparent that users of a BCI technology will not be truly free to grant or withhold consent, it may be inadvisable to proceed with its incorporation into an eHealth ecosystem.

During this stage, the ethical element of *privacy* is addressed by developing effective policies, practices, and roles to ensure that users' data will be protected throughout the later stages of the SDLC. The

element of *equity* is addressed by identifying relevant stakeholders (including ethicists, legal scholars, biomedical experts, hospitals, potential device users, and device manufacturers) and gathering their input before any major programmatic commitments are made. Many BCI technologies are quite expensive: decision-makers must consider how their incorporation into eHealth ecosystems may unfairly advantage those who can afford to purchase them and may increase disparities between financially privileged and disadvantaged individuals within society (Bostrom and Sandberg, 2009, p. 329) or between wealthier and poorer countries. Decision-makers must also consider the impact that incorporation of a BCI will have on those within the eHealth ecosystem who choose not to utilize such technologies: if BCIs become an important element of an ecosystem, then unwillingness to use a BCI might effectively deprive a patient of full access to the health care system (Bostrom and Sandberg, 2009, p. 329). Decision-makers must also ask whether BCIs are being used as an easy means of controlling or pacifying patients that avoids addressing broader medical or societal issues (Bostrom and Sandberg, 2009, p. 324).

Issues of *liability* must also be discussed at a systemic level, to clarify who will bear responsibility for all decisions and actions taken throughout the incorporation process. Moreover, in addition to addressing ethical concerns that are unique to the analysis and planning stage, during this stage decision-makers must also conduct a preliminary analysis of all of the ethical issues that are expected to arise during later stages – to be sure that none of those ethical issues is so severe that it warrants abandoning the BCI incorporation at this first stage.

SDLC Stage 2: The Design, Development, and Acquisition Stage

During the design, development, and acquisition stage of the SDLC, *beneficence* is addressed, for example, by ensuring that BCIs and the mechanisms incorporating them into an eHealth ecosystem possess appropriate failure modes that will minimize harm to users in the case of software errors, mechanical failures, or other problems (Gladden, 2015, p. 259), as well as testing BCIs to ensure that they do not generate unexpectedly harmful side-effects (Bostrom and Sandberg, 2009, p. 323). *Consent* includes obtaining the informed consent of all individuals who serve as test subjects during design and testing of the BCI incorporation. *Privacy* involves not only safeguarding the privacy of such test subjects but also ensuring that BCIs and their system connections are built to include adequate management, operational, and technical controls for information security (Gladden, 2015, pp. 205-304).

Questions of *equity* include ensuring that BCIs and their connections to an eHealth ecosystem are designed to work equally well for diverse kinds of users and that they do not unfairly advantage specific device manufacturers or users who possess a particular socioeconomic status, place of

residence, or set of mental and physical characteristics. Issues of *liability* include specifying liability for any accidents that might occur during testing of BCIs and their incorporation into eHealth ecosystems and developing clear liability frameworks for later stages in the implementation process.

SDLC Stage 3: The Integration and Activation Stage

The integration and activation stage involves connecting BCIs to an eHealth ecosystem and its services for the first time or activating features within the eHealth ecosystem that allow BCI users to individually connect to the system. In this stage, the dimension of *beneficence* involves ensuring that the initial integration of BCIs into the ecosystem does not cause harm to the BCIs' users or other participants in the ecosystem (e.g., through a lack of bandwidth or computer resources needed to simultaneously support the BCIs and all other ecosystem components). *Consent* requires that the BCIs of individual users not be accessed by or functionally integrated into an ecosystem (e.g., through remote management or participation in cloud-based services) without users' knowledge and agreement. The ability of minors and those with cognitive disorders to give informed consent for integration of their BCIs into an ecosystem may be nonexistent (Bostrom and Sandberg, 2009, p. 324). Clausen (2011, pp. 498-99) notes the special ethical issues raised by BCIs that are used to establish communication with patients who are otherwise unable to communicate, such as those suffering from locked-in syndrome: by definition, such patients are unable to express their consent before a BCI is installed and activated. While activating such a BCI – especially an invasive one – without a patient's consent could be considered unethical, refusing to apply such a beneficial life-enhancing technology because the patient is unable to express consent in advance might also be considered ethically inappropriate.

During the integration and activation stage, *privacy* requires not only that an ecosystem appropriately safeguard the particular data generated by a user's BCI but also that the mere fact that someone possesses a BCI and has become a member of the ecosystem be kept confidential. *Equity* requires that the order and robustness with which classes of BCIs and individual users' BCIs are incorporated into an eHealth ecosystem be determined in a manner that is just and not unlawfully discriminatory. Questions of *liability* are addressed by ensuring that clear legal frameworks and particular agreements are in place before an institutional or individual operator of BCIs or provider of BCI-related services is allowed to access an eHealth ecosystem.

SDLC Stage 4: The Operation and Maintenance Stage

During this stage, BCIs participate fully in an eHealth ecosystem while being actively employed by their operators and users for a range of therapeutic and augmentative tasks. Here, *beneficence* requires

that both BCIs and other components of the eHealth ecosystem (including any centralized management systems) respond effectively to changing real-time conditions to optimize service and risk levels, maximize the benefit, and minimize the potential of harm for BCIs' users. For example, eHealth ecosystem operators may need to monitor BCI users to detect whether use of the devices is generating addictions or harmful personality changes (Clausen, 2011, p. 499). Even non-invasive BCIs designed for seemingly harmless purposes may be employed by their users in ways that raise ethical questions for an ecosystem's managers. For example, BCIs ostensibly designed for educational purposes may yield more knowledgeable users but can also potentially generate negative effects such as increased selfishness, extremism, confusion, or manipulability (Bostrom and Sandberg, 2009, pp. 322-23). Moreover, if BCIs are used to link human minds to create a 'collective intelligence' of direct brain-to-brain communication, an ecosystem's operator may be responsible for preventing such interaction from erupting into the sort of 'flame wars' and trolling that are commonly found on the Internet and which can cause "stress and unpleasantness for everyone involved" (Bostrom and Sandberg, 2009, p. 322) – especially given some BCIs' powerful ability to force incoming communications into a user's immediate conscious awareness.

Bostrom and Sandberg note that economic competition and the need to secure and maintain a job might eventually force individuals to utilize BCIs who would otherwise never voluntarily choose to use them (Bostrom and Sandberg, 2009, p. 328; Gladden, 2016). Similarly, if the best and most effective health care ecosystems employ widespread BCIs for the provisioning of care, individuals may feel pressured to utilize such technologies in order to access adequate care. This raises questions of *consent* that must be monitored and addressed by an eHealth ecosystem's operators.

Moreover, BCIs in use generate large quantities of sensitive information (e.g., about a user's mental states, physical activities, social interactions, location, and environment) whose *privacy* must be safeguarded within an eHealth ecosystem. For example, even BCIs that do not typically create a permanent recording of a patient's electroencephalographic signals may do so during a device's training phase (e.g., when a patient is learning to control a motor prosthesis); Clausen (2011, p. 498) raises the ethical question of whether employers and insurers should be allowed to access such information. BCIs can also potentially be utilized by criminal hackers and other adversaries as a new and more effective tool for accessing or manipulating the data of an eHealth ecosystem's members – including those who do not possess BCIs (Gladden, 2015).

Ensuring *equity* in this stage involves guaranteeing that the providers of BCIs or BCI-related services do not take advantage of their possession of sensitive user data or users' physical and psychological dependency on such devices (Bostrom and Sandberg, 2009, p. 323) to unjustly exploit or extort their

users. Issues of *liability* are also important; for example, a BCI that allows a paralyzed patient to steer a motorized wheelchair must continuously detect and interpret the patient's brain signals, and the system will inevitably make errors that occasionally cause the wheelchair to move in an unintended manner, thereby potentially causing accidents that harm persons or property. Clausen (2011, p. 499) notes that a majority of surveyed BCI experts would attribute responsibility for such accidents to a system's user (Nijboer et al., 2013), but insurance companies or other participants in an ecosystem might instead be assigned responsibility.

SDLC Stage 5: The Disposal Stage

The ethical factor of *beneficence* requires that before managers and decision-makers permanently remove or limit the existing connection of BCIs to an eHealth ecosystem, they first ascertain whether such actions may cause immediate or future harm to the users of those devices (Gladden, 2015, p. 175). Given the fact that both the use of certain kinds of BCIs as well as the discontinuation of their use can have profound psychological and physical effects on their users, it may be necessary to obtain the *consent* of individual BCI users before changes are made to an eHealth ecosystem that result in a loss of BCIs' ability to interface with the system and utilize its services. In some cases, it may be unethical to disable or disconnect a BCI against its user's will, even when the device no longer serves the medical purpose for which it was originally prescribed (Clausen, 2011, p. 499).

In this stage, the ethical dimension of *privacy* involves ensuring that sensitive user data generated by BCIs' interaction with the eHealth ecosystem and stored within the system is permanently safeguarded, even after the BCIs' ability to participate in the ecosystem has been terminated. The ethical dimension of *equity* involves determining in a fair and impartial way which BCI services and interfaces are to be discontinued – e.g., as a result of budgetary constraints in managing an ecosystem. The ethical dimension of *liability* is reflected, for example, in questions of financial and legal responsibility for any harm occurring to individual users or their property due to actions by an ecosystem's operators that result in the disconnection or disabling of BCIs participating in the system (Bostrom and Sandberg, 2009, p. 323).

CONCLUSION

When seeking to incorporate innovative forms of ICT like brain-computer interface technologies into eHealth ecosystems, the operators of such ecosystems must grapple with a complex array of ethical questions that are not directly and comprehensively addressed by existing approaches within business ethics, health care ethics, and the ethics of BCIs. By utilizing a framework such as the one formulated in this text, managers can systematically identify ethical issues relating to BCIs and understand them as

questions of *beneficence, consent, privacy, equity, and liability* which can be addressed as they become relevant during the SDLC stages of *analysis and planning; design, development, and acquisition; integration and activation; operation and maintenance; and disposal*. It is hoped that this framework may facilitate the incorporation of beneficial BCI technologies into eHealth ecosystems in ways that fulfill ethical demands arising from regulatory requirements and the expectations for best practices on the part of stakeholders including patients, medical personnel, government policymakers, taxpayers, device manufacturers, and ecosystem operators. The application of this management tool in the case of BCIs may also lay the groundwork for its use when integrating other forms of innovative ICT into eHealth ecosystems. Given the growing social and economic significance of advanced health care within aging societies, the expanding role of BCIs in facilitating the provision of high-quality health care, and emerging possibilities for the use of BCIs in human augmentation, the importance of conceptual frameworks that can assist eHealth ecosystem operators in managing the ethical dimensions of such sophisticated technologies is only likely to grow in the coming years.

INFORMATION SECURITY CONCERNS AS A CATALYST FOR THE DEVELOPMENT OF IMPLANTABLE COGNITIVE NEUROPROSTHESES

Gladden, Matthew E.

Institute of Computer Science, Polish Academy of Sciences (IPI PAN), Warsaw, Poland

ABSTRACT

Standards like the *ISO 27000* series, *IEC/TR 80001*, *NIST SP 1800*, and FDA guidance on medical device cybersecurity define the responsibilities that manufacturers and operators bear for ensuring the information security of implantable medical devices. In the case of implantable cognitive neuroprostheses (ICNs) that are integrated with the neural circuitry of their human hosts, there is a widespread presumption that InfoSec concerns serve only as limiting factors that can complicate, impede, or preclude the development and deployment of such devices. However, we argue that when appropriately conceptualized, InfoSec concerns may also serve as drivers that can spur the creation and adoption of such technologies. A framework is formulated that describes seven types of actors whose participation is required in order for ICNs to be adopted; namely, their 1) producers, 2) regulators, 3) funders, 4) installers, 5) human hosts, 6) operators, and 7) maintainers. By mapping onto this framework InfoSec issues raised in industry standards and other literature, it is shown that for each actor in the process, concerns about information security can either disincentivize or incentivize the actor to advance the development and deployment of ICNs for purposes of therapy or human enhancement. For example, it is shown that ICNs can strengthen the integrity, availability, and utility of information stored in the memories of persons suffering from certain neurological conditions and may enhance information security for society as a whole by providing new tools for military, law enforcement, medical, or corporate personnel who provide critical InfoSec services.

Keywords: cognitive neuroprosthetics, implantable medical devices, information security, human enhancement, digital health ecosystems, health information systems, ISO 27000 series, ISO 27799, NIST SP 1800

INTRODUCTION

Developments in the field of neuroprosthetics are occurring at a rapid pace. Among the most revolutionary technologies are implantable cognitive neuroprostheses (ICNs) that are housed

permanently within a human host's body and which interact with the brain to regulate or enhance cognitive processes relating to memory, emotion, imagination, belief, and conscious awareness.

If such devices fail to function as intended, they can have a severe negative impact on the psychological and physical well-being of their human hosts. While information security (InfoSec) experts have begun formulating approaches to safeguarding these devices against computer viruses, cyberattacks, communication glitches, power outages, user authentication errors, and other problems that could disrupt their functioning, it is commonly presumed that InfoSec concerns represent a significant obstacle to the broader adoption of such technologies. Almost no consideration has been given to the possibility that InfoSec concerns might also create compelling reasons *in favor of* developing and deploying ICNs within society.

In this text, a conceptual framework is formulated which demonstrates that at each step in the process of creating and adopting ICNs, it is possible for InfoSec-related concerns to either impede the process or drive it forward. Before considering that framework, we can review the state of ICNs and industry standards for information security, especially as it applies to implantable medical devices.

BACKGROUND AND FOUNDATIONS

Overview of Implantable Cognitive Neuroprosthetics

A neuroprosthesis can be understood as “a technological device that is integrated into the neural circuitry of a human being” (Gladden 2015, p. 21; Lebedev, 2014). Such neuroprostheses can be sensory, motor, or cognitive in nature (Lebedev, 2014). In this text we focus on cognitive neuroprostheses – experimental devices that enhance, regulate, replace, or otherwise participate in cognitive processes and phenomena (Gladden, 2015, pp. 26-27) such as memory (Han et al., 2009; Ramirez, 2013), emotion (Soussou and Berger, 2008), personal identity and agency (Van den Berg, 2012), and consciousness (Kourany, 2013; Claussen and Hofmann, 2012).

Such devices are still in their early experimental stages; however, it is anticipated that they will eventually be used to treat a range of conditions such as anxiety disorders, emotional disorders, addictions, Alzheimer's disease, and other memory disorders (Ansari et al., 2007; Merkel et al., 2007; Stieglitz, 2007; Soussou and Berger, 2008; Van den Berg, 2012; Gladden, 2015, pp. 22-26) as well as to enhance cognitive capacities like memory and alertness beyond their natural limits (Spohrer, 2002; McGee, 2008; Brunner and Schalk, 2009; Koops and Leenes, 2012; Kourany, 2013; Rao et al., 2014; Warwick, 2014; Gladden, 2015, pp. 26-28).

Some neuroprosthetic technologies comprise large and sessile pieces of non-invasive equipment (e.g., fMRI machines) that are permanently housed in dedicated medical facilities and can only be used at those locations. Other neuroprosthetic technologies involve prostheses that are physically integrated into the biological organism of a human host but have an interface with the external environment; still others are implants which, after their surgical insertion, are entirely concealed within the body of a human host (often within the brain) and may remain there throughout the rest of their host's lifetime (Gladden, 2015, pp. 28-29). In this text we focus on implantable cognitive neuroprosthetic (ICNs), which display unique InfoSec characteristics because they: 1) are often deeply integrated with the biological neural network of their human host's brain, creating the possibility of severe psychological or physical harm (including death) if they are compromised or fail to function as intended; 2) must rely on wireless communication to interact with external health information systems and receive instructions and software updates; and 3) are highly mobile devices that enter a diverse range of unpredictable and unsecure environments as their host goes about his or her daily life (*ISO 27799*, 2008, p. 47; *NIST SP 1800-1a*, 2016, p. 1; *Content of Premarket Submissions*, 2014, p. 4; Gladden, 2015, pp. 62-65).

Fundamental Principles of Information Security (InfoSec)

Information security is an interdisciplinary field whose goal has traditionally been to ensure the *confidentiality, integrity, and availability* of information (Rao and Nayak, 2014, pp. 49-53; *NIST SP 1800-1b*, 2016, p. 9; "Security Risk Assessment Framework," 2014). This notion of a 'CIA Triad' has been expanded through Parker's vision of safeguarding the three additional attributes of the *possession, authenticity, and utility* of information (Parker, 2002; Parker, 2010). However, a neuroprosthetic device is not a conventional computerized information system; as an instrument integrated into the neural circuitry of its human host, it becomes part of the personal 'information system' that comprises the host's mind and body and which possesses a unique legal and moral status. As a result, ensuring information security for a neuroprosthesis also entails safeguarding the three additional attributes of *distinguishability*, or the possibility of differentiating information according to its nature or origin (e.g., the ability to recognize which of the thoughts experienced in one's mind are 'one's own' and which, if any, are being generated or altered by a neural implant); *rejectability*, or the ability of a host-device system to purposefully exclude particular information from the host's conscious awareness (i.e., the freedom *not* to recall certain memories or entertain particular thoughts at a given moment); and *autonomy*, or the ability of a host-device system to exercise its own agency in the processing of information (i.e., the ability to arrive at a decision through the use of one's own cognitive processes and of one's own volition, without the contents of that decision being manipulated or determined by some external agent) (Gladden, 2015, pp. 138-42). In the case of a neuroprosthetic device integrated with the

neural circuitry of its human host, information security thus involves not only securing all electronic data stored in or processed by the device but also ensuring the integrity of the thoughts, memories, volitions, emotions, and other informational processes and content of the natural biological portions of the host's mind in the face of a full range of vulnerabilities and threats including electronically, biologically, and psychologically based attacks (Gladden, 2015, pp. 40-57; Denning et al., 2009).

A key mechanism for promoting information security is the implementation of administrative, physical, and logical security controls (Rao and Nayak, 2014, pp. 66-69). This does not simply involve the installation of antivirus software but rather the creation and effective implementation of a comprehensive program of risk management (*NIST SP 800-33*, 2001, p. 19).

InfoSec Standards of Relevance to Implantable Cognitive Neuroprosthetics

Widely utilized standards that help organizations design and implement best practices for information security include the *ISO 27000* series that defines requirements for InfoSec management systems or ISMSes (*ISO/IEC 27001*, 2013) and a code of practice for InfoSec controls (*ISO/IEC 27002*, 2013). Similarly, NIST standards address risk management and InfoSec life cycles (*NIST SP 800-37*, 2010), InfoSec practices for managers (*NIST SP 800-100*, 2006), and security and privacy controls (*NIST SP 800-53*, 2013).

Beyond these generic InfoSec standards, national and international bodies are increasingly developing specialized standards relating to health care data and medical devices. For example, ISO has published standards and other resources relating to InfoSec for remotely maintained medical devices and information systems (*ISO/TR 11633*, 2009), IT networks that incorporate medical devices (the *IEC 80001* series, 2010-15), and InfoSec management in the field of health care (*ISO 27799*, 2008). In 2015, the NIST issued a draft publication on information security for health records stored or processed on mobile devices (*NIST SP 1800-1*). The US Food and Drug Administration has issued guidance relating to cybersecurity for medical devices utilizing off-the-shelf software (2005) and to the premarket (2014) and postmarket (2016) management of cybersecurity for medical devices. Industry organizations such as the Medical Device Privacy Consortium have proposed their own InfoSec standards (*Security Risk Assessment Framework for Medical Devices*, 2014).

These resources do not focus specifically on the InfoSec questions that arise with the use of ICNs. However, those questions have been explored from an academic perspective in works such as those by McGee (2008), Denning et al. (2009), Koops and Leenes (2012), Kosta and Bowman (2012), and Gladden (2015). By interpreting the published standards in light of such scholarship, it is possible to identify

specific InfoSec concerns of relevance to the stakeholders whose participation is required for the implementation of ICNs.

FORMULATING A CONCEPTUAL FRAMEWORK FOR INFOSEC CONCERNS AS AN IMPEDIMENT OR IMPETUS TO THE DEVELOPMENT OF ICNS

In order to identify ways in which InfoSec concerns can either drive or impede the adoption of ICNs, we propose a conceptual framework that incorporates two dimensions: 1) the chain of actors who participate in the development and adoption of such technologies; and 2) their disincentivization or incentivization to participate in that process as a result of InfoSec considerations. Note that many other factors may influence whether actors decide to pursue the development of ICNs, including ethical, legal, public policy, financial, and operational considerations; the framework formulated here only attempts to identify those factors relating to information security. We can consider the framework's dimensions in more detail.

First Dimension: Actors in the Process of Neuroprosthetic Devices' Adoption

Review of the InfoSec literature for medical devices makes it possible to identify seven types of stakeholders whose participation will be required in order for any implantable neuroprosthetic technology to be developed and deployed in human hosts and whose failure to implement effective InfoSec measures could potentially result in injury or death for an ICN's host (*Content of Premarket Submissions*, 2014, p. 3; Gladden, 2015, pp. 109-110; *Postmarket Management of Cybersecurity*, 2016, p. 10). These actors include: 1) the designers and manufacturers of neuroprosthetic hardware and software (i.e., its 'producers'); 2) the government agencies and licensing bodies that must authorize the use of cognitive neuroprostheses in order for it to be legal (the technology's 'regulators'); 3) the government health services and private insurers that bear the cost of such devices' surgical implantation and ongoing maintenance ('funders'); 4) hospitals, clinics, and physicians who assess individual patients and perform the implantation of neuroprosthetic devices ('installers'); 5) the human subjects in whom neuroprosthetic devices are implanted but who may or may not actually operate the devices ('hosts'); 6) the typically institutional service providers that manage devices' connections to external systems and may remotely manage the devices themselves (their 'operators'); and 7) the providers of physical maintenance and upgrades, software updates, and additional functionality for neuroprosthetic devices already in use (their 'maintainers').

Collectively, the first two types of stakeholders (producers and regulators) can be understood as enabling the *creation* of implantable cognitive neuroprosthetic devices; the following three types

(funders, installers, and hosts) as enabling their *implantation*; and the final two types (operators and maintainers) as enabling their *ongoing use*.

Second Dimension: Disincentivization or Incentivization of Participation in Adoption Process

For a given actor, InfoSec concerns may provide the actor with either disincentives or incentives (or both) to participate in the development and adoption of ICNs.

DISCUSSION OF POTENTIAL INFOSEC-RELATED DISINCENTIVES AND INCENTIVES FOR EACH OF THE ACTOR TYPES TO PARTICIPATE IN ICN DEVELOPMENT

By combining both dimensions, a two-dimensional framework is created; Figure 1 presents such a framework that has been populated with sample InfoSec concerns drawn from industry standards and other literature. We can now explore conceptually how for each of the potential actors in the process, InfoSec concerns can create either a disincentive or incentive for the actor to participate in the development and adoption of ICNs.

Producers: Designers and Manufacturers of Hardware and Software

Designers and manufacturers are largely responsible for the InfoSec characteristics of ICNs (*Content of Premarket Submissions*, 2014, p. 1). The reliance of implantable neuroprostheses on mobile, wireless, and networked technologies places them at significant danger for the embedding of malicious code and other attacks that can exploit vulnerabilities in such technologies (*ISO 27799*, 2008, p. 47; *NIST SP 1800-1a*, 2016, p. 1; *Content of Premarket Submissions*, 2014, p. 4). InfoSec breaches could have fatal consequences for the human hosts of ICNs (*ISO 27799*, 2008, p. 47); large-scale catastrophic InfoSec failures attributable to a manufacturer could result in massive fines and remediation costs, irreparable reputation brand damage, and even bankruptcy (“Security Risk Assessment Framework,” 2014, p. 16). Producers may thus decide that the risks inherent in producing ICNs outweigh any possible benefits.

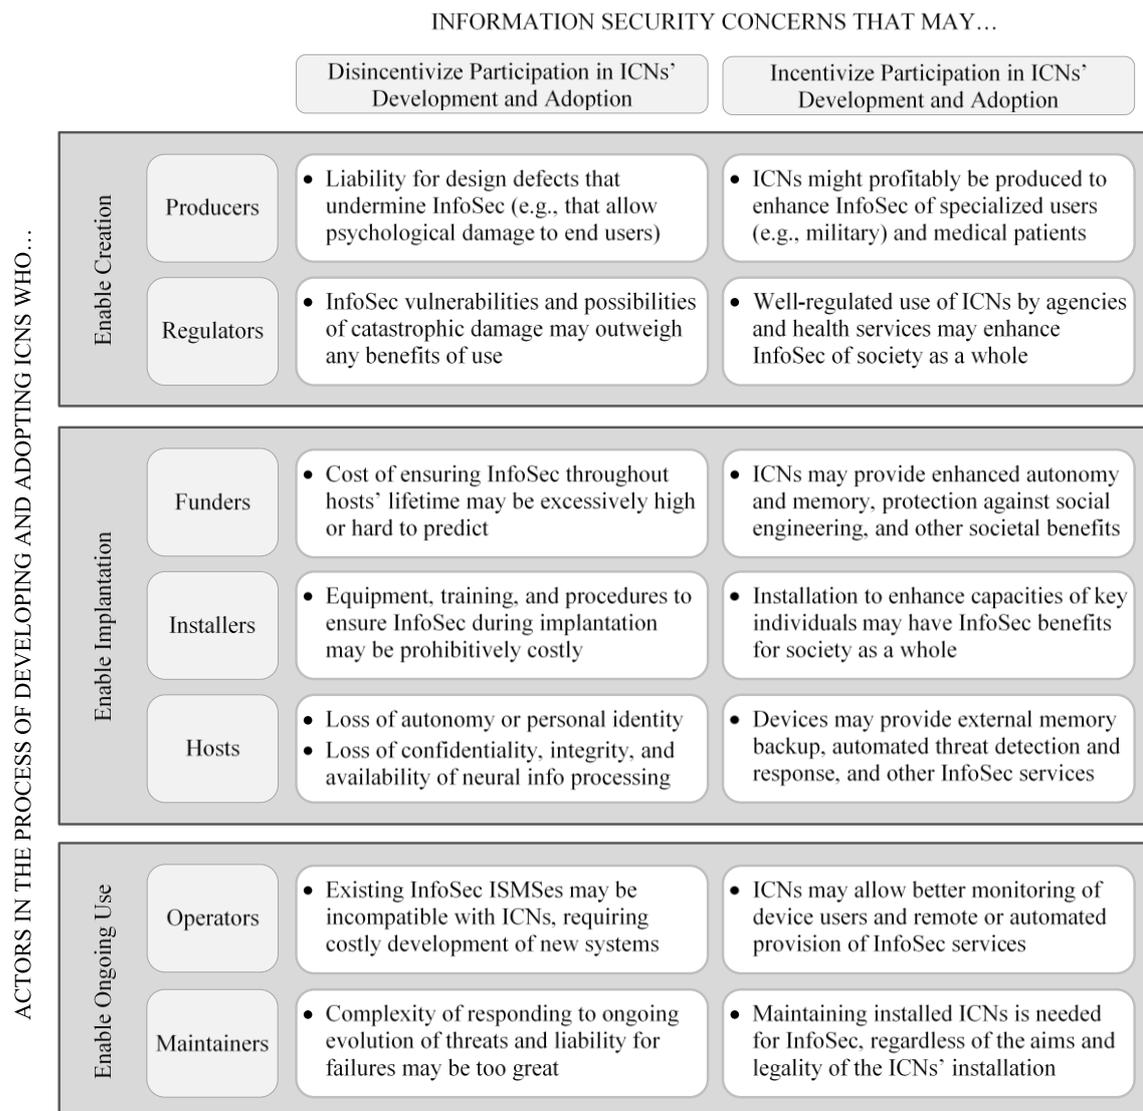

Figure 1. *Figure 1. Examples of InfoSec-related concerns synthesized from InfoSec standards and literature that could potentially disincentivize or incentivize participation of seven key types of actors whose involvement is necessary in order for implantable cognitive neuroprostheses (ICNs) to be developed and deployed.*

Moreover, the unique nature of ICNs may create contradictory InfoSec-related design requirements which are infeasible for manufacturers to satisfy simultaneously. For example, devices allowing access to neural functions must be maximally secure while at the same time granting full and immediate access to medical personnel in case of an emergency (*Content of Premarket Submissions*, 2014, p. 4). Similarly, for ICNs that store data in a biological or biomimetic neural network (see Merkel et al., 2007; Rutten et al., 2007; Stieglitz, 2007; Gladden, 2015, p. 31) or which transmit data through synaptic connections with biological neurons, it may be impossible to utilize the InfoSec best practice of

encrypting data (*NIST SP 1800-1e*, 2016, p. 5) without destroying the information's availability and utility.

Despite these concerns, though, it is possible that some individuals or organizations may wish to employ ICNs precisely in order to enhance their own information security or to protect that of others. In such a case, InfoSec considerations would constitute a factor driving demand for ICNs, which could make their development and production profitable and desirable for device designers and manufacturers. Such potential uses for individuals include strengthening the agency of users whose autonomy has been reduced by disorders such as Parkinson's disease (Van den Berg, 2012; Gladden, 2015, pp. 97, 150-51), restoring the memory mechanisms of individuals suffering from Alzheimer's disease or other neurological disorders (Ansari et al., 2007; Han et al., 2009; Ramirez et al., 2013; McGee, 2008; Warwick, 2014, p. 267), and providing the ability to record and 'play back' audiovisual experiences at will with perfect fidelity (Merkel et al., 2007; Robinett, 2002; McGee, 2008, p. 217; Gladden, 2015, pp. 156-57). Potential uses for organizations include augmenting the brains of military personnel to aid in their work of gathering and processing intelligence and engaging in cyberwarfare and combat operations (Schermer, 2009; Brunner & Schalk, 2009; Gladden, 2015, p. 34) and to enhance the availability of sensory information and memories by reducing their need for sleep (Kourany, 2013; Gladden, 2015, p. 151).

Regulators: Agencies and Licensing Bodies Authorizing Device Adoption

Regulatory agencies may be hesitant to approve the use of ICNs – especially for purposes of elective enhancement – if their InfoSec characteristics create a grave and widespread danger of psychological, physical, economic, or social harm for their users without counterbalancing benefits. However, regulators may be willing to authorize at least limited development of ICNs if they potentially create new and more effective tools for use by police personnel to analyze crime-related data and combat cybercrime, by military personnel to gather intelligence and conduct cyberwarfare, or by the personnel of private enterprises to detect and combat corporate espionage and cyberattacks (Gladden, 2015, p. 111). Regulation may also be desirable in order to create and enforce national or international InfoSec standards that, for example, allow emergency access to ICNs by medical personnel (Cho & Lee, 2012; Freudenthal et al., 2007; Gladden, 2015, p. 273).

Funders: Government Health Services and Insurers Subsidizing Device Use

The ongoing and unpredictable costs of protecting ICNs' human hosts from cyberattacks throughout the rest of their lives and of caring for those rendered psychologically, physically, or economically damaged as a result of such attacks may contribute to decisions by public health services and insurers

that subsidizing the implantation and use of ICNs – especially those employed for elective enhancement – is not a sound investment.

On the other hand, institutions such as national governments and large corporations may be willing to fund the use of ICNs by their own personnel if the devices would be utilized to enhance the information security of those institutions or the constituencies they serve – such as when used by specialized military, police, health care, or corporate business intelligence and InfoSec personnel (“Bridging the Bio-Electronic Divide,” 2016; Szoldra, 2016). Moreover, expenditures enabling the successful widespread use of ICNs to treat disorders such as Alzheimer’s disease (Ansari et al., 2007) could be understood as enhancing the ‘information security’ of significant populations within society (e.g., by increasing the integrity, availability, and utility of memories and other information available to affected individuals and the autonomy of such human beings as host-device systems) and could potentially be justified by government health services on the grounds of improving public health and generating long-term savings on health care costs.

Installers: Hospitals and Physicians Who Implant Devices

Small clinics or hospitals with great expertise in performing surgical procedures may not possess equivalent expertise in information security (ISO 27799, 2008, p. v), making it impossible for them to ensure adequate information security during the preparatory, surgical, and recovery stages of an ICN implantation.

However, the implantation of ICNs by hospitals and physicians to treat disorders such as Alzheimer’s and Parkinson’s diseases (Ansari et al., 2007; Van den Berg, 2012), treat emotional and psychological disorders (McGee, 2008, p. 217), and regulate levels of conscious alertness (Claussen & Hofmann, 2012; Kourany, 2013, pp. 992-93) could help fulfill their duty of care by enhancing the availability and integrity of patients’ information and the autonomy of the patients’ host-device systems. Possession of ICNs by a hospital’s medical personnel could also enhance the availability of information for those personnel by, e.g., providing instantaneous, hands-free access to online reference texts (Gladden, 2015, pp. 33, 156-57; McGee, 2008) or real-time advice from other medical personnel (Rao et al., 2014; Gladden, 2015, pp. 32-33). It has been estimated that effective InfoSec practices in fields like health care can increase organizational performance by up to 2% (ISO 27799, 2008, p. vi); if the use of ICNs by medical personnel would enhance their institutions’ InfoSec performance, there may thus be managerial and financial incentives for their deployment, beyond any directly health-related rationales.

Hosts: Human Subjects and End Users of Neuroprosthetic Devices

The human hosts of ICNs subject themselves to the potential introduction of computer viruses, worms, or malware (*ISO 27799*, 2008, p. 45; “Cybersecurity for Medical Devices,” 2013, p. 1) into their own cognitive processes and make their own thoughts and memories potential targets for attacks by hackers and other adversaries (*ISO 27799*, 2008, p. 45; Denning et al., 2009; Gladden, 2015). InfoSec failures relating to a host’s ICN could result in a loss of autonomy and personal identity; psychological, physical, economic, or social harm; or potentially even the host’s death (*ISO 27799*, 2008, p. 5; Gladden, 2015, pp. 145-68).

At the same time, particular human beings may have an incentive to acquire and utilize ICNs in order to combat the effects of Alzheimer’s disease, Parkinson’s disease, emotional disorders, sleep disorders, and other conditions that negatively impact the integrity and availability of memories stored within their brains and the integrity and autonomy of the ongoing information-processing activities of the individuals’ minds (Ansari et al., 2007; Van den Berg, 2012; McGee, 2008, p. 217; Claussen & Hofmann, 2012; Kourany, 2013, pp. 992-93; Soussou and Berger, 2008; Gladden, 2015, pp. 26-27). Individuals may also be able to use ICNs to enhance their information security beyond what is naturally possible for human beings – such as by artificially increasing the quantity and quality of external information accessible to their minds (Koops and Leenes, 2012; Merkel et al., 2007; Robinett, 2002; McGee, 2008, p. 217; Gladden, 2015, pp. 156-57) or enhancing their ‘internal’ memory capacity beyond natural limits (Spohrer, 2002; McGee, 2008; Warwick, 2014, p. 267; Gladden, 2015, pp. 33, 148).

Operators: Managers of Systems That Monitor and Control Devices

ICNs may create residual risks that the operators of ICN systems are not able to mitigate through the implementation of compensating controls and which may endanger ICNs’ ‘essential clinical performance’ (see *Postmarket Management of Cybersecurity*, 2016, pp. 9, 15). For example, given an ICN’s implantable nature, it may be impossible to maintain a secure physical perimeter around the device (*ISO 27799*, 2008, p. 29) and protect it from electromagnetic radiation and other potentially disruptive environmental emissions (*ISO 27799*, 2008, p. 30). For ICNs that store and process data in the form of a biological or biomimetic neural network, it may be impractical or even impossible to regularly back up the devices’ data in its entirety to a location that is physically secure in order to ensure its long-term availability (*ISO 27799*, 2008, p. 32; Gladden, 2015, p. 236). Potential operators may also decide not to deploy or support ICNs due to the fact that the organizations’ standard InfoSec practices cannot be applied to such devices. For example, operators of a health information system might typically limit network bandwidth for a compromised device or throttle its functionality in order to prevent it from degrading system services otherwise misusing system resources (*ISO 27799*, 2008, p. 46); such a

response may be impermissible if it would endanger the human host of a compromised ICN – who may not even be responsible for his or her device's excessive resource demand.

On the other hand, public health services may choose to operate ICN systems precisely in order to enhance the information security of patients suffering from cognitive disorders that disrupt the brain's ability to store or use information (Ansari et al., 2007; Han et al., 2009; Ramirez et al., 2013; McGee, 2008; Warwick, 2014, p. 267; Soussou and Berger, 2008). Operators of ICN systems might also include government military or police agencies, large corporations, or other institutions for which maximizing information security and combatting InfoSec threats is a critical organizational objective; in particular, personnel augmented by such devices could be more effective at gathering and analyzing intelligence and protecting organizations from cyberattacks (Schermer, 2009; Brunner & Schalk, 2009; Gladden, 2015, p. 34). In the case of individual senior political figures or corporate executives, implantation of an ICN may be warranted in order to counteract the effects of Alzheimer's disease, Parkinson's disease, or other cognitive disorders that could impair the individuals' information security and thereby imperil the mission of the institutions in which they work (see Gladden, 2015, pp. 144, 213, 216-17).

Maintainers: Providers of Software Updates and Physical Maintenance Services

Organizations (including third-party businesses) that provide physical maintenance services, antivirus software and updates, and other applications, upgrades, or accessories to expand the functionality of ICNs may be constrained in their ability to access necessary device functions and data due to legal restrictions regarding the privacy of personal health information (*ISO 27799*, 2008, p. 24) that bind the devices' installers and operators. Moreover, maintenance errors by third-party service providers can open a device to attacks (*ISO 27799*, 2008, p. 48) and create liability for those service providers. Such service providers recognize that a 'masquerade' committed by their own personnel to obtain unauthorized information relating to an ICN (either for financial reasons, to advance hacktivism, out of curiosity, or for other purposes) is also a very real danger (*ISO 27799*, 2008, p. 45); in the case of ICNs, the chance that such InfoSec breaches would cause severe psychological or physical harm to a device's host creates risks that service providers may be unwilling to bear.

Regardless of how and why ICNs have been implanted, though, the provision of effective maintenance and upgrade services is necessary in order to protect their users' lives and ensure their information security (*Postmarket Management of Cybersecurity*, 2016) – thus creating a potentially profitable market for such services. In the absence of regular maintenance and upgrades, ICNs would be vulnerable to new and evolving threats – which is an especially critical problem in the case of devices that are so closely integrated with their hosts' brain functions.

CONCLUSION

Many factors determine whether and how quickly particular new biotechnologies are developed and deployed. There is a widespread presumption that the need to ensure information security for organizations and individuals can create obstacles that *impede* or *disallow* the adoption of sensitive biotechnologies but that it cannot *accelerate* or *facilitate* the adoption of such technologies. It is rarely acknowledged by researchers, regulators, or industry practitioners that the desire for information security might itself potentially help drive the development and implementation of technologies such as implantable cognitive neuroprostheses. Thus the Medical Device Privacy Consortium argues, for example, that information security concerns “threaten to disrupt critical information flows to and from medical device companies” (“Welcome,” *Deviceprivacy.org*, 2016), and the FDA contends that effective cybersecurity is needed to safeguard the functionality of implantable devices (*Content of Premarket Submissions*, 2014, p. 1). In the policy statements, standards, and outreach campaigns of such leading bodies there is no hint that the converse might also be true – i.e., that properly designed and functioning ICNs and other implantable devices might be deployed precisely for the purpose of safeguarding and enhancing information security of individual users, organizations, or sizeable populations within human society.

By applying the framework developed in this paper to analyze issues raised in industry standards and scholarly literature, we have shown that when ‘information security’ is appropriately understood in its full sense of assuring the confidentiality, integrity, availability, possession, authenticity, utility, distinguishability, rejectability, and autonomy of information and information systems, for each of the actors involved in the process of developing and deploying ICNs it is possible for InfoSec concerns to serve either as an obstacle that discourages an actor from taking part *or* as a driving factor that encourages an actor to participate in the development and adoption of ICNs. This is true despite – or perhaps because of – the fact that among all forms of implantable devices, ICNs are those that are most intimately integrated with the neural circuitry of their human hosts and which are able to most directly participate in cognitive processes that are critical for their hosts’ psychological and physical well-being. It is our hope that conceptual frameworks such as the one developed here can serve as a basis for further theoretical and empirical studies to explore the ways in which InfoSec concerns can either hinder or impel the adoption of ICNs and other potentially revolutionary biotechnologies.

**NEUROMARKETING APPLICATIONS OF NEUROPROSTHETIC
DEVICES: AN ASSESSMENT OF NEURAL IMPLANTS' CAPACITIES
FOR GATHERING DATA AND INFLUENCING BEHAVIOR**

Gladden, Matthew E.

Institute of Computer Science, Polish Academy of Sciences (IPI PAN), Warsaw, Poland

ABSTRACT

Neuromarketing utilizes innovative technologies to accomplish two key tasks: 1) gathering data about the ways in which human beings' cognitive processes can be influenced by particular stimuli; and 2) creating and delivering stimuli to influence the behavior of potential consumers. In this text, we argue that rather than utilizing specialized systems such as EEG and fMRI equipment (for data gathering) and web-based microtargeting platforms (for influencing behavior), it will increasingly be possible for neuromarketing practitioners to perform both tasks by accessing and exploiting neuroprosthetic devices already possessed by members of society. We first present an overview of neuromarketing and neuroprosthetic devices. A two-dimensional conceptual framework is then developed that can be used to identify the technological and biocybernetic capacities of different types of neuroprosthetic devices for performing neuromarketing-related functions. One axis of the framework delineates the main functional types of sensory, motor, and cognitive neural implants; the other describes the key neuromarketing activities of gathering data on consumers' cognitive activity and influencing their behavior. This framework is then utilized to identify potential neuromarketing applications for a diverse range of existing and anticipated neuroprosthetic technologies. It is hoped that this analysis of the capacities of neuroprosthetic devices to be utilized in neuromarketing-related roles can: 1) lay a foundation for subsequent analyses of whether such potential applications are desirable or inappropriate from ethical, legal, and operational perspectives; and 2) help information security professionals develop effective mechanisms for protecting neuroprosthetic devices against inappropriate or undesired neuromarketing techniques while safeguarding legitimate neuromarketing activities.

Keywords: *neuromarketing; neuroprosthetics; neural implants; consumer behavior; marketing; biocybernetics; neurocybernetics; brain-computer interfaces (BCIs); information security; privacy*

INTRODUCTION

Ongoing developments in the field of neuromarketing are being made possible by innovative applications of various technologies. For example, neuromarketing researchers and practitioners rely on instruments such as EEG and fMRI equipment to gather data about the ways in which potential consumers respond on a subconscious or unconscious level to the contents of advertisements or other stimuli. Once such insights have been developed, websites, email, and social media platforms and other technologies utilizing microtargeting approaches can be applied to deliver personalized advertising messages that are shaped to maximize their appeal to an individual recipient.

In this text, we argue that the emerging technologies of sensory, cognitive, and motor neuroprosthetics are creating powerful new tools that can potentially be used by neuromarketing professionals both for gathering data about the cognitive activity of potential consumers and for influencing their behavior. Rather than immediately developing an ethical, legal, or business analysis of the case for or against utilizing neuroprosthetic devices in such neuromarketing-related roles, our focus in this text is on the conceptually prior task of formulating a comprehensive framework for analyzing the technological and biocybernetic capacities of neuroprosthetic devices to be employed in such roles.

It is hoped that this conceptual framework can inform further investigations of the propriety and desirability of neuroprosthetically facilitated neuromarketing approaches from ethical, legal, and business perspectives. Such a framework can also facilitate the work of information security (InfoSec) professionals in two ways. First, InfoSec personnel must develop effective mechanisms for protecting neuroprosthetic devices against external actors' deployment of neuromarketing techniques that are considered unwelcome by the users of such devices or which are inherently unethical or illegal. Second, InfoSec personnel must ensure that those forms of neuromarketing conducted by means of neural implants that are acceptable to and authorized by the devices' users are performed in a way that suitably protects the confidentiality, integrity, and availability of information belonging to all of the stakeholders involved in those activities. Developing and employing frameworks such as the one described in this text will become especially important as the number of human beings who possess neural implants continues to grow: while such devices are currently employed primarily to treat particular medical conditions, it is anticipated that their increasing use for purposes of human augmentation and elective enhancement will continuously expand the portion of society that utilizes such technology. Moreover, due to the kinds of enhanced capacities that neuroprosthetic devices may grant and the great expense, surgical risks, and other obstacles involved with the acquisition of such devices, the groups of people who possess neuroprosthetic implants for medical or augmentative purposes may tend to disproportionately manifest particular cognitive, biological, professional, or

socioeconomic characteristics (such as holding senior-level positions in business or government or possessing above-average levels of wealth) that make them especially attractive targets for particular kinds of neuromarketing. It is thus important to understand the full spectrum of ways in which neural implants might be employed for neuromarketing purposes.

Before our two-dimensional framework is presented, it will be helpful to briefly review the nature of neuromarketing and neuroprosthetic devices.

AN OVERVIEW OF NEUROMARKETING

The concept of 'neuromarketing' has been defined in various ways. Some definitions seek to position neuromarketing primarily as an academic discipline that analyzes consumer behavior through the lens of neuroscience. Lee et al. (2007, p. 200) emphasize the academic aspect, arguing that "neuromarketing as a field of study can simply be defined as the application of neuroscientific methods to analyze and understand human behaviour in relation to markets and marketing exchanges." Other definitions position neuromarketing primarily as a business practice; for example, for Fisher et al. (2010), neuromarketing can be "defined as marketing designed on the basis of neuroscience research [...]." Still other definitions span both spheres, positioning neuromarketing as the applied branch of the academic field of 'consumer neuroscience' (Fisher et al., 2010).

In both its academic and applied forms, neuromarketing seeks to help businesses and other organizations understand how particular stimuli (such as the words or images used in TV advertisements or the background music played in retail stores) influence potential consumers' behavior; however, it does this not by asking individuals for their conscious reaction to stimuli but by directly monitoring biological activity in the brain or other organs in order to detect subconscious or unconscious cognitive responses that the individuals themselves cannot clearly describe or do not even realize that they are manifesting (Fisher et al., 2010). Such research might, for example, measure how consumers' 'willingness to pay' (WTP) for different products and services is influenced by the presentation of different stimuli (Ariely and Berns, 2010). In order to gather such data, neuromarketing utilizes technologies such as electroencephalography (EEG), magnetoencephalography (MEG), functional magnetic resonance imaging (fMRI), Galvanic skin response (GSR), electrocardiography (EKG), electromyography (EMG), and eye tracking to detect responses to stimuli (Fisher et al., 2010; Lee et al., 2007; Morin, 2011; Ariely and Berns, 2010).

Applied forms of neuromarketing utilize the knowledge obtained by means of such technologies in order to craft designs for products and packaging, advertising messages, website content, and other goods, communications, or stimuli that are formulated to maximize the positive response on the part of

potential consumers. Although accounts in the popular media sometimes focus on the perceived danger that neuromarketing techniques might allow businesses or other organizations to illicitly manipulate the brain and coerce consumers into taking actions against their own will, when used ethically neuromarketing practices can play a positive role in matching consumers with the goods and services that they most truly desire (Ariely and Berns, 2010). Neuromarketing techniques can be applied effectively in such diverse areas as the development of TV advertisements for food products, the architectural design of new buildings, and the management of political campaigns (Ariely and Berns, 2010).

AN OVERVIEW OF NEUROPROSTHETIC DEVICES

Neuroprosthetic devices are pieces of technology that are directly integrated into the human body's neural circuitry (Gladden, 2015b, p. 20; Gladden, 2016; Lebedev, 2014). At present, such neuroprostheses are typically invasive devices designed to be surgically implanted in the body of their human host (often, though not always, within the brain itself); while non-invasive technologies such as EEG and fMRI equipment may be utilized as brain-computer interface (BCI) technologies in a broader sense, they are not generally considered to be neuroprostheses insofar as they are not "integrated into the neural circuitry" of their human subject in a direct and long-term manner. While future technological advances may yield a growing range of non-invasive neuroprostheses that can be incorporated into an individual's neural circuitry without physically entering the brain, for purposes of this text the phrases 'neuroprosthetic device' and 'neural implant' can be considered roughly synonymous. Neuroprostheses should not be confused with passive RFID tags or other kinds of implantable devices that may provide valuable information relating to their host's physical location or movements but which – because they are not integrated into a host's neural circuitry – do not directly gather information about or influence a host's cognitive activity.

Classification of Neuroprostheses by Function

Particular neural implants can be described as *sensory*, *cognitive*, or *motor* neuroprostheses; a neural implant may also combine more than one of these functions in a single device (Lebedev, 2014; Gladden, 2015b).

Sensory neuroprostheses provide sense data to the brain of their human host. Most existing sensory neuroprostheses are utilized for purposes of treating medical conditions; such devices already in use include cochlear implants and artificial retinas (Koops and Leenes, 2012; Gladden, 2015b, pp. 22-24). However, the use of sensory neuroprostheses for purposes of human augmentation and enhancement has already begun on an experimental basis and is expected to grow in the coming years; such

technologies might, for example, provide a human subject with telescopic or infrared vision or the ability to hear ultrasonic frequencies (Warwick, 2014; Gasson et al., 2012; Merkel et al., 2007).

Cognitive neuroprostheses affect cognitive processes and phenomena internal to the brain of their human host (Gladden, 2015b, pp. 26-27), including imagination (Cosgrove, 2004; Gasson, 2012), emotion (Soussou and Berger, 2008), conscious alertness (Kourany, 2013, pp. 992-93), and the sense of personal identity (Van den Berg, 2012). While it is not possible to precisely edit the contents of memories within a human mind using existing cognitive neuroprosthetic technologies – and may never be possible, if the nature of memory storage within the brain is sufficiently holographic or holistic (Levy, 2010, p. xv) – experimental technologies have, for example, already been developed that can create or erase simple memories in the brains of mice (Ramirez et al., 2013; Han et al., 2009).

Motor neuroprostheses, meanwhile, either detect motor instructions within the brain of their human host and convey them to some external system or generate motor instructions which the brain itself is not able to provide (Lebedev, 2014; Gladden, 2015b, pp. 24-26). Such devices allow their hosts to control robotic prosthetic limbs, motorized wheelchairs, or computers (Donchin and Arbel, 2009); are used to treat conditions such as bladder function disorders, swallowing disorders, and sleep apnea; provide a means of communication for paralyzed patients suffering from ALS, traumatic brain injury, or stroke (Taylor, 2008); and can potentially be used to treat conditions such as epilepsy (Fountas and Smith, 2007), Alzheimer's disease, anxiety disorders, bulimia, and addictions (Ansari et al., 2007) or to allow their users to control external networked systems such as drones or 3D printers (Gladden, 2015a).

Biocybernetic Aspects of Neuroprosthetic Devices

The field of cybernetics offers a transdisciplinary theoretical framework and vocabulary that can translate insights between the diverse range of disciplines that study patterns of communication and control in machines, living organisms, or social systems (Wiener, 1961). In the case of neuroprosthetic devices, such processes of communication and control involve both the devices themselves and the biological organisms in which they are implanted. When neural implants are viewed from a biocybernetic perspective, one considers not only their internal physical components and behaviors but also the ways in which they interact with a host's organism through executing, sharing in, or being affected by processes of communication and control.

While the interaction between a neural implant and human host may be relatively simple and unidirectional (such as when a cochlear implant electrically stimulates the cochlear nerve to present auditory sense data to the mind of its human host), a growing number of neuroprosthetic devices create complex biocybernetic feedback loops that allow their human users to both manipulate some

external physical or virtual environment and then sense the ways in which that environment has been altered as a result of their actions (Gladden 2015a; Fairclough, 2010; Park et al., 2009).

FORMULATING A TWO-DIMENSIONAL FRAMEWORK CAPTURING POTENTIAL NEUROMARKETING APPLICATIONS OF NEUROPROSTHETIC DEVICES

In addition to deploying specialized equipment (such as dedicated fMRI and EEG devices) to gather data about consumers' responses to stimuli and relying on customized tools such as microtargeting websites and TV advertisements to deliver the marketing messages that are developed as a result, we suggest that it will increasingly be possible for neuromarketing professionals to accomplish both tasks by utilizing neuroprosthetic devices that have already been implanted in members of the public for therapeutic or augmentative purposes and which possess direct access to the neural circuitry of their human hosts.

We would argue that such potential applications of neuroprosthetic devices for neuromarketing can be effectively identified and analyzed with the assistance of a two-dimensional conceptual framework that reflects: 1) the different functional types of neuroprosthetic technologies; and 2) the fact that a given technology can be employed either to gather data about consumers' cognitive activity or to influence consumers' behavior.

It should be noted that the conceptual framework presented in this text is intended to capture the full universe of potential neuromarketing applications of neuroprosthetic devices that are expected to become *technologically feasible* during the coming years; it is not, however, claimed that all (or even any) potential applications identified through use of this framework are *ethically meritorious* or *legally permissible*. Indeed, one of the anticipated uses of the proposed framework is to aid government policymakers, ethicists, neuroprosthetic device manufacturers, InfoSec professionals, and neuromarketing researchers and practitioners to identify new ethical questions and concerns that result from the increasing availability within the general population of implanted neuroprosthetic devices that can be exploited for neuromarketing purposes and to develop more robust legal and regulatory frameworks, industry best practices and ethics guidelines, and InfoSec countermeasures and controls to address such possibilities.

We can now consider each of the framework's axes in more detail.

First Axis: Functional Types of Neuroprosthetic Devices

One axis of the framework delineates the main functional types of neuroprosthetic devices – namely, 1) sensory, 2) cognitive, and 3) motor neuroprostheses. There is not a separate category for hybrid neuroprosthetic devices that combine multiple types, such as a bidirectional sensorimotor neuroprosthesis in the form of a robotic prosthetic arm that allows a human amputee to both feel the pressure of an object held within the robotic fingers' grasp and to control the fingers' motion through his or her thoughts; such a hybrid device could be analyzed within this framework as though it were a set of separate sensory and motor neuroprostheses.

Second Axis: The Role of Gathering Data or Influencing Behavior

The second axis of our framework describes two critical roles that a particular technological device might play within the practice of neuromarketing: 1) gathering data about potential consumers' cognitive activity; or 2) influencing potential consumers' behavior.

At present, the more widely accepted and employed use of neurotechnologies in neuromarketing is in gathering data about the way in which the brain of a potential consumer responds to different kinds of stimuli (Lee et al., 2007; Fisher et al., 2010; Morin, 2011). For example, neuromarketing research has used EEG and MEG technologies to study how the brain reacts differently to various kinds of advertisements and which types of formats and elements can be employed to optimize the processes of attention, memory, and trust that are needed to cultivate brand recognition and loyalty in consumers who are exposed to such advertisements (Lee et al., 2007, p. 201).

A more controversial role that neurotechnologies might possibly play within the field of neuromarketing is that of influencing or even directly controlling the behavior of consumers. Certainly, the use of technological media such as TV advertisements to influence consumers' actions is a longstanding and widely accepted practice. However, neurotechnologies provide new and potentially vastly more powerful tools for attempting to shape consumers' behavior. Such influence can be created either indirectly (e.g., through the creation of cybernetic sensorimotor feedback loops that incentivize and 'train' consumers to behave in particular ways) or directly, through the immediate artificial stimulation of neurons within the brain. While it is not feasible to directly influence consumers' neural activity without their knowledge or consent employing current technologies like EEG and fMRI (Fisher et al., 2010; Murphy et al., 2008, pp. 297-98), such actions might be possible in the future if consumers' existing neuroprosthetic implants could be accessed and exploited (Bonaci et al., 2015) by neuromarketing practitioners.

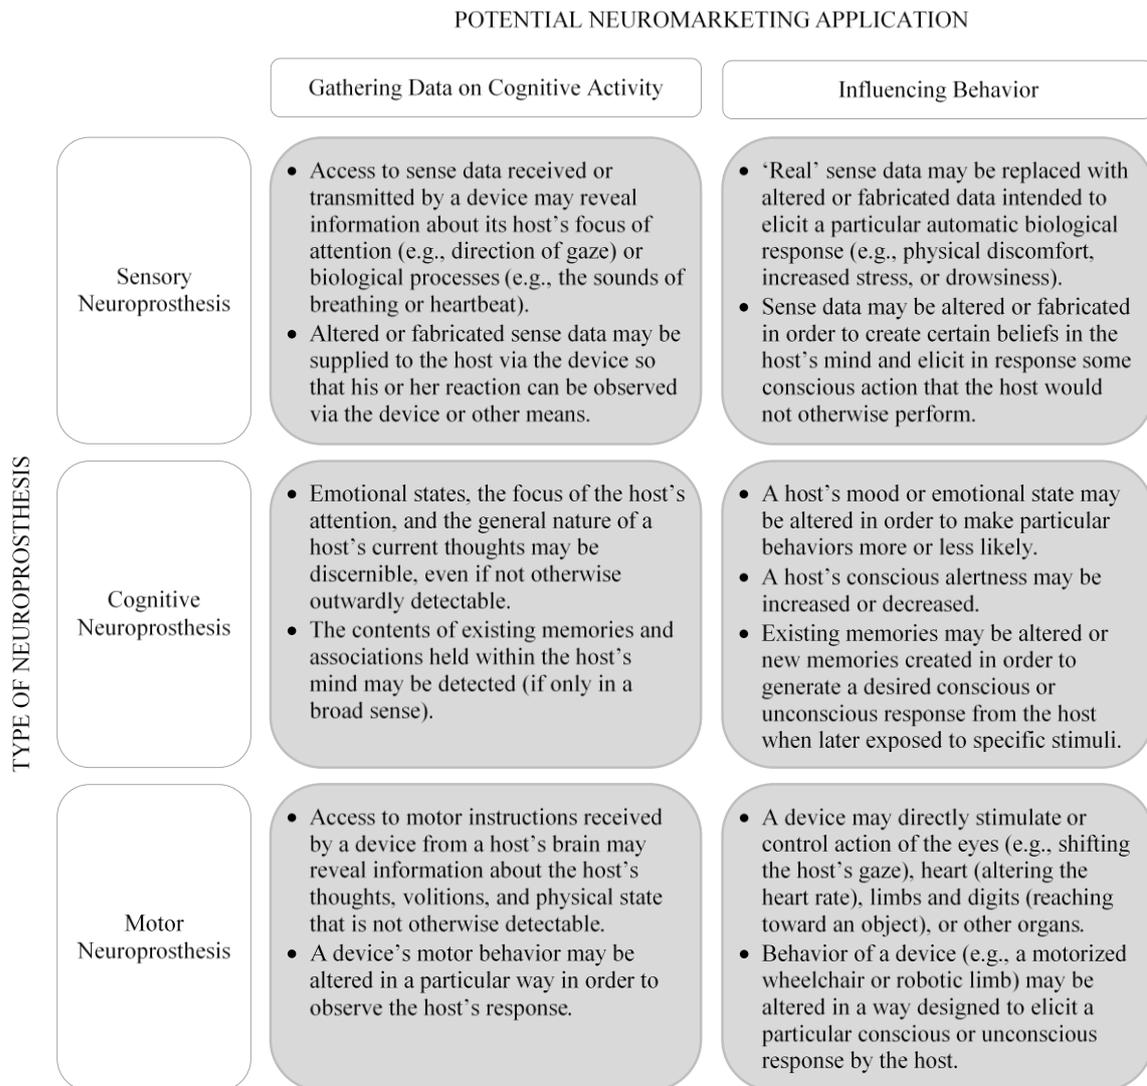

Figure 1. *Figure 1. For each of the three types of neuroprosthetic devices (sensory, cognitive, and motor neuroprostheses) it is technologically and biocybernetically conceivable that such a device could be used for the two key neuromarketing roles of gathering data about the cognitive activity of the device's human host or influencing the host's behavior. Examples of such applications are described in this diagram.*

Completing the Framework

When the two axes described above are combined, they yield a matrix of the sort depicted in Figure 1. For each of the six fields within the matrix, a description is shown of ways in which that type of neuroprosthetic device might fill that type of neuromarketing role, based on the device's technological and biocybernetic characteristics.

TECHNOLOGICAL AND BIOCYBERNETIC ASSESSMENT OF POTENTIAL NEUROMARKETING APPLICATIONS OF NEURAL IMPLANT TYPES

Having formulated this two-dimensional framework, we can now use it to identify capacities possessed by particular types of neuroprosthetic devices that are already in use or whose development is being pursued that can allow them to be employed in the dual neuromarketing roles of gathering data about the cognitive activity of the devices' human hosts or influencing the hosts' behavior. As noted earlier, the analysis of sensory, cognitive, and motor neuroprostheses presented below is not an assessment of the ethical or legal propriety or commercial desirability of utilizing neuroprosthetic devices for such purposes but rather a technological and biocybernetic assessment of the capacity of neural implants to be employed in such ways by an organizational or individual actor who wishes to utilize them in such a manner.

Sensory Neuroprostheses: Assessment of Potential Neuromarketing Applications

The commercial utilization of BCIs to detect covert mental states in the devices' human hosts for purposes of carrying out neuromarketing activities is noted by Brunner et al. (2011) as an emerging application for BCIs. One form that this activity might take is the exploitation of sensory neuroprosthetic devices that are already implanted in human hosts for medical or augmentative purposes in order to gain access to data about the hosts' cognitive processes. From a technological perspective, it is possible to perform such actions either with the knowledge and consent of a device's human host (e.g., if the individual 'opts in' to allowing a marketing firm or other company to have limited access to data contained in his or her sensory neuroprosthesis) or in a surreptitious and likely unlawful manner (e.g., by compromising or replacing the components of an already existing BCI device (Bonaci et al., 2015)). Data received or transmitted by a sensory neuroprosthesis and made available to neuromarketers might reveal information about its host's focus of attention (e.g., by decoding information from an artificial retina to detect the direction of its host's gaze) or biological processes (e.g., by filtering the audio data generated by a cochlear implant to detect its user's heart rate or breathing patterns). Moreover, altered or fabricated sense data representing particular stimuli might be supplied to the host's brain via the sensory neuroprosthesis so that the host's unconscious reaction could be observed using the device itself or another mechanism.

It is also technologically possible for various kinds of sensory neuroprostheses to be used legitimately or illicitly to influence the behavior of their human hosts. Daigle (2010, p. 40) notes that manipulation of the sensory signals reaching the brain can be used as a means of influencing or controlling the brain's behavior; for example, by hacking the artificial retinal implants of a human host and providing him or her with fabricated visual information that creates a particular (mistaken) belief about the host's

Innovation, Entrepreneurship and Digital Ecosystems ISBN: 978-9963-711-43-7

environment or physical state, the host could be induced to enact certain conscious physical responses that he or she would not otherwise perform. (For example, a host who is artificially made to feel thirsty or to falsely perceive that all of the other patrons of a restaurant are greatly enjoying their beverages might himself or herself choose to order a drink.)

Bublitz (2011, pp. 111-12) distinguishes between 'indirect' and 'direct' interventions in an individual's cognitive processes: *indirect interventions* include the presentation of stimuli to sensory organs (e.g., in the form of music, spoken language, or TV advertisements) that are processed by the brain along with all other external environmental stimuli, while *direct interventions* include techniques such as deep brain stimulation (DBS) and transcranial magnetic stimulation (TMS) that use technological means to artificially and directly stimulate neurons within the brain. According to that schema, the use of sensory neuroprosthetics to influence a host's behavior will typically constitute 'indirect' interventions, while 'direct' interventions might be performed more readily, for example, through the manipulation of cognitive neuroprosthetics.

Cognitive Neuroprostheses: Assessment of Potential Neuromarketing Applications

There are numerous ways in which already-implanted cognitive neuroprostheses could potentially be utilized by neuromarketers to gather data about the cognitive activity of their human hosts. Through access to data contained in such devices, a host's emotional states, the focus of a host's attention, and the general nature of a host's current thoughts may be discernible, even if they are not otherwise outwardly detectable. While it might not be theoretically possible for a neuroprosthetic device to identify complex semantic content of specific memories, it may be possible for a cognitive neuroprosthesis to determine on the basis of neural signals that, for example, its human host is listening to a particular piece of music (Horgan, 2004). Even generalized access to the contents of cognitive processes might help accomplish neuromarketing goal such as that of identifying "the relationship between smells and colors of food products" (Lee et al., 2007, p. 200).

Influencing a host's behavior through the use of an implanted cognitive neuroprosthetic device is also quite feasible. For example, deep brain stimulation can be employed to alter a user's moods (Bublitz, 2011, p. 116). Kohno et al. (2009) and Bublitz (2011, pp. 97-98) explicitly consider the possibility that hackers might illicitly access neural implants that have been installed in human hosts for legitimate therapeutic purposes such as DBS and use them to influence their hosts' thoughts, moods, and emotions in order to directly shape their behaviors as consumers – i.e., for purposes of neuromarketing. Analyzing the mind-altering effects of DBS that have already been demonstrated, Rowland et al. (2013) similarly raise the question of whether brain-machine interface devices might be used for 'cognitive

control.' It is also known that transcranial magnetic stimulation can affect the formation of volitions (Bublitz, 2011, p. 116). TMS devices induce an electric current in neurons in order to facilitate or inhibit synaptic activity; such tools have been used by researchers to temporarily take particular brain regions 'offline,' thereby allowing researchers to determine how the brain's performance of specific tasks is affected by impairing the functioning of those regions (Ariely and Berns, 2010). Having gained such knowledge through their use, the same or similar technologies could potentially be employed to elicit or block particular kinds of cognitive activity. It has also been shown that commercially available BCI technologies can already be used to develop 'brain spyware' or 'BCI-enabled malicious applications' which, for example, can electrically stimulate the brain to impede users' responses when they are lying (Bonaci et al., 2015, p. 35; Luber et al., 2009).

Moreover, if neuroprosthetic implants can store memories – thus serving as a sort of 'supplemental memory' to the storage capacity of the brain's natural biological neural network (Daigle, 2010, p. 37; Gladden, 2015b, pp. 148-49) – then any mechanism that can manipulate or alter the contents of such devices could be used to influence future behaviors that are dependent on or affected by such memories. Noting researchers' assessment of DARPA's ongoing \$40 million Restoring Active Memory (RAM) and Systems-Based Neurotechnology for Emerging Therapies (SUBNET) programs to develop next-generation implantable neuroprosthetics for treating memory and cognitive disorders, Talan (2014, pp. 9-10) cites "a growing concern that the manipulation of brain networks" by means of such devices "could be used as a form of mind control." Similarly, Krishnan (2014, p. 10) notes the possibility that an actor might compromise an implanted neural device in order to influence or control the behavior of its human host; he distinguishes the application of such 'mind hacking' to exercise short-term control over its host's body versus using it to effect a permanent 'rewiring' of the host's memories or behavior (Krishnan, 2014, p. 10).

Motor Neuroprostheses: Assessment of Potential Neuromarketing Applications

There are various means by which conventional motor neuroprostheses already implanted in human hosts could potentially be utilized by neuromarketers to gather data about the cognitive activity of those hosts. For example, access to motor instructions received by a device from a host's brain may reveal information about the host's thoughts, volitions, and physical state that is not otherwise detectable (Gladden, 2015b, pp. 24-26). It may also be possible to disrupt, control, or otherwise alter a device's motor behavior in a particular way in order to observe the host's response to that unexpected stimulus.

A motor neuroprosthetic device could also be used to directly stimulate or control action of the eyes (e.g., shifting the host's gaze to a particular object), heart (e.g., artificially increasing or decreasing the heart rate), limbs and digits (e.g., extending an arm to reach for an object), or other organs. The behavior of a device such as a motorized wheelchair or robotic limb might also be altered in a way that is designed to elicit some desired conscious or unconscious response by the device's human user. Already, tens of thousands of people worldwide possess implanted neuroprosthetic devices used for deep brain stimulation, which is employed primarily to treat Parkinson's disease and other movement disorders but which has also been found to generate mood changes in patients (Daigle, 2010, pp. 35-36; Van den Berg, 2012); such neuroprostheses could potentially be used to alter the moods of their human hosts in a way that would make certain consumer activities more or less likely at a given point in time.

CONCLUSION

As we have seen, the kinds of neuroprosthetic devices that are utilized by a growing segment of the population for the treatment of medical conditions or for purposes of human enhancement constitute powerful new tools that can conceivably be used for the two key neuromarketing tasks of gathering data about the ways in which potential consumers' cognitive processes react to particular stimuli and delivering stimuli that can influence consumers' behavior in a desired fashion. While general questions have already been posed by ethicists and others regarding the use of neuroprosthetic devices to gather information about the cognitive activity of their human hosts – either surreptitiously or with the hosts' consent – and to influence the hosts' behavior, such issues have not yet been comprehensively explored from the perspective of the technological and biocybernetic capacity of neuroprosthetic devices to be employed for such purposes within the field of neuromarketing. The conceptual framework proposed in this text represents one approach to developing such a framework; it is hoped that it can aid scholars and practitioners in identifying and exploring the practical, legal, and ethical issues that arise if neuroprosthetic devices that have been implanted in human hosts for other purposes are accessed and utilized by neuromarketing professionals for neuromarketing-related ends. Moreover, it is hoped that the schema presented in this text can assist InfoSec professionals in developing robust security practices and mechanisms both to safeguard the users of neuroprosthetic devices against undesired and illicit forms of neuromarketing and to ensure that legitimate forms of neuromarketing conducted by means of neural implants are carried out in a way that appropriately protects the confidentiality, integrity, and availability of the information of all stakeholders who participate in such activities.

IS MENTORING HELPING WOMEN GETTING PROMOTED IN GERMAN COMPANIES?

Goehlich, Véronique; Gilbertson, Briony; Bremse, Kerstin

International Business, Pforzheim University of Applied Sciences, Pforzheim, Germany

ABSTRACT

Gender diversity in higher management levels of companies is becoming an increasingly relevant topic – organisations in general are realising the necessity of having a higher proportion of women in higher level management positions. This can only be achieved through actively promoting women in business. Various HR instruments are available to support a gender diversity strategy, one of which is mentoring. This paper ascertains in what way mentoring is a sustainable instrument for the promotion of women in business specifically in Germany, by analysing mentoring programmes in various German companies from the points of view of both mentees and mentors. With the help an online survey amongst female mentors and mentees and the theory given in the literature, the organisational aspects as well as the implementation of such programmes are assessed with the aim of recognising potential areas of improvement for companies in Germany in future. Based on this analysis, it can be concluded that mentoring for women is organised quite successfully in Germany, but that nevertheless certain areas of consideration exist in view of the general organisation and the communication and marketing of the programme.

This article is based on the unpublished Bachelor's thesis of Briony Gilbertson, handed in at Pforzheim University of Applied Sciences in July 2013

Keywords: *Mentoring, Gender Diversity, German companies, Sustainable instruments in Human Resources, Female Top-Managers*

INTRODUCTION

Women are still underrepresented in the highest levels of German organizations. Although the possible benefits of having more female managers in higher level management might expected, there is no legal obligation for German companies to increase the number of women in their boards. It seems that German women do not want to be token women, but prefer to be selected only on the basis of their qualifications and not on the basis of their gender in order to fulfill quotas. Therefore large German companies have been introducing HR tools in order to push women to the top without using quotas. One of the reasons why women are not reaching top management is often associated with the Innovation, Entrepreneurship and Digital Ecosystems

lack of female internal and external networking. Women do not seem to be as good networkers as men and need support to enter networks. One possible solution is to implement mentoring, a situation in which a more senior person and an employee come together to exchange professional experiences. The objective of this paper is to demonstrate to what extent mentoring is a sustainable HR instrument for the promotion of women in German companies whilst detecting areas of improvement and deriving recommendations for future implementation.

In the first part of this paper, we briefly review the effects and implications of female leadership for companies. Furthermore we give an overview of mentoring programmes in general before analytically investigating in the second part of the paper how mentoring is actually conducted in German companies and whether it fits the theoretical framework. *For this, an online survey was conducted among female employees throughout Germany. The aim was to gain insights into mentoring programmes for women from the participants' point of view.* In the final section we summarize a few recommendations for companies on how their mentoring programs could be improved in the future.

LITERATURE REVIEW

Female leadership can have positive effects on subordinates and co-workers. An analysis during crisis times showed that women and men took different decisions leading their companies with equal success where women focused more on client relations and employment benefits (Alonso Almeida, Bremser, 2015). Women in management positions can also better relate to the needs of female consumers or customers, as they can take the female "insider" point of view, a consideration which is especially important in times of growing female customer bases (Pullen, 2010). This can allow companies to take advantage of the entire potential market and avoid blind spots which might occur in a homogeneous male leadership group (Deutsche Gesellschaft für Personalführung e.V., 2012). Finally, having women in higher management positions allows the company to outperform competitors with few or even no women in higher level positions. An extensive study by Roy Adler (2001) shows that among the Fortune 500 companies, 25 enterprises with a large number of female executives were between 18% and 69% more profitable than those companies which did not have as many women in higher management positions. Other studies have been conducted on the same topic and have come to similar results (Perryman et al, 2016, and Post and Byron, 2015).

Furthermore a larger amount of women in higher management positions improve the corporate governance structures of companies (Visser, 2011). In Europe, Germany ranks average, with a ratio of female board members of 12.8% (Zehnder, 2012). Schwarze et al. (2012) proved a general increase in the number of women not only in higher management positions, but also in middle and lower

management: between 2001 and 2010, for example, German private businesses experienced a general increase of female managers from 22% to 30% (Holst and al, 2012).

Nevertheless, the further up the hierarchy one goes, the fewer female managers there are. A study by McKinsey & Company from 2012 showed that from an average of 37% female employees, only 2% managed to reach the level of CEO. *In general, female participation in management remains low as several studies have shown (Dezso et al., 2016)*. The following three factors were identified in an analysis of Egon Zehnder International (2012): firstly, even though more and more women are joining boards in Europe, they are mostly appointed as non-executive directors (NEDs), of which they represent 18.1%. Women with actual managerial power account for only 4.8% of all executive directors (EDs). Germany is just below the European average, with 15.9% female NEDs and 4.5% female EDs, though Devillard and al. (2012) highlighted an upward turn to be expected in future, as 16% of all new ED positions were filled by women in 2011. Secondly, there is a substantial difference between different sectors and industries: while 33.3% of the board positions in European companies for household appliances were held by women in 2012, the steel industry only accommodated an average of 7.9%. Overall, female board members are relatively well represented in the service and retail sectors, while their absence is clear in the technological and scientific sectors. Finally, the number of women in management positions generally depends on the size of the company. In Germany, Schwarze et al. (2012) showed that small and medium sized companies have much higher proportions of women in general management positions than larger companies, and their absolute numbers have been growing more importantly compared to large companies over the past few years.

German women are trying to fight their way into top management positions, meaning they have to break through the bonds of the “old boys’ network” (Holst and al, 2012). Apart from these social aspects, female employees are faced with structural challenges when trying to advance in their career. Many find it hard to combine their private and family life with their professional career, mainly due to a lack of childcare facilities (Goehlich, Wüst, 2015). But it is not only external factors which challenge the promotion of gender diversity in higher management levels: women themselves are often too shy to stake their claim and fear the pressure of too much responsibility, which limits their ability to self-market themselves (European Women’s Management Development, Helga Stödter Stiftung, 2010). They often await opportunities, rather than pursuing them and do not try to take as much advantage of networks as men do, even if these were available, as they are often of the opinion that career advancement should not be justified through using business contacts but through achievements and qualifications (Hewlett et al, 2011). These external and internal challenges have been recognized by businesses and politics, which are taking active steps towards more gender diversity. Germany promotes gender diversity through regulating the proportions of men and women in the employee

representative bodies, which must be equal to the gender ratio of the staff overall. Germany has also been debating about a national quota, but decided in April 2013 that there would be no introduction of such a regulation before 2020.

MENTORING

Many German companies conduct gender diversity management and have started promotion programmes for women. Several German companies have set internal voluntary quotas, independently from any national regulation, for example the Deutsche Telekom, Bayer and Eon. All of the 30 listed companies on the German share index Deutscher Aktienindex (DAX) have worked together to introduce internal company quotas and have prepared medium- to long-term plans to realise these (Bundesministerium für Familie, Senioren, Frauen und Jugend, 2012). The actual implementation of the initiatives is linked to the overall HR activities, and should be actively supported by the HR department, which can use a broad spectrum of instruments.

One important instrument for the promotion of women in business is the implementation of mentoring programmes. Peters (2004) defines a mentoring relationship as a professional relationship between two people, who come together on a regular basis over a limited period of time, to discuss current professional topics, whereby one person is in an advisory function (mentor) while the other seeks advice (mentee). Mentoring programmes are the framework for organised and structured mentoring relationships. They are offered by organisations and can be conducted before the appointment of the mentee or during employment. The mentor is mostly an older or more highly ranked person who supports a younger or lower ranked mentee on a voluntary basis. Mentoring is therefore usually cross-generational. The relationship is traditionally organised as a top-down flow, meaning that the mentor will pass on information which the mentee can benefit from. Due to the discussions on gender diversity in higher level management positions, women have become a major target group for mentoring programmes, at various stages of their careers (Thomson, Lloyd, 2011).

Generally speaking, the objectives of mentoring programmes range from the communication of corporate culture and values, to the recruitment and support of new employees and the development of leadership skills of potential executives and the reduction of employee turnover. A major objective is the specific support in the career development of selected employees. The mentor should support the mentee with current professional challenges and help him/her on his/her future career path, not only through passing on formal facts and official information but also informal knowledge such as personal experiences, and by giving regular feed-back on behaviour and leadership skills. Furthermore, the mentor can introduce the mentee to professional networks. Mentoring should not

only help women increase their professional networks in the first instance, but also give them the competence to create new networks of their own even after the mentoring relationship is over.

Mentoring as opposed to more traditional instruments for the promotion of women is becoming more and more popular, as the more modern and flexible approach to knowledge-transfer and career development which mentoring offers coincides with the current trends for employment in general. These themselves promote increased flexibility and less static work methods. Moreover, many women actively request assistance in their career development while at the same time wanting to remain independent in their objectives and decisions (Peters, 2004).

Formal mentoring is conducted in the form of a structured programme. The idea is that career advancement should no longer rely on informal or even accidental mentoring relationships, and that organised programmes and networks are a better method for advancement. One definite advantage of formal mentoring programmes is the possibility of monitoring the development and the outcomes (Dinolfo, Nugent, 2010). In an internal mentoring programme, both mentor and mentee are from the same company, which allows the mentee to gain detailed insights into the company and corporate culture. Lukoschat and Kletzing (2006) recommend this form of mentoring if the overall objective is linked to internal developments, for example to the transfer of company-specific information or to the specific development of the mentee within the organisation. The mentor should be placed considerably higher within the organisation. External mentoring programmes are organised by a third party and match mentors and mentees from different organisations. This gives the mentees a wider choice of mentors and the opportunity of gaining experience outside their own company. The success of a mentoring program will depend on the capability to clearly state the purpose, the art and the target group of the selected program. Therefore, it is crucial to perform an internal analysis at the beginning of the process in order to clearly define these aims and objectives (Ramalho, 2014). Only once this first step has been achieved, it becomes possible to find appropriate mentors and to match them with interested mentees.

Many companies experience difficulties in attracting and recruiting appropriate mentors (United States Office of Personnel Management, 2008). Meanwhile, a mentee should be an employee or candidate who shows high potential for future managerial positions. He /she should be willing to be mentored, meaning that he/she must be open to being supported with the possibility of taking on high levels of responsibility later on. On the other hand, he/she must also be prepared to accept critical feedback and should not be afraid of setbacks or failures. To assess whether potential candidates are suitable, it is possible to conduct a screening process in which these complete a questionnaire or form, in which they state their own motivations for joining the programme and outline what goals and

objectives they have. It is very important that the mentee is strictly selected according to the target group of the programme.

Matching is the next step in the organisational phase in which the mentors and the mentees who have been selected to participate in the programme are assigned to their partners. This process should be conducted centrally by the coordinators. There is no one correct way to match the partners (Di Renzo 2009). However, it is important that the matching process is aligned with the overall objectives of the programme, meaning that if career advancement is the primary objective, a mentee should be matched with an influential and highly ranked mentor, while if the objective is personal development, a mentor with a high degree of availability may be preferable (Ibarra et al.,2010). Furthermore, the interests of both the mentor and the mentee should be taken into account and matched in an appropriate fashion and the skills and goals of both individuals as well as their professional backgrounds should be considered. Central matching can also be conducted according the gender of the participants – a goal is often to mix male mentors who are more strongly represented in higher level positions with female mentees, so that these can gain access to the male dominated business networks of their mentors (Dinolfo, Nugent, 2010). However, care has to be taken with this approach since studies have shown that gender differences influence the trust building in mentoring relationships, which is essential to their success. Men often have problems to share information with emotive women (Leck, Orser, 2013).

Very few studies exist on how many mentoring programmes for women are offered and conducted in Germany. A study by the CERF Institute in 2009 estimated that around one-third of all companies promoted female employees specifically through mentoring. However, Edelkraut (2011) presumed that far more companies offer mentoring programmes to their female employees and that additionally many women engage in mentoring relationships of their own accord on an informal basis. The aim of this paper is to close the gap and to

- a) see if women chose mentoring programs of their own account and
- b) provide some insight on the implementation of mentoring programmes for women of tutoring programs for women in German companies.

METHODOLOGY AND RESULTS:

A quantitative online survey with 24 questions was conducted online between April 22 and June 16 2013. The survey was distributed virally in German women's career networks and via Social Media (career networks Xing and LinkedIn; no predefined sample size; pre-test for reliability, validity and responsiveness conducted with sample of 10). The aim of the survey was to investigate the effectiveness of women's mentoring programmes in German companies, by analysing first the

objectives and the process, then the various frameworks and finally the personally experienced success factors of mentoring, from both mentees' and mentors' points of view (incl. automatic redirection to relevant follow-up questions depending on previous answers of participants). In total, 92 female employees, who were active in various areas of business, most notably in the automobile industry, in the finance sector and in the consulting business participated in the study. Of the 89 employees who indicated the size of their company, 70.8% were employed in large enterprises with more than 1,000 employees, 11.2% in medium sized companies with 101-1,000 employees, and 9% in small companies (11-100 employees).

68.5% of the participants had already experienced a mentoring relationship. Of the employees with mentoring experience, 38.1% had acted as a mentor and 61.9% as a mentee. Among the employees with experience in mentoring, 86.8% of the mentees and 91.7% of the mentors stated that they would generally engage in a mentoring partnership again, and 97.4% of the previous mentees could imagine a future role as a mentor. The latter indicates a growing number of potential mentors. 86.2% of those employees without mentoring experience stated that they could certainly imagine participating in a programme in the future, while 13.8% indicated that this could be a possibility.

Most programmes are not organised, nor documented in a strict fashion as described in the literature, but rather as a combination of several organisational frameworks. An overview of the organisational frameworks of the mentoring programmes is illustrated in Figure 1.

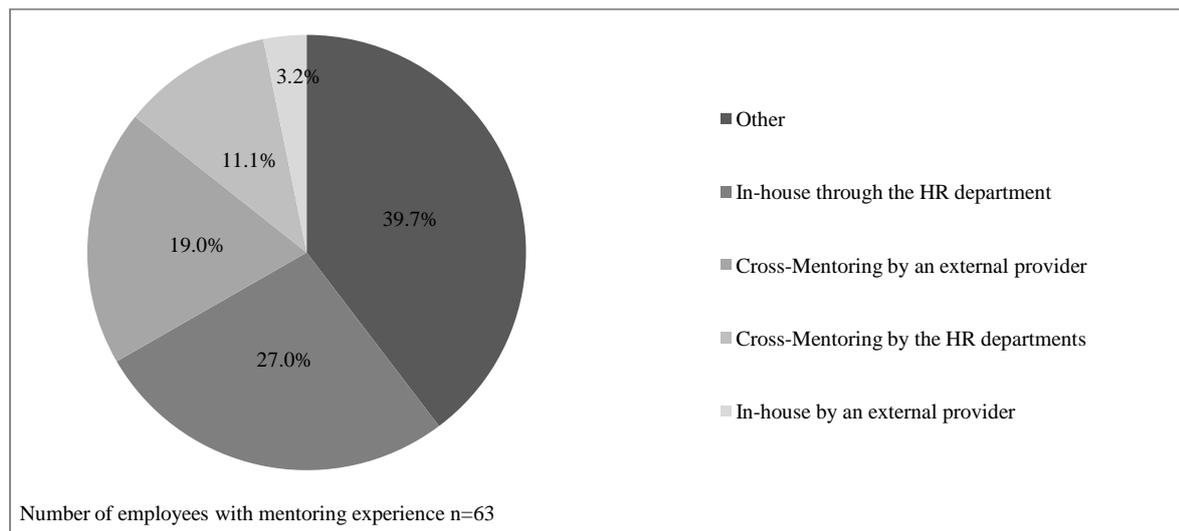

Figure 1: Organisational framework of mentoring programmes

Source: based on the results of own questionnaire.

The findings concerning the organisational framework indicate that there are in fact many possible responsible entities concerned with the organisation of mentoring programmes. The HR departments are not the main coordinators even if they still play an important role. Other responsible parties include equal opportunity commissioners or external mentoring programmes. Mentoring in practice is

in fact not an entirely HR-related instrument for the promotion of women in business, but rather an accompanying cooperative tool as an interface with other entities. Additionally, showing the high rate of “other” is an indicator that many women engage in mentoring on their own account without necessarily relying on formally organized events.

Many participants in the survey indicated that they were matched with their partners centrally by the coordinators of their mentoring programmes. The process was mostly based on compatible professional criteria, motivations and preferences, as well as on personality traits and skills. On the other hand, 33.3% of both the mentees and mentors in the survey could be free to conduct the matching process individually without intervention by the coordinators. For the mentees, the choice of their mentor depended on very different aspects, but the most frequently mentioned were the experience and high position, as well as a good personal relationship and the compatibility of the personal and professional goals. 43.2% chose a female and 53.8% a male mentor, which indicates that cross-gender mentoring relationships are indeed slightly more popular than single-gender mentoring relationships. However, one has to take care with the interpretation of this fact. An exploratory study showed that when describing an ideal mentor, women were more likely to opt for a woman instead of a man (Bailey et al., 2016). The preference observed here, could result from the observation that there are fewer women further up the hierarchy so the participants could not imagine benefiting from a mentoring relationship with a woman. When choosing their mentee, the mentors emphasised, among other criteria, common interests and goals as well as the impression of the mentees being highly skilled and motivated.

Overall, the matching process in German companies, when conducted centrally by the coordinators, seems to be comparable to the theory. Many match the participants according to their objectives and wishes, and take different aspects and criteria into account, a fact which is essential for the success of the mentoring relationship. Nevertheless, several mentees in the survey noted that they had a mentor who did not have similar goals or working styles to their own and could therefore not promote and support them adequately, but was more intent on passing on personal knowledge which was not really relevant to the mentees. This could indicate that the criteria for matching the mentors and the aspects taken into account are not always considered carefully enough. Newer literature suggests that matching should occur on the two specific personality traits openness to experience and conscientiousness in order to increase success (Menges, 2016). Even though the literature suggests a centrally organised matching process, many participants were able to choose their partners independently, and both the mentees and mentors chose their partners following compatible criteria. Although it could be assumed that the success rate for individually matched partnerships would be higher, as both participants have direct influence on the constellation and are free to choose the

mentor whom they deem the most suitable, the results of the survey show no connection between the matching process and the success rate.

Figure 2 summarizes the most frequent form of preparation of the mentors through the coordinators, with 25% of them not being prepared at all.

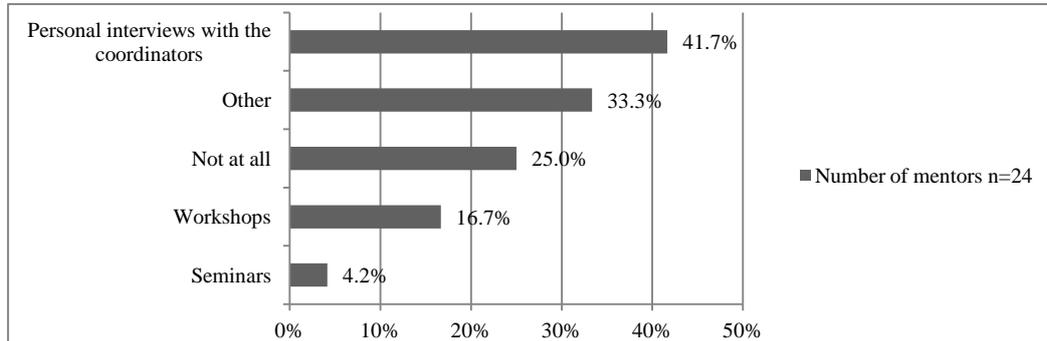

Figure 2: Methods for the preparation as indicated by the mentors

Source: based on the results of own questionnaire.

Some of the mentees indicated that they too were not sufficiently prepared and would have appreciated some form of guidance before the beginning of the programme. Also, the lack of preparation of the personal mentor was mentioned, as well as the fact that he/she was not clear about what was expected of the programme itself and of the mentee.

It can be assumed that there is a lack of information between the coordinators and the participants. Mentors and mentees should be informed more clearly that preparing the mentoring relationship is their responsibility, as is indicated in the literature.

Figure3 gives an overview of the frequency of the meetings between both mentees and mentors and their respective partners.

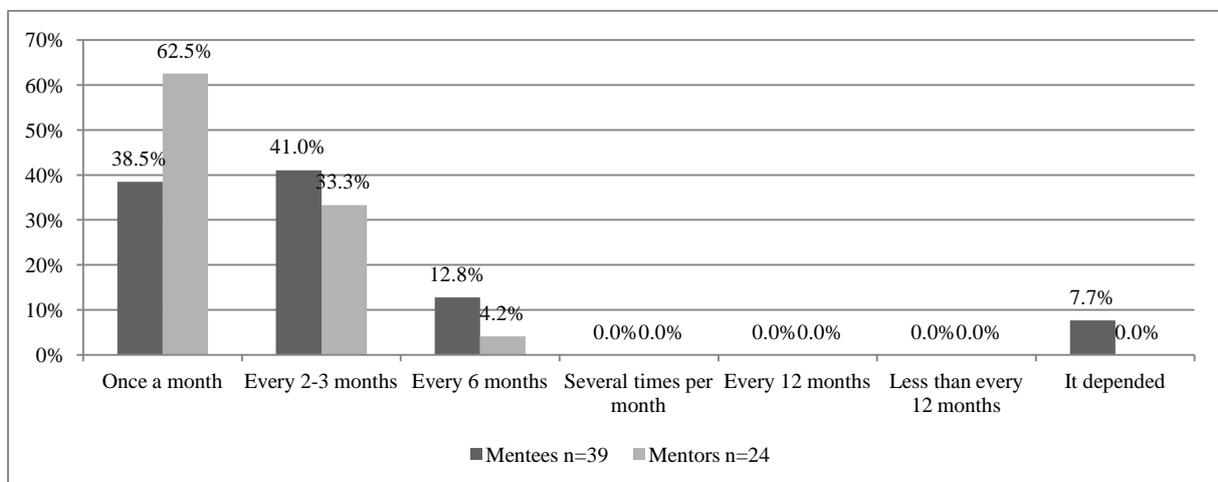

Figure 3: Frequency of mentoring meetings of mentees and mentors

Source: based on the results of own questionnaire.

In general, most pairs met either monthly or bimonthly. Benchmarking suggests that meeting should take place every 3 – 7 weeks in order to achieve a total of approx. 10 meetings per year (Poulsen, 2013). Here, German companies still have potential to improve the mentoring relationships.

As Figure 4 shows, the advantages most frequently experienced by the mentees in the survey were the chance for the reflection on, and solution of, current job-related challenges and the planning of future career development.

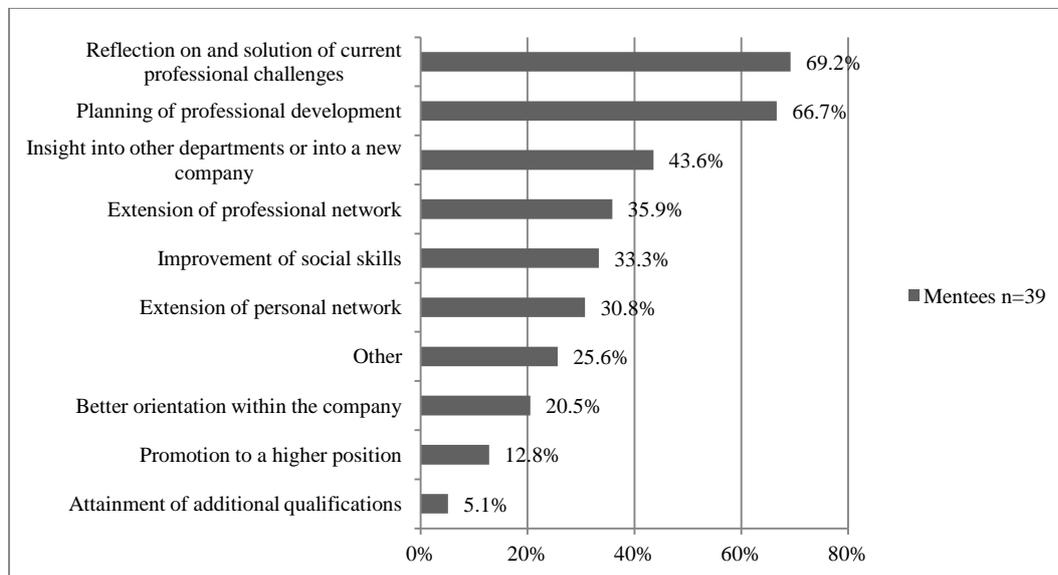

Figure 4: Advantages of mentoring relationships experienced by mentees

Source: based on the results of own questionnaire.

When comparing these advantages with the objectives of the mentoring relationship, it is clear that they do not always fully coincide.

The most important advantages for the mentors in the survey are summarised in Figure 5.

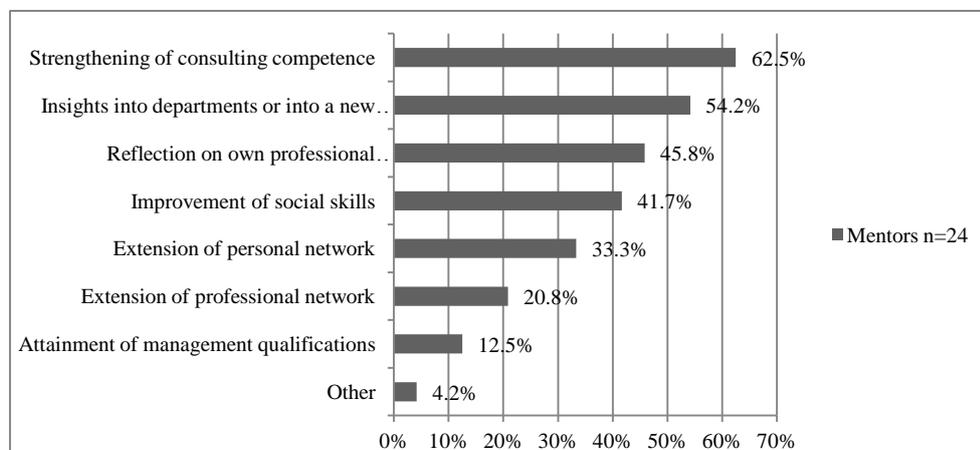

Figure 5: Advantages of mentoring relationships experienced by mentors

Source: Own illustration based on the results of own questionnaire.

In contrast to the literature, the mentors mentioned several negative aspects related to mentoring relationships, especially high investment of time. Possible solutions could be blended mentoring or even virtual or online based mentoring, both of which allow mentor and mentee to conduct meetings without having to leave their workplace too often.

Overall, the mentoring programmes for women in German companies were evaluated very positively, as Figure 6 shows.

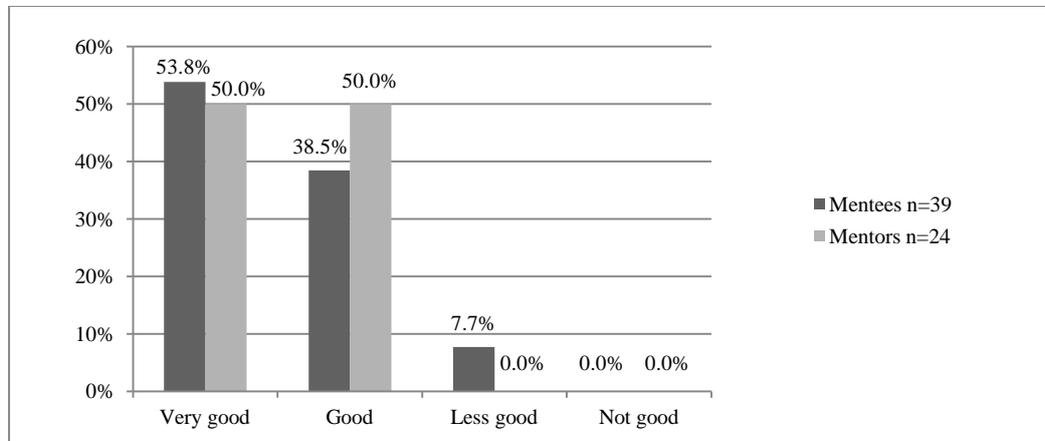

Figure 6: Overall evaluations of the mentoring relationships by mentees and mentors

Source: based on the results of own questionnaire.

CONCLUSION:

Formal programmes improve the success rate of mentoring relationships for female mentees, as long as the matching process is conducted centrally and carefully. Before the first meeting, the mentor should be clear about what timeframe would be possible, how many meetings could take place and what he/she would like to communicate to the mentee. At the same time, the mentee should prepare him-/herself by making clear what his/her objectives and the long-term goals are and what possible steps need to be taken and what challenges must be overcome on the way there. Finally, it should be clarified what is expected of the mentor. It should be decided how often meetings are to be conducted, where they should take place, what they should include and how they are to be designed, what should – or what should not – be discussed, and when the relationship is to be terminated. This could for example be recorded in an agreement between the two participants. As the comparison of theory and practice shows, the frequency of meetings in German companies is mostly longer than the literature recommends. Moreover companies may be advised to conduct their programmes over at least twelve months, in order to improve their success. Due to the small sample size in this study (24 mentors and 39 mentees), the results can only be seen as an indication. Additionally, it might be useful to obtain information from companies in order to find out, how they benefit from mentoring.

Therefore further work will include an investigation with German companies regarding their experience with mentoring.

RECOMMENDATIONS FOR COMPANIES:

The coordinators' challenge lies in guaranteeing a better selection and matching of the mentoring partners and in better communicating the programmes and related measures throughout the company. This would ensure that the overall goals of the programme, as well as the relation to and importance of the mixed management strategy are clear to all staff members. It should be clearly stated to the employees that the objectives should not be seen as a necessarily attainable goal, but rather as a starting point from which the mentees can pursue these goals by themselves at a later stage, unless the mentoring programme includes elements of sponsorship, in which case a promotion to a higher level position can be expected as a result. Networking, though theoretically described as one of the main objectives of mentoring, is only seen as a minor objective by the participants.

Even though mentoring programmes are generally considered successful in German companies and are evaluated very positively by the participants, there are still some areas for improvement like better preparation through guidelines, seminars and workshops before the beginning of the programme, better selection of the mentors and improved matching process and more support by the coordinators. From the mentors' side one suggestion was to include the direct supervisors more actively, so as to increase the degree of acceptance of the programme within the company. Combined with the desire of female employees to be involved in mentoring in future and the already increasing number of female managers who can act as role models, mentoring programmes in Germany can remain a sustainable instrument for the promotion of women in business, even if it is no longer a pure HR instrument.

THE RATE OF SAVINGS AND DEBT THE HOUSEHOLD LEVEL AS A FACTOR IN THE CLASSIFICATION OF EU COUNTRIES

Grzywińska-Rąpca, Małgorzata¹; Grzybowska-Brzezińska, Mariola²

¹Department of Quantitative Methods, Faculty of Economic Sciences, University of Warmia and Mazury in Olsztyn, Poland

²Department of Market Analysis and Marketing, Faculty of Economic Sciences, University of Warmia and Mazury in Olsztyn, Poland

ABSTRACT

The aim of this study was to examine the level of variables, such as the savings rate, the ratio of gross debt to household income and adjusted gross disposable income of households per capita in spatial terms (EU) in 2010 and 2014, using methods of multivariate statistical analysis. The concept of the saving is one of the basic economic concepts. It is a very important process from the point of view of the economy, businesses and households. Household savings are an important element of national savings. This means they can function properly, both the market and the households themselves. In the understanding of the issues may be helpful economic theories to comment on the accumulation and consumption, which his party recognize the consumer. The entity that has a consumption at any given time (reserving some savings for the future) to as much as possible to increase the utility function. The purpose of this article is the classification of some European Union countries with the following variables: the savings rate, the ratio of gross debt to household income and adjusted gross disposable income of households per capita. The time range adopted for the analysis of the years of 2010 and 2014. Source of data were the Eurostat database.

Keywords: *saving rate, household debt, household income*

INTRODUCTION

On the issue of saving they are related to theories that have their origin in the 30s of the twentieth century. The first one by I. Fisher, was based on the assumption that household savings are purposeful. Fisher also argued that consumption is not characterized by proportionality in relation to income and the fact that current income does not explain the savings rate. According to the theory was

¹ Department of Quantitative Methods, Faculty of Economic Sciences, University of Warmia and Mazury in Olsztyn, Poland

² Department of Market Analysis and Marketing, Faculty of Economic Sciences, University of Warmia and Mazury in Olsztyn, Poland

J.M. Keynes tendency to consume from current income are almost unchanged. As a rule, often conserved is the difference between income and expenditure in order to maintain a particular standard of living. In this case, it can be concluded that increasing the proportion of income should have the effect of savings (Białowas, 2013).

Factors detailed in the literature are classified in different ways, eg. They are divided into subjective and objective, internal and external, related to the macro-environment and micro-environment and related to individual decisions by collecting cash resources.

According to Milton Friedman on the level achieved by the households savings may be affected by two groups of factors: objective reasons which relate to economic conditions influencing the income derived and group factors on preferences, needs, rules and rules of revenue sharing (Rószkiewicz, 2008). As the basic motives of saving are distinguished: caution, caution, the benefits of consumption, speculation, entrepreneurship, the need for independence, avarice and desire to leave after a fall. For these reasons often include a tendency to accumulate wealth. The authors of this extension were Lusardi and Browning. According to them, the economists was created list, which restricts the set of possible motives consumers to save, where a large part of them have already been used in the creation of contemporary models of saving (Białowas, 2013).

Every household deciding to postpone part of their income directed to other conditions. For surely part of it may be a desire to protect their future or the future of the family, or place in front of the specific purpose for which you want to save. Income inequality effects on the households and socio-economic groups hierarchy are present in every developed market economy. While considering these issues in the light of the integrated development concept it must be emphasized, however, that the scale of income disparities within developed countries can have diverse effects on the severity of other social problems, which may be a barrier to the processes of modernization and achieving economic and social cohesion (Leszczyńska, 2015)

A. Lindqvist based on the division of J.M. Keynes distinguished in saving basic level concerning the disposal of cash, which aims to safeguard the possibility of the current expenditure management of the household. In the next stage, after obtaining a satisfactory level of liquidity, there is a thread about protection against unplanned events. Another motive is or buying expensive goods and services. In turn, the highest level in the classification of motives is wealth management. Due to the broad meaning property management, even it was necessary to create a division having the most important theories of saving. Considering the wealth management lists: duplication of assets, protection of pensions and leaving behind a legacy.

PURPOSE AND TEST METHOD

The purpose of this article is the classification of some European Union countries with the following variables: the savings rate, the ratio of gross debt to household income and adjusted gross disposable income of households per capita. The study adopted the factors affecting decisions on making choices between consumption and saving.

The main factor affecting both the level of consumer spending and the level of savings is income. It is, therefore an additional factor affecting consumption, which can be omitted in favor of saving. Statistical analysis of the diversity of the variables studied was carried out in terms of single and multi-dimensional. Have also been used measures the Mahalanobis immersion observation of the sample (Donoho, Gasko, 1992, Rousseeuw, Ruts, 1996).

The values are measures dipping to between 0 and 1. Member States, which correspond to higher values of this measure, are located more centrally in the test data set. It can be assumed that analyzed the characteristics adopt in these countries the typical values. A measure of dipping observations in the sample allows the determination of similar countries because of the numerical values of the variables examined in the studied years.

ANALYSIS OF DIFFERENTIATION STATES

The level of household savings is primarily measured savings rate, which expresses the percentage of savings in disposable income of households (Figures 1 and 2).

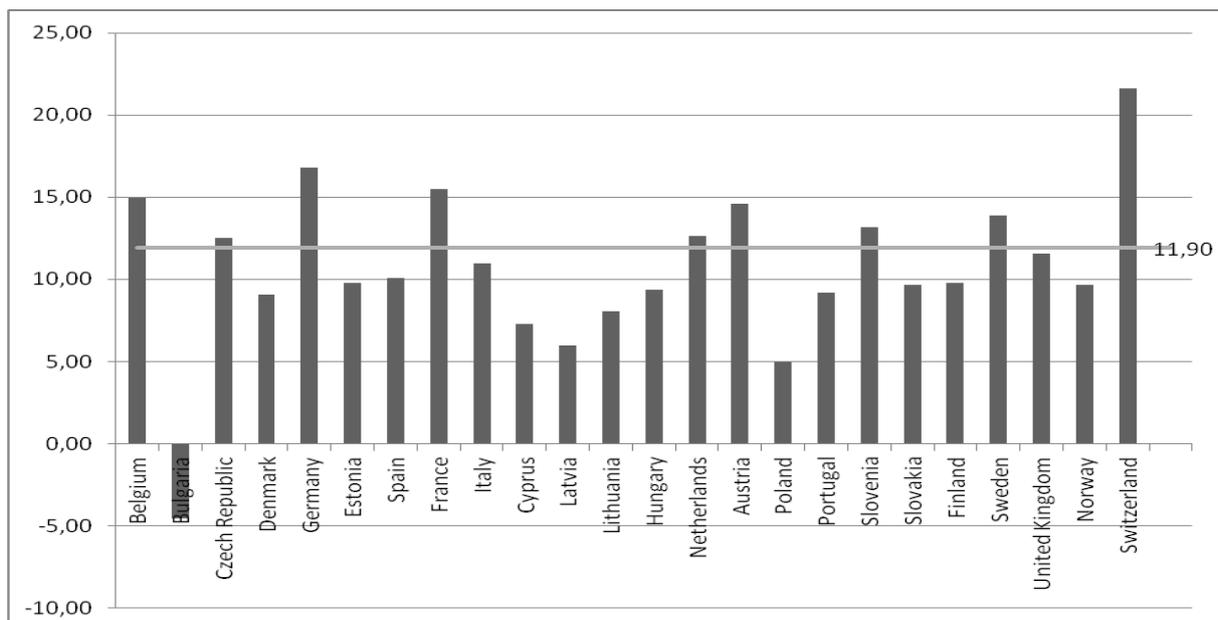

Figure 1. Interest savings of households selected EU countries in 2010

Source: own study based on www.eurostat.com

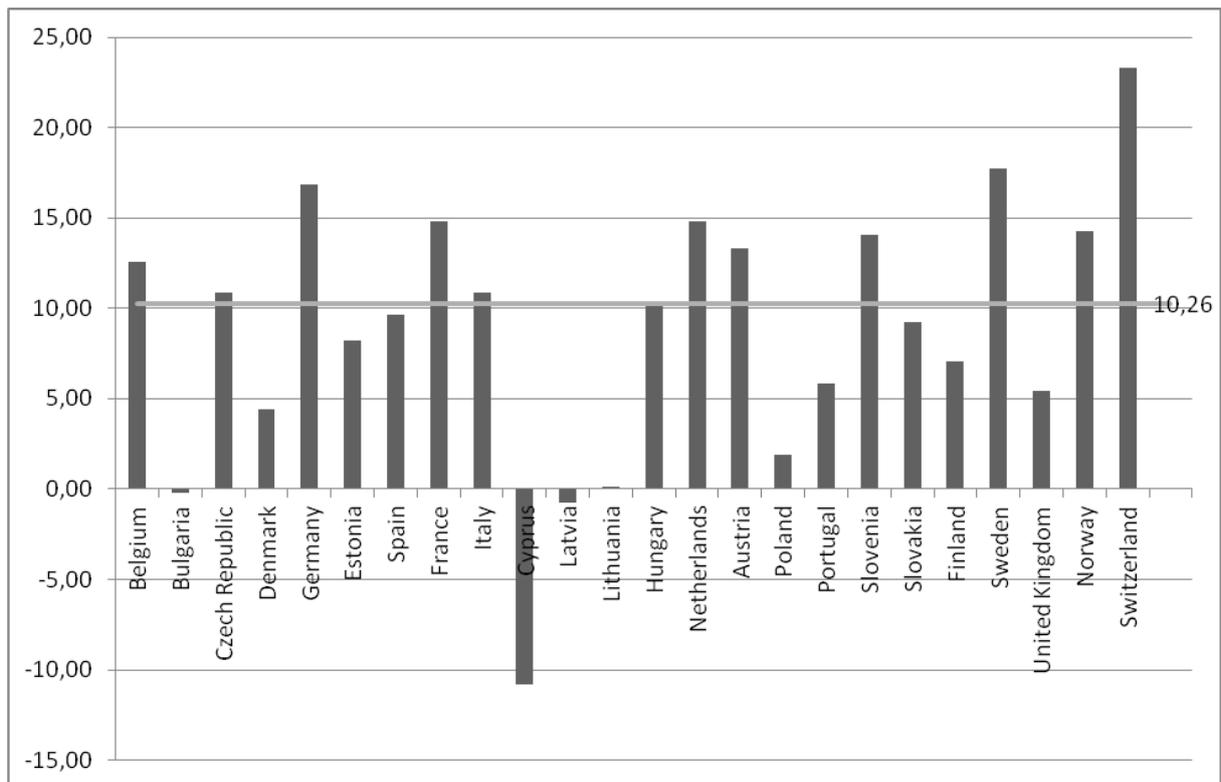

Figure 2. Interest savings of households selected EU countries in 2014

Source: own study based on www.eurostat.com

Average savings rate (Fig. 1 and 2) selected for the analysis years (2010 and 2014) for all the EU countries decreased by 1.64 p.p. The biggest change can be seen in the case of Cyprus. In the year 2014 compared to those of 2010, there was a significant drop in the savings rate of the country. In countries such as Switzerland, Germany, Sweden recorded the highest saving rates in both 2010 and 2014.

The analysis of correlation of the analyzed *ziennych* is statistically significant for the level of significance of $p < 0.05$ (Table 1).

Variable	Specification				
	Average	std	savings rate	Gross debt-to-income ratio of households	Real adjusted gross disposable income of households per capita
2010					
savings rate	10,69	4,905	1	0,226279	0,734365
Gross debt-to-income ratio of households	106,14	60,983	0,226279	1	0,569054
Real adjusted gross disposable income of households per capita	18104,67	5331,165	0,734365	0,569054	1
2014					
savings rate	8,91	7,383	1	0,077338	0,656209
Gross debt-to-income ratio of households	104,56	63,449	0,077338	1	0,538949
Real adjusted gross disposable income of households per capita	19398,42	5505,035	0,656209	0,538949	1

Table 1. Correlations of the analyzed variables. Source: own - statistica 12.5

The lowest coefficient of Pearson correlation occurred between the savings rate and the ratio of debt to income ($r = 0.22$ in 2010 and $r = 0.07$ in 2014). The values of the remaining correlation coefficients ranged from 0.569 to 0.734. This indicates a linear correlation between the two traits. The relationship between the variables presented in figure 3 and 4.

Table 3. Measures dipping Mahalanobis data features

Źródło: opracowanie własne

Measures dipping to Cyprus in 2010 reached the lowest values. In 2010 in Italy, Slovakia, the UK and Austria recorded the highest level of immersion measures. These countries can be considered as outliers due to the highest values of variables. The highest values of measurement dipping in 2014 correspond to Belgium, Slovakia, Italy, Portugal and Spain. It can be assumed that the characteristics adopted for the analysis of achieving them, the most typical values.

Countries belonging to the same classes can be regarded as similar because of the numerical values of the analyzed variables. Most countries belong to the cluster B.

Reflag selected for the analysis of European Union countries because of the measure of immersion stem from a decline or growth characteristics. Graphically illustrated in Chart 3.

SUMMARY

One factor stratification and differentiation of society is the income inequality. The level of income is a determinant of inequalities that are inevitable and even to a certain extent necessary - represent, as part of incentive mechanisms in consumer behavior. The income situation of households directly determines the level of savings and debt (Sikora, 2012).

Calculated values of the metrics dipping allowed to organize the country due to the level of the analyzed characteristics. This enabled the separation of clusters, with a similar economic situation of households in 2010 and 2014. Some countries have changed affiliation to the cluster in 2014 in relation to 2010. Cyprus changed its affiliation with cluster B in 2010, the cluster A in 2014. Thus, you can specify Cyprus, as the state's most unusual because of adopted to analyze the characteristics of.

We conclude that in terms of the level of savings rate, the ratio of gross debt to household income and adjusted gross disposable income of households per capita are the state, between which there is too much disparity, as well as outliers. The phenomenon of such stratification is typical of developed countries economically.

The results indicate the need for further research to define the factors determining the choice of financial instruments for private savings by households, in particular the level of households' knowledge about the functioning of the financial market and their attitudes and preferences to risk-taking.

THE SOLIDARITY MODEL OF THIRD COUNTRY NATIONALS' FOREIGN PRODUCT PURCHASE

Halimi, Tariq; D'Souza, Clare

La Trobe Business School, La Trobe University, Melbourne, Australia.

ABSTRACT

This research aims to examine the underlying motivations which lead third country nationals to boycott a product country of origin engaged in politically offensive actions against a country or nation other than their own.

Data were collected by conducting 20 in-depth interviews with respondents coming from countries other than the countries involved in the animosity case. Qualitative grounded theory has been employed to analyse data in order to establish the model.

The findings reveal that third country nationals' decision to participate in the boycott against the offending COO is influenced by five variables: 1) awareness of the offending COO's actions; 2) Egregiousness of the COO's actions towards the offended nation; 3) the offended nation's actions towards the offending COO; 4) contemporariness of the COO's egregious actions, and 5) consumer values.

This study is a first attempt to examine third country nationals' participation in a boycott based on an international animosity case outside their countries. It can potentially help international marketers in understanding the motivations of these consumers in order to set effective marketing strategies to target them as consumers.

Keywords animosity, consumer boycott, country of origin, grounded theory, solidarity.

PROBLEM AND PURPOSE

Consumer animosity has been widely studied by marketing researchers as it has been found that it can influence consumer's willingness to buy (WTB) products from a hostile nation independently of product judgement (Klein et al, 1998). The consumer may refuse to buy a product of a particular brand even if it is perceived as high-quality due to antipathy towards its country of origin (COO). The various animosity studies reviewed in the literature focused on the relation between the consumer and the hostile COO, with the attention given to distinguish animosity from ethnocentrism (Klein et al, 1998).

Participation of third country nationals (TCNs) in the boycott against the offending COO involved in an animosity case appeared to be absent from the literature. The term TCNs refers to citizens who

do not belong to the offending country/nation nor the offended country/nation involved in the conflict. It has been speculated that TCNs do not have feelings of animosity towards the offending COO as they are not affected by the COO's offenses (Jung et al, 2002). This is relevant to a number of animosity cases in the world such as the Middle-East conflict between Israel and its neighbouring Arab states (Karkar, 2010) and the conflict between China and Tibet in East Asia (Australia Tibet Council, n.d.; International Campaign for Tibet, 2015) which are attracting the attention of people from different nationalities around the world.

Consumer animosity can be split into two categories: national animosity and personal animosity (Jung et al, 2002). National animosity refers to "individual's resentment of how his/her country has suffered because of the actions of another country", while personal animosity refers to "individual's resentment towards another country because of negative personal experiences s/he has with the foreign country or with people from that country" (Jung et al, 2002, p.8).

Based on this categorisation of animosity, TCNs would not have animosity towards the COO involved in these offensive actions as they are not affected at the personal or national level by these actions; yet, they are showing concern about the conflict through their participation in the boycott against the offending country. Such a phenomenon raises a number of questions: why are these TCNs involved in these political issues through their participation in the boycott against the offending COO while they presumably do not have animosity sentiments towards it? And why do they put more emphasis on a particular animosity case among others if their involvement is limited to one case?

As TCNs' involvement in the animosity case is manifest in their participation in the boycott against Israel, the literature on consumer boycotts was consulted. Studies including Garret (1987) and Klein et al (2004) have compiled a number of variables which may influence consumer participation in boycotts; however, these studies were generally conducted at the micro-company level rather than at the macro-product's COO level. Additionally, these studies do not clearly address why consumers would put more emphasis on a particular boycott case among others outside their national borders in the context of animosity between countries and nations.

This study aims to explore this untapped phenomenon. It investigates why TCNs participate in a boycott against the offending product COO involved in actual and contemporary NationA-NationB animosity case, where NationA is the perceived offending nation and NationB is the offended nation (the animosity case will not be revealed in this study) which is apparently irrelevant to them, and why they give greater emphasis to this conflict among others in the world. In order to examine these objectives, the literature on country image and animosity will be reviewed.

COUNTRY IMAGE EFFECT

Country image “is defined as attitudes that consumers hold towards a particular country” (Maher and Mady, 2010, p.632). According to Roth and Diamantopoulos (2009), country image can be split into two components: cognition and affect. The cognitive component refers to such variables as the product COO’s economic development level, its degree of industrialisation (Roth and Diamantopoulos, 2009), and competence of its people (Maher and Mady (2010). It is cited in Al-Sulaiti and Baker (1998) that consumers can be bias against products from less developed nations as their products’ quality may be perceived as inferior to those coming from developed countries.

The affective component refers to the emotional reactions a consumer has towards the COO (Roth and Diamantopoulos, 2009). Consumers may recognise the high quality of products made in a particular country; however, they may have negative attitude towards this country’s products due to the negative emotions associated with it. Of particular interest to this research is consumer animosity as an affective dimension, which may similarly affect consumer WTB regardless of product judgement (Klein et al, 1998). Among the two, it is the cognitive, rather than the affective, component which has received much attention in the literature (Maher and Mady, 2010). This research will focus on the affective component through its animosity dimension.

ANIMOSITY CONSTRUCT

Animosity has been investigated in a number of empirical studies, beginning with Klein et al’s (1998) in the context of the Nanjing massacre by the Japanese against the Chinese in 1937. The authors proposed that animosity towards a country can affect consumer purchase decision regardless of product judgment. However, recent studies such as Tian and Pasadeos (2012) and Shoham et al (2016) found that consumer animosity can influence product quality judgment negatively.

Subsequent studies either tested Klein et al’s (1998) model in different contexts, such as Klein et al (2002) and Nijssen and Douglas (2004), or refined its conceptualisation (Riefler and Diamantopoulos, 2007) such as Jung et al (2002), Leong et al (2008), and Harmeling et al (2015). Considering the aims of this research, these studies examined the effects of animosity on local citizens of the countries affected by another country’s aggression without examining TCNs’ reaction to animosity cases under investigation. Jung et al. (2002) proposed that animosity can be split into national animosity and personal animosity, identified as animosity’s locus of animosity. National animosity refers hostile sentiments perceived by citizens toward an aggressive country when its actions are affecting their country at the macro level. This is applicable to animosity felt by some East Asian countries towards Japan and the US during the East Asian economic crisis in 1997 (Leong et al, 2008). Personal animosity refers to hostile feeling towards the COO when it is directly offending the individual as it was the case

for the Chinese who suffered from or were killed by the Japanese occupation in the 1930s and 1940s (Klein et al, 1998).

Another conceptualisation of animosity, according to Jung et al (2002), is related to sources of manifestation, which distinguishes situational animosity from stable animosity. Situational animosity refers to temporary animosity arising from a specific provocation (Jung et al., 2002) which decreases over time when the provocation stops, as it was the case for Australian consumers towards France during the French nuclear testings in the Pacific Ocean in the 1990s (Ettenson and Klein's, 2005; Riefler and Diamantopoulos, 2007). Animosity soared in the year when the testings took place, then faded away afterwards when the testings stopped (Riefler and Diamantopoulos, 2007) in the following year.

Stable animosity, on the other hand, refers to enduring "long lasting and deep rooted" animosity (Leong et al., 2008, p.998) as a result of cumulative provocations over time (Jung et al., 2002). This may be applicable to Chinese citizens who still harbour animosity towards Japan as a result of the Japanese invasion of China during World War II and the associated Nanjing massacre (Klein et al., 1998).

RESEARCH METHODOLOGY

Qualitative-interpretive research methodology has been used for this research for a number of reasons. Firstly, the aim of this research is to find out why TCNs would be involved in a particular animosity case outside their national borders, and how such involvement affects their purchase decision from the country being aggressive towards another. Qualitative-interpretive research methodology is more appropriate for answering "why" and "how" questions, according to Carson et al, 2001. Secondly, the topic is novel in the literature which demands qualitative approaches in order to explore such understudied area (Carson, et al, 2001). Hence, this research works on building theory rather than testing existing theories for answering its questions. This is achieved through in-depth interviews in order to gain insight into respondents' experiences about an actual boycott case against a product's COO. This has the advantage of capturing real-time reactions (Klein et al, 2004) in their natural settings.

Sampling

Purposeful/theoretical sampling was used to select respondents for this study. The choice of respondents was dependent on the concepts (themes) (Strauss and Corbin, 1998) which emerged from previous interviews.

20 respondents participated who are not citizens of any of the two conflicting parties of the animosity case under investigation. They come from different nationalities. Out of the 20 respondents interviewed, 12 were males. 15 of the respondents participate in the boycott who are political activists

affiliated with political organisations calling. Non-participants in the boycott are recruited in order to examine the factors which distinguish those who do participate in the boycott from those who do not. The age of respondents ranged from 20 to 60. Telephone, face-to-face, and online-chat interviews were conducted in English in Melbourne Australia in 2015. Each interview took 30 to 60 minutes.

Interview Guide Design

The interview guide was semi-structured. The funnelling technique (Minichiello et al., 2003) was used, beginning with broad open-ended questions then narrowing down. Respondents were given the opportunity to freely express their feelings and share their experiences about the topic in their own words, followed by more specific questions. The recursive model of questioning was used in which previous conversation influences the structure and content of what would be asked next (Minichiello et al., 2003). Additionally, a priori themes from previous animosity studies were also used, particularly to check whether TCNs harbour animosity towards the offending COO.

Data Analysis

Grounded theory methodology was employed in this study in order to generate theory about WTB from offending POs grounded in the collected data (Strauss and Corbin, 1998). This was achieved by extracting themes which were identified through repetition of topics reported by respondents (Ryan and Bernard, 2003). Units of data were systematically compared in order to find similarities and differences between respondents' reports. Iteration was used through which preceding operations of an interview shape the subsequent ones (Spiggle, 1994). The interview guide was updated according to themes that emerged from the analysis of data collected from previous interviews.

FINDINGS (THEMES)

It has been found that TCNs' participation in the boycott against the offending COO is driven by solidarity towards the targets of the offending COO rather than by animosity towards the COO. Solidarity towards the COO's targets is triggered by five variables: 1) awareness of the offending COO's actions; 2) Egregiousness of the COO's actions towards the offended nation; 3) the offended nation's actions towards the offending COO; 4) contemporariness of the COO's egregious actions, and 5) consumer values. This relation is depicted in Figure.1.

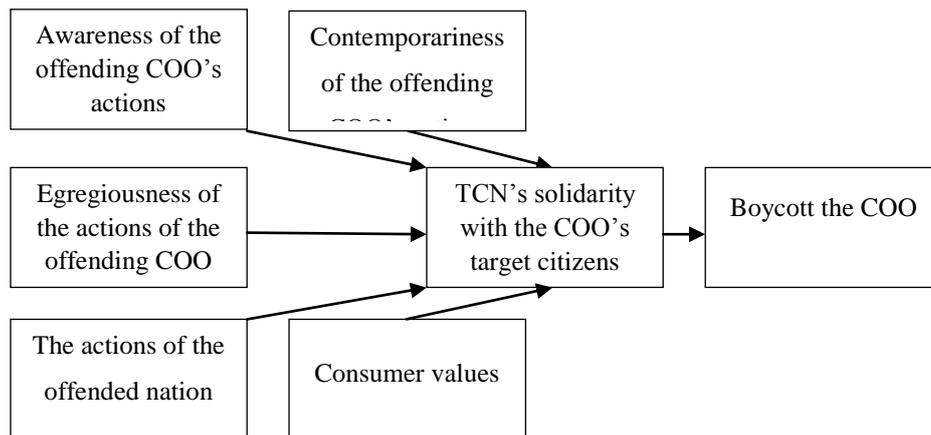

Figure 1: The solidarity model of third country nationals' foreign product purchase

These findings are based on themes which emerged from respondents' reports and further, which are discussed in the following sections.

Theme: Awareness of the COO's actions

Awareness of the COO's political actions is an important step towards becoming involved in the political issue. Some of the respondents who do not participate in the boycott reported that they are not fully aware of the conflict:

I always see on TV and hear about many political problems in the world but I don't get the chance to know more about them.

Participants in the boycott highlighted the amount of knowledge they have about this political issue which may explain why they give greater emphasis to NationA-NationB animosity case:

I am concerned about all humans suffering from injustice and oppression, but I have more emphasis on NationA-NationB conflict because I know more about it.

Respondents also reported various ways of gaining knowledge about the actions of the COO which played an important role in increasing their concern about the suffering of humans and in turn to become involved in this animosity case rather than others. Some respondents reported that they sympathise with their friends who come from NationB:

I generally have interest in politics...but my interest in NationA-NationB conflict particularly was further developed through my two NationB friends who kept me informed about it

Others highlighted the effect of visual media on their decision to participate in the boycott:

...I have seen [on TV] what NationA did to NationB... It was shocking. I strongly believe that something should be done in order to stop these atrocities

Theme: Egregiousness of the COO's actions

Participants in the boycott reported their resentment towards the COO's egregious actions against its target citizens:

I totally disagree with what NationA is doing against NationB...I feel sorry for NationA citizens.

When comparing this conflict with other conflicts in the world, respondents reported that the egregiousness of NationA's actions is greater than the egregiousness of other nations' actions:

I think supporting NationB is more urgent...thousands of people have been killed and houses have been destroyed which is not happening anywhere else at our current time as far as I know.

The crimes of NationA are not happening anywhere else in the world..., I believe

However, not all respondents had the same perception of the COO's actions as some respondents reported their resentment of what NationB citizens are doing against NationA. This suggested a new theme to emerge: the offended nation's actions towards the offending nation.

Theme: the offended nation's actions

Perception of the COO's (egregious) actions is dependent on the actions of its targets. When comparing this conflict with another one in the world, given the name of NationC-NationD conflict (NationC is offending NationD), some respondents reported their refusal to support NationD due to the actions of its citizens towards NationC. A respondent who does not belong to NationC or NationD reported:

NationC-NationD case is different to NationA-NationB. What NationD citizens are doing is wrong. The boycott against NationC is not justified.

This is also applicable to the conflict between NationA and NationB, as a respondent who refuses to boycott NationA reported:

I don't participate in the boycott against NationA...I stand against it...I believe that NationA has the right to defend itself against [the actions of NationB].

A non-participant in the boycott against NationA conditioned her potential participation to the actions of NationB:

Before I decide whether to boycott NationA, I would have to know why NationA is treating the citizens of NationB like that; it might be their [NationB's citizens] fault

Theme: contemporariness of the COO's egregious actions

Participants in the boycott explained that they give more emphasis to NationA-NationB animosity case due to its contemporariness compared to other cases such, which has no more impact on people any more:

It would be relevant if these actions were continuing until now, but that's something that had passed and has no impact on people's lives anymore, so there is nothing in that regard that would interest me or interest other activists, I guess.

Theme: Consumer values

When questioned about how they get affected by this issue as they do not belong to any of the nations at conflict, respondents emphasised that their participation in the boycott is for humanitarian purposes; they are not seeking any personal benefit but rather they are concerned about the welfare of those who are suffering from oppression in the world. This is evident in the following reports:

Personally I do not get affected by what's happening to NationB as I did not lose a relative or had my home destroyed, but my feelings get affected by what's happening to others regardless of who they are...

These reports indicate that participants in the boycott pursue others-oriented values which prompt them to care for the welfare of humans beyond their ethnic or national boundaries. Non-participants in the boycott, on the other hand, pursue self-orientation values which conflict with others-oriented activities in the form of boycott. This is highlighted in the following report:

I don't have much time to get involved in these activities [the boycott] as I have a lot of personal commitments...

I tell you the truth, I do not have much time to know what's happening in the world...I am always busy with my work...

Theme: solidarity (the irrelevance of animosity)

Participants in the boycott against NationA informed that their participation in the boycott is driven by their solidarity towards NationB rather than by animosity towards NationA. The following comments highlight this theme:

I would not say that NationA is my enemy as I am not personally affected by their actions.... My participation in the boycott is purely for humanitarian reasons.

I would not say that I am boycotting NationA because it is my enemy, but it is rather a necessary action taken in order to show solidarity with NationB...

These reports show that TCNs' participation in the boycott is originated from their solidarity with the target citizens of the COO rather than by animosity towards the COO. The boycott is used by TCNs to exert pressure on the COO in order to stop its egregious actions against its targets.

THEORETICAL IMPLICATIONS

The findings of this research have important implications on the current literature of country of origin, animosity, and consumer boycott literature. This research contributes to the country image literature by suggesting that solidarity towards the target citizens of a COO involved in an animosity case is an affective dimension of country's image (distinct from animosity) which can negatively affect TCNs' emotions towards the offending COO and play an important role in their participation in the boycott (Lindenmeier et al. 2012) against this COO. Solidarity is defined as a moral concept which denotes unity between people (Scholz, 2007). It is the act of supporting others and assisting them in overcoming a particular problem. This is driven by the assistant's concern for the assisted person (Rippe, 1998). Similarly, in the current animosity case, the TCNs believe that the target citizens of the COO are oppressed and need their help to overcome this problem. Their assistance is manifest in their participation in the boycott as a strategy to stop the COO's oppressive practices towards its targets.

Factors leading to solidarity with the target citizens of the COO are generally existent in the literature. This research conceptually extends on each one of them. 'Awareness' has been discussed in the boycott literature (e.g. Garret, 1987). The current research highlights the various methods used by participants to gain knowledge about the COO's actions such as watching it through visual media or being informed about it through a concerned friend about the conflict, which would potentially give the TCNs further momentum to refuse to buy from the offending COO.

'Egregiousness of the COO's actions towards the offended nation' is consistent with Klein et al's (2004) company's egregiousness from the boycott literature. This study extends on Klein et al' (2004) findings in two ways. Firstly, it suggests that TCNs give priority to the animosity case in which the COO's target citizens face greater egregiousness from the COO's actions when there is more than one contemporary animosity case in the world. Secondly, it proposes that perception of egregiousness of COO's actions is dependent on consumer's perception of COO's target citizens' actions factor. Consumers may not be motivated to boycott the COO if they believe that the target citizens are at fault and hence which makes them feel reluctant to support them.

Contemporariness of the COO's egregious actions somehow overlaps with Jung et al's (2002) distinction between stable animosity and situational animosity. For TCNs, they use this factor to

prioritise contemporary conflicts over those which took place in history and do not have much impact on people as before. Moreover, the reescalation of violence by the COO of the contemporary animosity case may lead to reviving or increasing solidarity with the victims and hence increase motivation to boycott the products of the COO.

Participants in the boycott who show solidarity towards the offended nation are others-oriented who value the welfare of others. This suggests that they pursue helping values, according to Rokeach's (1973) list of values.

Based on this discussion, there are three factors which distinguish participants in the boycott them from non-participants: 1) awareness of the COO's egregious actions; 2) interpretation of the offending nations' (COO's) actions as well as the actions of the offended nation, and 3) consumer values. Participants are well informed about the conflict and the hard conditions the offended nation (NationB) live in due to the offending nation's (NationA's) actions, which is consistent with the findings of previous boycott studies (e.g. Garret (1987). Non-participants may lack such awareness as it is the case with three of the respondents.

In relation to interpretation of both nations' actions, one of the non-participants in the boycott refuses to help the NationB through participation in the boycott against NationA because he believes that NationB is the one at fault. Participants in the boycott, however, believe that NationB deserves their support because NationA is engaged in transgression against NationB and they use the boycott to help NationB by exerting pressure on NationA to stop such transgression.

Participants are others-oriented who care for the welfare of all humans regardless of their national, ethnic, or religious backgrounds who are well informed. On the other hand, non-participants in the boycott are self-oriented people who have no interest in world politics and pursue and prioritise such values as a sense of accomplishment (completing studies) and pleasure (buying drinks for enjoyment).

MANAGERIAL IMPLICATIONS

The findings of this research provide implications for international marketers who want to benefit from the boycott as well as the targets of the boycott who want to avoid its negative consequences on their marketing. For marketers who come from a country other than the offending COO, the boycott is an opportunity for them to attract consumers who are politically active and frequently exposed to the conflict, pursue values which promote the welfare of others, and believe that the COO is at fault, especially when violence between the conflicting parties escalates. They need to highlight the positive or at least the neutral position of their country which does not negatively contribute to the suffering of the offended nation.

Marketers from the offending COO need to target self-oriented consumers who do not give attention to political conflicts occurring outside their countries. These marketers still, however, have an opportunity to target the participants or potential participants in the boycott against their country. They can attempt to convince the public that the offended nation, rather than their country, is at fault, and that solidarity has to be shifted to their country. If this fails, they have two strategies to avoid the boycott. They can discount their country of origin and focus on other attributes of their products which may attract consumers to their products. Alternatively, they can distance their brands from their government unfavourable practices against the offended nations, and make associate their brands with corporate social responsibility which promotes human rights and the welfare of all people.

CONCLUSION AND FURTHER RESEARCH

This study introduces the solidarity construct as an affective dimension of country's image which can influence TCNs' purchase decision to buy from a COO involved in offensive actions against another country or nation. It supports Makarem and Jae's (2016) findings that human rights violations play an important role in causing consumer boycotts, as it is the case with TCNs who boycott the offending COO in order to save a particular nation from its offenses.

As qualitative-interpretive approach was used, the model proposed in this research needs to be tested in future studies using quantitative research methodologies in order to obtain further validity, which can also be applied in different animosity contexts. Given the small sample used in this research, especially the sample of non-participants in the boycott, future studies need to further investigate the factors which distinguish participants from non-participants.

Animosity / boycott studies need also to test the effects of different awareness methods on consumer purchase decision / behaviour, possibly using projective research methods. Also, longitudinal research can be conducted in order to test the effects of time on consumer decisions. Additionally, further research is needed to set scales for animosity and solidarity as distinct constructs influencing consumer involvement in a political issue attracting international attention. Solidarity can be measured against countries'/nations' levels of (post-) materialism levels.

THE INFLUENCE OF CAUSE RELATED MARKETING (CRM) ON THE BRAND IMAGE AMONG CONSUMERS IN JORDAN

Hashem, Tareq N.

Marketing Department, Isra University, Amman, Jordan

ABSTRACT

The main aim of this research study is to examine the influence of Cause-Related marketing campaigns on the brand image among Jordanian customers in terms of the brand image, intention to purchase solidarity purchase and brand loyalty. A self-administered questionnaire was distributed on 300 convenience sample in Amman, Jordan during the year 2015. The results of the study showed that cause related marketing is mainly used for charity issues as a form of the good well that the company has in regards to its community. Also, customers in Jordan understand the core concept of CrM and they have a full perspective about the concept, they were able to locate their attitudes towards the concept in regard to their own personality and beliefs which is a good indicator to the degree of knowledge that the Jordanian customers have.

Keywords: *Cause Related Marketing (CrM), Brand Image, purchase intention, solidarity purchase, Brand loyalty, buying behavior, commitment to society.*

INTRODUCTION

Everything in the world is originated from a reason; it is normally triggered by a person or an activity which makes it happen from the first place. This is normally called as a (cause). Many philosophers have tried over the years to give a fine and direct definition to the word "cause". Butnariu (2007) defined the word "cause" as an action, event or a motive that triggers, motivates or stems something else to happen. From that definition, it can be easily noted that everything in our world happen due to a reason, there have to be a cause and an effect.

In marketing, there appeared a term that falls into those criteria; it is called the Cause Related Marketing, this term is not that old in the history of marketing, but it's managed to prove its influence over the last few decades. Basically, Cause Related Marketing or sometimes referred to as Cause Marketing is built up on the concept of driving customers to buy certain company's services or products because there is a financial profit or benefit for a nonprofit side.

AIM AND OBJECTIVES

This current paper aims at understanding the influence of cause related marketing or as is it widely known "cause marketing" on the brand image among customers in Jordan within three variables which are: Purchase Intention, Solidarity Purchase and Brand Loyalty. The main question of the study will be "To what extent can cause related marketing be influential on the brand image in terms the intention to buy, the solidarity buying and the brand loyalty?"

HYPOTHESES

The hypotheses of the study will be as follows:

- There is a statistically significant influence of cause related marketing on the brand image among Jordanian customers.

The sub-hypotheses of the study will be:

- There is a statistically significant influence of cause related marketing on the purchase intention among Jordanian customers.
- There is a statistically significant influence of cause related marketing on the solidarity purchase among Jordanian customers.
- There is a statistically significant influence of cause related marketing on the brand loyalty among Jordanian customers.

LITERATURE REVIEW

THE HISTORY OF CAUSE RELATED MARKETING

The concept of cause related marketing is becoming one of the hot topics specifically through the last decade. It is becoming more and more apparent among companies specifically after realizing the kind of effect that it has over the success and prosperity of the enterprise. The very first definition for the term cause related marketing, or as it will appear in this paper (CrM) was first defined back in 1988 by Varadarajan and Menon who were considered as the pioneers in this field, the authors defined CrM as *"The process of formulating and implementing marketing activities that are characterized by an offer from the firm to contribute a specified amount to a designated cause when customers engage in revenue-providing exchanges that satisfy organizational and individual objectives"* (Shabbir, et al 2009: p. 1231). Biglione and Woods (2007) defined the terms CrM as *"A way to promote strategic alliances between companies and civil society organizations (CSOs), stimulating social investment and mobilizing consumers and all of society to contribute towards different social causes"* (IDIS, 2007, P. 2). And one of the early definitions for the term was the one which was presented by Varadarajan and Menon in 1988 as an early unpolished

definition referring to "A new form of corporate philanthropy based on the rationale of profit-motivated giving" (Varadarajan and Menon, 1988). The authors in that definition have used the word "Philanthropy" as a reference to the voluntary deeds that a company does to community. From another perspective Anghel and others (2011) define CrM as "A commercial activity by which business and charities or causes form a partnership with each other to market an image, product or service for mutual benefit" (Anghel, et al 2011. P. 73). According to Bronn and Virioni (2001) CrM is something that every corporate has to do as a form of corporate social responsibility which refers to "The policy and practice of a corporation's social involvement over and beyond its legal obligations for the benefit of the society at large" (Bronn & Virioni, 2001. P. 209).

Figure 1: CrM is a part of social responsibility (Anghel)

The very first attempt to market for a cause or to initiate a cause related marketing campaign was done by The American Express Corporate back in 1983. The corporate at that time have raised funds for the preservation of the statue of liberty. In no more than 4 months, the corporate managed to raise \$1.75 million for that cause and its benefits went up to 28% (Laszlo & Lyons, 2014).

TYPES OF CRM

Looking at the previous literature, and examining the nature of CrM campaigns that are taking place among non profit and for profit organizations one can see that there are a lot of types that might be considered as main types of CrM. However, there are mainly three types for CrM which are (Sinčić Ćorić et al, 2011):

- The traditional CrM

This kind of cause marketing takes place when a part or a portion (set amount) of the profit from the purchase goes to a certain non profit body. That is when part of the amount that customers' payments goes to a certain donation or charity that the company generates after reaching a target. This type of cause marketing can be beneficial in terms of generating more sales, promoting the idea of repetitive

purchase, in addition to increasing the percentage of merchandize. Among the most famous examples of such cause marketing is Yoplait's campaign "save lids, save lives" for breast cancer (Grome, 2013).

- **Even sponsoring**

This type of cause marketing is based on a specific reason that the event is based on, from that, the collaboration from either one or more than one firm in exchange for donation; normally the donation is not direct in that type of cause related marketing.

- **Customers' fundraising**

This type of cause marketing is defined as a way of raising fund where customers use their own funds to support a certain non profit organization. Examples of that type of cause marketing is the point of sale campaigns and the peer to peer fundraising, it can also take even sponsoring into consideration specifically if it appeared through customers own efforts.

CRM AND BRAND IMAGING

Lindberg (2010) defines Brand Image as the perception of customers towards a certain brand in accordance with the experience that is held in the customers' memory. Also, Maurya (2012) sees that brand image is defined as everything that people connect to a certain brand, which includes feelings, attitudes, perceptions, and decisions. In an overall estimation, brand image is the total of attributes and associations that customers connect to a certain brand (SondohJR et al, 2007).

In a study by Heidarian and Bijandi (2014) on the influence of CrM on brand perception in a garment industry, the authors aimed at understanding the role of cause marketing on the perception of the brand image in garment industry through distributing a total of 260 questionnaires on customers on Tehran. The results of the study showed that there is a positive and effective factor of cause marketing on the brand image specifically among suspicious customers. It was also found out that the motivations of the firm' behind going through the cause marketing plays a huge role in changing the mental image of the brand among consumers.

Another study by Qamar (2013) aimed at understanding the role of cause marketing on the intentional purchasing and brand accepting among customers in Pakistan. A total of 278 out of 350 respondents have gone through a self-administered questionnaire. The results of the study showed that cause related marketing campaigns have a deep contribute in the intentions of customers to purchase a certain product in addition to that it helped in enhancing the power of the corporate brand effectiveness.

METHODOLOGY

The followed methodological approach in the current research paper was descriptive in its nature; it was quantitative where the author formed a self-administered questionnaire and distributed it on a group of customers to form a convenience sample on different shopping malls and commercial complexes in the capital of Jordan (Amman). The convenience sample of the study reached 300 respondents in the final counting of the participants. The author tried to distribute and retrieve as much questionnaires as possible in order to understand the nature of influence that cause marketing might has on brand image specifically among Jordanian customers in Amman.

STUDY MODEL

The model of the study will be as the following:

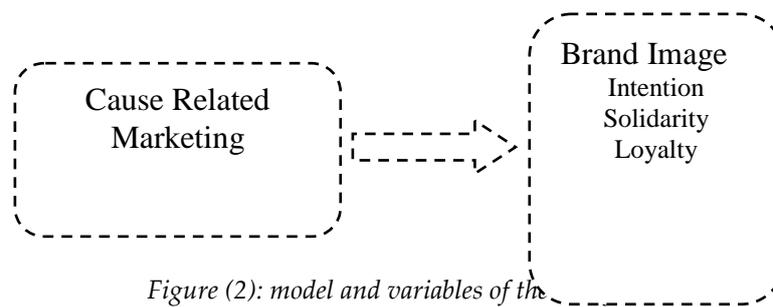

Figure (2): model and variables of the

The above model describes the relation between the variables of the study; the author here has taken into perspective the influence of cause related marketing on some factors of the brands image which are (the intention to buy, solidarity purchasing, and the brand loyalty).

SAMPLE OF THE STUDY

The convenience sampling was chosen to form the sample of the study which reached in its final calculating to 300 respondents (customers) from different shopping malls and trading centers in the capital of Jordan (Amman).

TOOL OF THE STUDY

The study was based on the questionnaire as a tool in order to collect data. The questionnaire consisted of two main parts, the first part is the demographic variables which included (gender, age, educational level, and income), while the second part covered the variables of the study which were (purchase intention, solidarity purchase and loyalty to brand); the questionnaire was built on likert (5) scale (strongly agree, agree, neutral, disagree, strongly disagree).

RELIABILITY TEST:

A Cronbach Alpha test was used to ascertain instrument reliability. The value was = 84.2% for the questionnaire. All values are accepted since they are more than 60% (Malhotra, 2004).

DATA PROCESSING

The data which was retrieved from the questionnaire was processed and treated through the SPSS (Statistical Package for Social Sciences). Through SPSS formulas, descriptive analysis was done on the data in addition to the hypotheses testing that included simple regression of each hypothesis presented in this paper.

Category	Frequency	Percentage%
Education		
Diploma or less	21	7.0
Bachelor	191	63.7
Master	78	26.0
PHD	10	3.3
Total	300	100.0
Gender		
Male	180	60.0
Female	120	40.0
Total	300	100.0
Income		
Less than \$500	15	5.0
\$501-1000	141	47.0
\$1001-1500	55	18.3
Above \$1500	89	29.7
Total	300	100.0
Age		
Less than 23 years	27	9.0

30-35 years	129	43.0
Above 36 years	25	8.3
Total	300	100.0

Table (1): Sample distribution according to demographic variables

RESULTS AND DISCUSSION

- Results

The current section will be presented in two sections; the first one will cover the analysis of the demographic variables while the second section will cover the analysis of the study variable. Means and standard deviations were computed in order to show the degree of influence that CrM had on the brand image among customers in Jordan.

- **First section: Demographic variables**

Frequency and percentages were computed for the sample's characteristics.

The table above indicates that 21% of the sample has a diploma or less, 63.7% of the sample has bachelor degree, and the rest have higher studies. Which shows that the higher percentage of the sample were of bachelor degree holders as an indicator of individuals who were mostly interested in responding to the questionnaire and going through its paragraphs. This result rhymes with what appeared with Jeddi and Zaiem (2010) referring to the fact that individuals with higher educational level are more likely to purchase as per the brand and the label that the item is carrying compared to lower educational levels. As for the gender issue, and from the analysis of the study it appeared surprisingly that 60% of the sample were males and 40% was females, this was considered to be surprising due to the fact that women are known to be more interested in shopping and brands compared to men, in addition to that, this result contradicted with what Moosmayer (2010) reached in his study which highlighted that women were more interested in CrM compared to men, and the amount of donations that appeared from women were larger than those appeared by men. From another perspective, it can be said that considering the application process took place within the malls and the commercial complexes where families are shopping, it was the man who answered the questionnaire not the woman. On the contrary, a study by Zenyali and Safarnia (2012) which took place in Iran and aimed at focusing the attitudes of customers in terms of the intention to buy and gender, the result indicated that there a difference between males and females in their attitudes towards CrM for the benefit of males, while Safarnia and other (2012) came up with the same results of the deep influence of CrM on males more than females and the general influence that CrM had on the customers intention to buy in Iran and China. As for the income part, the analysis showed that 5% of the sample earns less than \$500 per month, whereas 47% of the sample earns between \$501-1000 per month. This can be read as a type of imposed state where the income has a really vivid role to play when it comes to shopping and purchasing. People who earn less money will care less for the type of social deeds that a company is performing and their main interest will focus on the prices and quality of the goods that they are dealing with. Finally, in regards to the age element, it was found out that the highest percentage of respondents were of individuals aged between 30-34 years which can be considered as the age where an individual is fully aware of the meaning of social responsibility and the concept of servicing a society.

To sum up, the overall description of the individual who participated in the study was male individuals who holds bachelor degrees aged between 30-34 years and earned 501-1000 JOD per month.

- **Second section: Study variables analysis**

Mean and standard deviation are used to describe attitudes toward following questions:

- **CrM positively influences the brand image among customers.**

From the descriptive analysis it is appeared that CrM has a positive influence on the brand image from the customers' perspective, it is attributed to the fact that the means of the paragraphs are above the mean of the scale (3). The most influential paragraph of all was "I think that most companies use cause related marketing for profit purposes only" which scored the highest rank (4.43) followed by "I do respect companies which participates in local community service" which came in the second rank (4.10). It can be seen that most influential paragraphs came somewhat contradicting, a large group of respondents believe that companies are carrying society related campaigns just for the sake of increasing their profit margin and spread their brand on a wider domain. This belief was followed by a totally contradicting one which stated that most of the respondents respected companies who initiated such campaign that might support the public policy. This result came along with the results which were reached by Heidarian and Bijandi (2015) arguing that CrM *"is effective on the consumer's mental image of the brand and consumers make judgment about the product quality based on mental utility of the quality"* (Heidarian and Bijandi, 2015. P. 416)

- **CrM influences the purchase intention among customers.**

From the descriptive analysis it is appeared that the most influential paragraph was "I think that this kind of marketing is a form of social contract between the company and the society so I am willing to purchase their goods" which scored the highest rank (4.38) followed by a really contradicting paragraph which indicates "I am not willing to buy such goods because I know that it will never achieve the claimed aims" scoring (4.10). This draws the attention that CrM can increase the intention to purchase the goods if they were connected to a certain non-profit goal. The results here came along with what Qamar (2013) reached in his study which stated that *"Cause Related Marketing campaigns do contribute in consumers purchase intention"* (Qamar, 2013. P. 633). Another study by Corbishely and Mason (2011) indicated that CrM had a positive influence on the purchasing behavior among respondent, the author saw that customers were more "responsive" to CrM in accordance to the cause, the results of the study matched the current study which indicated that age group 30-41 years were more interested in buying CrM products, they had positive attitudes towards the concept itself compared to the other age groups.

- **CrM influences solidarity purchase among customers.**

From the descriptive analysis it is appeared that that CrM does have a positive influence on solidarity purchasing, the analysis of the paragraph scored higher than (3) scale. The most influential paragraph was "I don't support that kind of marketing because I am sure the money will not be used for the promoted reason" ranking the highest of (4.03) followed by "I only buy the item if the cause of

marketing was convincing to me" ranking (3.92) which shows the negative attitude that customers held for cause related marketing and the level of belief that they had for that kind of marketing.

- **CrM influences the loyalty towards the brand among customers.**

The analysis of this question came with a positive connection between the CrM and the brand loyalty among customer as all of the paragraphs achieved higher than (3) on the scale. However, the most influential paragraph among the answered questionnaire was "companies who support their society reflex their good intentions" scoring (4.37) followed by "I always buy the goods of the brand that I prefer which supports me and my community" scoring (3.92). This result matched what Hunjara and others (2012) reached to in their study stating that CrM campaigns have positive influence on the brand loyalty which in its turn influences the sales. Also, Adiwijaya and Fauzan (2012) referred in their study to the same idea in which the CrM approaches that companies usually carry out can increase the level of customer satisfaction which eventually leads to the status of increase in the brand loyalty.

- **Hypothesis testing**

Basically, concerning the hypotheses of the study, the following table describes results of hypotheses testing.

Hypothesis	R	R Square	F	Sig.	Constant(B	t	Sig.	
1	.575	.331	147.178	.000	2.241	0.411	12.132	0.000
2	.497	.247	97.555	.000	2.117	.433	9.877	0.000
3	.295	.087	28.315	.000	2.868	.245	5.321	0.000

Table (2): Hypotheses Testing

H1: There is a statistically significant influence of cause related marketing on the brand image among Jordanian customers.

Simple Regression is used to test above hypothesis; it is found that a calculated value of (F) is significant at (0.05) level. This means that null is rejected, which means that there is a statistically significant influence of cause related marketing on the brand image among Jordanian customers with moderate Pearson correlation 0.575. This idea was examined by Hajikarimi and others (2014) when they tried to understand the influence of the cause related marketing with the mediating role of firm motivations, social responsibility, and perceived quality among consumers. So the author has chosen to measure the direct influence of the CrM on the brand image from different perspective that took into perspective the factors within brand image itself.

H2: There is a statistically significant influence of cause related marketing on the purchase intention among Jordanian customers.

Simple Regression is used to test above hypothesis; it is found that a calculated value of (F) is significant at (0.05) level. This means that null is rejected, which means that there is a statistically significant influence of cause related marketing on the purchase intention among Jordanian customers with moderate Pearson correlation 0.497. In order to form this hypothesis the author depended on the aim of Fianto (2014) in his paper "The Influence of Brand Image on Purchase Behavior through Brand Trust" Fianto in that sense tried to understand the influence of the brand image in the intention to purchase from a behavioral perspective.

H3: There is a statistically significant influence of cause related marketing on the solidarity purchase among Jordanian customers.

Simple Regression is used to test above hypothesis; it is found that a calculated value of (F) is significant at (0.05) level. This means that null is rejected, which means that there is a statistically significant influence of cause related marketing on the solidarity purchase among Jordanian customers with weak Pearson correlation 0.295.

H4: There is a statistically significant influence of cause related marketing on the brand loyalty among Jordanian customers.

Simple Regression is used to test above hypothesis; it is found that a calculated value of (F) is significant at (0.05) level. This means that null is rejected, which means that there is a statistically significant influence of cause related marketing on the brand loyalty among Jordanian customers with moderate Pearson correlation 0.597.

As for the afro-mentioned variables of loyalty to the brand and the solidarity purchasing, mainly the author depended to measure those two variables on what Galan-Ladero (2012) has tested to measure the attitude of customers towards cause related marketing. Galan-Ladero tried to understand in what sense some variables helped in forming the attitude of customers towards the cause related marketing. Gathering between the three mentioned previous studies the author of the current research study formed the hypotheses and main aim to understand the influence of the cause related marketing on the brand image launching the debate from the variables of intention, solidarity, and loyalty.

CONCLUSION

Through the current research study, and launching from the nature of results which were attainable through the analysis, it was found out the following:

- Cause-Related Marketing has a deep influence on the way the brand is being presented.

- Some of the participants have connected it to the public policy and the commitment that a company has towards its society while other saw it as a social contract that is found between the company and the society and bonds the first to the well-fare of the later based on some actions and campaigns that can be done in order to develop the nature of life style that people lead.
- In general, and looking at the concept from a more general perspective it is normally known that the idea of cause related marketing is used for charity issues, it can be seen as a support to the local as well as a presentation to the good well that the company has in regards to its brand and intentions.
- Through the analysis, it was seen that customers in Jordan understand the core concept of CrM and they have a full perspective about the concept. In addition to that, they were able to locate their attitudes towards the concept in regard to their own personality and beliefs which is a good indicator to the degree of knowledge that the Jordanian customers have.

**PHASE-SPECIFIC ANTECEDENTS OF INNOVATIVE WORK
BEHAVIOR: THE ROLE OF KNOWLEDGE JOB CHARACTERISTICS
AND ORGANIZATIONAL CLIMATE**

Hernaus, Tomislav¹; Miocic, Marin²; Aleksic, Ana¹

¹Department of Organization and Management, Faculty of Economics & Business, University of Zagreb, Zagreb, Croatia

²Hrvatski Telekom, Zagreb, Croatia

ABSTRACT

Employee innovativeness has become a major human resource challenge within the global and highly competitive business environment. Recent studies have confirmed organizational climate and job characteristics as critical antecedents and a driving force for innovative work behavior (IWB). Although we know that the micro-innovation process is a multi-stage process we still lack a more clear understanding of the phase-specific antecedents of IWB. Therefore, the aim of the paper is to investigate and determine specific relationships between knowledge job characteristics, organizational climate and different employee IWB stages. A cross-sectional field research was conducted on the sample of 111 knowledge workers from six telecommunication companies in Croatia. Our research findings indicate that employees' knowledge job characteristics in general are positively related to each phase of their IWB while perceived organizational climate seems to be relevant only for idea promotion. Nevertheless, the role and importance of particular job characteristics clearly differ along the innovation process. The present study provided industry-specific empirical insights about the current level of IWB of knowledge workers, as well as comparable results that can offers better understanding of job-level innovations.

Keywords: *innovative work behavior, job design, organizational climate, creativity and innovation, Croatia*

INTRODUCTION

Organizations need creative and innovative employees to retain their competitive advantage. Thus, employee innovation or innovative work behavior (IWB) has been put upfront as a multi-stage process by which new ideas are created and implemented within the workplace (e.g., Holman *et al.*, 2012). Such a positive organizational behavior should not only be expected, but also intended and encouraged

through human resource management (HRM) policies and practices. Previous studies have already examined numerous HRM- or people-based antecedents of job-level innovations (e.g., Scott and Bruce, 1994). Both job characteristics and organizational climate have been recognized as critical antecedents and a driving force for employee innovativeness (e.g., Hammond *et al.*, 2011; Montani *et al.*, 2014).

However, there is still a lack of findings how they mutually shape innovative outcomes. In addition, the link between job design and IWB has been primarily examined by primarily addressing the role of task characteristics (Hackman and Oldham, 1976). More recent approach to job design, i.e. Work Design Questionnaire (WDQ) developed by Morgeson and Humphrey (2006) has recognized the relevance of other job features such as social, knowledge and work context characteristics. As knowledge economy is gaining the momentum worldwide, it seems particularly interesting to examine how knowledge job characteristics determine the level of individual innovativeness at work. Similarly, already Amabile *et al.* (1996) and Ekvall (1996) had recognized that organizational climate represents a broader context that might constrain or foster creativity. While employees' shared perceptions of the importance of creative and innovative behavior are highly relevant for contemporary organizations, we still do not know how team-level or organizational climate is related to different stages of the innovation process (i.e. idea generation, idea promotion, and idea implementation).

The aim of the current study is to capture and determine the pattern of relationships between job design, organizational climate and employee innovativeness. Therefore, we conducted a cross-sectional field research within the highly-innovative telecommunication sector to gain a better understanding of the current job-level innovation practices. Employees in the telecommunication sector are in the focus of our research as this sector was one of the most dynamic and fast growing ones in Croatia in the last decade. A heterogeneous sample of industry-specific individuals has been examined and knowledge workers' perceived values have been analyzed.

The study clearly points to the idiosyncratic role and situational importance of organizational climate and particular knowledge job characteristics along the innovation process. It confirms and extends our phase-specific knowledge about IWB antecedents. Being one of the first innovation management job-level studies conducted in the Euro Mediterranean region, it provides comparable results and offers better understanding of the innovation imperative.

LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

Innovative work behavior

Realizing the central importance of creativity and innovation for maintaining the sustainable competitive advantage (e.g., Bysted and Hansen, 2015), scholars increasingly strive to define and determine factors that can help organizations boost job-level innovativeness. Innovative behavior of employees – a concept similar to intrapreneurship or entrepreneurial behavior in organizations has become a spotlight issue not only for managers and HR practitioners, but as well for scholars and policy makers. IWB represents “an intentional introduction and application of new ideas, processes, products or procedures, within a role, group or organization” (West and Farr, 1990). Such a positive employee behavior includes exploration of opportunities, the generation of new ideas, idea promotion and championing, and implementation activities. Specifically, individuals can be innovative by generating new ways to perform their job, by coming up with novel procedures and innovative ideas, and/or by reconfiguring known approaches into new alternatives (Prieto and Perez-Santana, 2014).

IWB has dominantly been understood as a process that encompasses creativity- and implementation-oriented behavior, including not just generation and promotion of new and useful ideas concerning products, services, processes and procedures (i.e. creativity-oriented behavior), but also their implementation in the existing working environment (i.e. implementation-oriented behavior) (Dörner, 2012). Although the process-nature of innovativeness has been somewhat acknowledged, and several authors already pointed that various IWB phases are probably predicted by different factors (e.g., Yuan and Woodman, 2010) and ask for various individual behaviors (e.g., Kleysen and Street, 2001), we still need to understand the ambidextrous nature of IWB. The existing research in the innovation management literature has been predominantly oriented to creativity behavior, neglecting implementation-oriented aspects of employee behavior that seems to be critical in the innovation process (Hernaus, 2016).

Job design and knowledge job characteristics

Job design represents a useful HRM tool that significantly shapes daily working practices, including innovative actions of individuals. It can be defined as set of processes and outcomes of how work is structured, organized, experienced, and enacted (Parker and Wall, 1998). Job design is mostly assessed through job characteristics that are seen as objective and measurable work attributes (e.g., Morgeson and Campion, 2003). Recently developed WDQ (Morgeson and Humphrey, 2006) and related meta-analytic study of Humphrey *et al.* (2007) provided an integrative job-design typology addressing task-, knowledge-, social- and contextual job characteristics.

Knowledge job characteristics particularly need to be put upfront as work has become more cognitively-demanding and complex due to increased technological changes, quest for skill variety and knowledge-based organizations (Humphrey *et al.*, 2007). This understudied job design category reflects the kinds of knowledge, skill, and ability demands that are placed on an individual as a function of what is done on the job (Morgeson and Humphrey, 2006). Five knowledge job characteristics are particularly important and highly-relevant: *job complexity* (i.e. extent to which the tasks on a job are complex and difficult to perform); *information processing* (i.e. degree to which a job requires attending to and processing data or other information), *problem solving* (i.e. the degree to which a job requires unique ideas or solutions and reflects the more active cognitive processing requirements of a job), *skill variety* (i.e. extent to which a job requires an individual to use a variety of different skills to complete the work) and *job specialization* (i.e. extent to which a job involves performing specialized tasks or possessing specialized knowledge and skill).

While job design is considered to be an important determinant of IWB, and large empirical evidence shows that task- and social job characteristics are associated directly with both the generation and implementation phases of the innovation process (e.g. Oldham and Cummings, 1996; Axtell *et al.* 2000; Hammond *et al.*, 2011; Anderson *et al.*, 2014), we still lack a complete understanding of the role of knowledge job characteristics within the innovation process. For instance, Frese and Fay (2001) proposed that job complexity makes innovation more likely since it promotes personal initiative (Ohly *et al.*, 2006), but empirical studies only examined the positive influence of job complexity on creativity (e.g., Tierney and Farmer, 2002; Hammond *et al.*, 2011). In addition, problem solving and skill variety have also been recently considered to have an important influence on innovation (Daniels *et al.*, 2011; Grant and Berry, 2011). Unfortunately, the relationship between knowledge job characteristics and IWB was examined partially, and some specific job characteristics have not been yet addressed. Thus, recognizing the need for analyzing the nature of job characteristics that provide the opportunity to use and acquire knowledge (e.g., Ramamoorthy *et al.*, 2005) within the innovative context, we propose the following hypothesis:

H1: *Knowledge job characteristics (i.e. job complexity, information processing, problem solving, skill variety, and job specialization) are positively related to employees' IWB.*

Organizational climate

Climate has been characterized as employee perceptions of the organizational work environment (Rousseau, 1988). It represents a contextual factor (i.e. shared employees' perceptions of organizational

policies, practices, and procedures regarding their workplace and expected behaviors, cf. Schneider, 1990) that has a strong influence on shaping individual behaviors (Ekvall, 1996).

Organizational climate has been emphasized to have a significant influence on level of innovation in organizations (e.g., Scott and Bruce, 1994; Axtell et al., 2000). A climate for innovation has been labeled as a highly relevant contextual issue either for creativity (e.g., Černe *et al.*, 2014) or innovation implementation (e.g., Somech and Drach-Zahavy, 2013). Moreover, managers whose employees perceive their organizations to be open to and encouraging innovation and receptivity of new ideas, may expect to have the best of both, i.e. higher levels of IWB (e.g., Hülshager *et al.*, 2009). Strong and positive climate for innovation that is characterized with open communication and trust, and provides a challenging work and cohesion among employees (Sluis, 2004) can be seen as a climate that will be particularly related to innovation. Thus, we propose our second hypothesis:

H2: *Organizational climate is positively related to employees' IWB.*

Phase-specific influence of knowledge job characteristics and organizational climate on employees' IWB

Recently, several authors have noted that it is possible to recognize a distinct influence of job characteristics on different stages of the micro-innovation process. For example, Bledow *et al.* (2009) stressed that it is possible to recognize the need for different task demands depending of idea generation and idea implementation. Yuan and Woodman (2010) also mentioned that various IWB phases are probably predicted by different factors. Such an argument calls for a contingency-based approach that emphasizes potentially different behaviors required for creative and innovative activities (e.g., Scott and Bruce, 1994; de Jong and den Hartog, 2010). Some of the previous studies (e.g. Axtell *et al.*, 2000; Baer, 2012) showed that idea implementation is more strongly associated with group or organizational factors than with individual or job factors. In other words, enriched knowledge job characteristics such as job specialization, problem solving requirements and information processing might be relevant for idea generation (i.e. creativity-oriented behavior), while organizational climate should facilitate idea promotion and implementation phases (i.e. innovation-oriented behavior). Therefore, we propose our third hypothesis:

H3: *Knowledge job characteristics have a stronger influence on idea generation, while organizational climate is a dominant predictor of idea promotion and implementation.*

RESEARCH METHODOLOGY

Sample

To test the proposed hypotheses, research methodology and instrument have been developed. We used self-reported anonymous questionnaire that gathered perceived values of employees. On-line survey invitation had been sent via e-mail addresses to the conventional sample of 147 employees from six major telecommunication companies in Croatia during December 2015. We chose employees working in core business activities and innovative jobs. Total of 111 questionnaires were received back, presenting a very high-response rate of 75.5%. Initial analysis revealed that eleven answers were not filled out correctly (e.g., missing values) so those responses were excluded from further data analysis. The final sample consisted of one hundred individuals who were predominantly men (72%), had on average 38 years of age ($SD = 7.2$) and were largely highly-educated (86%). The average job tenure of respondents in current organizations was 11.9 years ($SD = 6.73$). Sampled individuals were mostly working in a technical area (71%), occupying either professional positions (76%), or being project managers (17%) and supervisors (7%).

Measures

Survey respondents were kindly asked to provide their perceptions about their work organization, the working atmosphere and personal idea management efforts. Questionnaire items were adopted from prior studies, and measured on a five point Likert-type scale (response options ranged from 1 = "strongly disagree" to 5 = "strongly agree").

Items measuring *innovative work behavior* (IWB) were adopted from Jansen (2000). Respondents were asked to assess their supervisor's perception of his or her engagement in the micro-level innovation processes – i.e. *idea generation* (IWB1, 3 items, $\alpha = .827$), *idea promotion* (IWB2, 3 items, $\alpha = .691$) and *idea implementation* (IWB3, 3 items, $\alpha = .789$). The overall measure of IWB was also calculated as an aggregate measure of different IWB phases (IWB, 9 items, $\alpha = .887$). To analyze *knowledge job characteristics* respondents were asked to indicate the extent to which a particular statement describes the specific nature of their jobs. Five job characteristics' scales were adopted from the WDQ questionnaire developed by Morgeson and Humphrey (2006), and encountered 20 items measuring: *job complexity* (JCOMPLEX, 4 items, $\alpha = .809$), *job specialization* (JOBSPEC, 4 items, $\alpha = .812$), *information processing* (PROCINF, 4 items, $\alpha = .758$), *skill variety* (SKILVAR, 4 items, $\alpha = .860$) and *problem solving* (PROBSOLV, 4 items, $\alpha = .702$). *Organizational climate* instrument was adopted from Sung and Choi (2014) and it measured respondent's perception on how organizational climate of their organization accepts new ideas, develops mutual trust and gives employees the opportunity to freely communicate

their ideas and opinions (CLIMATE, 3 items, $\alpha = .764$). Although organizational climate was conceptualized here as an individual-level variable, similar to prior research for the sake of parsimony we empirically aggregated individual perceptions of climate at the organizational level (Schneider, 1990; Montani et al., 2014). We also controlled for gender, age (measured in years), job tenure (measured in years), educational level, (high school degree, college degree, university degree, postgraduate/master degree), job type (technical, marketing, sales, finance, others) and occupational position (professional workers, project managers, supervisors).

Data analysis

Data collected were analyzed in several steps and using various statistical methods in SPSS 23.0 software package. The descriptive data analysis was initially conducted together with the reliability analysis. Cronbach's alpha coefficients were used to test internal consistency of the research instrument applied (Feldt and Kim, 2008). As previously indicated, calculated Cronbach's alpha coefficients were larger or very near ($\alpha = .691$ for IWB2) the cut-off value of .70, which implies internal consistency of the scale's items.

Descriptive data analysis indicated that respondents perceive to have knowledge-enriched jobs, where skill variety ($\bar{x} = 4.41$, $SD = .55$) and information processing ($\bar{x} = 4.41$, $SD = .53$) encountered highest average scores. They believe to have complex jobs that require various skills and a lot of information processing in order to perform their formal tasks. Additionally, respondents perceive their jobs as highly specialized with tasks that seek problem solving on a daily basis. However, it should be kept in mind that given results can be somewhat attributed to the sample characteristics, since most of the respondents were technical experts who work in a rather complex area of expertise. The perceived value of organizational climate ($\bar{x} = 3.44$, $SD = .79$) and the overall level of IWB ($\bar{x} = 3.41$, $SD = .78$) had significantly lower average values than examined job-design characteristics. Telecommunication employees indicated that they perceive to work in the organizational climate that accepts and encourages creation of new ideas, and they believe to practice creative and innovative behavior to a certain extent. However, we found that IWB phase-specific behaviors somewhat differed. The highest level of innovation engagement was present in the idea generation ($\bar{x} = 3.72$, $SD = .85$), as opposed to employees' engagement in idea promotion ($\bar{x} = 3.23$, $SD = .90$) and idea implementation ($\bar{x} = 3.29$, $SD = .93$). Correlation and regression analysis were further conducted to test the nature of the relationships between analyzed variables.

RESULTS

We tested for the existence of relationship between each knowledge job characteristic (i.e. job complexity, job specialization, information processing, skill variety, and problem solving), organizational climate and both overall- and phase-specific employee innovativeness behavior. Table 1 presents correlation matrix for all the variables analyzed in the study. Pearson's correlation coefficients have revealed statistically significant positive relationship between knowledge job characteristics and overall IWB, where problem solving ($\rho = .472$, $p < .01$, $N=100$), information processing ($\rho = .410$, $p < .01$, $N=100$) and skill variety ($\rho = .403$, $p < .01$, $N=100$) showed highest coefficient values. Taking the phase-specific view, three out of five knowledge job characteristics (i.e. PROCINF, SKILVAR and PROBSOLV) were positively related to each of the IWB phases; job complexity and job specialization were not significantly related within the idea promotion phase, and job specialization was neither statistically significantly related to the idea generation. Nevertheless, correlation results clearly show that knowledge job characteristics are predominantly positively related to IWB, thus confirming our first hypothesis.

Organizational climate (as a team-level antecedent) was positively related to overall IWB as an outcome variable ($\rho = .202$, $p < .05$, $N=100$). However, somewhat different results were reported considering different stages of IWB. Interestingly, a climate for innovation has been statistically significantly positively related to IWB only within the idea promotion stage ($\rho = .279$, $p < .05$, $N=100$), but not for idea generation and idea implementation phases of the micro-innovation process. Therefore, we were able to partially accept our second hypothesis.

Additionally, correlation analysis showed negative correlation between overall IWB and control variables such as job tenure ($\rho = -.262$, $p < .01$, $N=100$) and age ($\rho = -.248$, $p < .05$, $N=100$). This indicates that IWB is decreasing with higher job tenure and age. No statistically significant correlations have been found between job type, occupational group, educational level and the outcome variable.

Table 1. Correlation analysis results

Next, regression analyses were conducted to test the influence of organizational climate and different knowledge job characteristics on employees' IWB. Multiple regression models were compared for the following outcome variables – three different IWB phases as well as for the aggregated IWB measure. Best fit models *per* outcome variable are presented in Table 2.

Table 2. *Regression analysis results*

Our regression models revealed that different knowledge job characteristics do not have equal influence on the specific IWB phases. The role and importance of particular job characteristics clearly differ along the innovation process as multiple regression analyses revealed the existence of phase-specific antecedents of IWB. During the initial (creativity) phase, problem solving ($\beta = .345$, $p < .01$), information processing ($\beta = .322$, $p < .05$) and job specialization ($\beta = -.222$, $p < .10$), together with organizational climate ($\beta = .178$, $p < .05$) reported to have a significant influence on idea generation. Within the idea promotion phase, skill variety ($\beta = .290$, $p < .01$) and organizational climate ($\beta = .328$, $p < .01$) have been determined as significant antecedents, while problem solving ($\beta = .331$, $p < .05$) was recognized as a single antecedent relevant for the idea implementation phase. In addition, employee age as a control variable had a moderating effect on the examined cause-and-effect relationship, where younger employees perceived to be more creative and innovative than their experienced counterparts. Therefore, our third hypothesis is partially accepted as knowledge job characteristics really have a stronger influence on idea generation than idea promotion and implementation; although, organizational climate seems to be important both for idea generation and promotion.

DISCUSSION AND CONCLUSION

This paper sought to analyze and empirically test the relationship between different knowledge job characteristics, organizational climate and IWB. Specifically, our goal was to examine and determine phase-specific antecedents of the micro-innovation processes. The cross-sectional field research investigated work-related perceptions of knowledge workers employed within Croatian telecommunication sector. Statistical analyses initially showed that all analyzed aspects of knowledge job characteristics and organizational climate are positively related to IWB. However, regression analyses further revealed that different IWB phases are under the influence of different job characteristics. The most important job-level antecedent across different IWB phases is problem solving. Since problem solving is conceptually related to the creativity at work (Morgeson and Humphrey, 2006), we might conclude that our results confirm previous studies by indicating the importance of problem solving for IWB (e.g., Scott and Bruce, 1994). On the other hand, job complexity does not influence IWB of sampled individuals. This is also in line with previous research efforts that noticed how influence of complexity disappeared when other variables were introduced (e.g., Ohly *et al.*, 2006). Organizational climate as a team-level antecedent is positively connected with all phases of IWB, thereby confirming findings that already emphasized the importance of working atmosphere for enhancing innovativeness (e.g., Scott and Bruce, 1994; Imram *et al.*, 2010). Organizational climate fosters innovation by ensuring employees' skill in innovation use, providing incentives for innovation use and disincentives for innovation avoidance, but also by removing obstacles in using innovation (Klein and Speer Sorra, 1996). However, it is interesting that our results indicate that organizational climate has no effect on idea implementation, but has a major influence on idea generation and idea promotion phases. This leads to conclusion that current organizational climate within Croatian telecommunication companies does not support idea implementation. Employees are not supported enough to go for an extra mile to deliver the innovative idea to the market. Therefore, organizational leadership should strive to improve organizational climate by directing employees towards innovative behavior, by developing an open communication and by introducing the compensation system that rewards creativity and innovation.

Our research findings should be examined in the light of certain limitations. The first limitation is related to the questionnaire itself. IWB measures were self-reports, potentially leading to the problem of subjectivity. There is also a problem of the common-method bias because the same respondents have answered on both independent and dependent variables. Also, the study sample was rather small and biased towards professional workers who primarily occupy technical jobs. Future research should include more heterogeneous sample of both job types and industries to offer more generalizable conclusions. Finally, other antecedents from multiple levels of analysis could be analyzed, such as Innovation, Entrepreneurship and Digital Ecosystems

leadership and management practices that can hinder or ease innovation process in organizations. Despite potential limitations, the research findings have offered an insight into the current level of IWB of knowledge workers in Croatia. We believe that theoretical contribution of this study is in taking a phase-specific view of the multi-stage and multi-level innovation process, thus offering a contingent approach to the understanding of the innovation process at the individual level. Additionally, our paper contains new insights about how to foster innovation in a telecommunication sector. It emphasizes gaps and areas of improvement that managers can acknowledge and address in their everyday working practice.

PREDICTION OD SEASONALLY CLEANED DATA CONCERNING FOREIGN TRADE EXCHANGE

Hindls, Richard¹; Hronová, Stanislava²; Marek Luboš¹

¹ Department of Statistics and Probability, University of Economics, Prague, Czech Republic

² Department of Economic Statistics, University of Economics, Prague, Czech Republic

ABSTRACT

This paper presents an original method suitable for predictions in seasonally cleaned economic time series. The method makes use of two mutually opposite polynomial trends, visually shaped as a fin, and the parameters of this model are estimated. This approach provides us with a relatively narrow non-stochastic prediction interval, which is suitable for short-time predictions in the underlying economic time series. The described fin-shaped prediction is illustrated on real data of total exports from the Czech Republic.

Keywords: *Imports and exports of goods and services, polynomial fin-shaped trends, non-stochastic span of predictions.*

INTRODUCTION

Virtually any considerations related to the economy of the Czech Republic are connected with imports and exports. The Czech economy is small and open; therefore, it is considerably dependent on foreign trade. One of the starting points to quantitative analysis of this important and sensitive factor is the time series of foreign trade, namely, total exports.

When analysing time series in the area of foreign trade, there are many unresolved issues connected with eliminating the influence of outliers, and also with constructing predictions (cf. Hummels and Klenow, 2005). The present contribution aims at addressing these issues. From the viewpoint of statistics, the evolution of foreign trade is rather complex due to the existence of many administrative measures (customs duties, taxes, exchange rate interventions, etc.), which considerably interfere with the stochastic structure of the foreign trade time series (cf., e.g. Marek and Vrabec, 2015 or Arise, 2000)

This fact is manifested in several respects. First of all – it is rather risky to formulate any elaborated, quantified hypothesis on seasonal aspects of time series in the area of foreign trade (exports) and to start with seasonal cleaning based on such a hypothesis. Even though such an approach is sometimes taken in practice, the reason is that it is practically inevitable, and we have to be aware of crude

approximations we thus admit (cf. Tomšík, 2000). If we try to identify seasonal periodicity with the aid of statistical filtration, certain administrative interventions may prevail, which are, as a rule, most pronounced at the beginning of a calendar year. Seasonal cleaning hence requires a twelve-month wave (cf. Kozák *et al.*, 2000). This fact may imply that the "administrative" component of the periodic evolution prevails among the real-core seasonal aspects, which are undoubtedly present in the underlying time series.

If we consider the administrative interventions known and (to a certain extent) calculable, another question arises: how should we treat predictions in this "stochastic-administrative mixture" because time series in the area of foreign trade are nothing else but such mixtures. This question is most pressing in instances of one-time, unrepeatable administrative interventions. Are we entitled to make any stochastic predictions at all under such circumstances? Or should they be used anyway, but in a modified way? Or should it be more purposeful to make non-standard predictions? The present contribution is trying to follow this non-standard approach.

INSTRUMENTATION FOR PREDICTIONS

Any extrapolations require that the time interval on which they are based should be specified and the model be methodologically described. Our extrapolation will be based on a sequence of quarterly values of total exports in the period beginning in 2008. The dependent variable y_t includes the values of the time variable $t = 1, 2, \dots, 30$, where $t = 1$ corresponds to the 1st quarter of 2008. Methodologically, the two solutions described below will be studied: the classical one, treated in Chapter *Traditional span of predictions*, and our original methodology described in Chapter *Fin-shaped prediction span*.

Classical predictions

We will begin with a classical solution: the point predictions are, under the above-described circumstances, defined as an extrapolation of the linear trend and the classical interval predictions are 95% two-sided confidence intervals (cf., e.g. Box *et al.*, 1994 or Mills, 1999). Methodological details are described in Chapter *Traditional span of predictions*.

For classical predictions in the y_t time series, the following considerations come into question: at a given horizon $h > 0$ (where h is a positive integer) a predictor π is constructed between points n and $n + h$; this predictor is viewed as a statistical estimate of the unknown variable y_{n+h} to be predicted, complemented with two more predictors, π_l and π_u , fulfilling inequalities $\pi_l < \pi < \pi_u$. Here π is called the mean predictor, and π_l and π_u are the lower and upper predictors, respectively. The interval (π_l, π_u) is called the span of predictions.

A traditional stochastic span of predictions is usually used, i.e., a symmetric two-sided confidence interval for the mean predictor π with the lower and upper predictors $[\pi - \Delta, \pi + \Delta]$. Here Δ is a random variable such that probabilistic inequalities $P[|\pi - y^{(m)}| \leq \Delta] \geq 1 - \alpha$ or $P[|\pi - y^{(m)}| \leq \Delta] \geq 1 - \alpha$ at a given value of Δ , where $0 < \alpha < 1$ and $y^{(m)}$ stands for the prognostic model used for the variable to be predicted.

The traditional span of predictions is more or less a mathematical "artefact" in the sense that its probabilistic assumptions are hard to justify. Hence we also encounter proposals of non-traditional spans of predictions, in which the mean value is compared with lower and upper limits, which are based on factual considerations, not on probabilistic ones (cf. Kozák *et al.*, 1999). Let us divide these predictions into pessimistic and optimistic alternatives.

Traditional span of predictions

In order to describe the behaviour of the process under consideration, we can use a two-parameter linear regression function with positive, monotonously decreasing values of the independent variable. The problem of prediction is now solved in a classical way: the mean predictor is obtained by extrapolation of the deterministic component from the past to the future, and the span of predictions by enveloping the mean predictor with the classical symmetric two-sided confidence interval (cf., e.g. Granger and Newbold, 1986 or Wei, 1990).

We begin with the fact that the dependent variable can be described as

$$y_t = \alpha + \beta x_t + \varepsilon_t, \quad t = 1, 2, \dots, n, \quad (1)$$

where

$$x_t > 0, \quad t = 1, 2, \dots, n, \quad (2)$$

stands for the known decreasing values of the independent variable, α and β for unknown non-stochastic parameters, and ε_t for random perturbations characterized by

$$E(\varepsilon_t) = 0 \quad \text{for } t = 1, 2, \dots, n, \quad (3)$$

$$\begin{aligned} E(\varepsilon_t \varepsilon_s) &= \sigma^2 \quad \text{pro } t = s, & t, s = 1, 2, \dots, \\ &= 0 \quad \text{for } t \neq s. \end{aligned} \quad (4)$$

The estimates a and b of the parameters α and β respectively are identified with the aid of the least squares method, i.e., using the formulas below:

$$a = y - bx, \quad (5)$$

$$b = \text{cov}(x,y) / \text{var } x = r (\text{var } y / \text{var } x)^{1/2}, \quad (6)$$

where r is the correlation coefficient between y and x .

Estimates of the random perturbations (residuals)

$$e_t = y_t - a - bx_t, \quad t = 1, 2, \dots, n, \quad (7)$$

have, with respect to Formulas (5) and (6), residual variance

$$\text{var } e = (1 - r^2) \text{var } y. \quad (8)$$

The usual coefficient of determination $R^2 = 1 - \text{var } e / \text{var } y$ is here reduced to $R^2 = r^2$ (9)

and an unbiased estimate for the variance of random perturbations σ^2 has the form

$$s^2 = n(n-2)^{-1} (1 - r^2) \text{var } y. \quad (10)$$

The prediction problem is solved on the basis of the fact that the independent variable's value,

$$x_{n+h} > 0 \text{ for } h = 1, 2, \dots, m, \quad m < n, \quad (11)$$

is known between points n and $(n+h)$. The mean predictor is then

$$\hat{I}(h) = a + bx_{n+h} \quad (12)$$

where a and b stand for the estimates (5) and (6). With respect to the unknown variable y_{n+h} to be predicted, the error amounts to

$$d(h) = \pi(h) - y_{n+h}. \quad (13)$$

If the *ceteris paribus* principle is valid for the variable to be predicted, i.e., if the $y_{n+h} = y^{(m)}$ prognostic model is considered in relation with the model specified by Formula (1), which describes the past with the following properties:

$$y^{(m)} = \alpha + \beta x_{n+h} + \varepsilon^{(m)}, \quad (14)$$

$$E(\varepsilon^{(m)}) = 0, \quad E[(\varepsilon^{(m)})^2] = \sigma^2, \quad (15)$$

$$E(\varepsilon^{(m)} \varepsilon_t) = 0, \quad t = 1, 2, \dots, n, \quad (16)$$

then the variable under consideration is *ex ante* unbiased,

$$B_m[\pi(h)] = E[d(h)] = 0, \quad (17)$$

and its *ex ante* quadratic risk equals

$$R_m[\pi(h)] = E\{[d(h)]^2\}, \text{ which in its turn equals}$$

$$R_m[\pi(h)] = \sigma^2 C_n(h) \quad (18)$$

while there is

$$C_n = \frac{(n+1)}{n} + \frac{(x_{n+h} - x)^2}{n \cdot \text{var } x}, \quad h = 1, 2, \dots, m. \quad (19)$$

The traditional span of predictions will be determined as follows: when the coefficient of reliability is given as

$$1 \otimes \Delta, \quad 0 < \Delta < 1, \quad (20)$$

the lower variant $\pi_L(h)$, and the upper one $\pi_U(h)$ are calculated:

$$\pi_L(h) = \pi(h) \otimes D(\Delta, h), \quad \pi_U(h) = \pi(h) + D(\Delta, h), \quad (21)$$

where

$$D(\Delta, h) = \mu(\Delta) \{s^2[C_n(h)]\}^{1/2} \quad (22)$$

stands for an admissible error value, and $\mu(\Delta)$ is a $(1 \otimes \Delta/2) \cdot 100\%$ quantile for the Student *t*-distribution with $(n \otimes 2)$ degrees of freedom. The resulting construction admits the following interpretation: if all the hypotheses on the model are valid (especially, the assumption that the random perturbations have normal distributions and the variable to be predicted complies with its *ceteris paribus* prognostic model), then the variable to be predicted will lie inside the interval $[\pi_L(h), \pi_U(h)]$ with the probability value equal to $(1 \otimes \Delta)$, and outside this interval with the complementary probability value of Δ .

Fin-shaped prediction span

As we have tried to prove (cf. Kozák and Hindls, 1997), we can follow two non-stochastic alternatives in addition to the probabilistic options (21). Both of them are connected with two more models for the dependent variable

$$y_t = \alpha_p + \beta_p(x_t)^p + \varepsilon_{p,t}, \quad 0 < p < 1, \quad t = 1, 2, \dots, n, \quad (23p)$$

$$y_t = \alpha_{1+q} + \beta_{1+q}(x_t)^{1+q} + \varepsilon_{1+q,t}, \quad 0 < q < 1, \quad t = 1, 2, \dots, n. \quad (23q)$$

Regarding their interpretation with respect to model (1), it is useful to require that all of these three models should have the same deterministic components both at the beginning of the prediction, $t = n$, and at the beginning of series, $t = 1$. With respect to Formulas (1), (23p), and (23q), it seems reasonable to require that the following boundary conditions should be met:

$$\alpha_p + \beta_p(x_i)^p = \alpha + \beta x_i, \quad 0 < p < 1, \quad i = 1, 2, \dots, n, \quad (24p)$$

$$\alpha_{1+q} + \beta_{1+q}(x_i)^{1+q} = \alpha + \beta x_i, \quad 0 < q < 1, \quad i = 1, 2, \dots, n. \quad (24q)$$

We have estimates (5) and (6) for α and β ; hence, denoting by a_p, a_{1+q}, b_p , and b_{1+q} the estimates for $\alpha_p, \alpha_{1+q}, \beta_p$, and β_{1+q} (respectively), we can calculate them with the aid of the following Formulas

$$a_p + b_p(x_1)^p = K_1, \quad a_p + b_p(x_n)^p = K_n, \quad (25p)$$

$$a_{1+q} + b_{1+q}(x_1)^{1+q} = K_1, \quad a_{1+q} + b_{1+q}(x_n)^{1+q} = K_n \quad (25q)$$

where

$$K_1 = a + bx_1, \quad K_n = a + bx_n. \quad (26)$$

In other words, the equality

$$a_p = a + b [x_1(x_n)^p \otimes x_n(x_1)^p] / [(x_n)^p \otimes (x_1)^p] \quad (27p)$$

is valid and there is

$$b_p = b (x_n \otimes x_1) / [(x_n)^p \otimes (x_1)^p]. \quad (28p)$$

Analogically,

$$a_{1+q} = a + b [x_1(x_n)^{1+q} \otimes x_n(x_1)^{1+q}] / [(x_n)^{1+q} \otimes (x_1)^{1+q}] \quad (27q)$$

and there is

$$b_{1+q} = b (x_n \otimes x_1) / [(x_n)^{1+q} \otimes (x_1)^{1+q}]. \quad (28p)$$

Models (23p) and (23q) provide alternative predictions

$$\pi_p(h) = a_p + b_p (x_{n+h})^p, \quad 0 < p < 1, \quad (29p)$$

$$\pi_{1+q}(h) = a_{1+q} + b_{1+q} (x_{n+h})^{1+q}, \quad 0 < q < 1, \quad (29q)$$

and the goal is to compare those with the mean variant (12), related to the original model (1). It can be proven that they fulfil the following inequalities:

$$\pi_p(h) < \pi(h) < \pi_{1+q}(h) \text{ or } \pi_{1+q}(h) < \pi(h) < \pi_p(h); \quad (30)$$

hence the lower and upper predictions

$$\pi_p(h) \text{ at } 0 < p < 1, \text{ and } \pi_{1+q}(h) \text{ at } 0 < q < 1 \quad (31)$$

can, as related to the mean variant $\pi(h)$, be viewed as the limits of a non-traditional span of predictions, called a "fin-shaped" span. Of course, selection of the constants p and q is decisive for this construction.

This approach provides us with a relatively narrow non-stochastic prediction interval, which is suitable for short-time predictions in the underlying economic time series.

FIN-SHAPED SPAN OF PREDICTIONS FOR TIME SERIES IN THE AREA OF FOREIGN TRADE

We are now going to illustrate our procedure in constructing a fin-shaped span of predictions for time series of total exports from the Czech Republic. In line with the introductory remarks, we will extrapolate the quarterly values of exports from the 1st quarter of 2008 until the 2nd quarter of 2015. That is, $t = 1, 2, \dots, 30$, where $t = 1$ corresponds to the 1st quarter of 2008, and $t = 30$ to the 2nd quarter of 2015.

We will derive the fin-shaped predictions for the 3rd and 4th quarters of 2015 and compare them with the actual values, which were already officially known at the time this paper was written. The considered time series is taken over from the National Accounts of the Czech Republic and it is seasonally cleaned (which is a necessary condition for applying a fin-shaped prediction); it is given in current prices.

In Table 1 we provide the values for periods from Q1/2008 to Q2/2015, and (in parentheses) the known values for Q3/2015 and Q4/2015 (highlighted in grey). However, we will try and predict these two last mentioned values with the FIN model – that is why they are shown in parentheses. Subsequently, we will assess the predictions' accuracy with the aid of these actual data values.

The first step is to identify the values of the p and q parameters. They are selected so that the curves connecting the Y_t^H values (corresponding to p) and Y_t^D values (corresponding to q) make up a "fin" covering a substantial proportion of the Y_t actual values. We set $p = 0.5$ and $q = 0.98$. Other values, close to the chosen ones, would also be possible; we can easily verify this possibility by experimenting. The parameter values according to Formulas (5), (6), (27p), (27q), (28p), and (28q) are: $a = 544,374.074$; $b = 12,215.193$; $a_p = 477,468.705$; $b_p = 79,120.561$; $a_{1+q} = 556,167.458$, and finally $b_{1+q} = 421.808$. The calculations and results are shown in Table 2.

Table 2. Calculations

In Table 2, showing calculations, we can see the actual values y_t of total exports, determined by the trend line Y_t and the upper Y_t^H , and lower Y_t^D limits of the fin, including the difference between these limits. The actual and predicted values for Q3/2015 and Q4/2015 are again highlighted in grey. The $(Y_t^H - Y_t^D)$ difference equals the width of the desired non-stochastic fin-shaped span of predictions. The prediction of total exports for Q3/2015 lies in the interval (917,993; 934,620), and for Q4/2015 in (925,042; 959,174). The absolute value of the non-stochastic span of predictions is 16,626 or 34,132 million CZK, respectively.

Figure 1 below shows the graphical shape of the results, including the fin shape.

From the results summarized in Table 2 and Figure 1, we can see that a prediction of the total exports from the Czech Republic was very accurately estimated for the 4th quarter of 2015 (i.e., at time $t = 32$) and with a small error for the 3rd quarter of 2015 (i.e., at time $t = 31$).

The percentage error of this non-stochastic span of predictions does not exceed a value of approx. 1.5%, which can be considered an accurate estimate for the prediction of the exports.

CONCLUSIONS

The paper brings an original method for the construction of non-stochastic prediction of the time series. Its advantage is that the choice of parameters p , q can be transferred directly past behaviour of economic indicators in forecasting interval. Thus combining two concepts - models with constant parameters and models with changing parameters. Application of this method is especially suitable for processes that are not burdened by interventions into the character of the time series.

There are open questions and topics for future work connected with the concept of the non-stochastic fin-shaped predictions. The key issue is that of selecting the p and q parameters, and there are two basic options for resolving this issue. The first is to choose these parameters so that most of the empirical values lie between the created polynomial trend curves. Of course, the more variable the actual values of the analysed time series, the wider the area between the polynomial trends (which make up a shape of a "fish", as can be seen in Figure 1), and vice versa. For the fin-shaped predictions the situation is similar.

Let us once more point out that the time series under consideration must have been seasonally cleaned in advance. Otherwise the "fish" is unable to cover the values of the time series (the seasonal fluctuations quickly get out of the fish area).

Another option for choosing the p and q parameters would be to use a pseudo-prediction method. That is, the time series can be shortened by, say, two values, a fin-shaped prediction applied, and the obtained predicted values compared with the known two values ("kept secret" when constructing the fin). Then the classical Theil index of discrepancy comes into play. From a computational point of view this means that all real combinations of the p and q parameters should be gone through. Since there are infinitely many such combinations, the search for these parameters must be reduced with the aid of the above-described procedure – this fish body visualisation. For admissible pairs of p and q parameters (substantially fewer) the Theil index values will be calculated and on the basis of these values the most suitable variant of the parameters will be determined.

HOW DO EMPLOYEES' ATTITUDES AND BEHAVIORS AFFECT ORGANIZATIONAL PERFORMANCE: EXAMINING THE CRUCIAL ROLE OF HRM IN THE EURO-MEDITERRANEAN REGION

Hoppas, Costas

Administration and Finance, Cyprus University and Technology, Limassol, Cyprus

ABSTRACT

Organizations are seeking to understand how their human resources can be better utilized and managed in order to gain competitive advantage, thereby enhancing organizational performance. The importance of understanding and managing human resources has never been greater than it is today. Moreover, as organizations strive to survive during the current economic crisis, they must intensify their efforts to adopt HRM Systems (practices and policies) that will help them to achieve their aims. Reflecting on existing literature, and by adopting a quantitative methodology, the present study theoretically develops and empirically tests a conceptual model that describes how the perceived HRM system is likely to have an impact on Employees' Attitudes and Behaviors. Specifically, the mediating role of human capital, employee commitment, and employee performance are investigated within the distinct setting of higher education in the Euro Mediterranean Region. Findings, of interest to stakeholders, provide an in-depth holistic perspective of the mediating elements and mechanisms that define the impact of the perceived HRM system on organizational performance. Furthermore, implications for managers on how human resources can be more effectively managed and research directions for scholars are presented.

Keywords: *HRM; Employees' Attitudes and Behaviors; Organizational Performance; Higher Education; Euro-Mediterranean Region.*

INTRODUCTION

The current economic crisis "has made life particularly difficult for those involved in crafting business strategy and who must make difficult decisions affecting all sizes of businesses and the people who work within them" (Worrall and Cooper, 2012: 8). Based on current research evidence in businesses, it is becoming increasingly clear that the HRM system is one important component that can help an organization become more effective and achieve competitive advantage (Guest, 2011; Wright and McMahan, 2011; Wright and Nishii, 2012). Academics and scholars have devoted a great deal of

attention to examining the linkage between HRM practices and organizational performance (*see for example*, Boxall et al., 2011; Jiang et al., 2012; Wright and Nishii, 2012; Zhou et al., 2013).

Higher education institutions, like any other organization nowadays, are under increasing pressure to improve their competitiveness (Bui and Baruch, 2011). They exist in a rapidly changing environment and therefore university strategies must reflect the need to be able to adapt to constantly changing circumstances (Shattock, 2012). Major changes in higher education during the last decade, especially in European universities, have significantly altered and shaped the activities of higher education institutions. These changes have created pressures not only for changes in the internal structure of universities, but also more general changes including a reassessment of the role of universities in the society (Deem et al., 2007). As Smeenk et al. (2008) described, these changes have forced universities all over Europe to replace their “professional” strategies, structures and values with organizational (business) characteristics that could be labeled as “private sector” features.

Nevertheless, today there is a lack of understanding on how HRM can contribute and support institutions of higher education to adopt and manage effectively these changes; moreover, how IHE’s can realize the importance of the major variables and underlying mechanisms through which HRM influences performance in their institutions (Guest and Clinton, 2007).

Prior research in the business environment suggests that HRM systems can lead to competitive advantage (Allen and Wright, 2006; Becker and Huselid, 1998; Wright et al., 2001), whereas numerous studies have demonstrated relationships between different bundles of HRM practices or philosophies and organizational performance (Delery and Doty, 1996; Huselid, 1995; MacDuffie, 1995; Wright et al., 2005). Despite the fact that recent studies unequivocally assert the relationship between HRM practices and outcomes what is absent from the literature is research aimed at explaining the processes by which the perceived systems of human resource practices affect organizational outcomes (Boselie et al., 2005; Jiang et al., 2012; Paauwe, 2009; Wright and Haggerty, 2005).

This study aims to holistically investigate this gap by examining the role of employees’ attitudes and behaviors, and further enhance our collective understanding of the issue that a number of scholars have eloquently called the “black box” problem of HRM (Becker and Gerhart, 1996; Boselie et al., 2005; Boxall et al., 2011; Gong et al., 2009; Guest, 2011; Paauwe, 2009; Purcell et al., 2003; Wright and Gardner, 2004; Wright and Nishii, 2012).

THEORETICAL FRAMEWORK

The Resource Based View (RBV)

The theoretical basis and explanatory framework for linking HRM practices, human capital and organizational performance is the resource-based view of the firm, which supports the development of a

winning edge through investment in people (Boxall and Purcell, 2008). According to Barney (1991), organizations develop sustained competitive advantage by creating value in a way that is rare and hard to imitate. In order for the resources to provide a sustained competitive advantage, four criteria must exist; it must add value, be rare, be inimitable, and it cannot be substituted. SHRM theorists propose a resource-based argument that is centred on how HRM practices form a sustainable competitive advantage for organizations (Becker et al., 1997; Boselie et al., 2005). They also argue that an HRM system is an "invisible asset" creating value as it is so embedded in the organization that it enhances the firm's capabilities. According to these theorists, the HRM system is path-dependent in that policies and programmes are developed over time and cannot be purchased "over the counter" by the competition, thus making it difficult to mimic (Becker and Gerhart, 1996).

This view places emphasis on an organization's internal resources (Barney, 1991) and its investment in human capital. It maintains that through progressive human resource practices, organization specific capabilities - core or distinctive competencies - (Hamel and Prahalad, 1994) are developed by building knowledge and assets, thereby creating and sustaining a competitive advantage (Colbert, 2004; Wright and McMahan, 1992). By investing in (organizational learning ability, Yao 2013) and implementing (strategic implementation capacity, Wu 2013) programs that develop and motivate people, organizations create their competitive advantage through people (Colbert, 2004; Wright and McMahan, 1992). Therefore, as Boxall and Purcell (2008) note, "...under the RBV, the organization's distinctive HR advantage (HRA) is a combination of appropriately talented people (Human Capital Asset or HCA) and the way they work together (Organizational Process Advantage or OPA)". Moreover, Lepak and Snell (2007) argue that organizations need a commitment-oriented HRM system for employees whose skills are critical to an organization's core or distinctive capabilities.

The Social Exchange Theory (SET)

Social exchange theory focuses on the motivational component of employee-organisation relationships and provides insights regarding the implications of the fit between the expected inducements and contributions provided in an employee-employer exchange (Tsui et al., 1997). Specifically, social exchange theorists (e.g., Gouldner, 1960) examine the exchanges that occur between employers and employees regarding perceptions of reciprocity at an individual level of analysis. The essence of social exchange theory is the notion of a norm of reciprocity that develops, which makes employees feel obligated to respond equitably to treatments from others (including one's employer).

Any fit to firm strategy must first consider the type of employee behaviors required to successfully execute the strategy, and the type of skill necessary to exhibit those behaviors (Allen and Wright, 2006). The motivational processes of social exchange theory and the norm of reciprocity (Blau, 1964; Molm et

al., 2007) may explain the relationships among human resource practices and employee outcomes (Eisenberger et al., 1990; Setton et al., 1996; Wayne et al., 1997). A well-established stream of research rooted in social exchange theory has shown that employee commitment to the organization derives from their perceptions of their employer's commitment to and support of them (Eisenberger et al., 1990; Cropanzano and Mitchell, 2005; Setton et al., 1996). The research suggests that employees interpret organizational actions such as human resource practices (Rhodes and Eisenberger, 2002; Setton et al., 1996; Wayne et al., 1997) and the trustworthiness of management (Aryee et al., 2002; Eisenberger et al., 1990; Setton et al., 1996) as indicative of the personified organization's commitment to them. They then reciprocate their commitment accordingly.

Integrating the Resource Based View and the Social Exchange Theory

While researchers have increasingly investigated the impact of HRM on economic success with the resource based view of the firm (eg., Barney and Wright, 1998) and have developed more middle level theories regarding the processes through which HRM impacts firm performance (Boselie and Paauwe, 2000; Takeuchi et al., 2007), much work still needs to be done (Guest, 2011; Jiang et al., 2012; Wright and Haggerty, 2005; Wright and Nishii, 2012). As the discussion in the previous section suggests, there appears to be a disconnection in the understanding of the relationship and mechanism between HRM, human capital and performance or/and HRM, employees' attitudes and behaviors and performance.

One of the reasons that this is the case may be due to the relative emphasis placed by the resource-based view of the firm on human capital and the emphasis placed on employee attitudes and behaviors by the behavioral perspective without considering these perspectives simultaneously. In both of these perspectives, employee behavior is the key mechanism that promotes high performance as a result of HRM practices. Thus, by integrating both perspectives and simultaneously looking at human capital and employee attitudes and behaviors (commitment) as important components of performance, a better understanding of how HRM systems lead to organizational performance can be gained. Such HRM systems are generally found in high performance work environments (Becker et al., 2001; Den Hartog and Verburg, 2004; Macky and Boxall, 2007), they reflect a strategic focus and promote the organization's commitment to its employees (Whitener, 2001). By integrating the social exchange theory and the resource-based view, a mediating model is proposed in which the perceived system of HRM practices is linked to organizational performance through human capital, employee commitment and employee performance in sequence.

The focus of this research was driven by the need to fully understand the relationship between a perceived system of HRM practices and organizational performance, by taking into consideration

employees' attitudes and behaviors as the mediating variables. More specific, how the perceived system of HRM practices impacts human capital and employee commitment (within a fully specified system of mediating mechanisms), including the nature of their mediating role. Reflecting on the recent literature on SHRM, RBV and SET, as explained above, the proposed model (see Figure 1) provides an integrated framework that can shed light on the mediating variables and mechanism through which the perceived system of HRM practices impacts organizational performance.

Furthermore, the proposed model provides a framework for understanding the potential performance implications of an organization's human capital and employee commitment. The system of HRM practices is the primary way to influence employees' attitudes and behaviors, namely the level of human capital that organisations possess and employee commitment that are exhibited for the organizations as depicted in the following five hypotheses.

Hypothesis 1: There is a positive relationship between the perceived system of HRM practices (HRMSYS) and the level of human capital (HUMC).

Hypothesis 2: There is a positive relationship between the perceived system of HRM practices (HRMSYS) and employee commitment (COM).

Hypothesis 3: There is a positive relationship between the level of human capital (HUMC) and employees' performance (EMPP).

Hypothesis 4: There is a positive relationship between employees' commitment (COM) and employees' performance (EMPP).

Hypothesis 5: There is a positive relationship between employees' performance (EMPP) and organizational performance (ORGP).

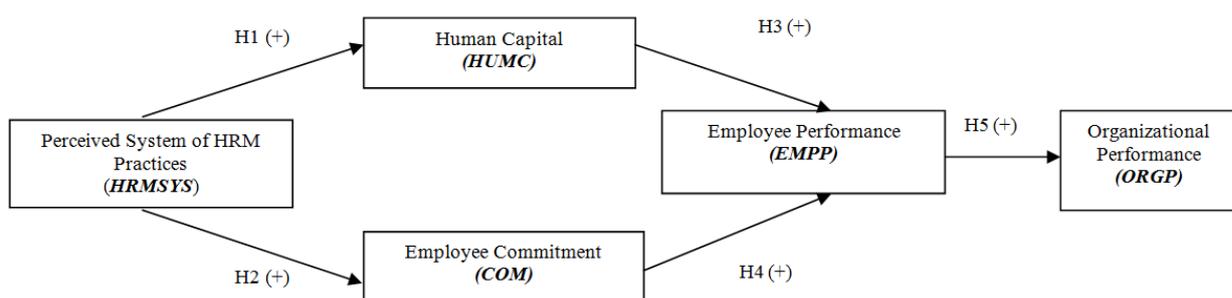

Figure 1: The Proposed Conceptual Model

RESEARCH DESIGN

Research setting and sample

Cyprus' accession to the EU reiterated the need for organizations to recognize the critical importance of managing human resources as a strategic element of their operations. However, the alleged advantageous outcomes of strategic HRM practices and systems have not been fully realized by Cypriot organizations (Costea-Stavrou, 2002, 2005; Hoppas and Ellinas, 2004). Indicative is the fact that a scan of relevant literature reveals that only a handful of studies have investigated HRM in Cyprus and none has ever explored the causal relationship of HRM systems/practices and organization performance. The apparent underutilisation of related theories and the scarcity of empirical investigations in the Cyprus-specific environment provided the impetus for this research endeavour.

By adopting a quantitative methodology, a survey was developed and administered to all administrative employees (approximate number 750) currently working at the country's university-level institutions, the main focus of the study. For practical purposes, the questionnaire was initially developed in English and then translated into Greek language with the assistance of a linguist. Back translation was finally applied in order to ensure the conceptual clarity and enhance the validity and reliability of the research tool. Prior to administration the surveys were tested for reliability (test-retest method), and content validity (panel of experts). Questionnaires were distributed to all 750 administrative employees working in the five participating universities, out of which 321 were deemed appropriate for further analysis, thus yielding an effective response rate of 43%.

Measures

The perceived system of HRM practices was measured using twenty items (the initial construct consisted of twenty-nine items). The items for consideration were derived from studies conducted by Lepak and Snell (2002); Macky and Boxall, (2007); Boselie (2010); and Kehoe and Wright (2013). The twenty items were measured using a six-point interval scale ranging from "strongly disagree" (1) to "strongly agree" (6). Cronbach's alpha for the measures of the five HRM practices ranged between 0.75 and 0.94.

Administrative employees assessed the level of human capital that each university possesses, using four items from Youndt and Snell (2004) intellectual capital scale. This construct captures the level of human capital. This is not a measure of individual knowledge, skills and abilities, but a measure of the overall knowledge, skills and abilities of the university administrative employees. This construct was measured by asking respondents to assess the quality of the university's administrative

employees relative to that of its competing universities in Cyprus for the overall knowledge, skills and ability, job related skills and educational level. Respondents indicated their perceptions for this practice on six-point Likert-type scales ("1 = strongly disagree" to "6 = strongly agree"). An example item asking the employee to assess the level of human capital is "The employees working in this university are highly skilled". Cronbach's alpha estimate for internal reliability was 0.88.

Affective commitment was measured using four items from Wayne et al. (1997), Meyer et al. (1993) and Allen and Meyer (1990). This construct, in the same vein as human capital, is a measure of the overall employee commitment to the university. Respondents indicated their agreement from "1 = strongly disagree" to "6 = strongly agree." Examples items are: "I would be happy to spend the rest of my career with this university"; "I find my values and the university's values very similar". Cronbach's alpha estimate for internal reliability was 0.91.

Three items of perceived employee performance from Way (2002) and Williams and Anderson (1991) were used to measure this construct. Perceived employee performance was used rather than any other objective measure of performance, i.e., customers served per employee, which is a widely used measure of performance/productivity, due to the difficulty of collecting such objective measure at the university-level education. The first item is: "Our employees' performance/productivity is higher than those of other universities" with two additional items developed for the study ("Our employees perform/produce outputs in an efficient manner," and "Our employees' productive power is higher than those of other universities"). This construct, again, is a measure of the overall employee performance. The resulting three-item scale had a reliability of 0.88.

The organizational performance construct was measured using a subjective assessment of the university's performance relatively to other universities in Cyprus. This approach was utilized because the university's ability to generate superior performance relatively to its competitors is viewed as most relevant, rather than financial measures of performance. The organizational performance construct for the current study consists of eight items using a five-point interval-type scale measuring performance, quality of service and programs (service quality), development of new services and programs, ability to attract essential employees, ability to retain essential employees, satisfaction of customers or clients, relations between management and other employees, relations among employees in general, profitability, innovation, and productivity.

Administrative employees were asked to rate their University's performance in relation to other universities in Cyprus over the past three years. This scale was based on similar scales developed by Delaney and Huselid (1996) and Youndt et al. (1996) for measuring organizational performance, but minor modifications were made to some items and additional items were developed especially for university performance. An example item is "Compare your university to other universities in Cyprus

over the past three (3) years, how would you rate the (quality of services and programs) of your university? Cronbach's alpha estimate for internal reliability was 0.89.

Data analysis

Structural Equation Modeling (SEM), a flexible and powerful tool that combines aspects of both multiple regression and factor analysis (Hair et al., 2010) was utilized to analyse the data and address the postulated hypotheses in a holistic manner. The AMOS software program with the maximum likelihood estimation (MLE), SEM's most widely used estimation method, has been utilized in the analysis.

RESULTS

Prior to the evaluation of the construct validity of the overall measurement model, the construct validity of the second order factor (HRMSYS Construct – Perceived System of HRM Practices) was examined. The second order factor consisted of five first order factors, namely, (1) Employee Selection (Fes), (2) Employee Training and Development (Fetd), (3) Performance Management (Fpm), (4) Compensation and Incentives (Fci), and (5) Employee Involvement and Participation (Feip). The model yielded a χ^2 value of 395,095 with 162 degrees of freedom ($p=0.000$). In response to chi-square's in-built limitations, the CMIN/DF (χ^2 divided by the degrees of freedom) computed was satisfactory (2.438) since values less than 3 indicate an acceptable fit (Tabachnick and Fidell, 2007). In terms of additional fit statistics, the model yielded a Root Mean Square Error of Approximation (RMSEA) of (.067) (below the acceptable threshold of .07, as suggested by Steiger, 2007), with a lower boundary of a two-sided 90% confidence interval for the population of (.058) and an upper boundary of (.075). Moreover, the model produced a CFI (Comparative Fit Index) score of .948, and an IFI (Incremental Fit Index) score of (.949); both of which fall within the ideal ranges ($>.90$) for acceptable fit (Hair et al., 2010). Parsimonious fit indices such as PRATIO (.852) and PCFI (.809) (Mulaik et al., 1989) and convergent and discriminant validity scores (eg., Factor Loadings, Average Variance Extracted, Construct Reliability, Interconstruct Correlations, and Squared Interconstruct Correlations) also support the acceptability of the model.

Following the development and acceptability of HRMSYM, as a second order factor, goodness-of-fit measures were utilized to evaluate the overall model. The model yielded a χ^2 value of 1634,778 with 684 degrees of freedom ($p=0.000$) and an acceptable CMIN/DF of 2.390. The Root Mean Square Error of Approximation (RMSEA) yielded a score of (.066) with a lower boundary of a two-sided 90% confidence interval for the population of (.062) and an upper boundary of (.070). Moreover, a CFI (Comparative Fit Index) score of .901, an IFI (Incremental Fit Index) score .901 and parsimonious fit

indices such as PRATIO (.919) and PCFI (.828) also support the acceptable fit of the model. It is important to note that according to Hair et al. (2010) in models with more than 250 observations and 30 or more observed variables, clearly the case in this study, a CFI above .900 in conjunction with an RMSEA of less than .070 suggest an acceptable fit.

The models convergent validity qualities were also evaluated. As exhibited in Table 1, all factor loadings exceeded the minimum acceptable of 0.700, the model's average variance extracted (AVE) was way above the .500 threshold, and all construct reliability values fall within acceptable ranges (>.70). In particular, the final model yielded an AVE of 0.66, and reliability scores ranging from 0.88 to 0.92. Finally, the discriminant validity of the final model was also verified since AVE scores for each factor exceed their respective squared interconstruct correlation (SIC) score for both the factor itself and all the remaining factors (See Table 1).

Notes: Model's Average Variance Extracted (AVE) = 0.66; * HRMSYS = Second Order Factor

Table 1: Convergent Validity of the Overall Model

Standardized path coefficients and the significance of the hypothesized relationships were utilized to test the postulated hypotheses in a causal diagrammatic form. Findings revealed a significant positive association between the perceived system of HRM practices (HRMSYS) and the level of human capital (standardized path coefficient $\beta = .712$; $t = 11.277$, $p < 0.001$), thus leading to the acceptance of H1. Similarly, H2 can also be supported since findings revealed a positive relationship between the perceived system of HRM practices and employee commitment (standardized path coefficient $\beta = .593$; $t = 10.123$, $p < 0.001$). Moreover, Hypotheses 3 and 4 can be supported since findings revealed that the level of human capital has a significant positive effect on employee performance (standardized path coefficient $\beta = .507$; $t = 8.055$, $p < 0.001$), whereas employee commitment is also positively associated with employee performance (standardized path coefficient $\beta = .209$; $t = 3.701$, $p < 0.001$). Finally, Hypothesis 5, which posited that employee performance has a positive impact on organizational performance, can also be supported (standardized path coefficient $\beta = .676$; $t = 10.610$, $p < 0.001$). Overall, the analysis, exhibited in Table 2, revealed that all five postulated hypotheses can be supported.

Hypotheses	Standardized coefficient	path	t-value	Results
H1: HRMSYS →(+) HUMC	.712		11.277**	Accepted
H2: HRMSYS →(+) COM	.593		10.123**	Accepted
H3: HUMC →(+) EMPP	.507		8.055**	Accepted
H4: COM →(+) EMPP	.209		3.701**	Accepted
H5: EMPP →(+) ORGP	.676		10.610**	Accepted

Note: HRMSYS=Perceived System of HRM Practices; HUMC=Human Capital; COM=Employee Commitment; EMPP=Employee Performance; ORGP=Organizational Performance

*Significant at $p < 0.05$; **Significant at $p < 0.01$

Table 2: Summary of Hypotheses and Results

Mediation analysis

The above findings led to further investigation with the utilization of mediation analysis. Mediation refers to a situation that includes three or more variables, such that there is a causal process between them (Preacher and Hayes, 2008). The mediation relationship as applied in the context of the current analysis describes a direct effect between an independent variable (e.g., system of HRM practices) and the dependent variable (e.g., organizational performance). There might also be indirect effects between the independent variable and the mediating variables (human capital and employee commitment), and between the mediating variables and the dependent variable. The degree to which

the direct effect changes as a result of including the mediating variables is referred to as the mediational effect (MacKinnon et al., 2002; Preacher and Hayes, 2008).

The empirical model developed has multiple mediations meaning that there are several putative mediators to account for the relationship between the system of HRM practices and organizational performance. Specifically, HRMSYS has a direct relation with ORGP (HRMSYS → ORGP) and two indirect (mediated) relations through COM (HRMSYS → COM → ORGP) and HUMC (HRMSYS → HUMC → ORGP) respectively. In cases of multiple mediations it is advised (Preacher & Hayes, 2008) that all the mediations are tested using a single multiple mediation model. The methodology involves two distinct models. First a model is developed including only the direct relationship of HRMSYS to ORPG, whereas a second model includes all the indirect relationships and the direct one. In particular, Model 1 investigates whether the regression weight of the direct relationship is statistically significant, whereas Model 2 investigates if the direct and indirect effects are statistically significant (See Table 3).

Direct effect w/o Med (Model 1)	Direct effect with Med (Model 2)	Indirect effects (Model 2)	Mediation Type Observed
0,138 (***)	0,273 (0,002)	0,322 (0,002)	Partial

Note: Model comparison suggests that Model 2 has a better fit than Model 1. (Inside the parentheses in the significance level computed from AMOS).

$$\Delta^2/\Delta() = 287.032 (2), \leq 0.05$$

Table 3: Mediation Results from Model 1 and 2 concerning direct and indirect effects

Findings, exhibited as Table 3, suggest that Model 2 has a better fit than Model 1. In simple terms the findings suggest that the perceived system of HRM practices has both direct and indirect effects (through employee commitment) on organizational performance. The empirical finding is compatible with the recent literature (Ng and Feldman, 2010) where it is supported that the level of human capital is considered as very important in the relationship between the HRM practices and organisational performance. However, as it was empirically extracted in the results, its relation to organizational performance is not direct, but rather affects employee commitment which in turn impacts employee and organizational performance.

CONCLUSION AND DISCUSSION

Implications for theory and research

This study contributes to the extant body of the relevant literature in a number of ways and has important implications for further theory building. Firstly, it looks at the performance effects of the perceived system of HRM practices in relation to human capital and employee commitment drawing

on two influential but distinct theories, the RBV and SET, by integrating them in a holistic conceptual model for the first time in the university-level education environment. This, along with the evidence provided from the results of the current study (that the level of human capital and employee commitment relate to employee and university performance), contribute to the better understanding of the mediating mechanisms linking HRM and university performance and shows the value of thinking across theoretical boundaries.

Secondly, the findings of the study highlight the importance of the perceived system of HRM practices and its multi-dimensional nature. Although in other studies in the literature, this construct was operationalized as a separate uni-dimensional construct, in the current study, the perceived system of HRM practices was conceptualized and treated as a multi-dimensional construct. Moreover, the multi-dimensional construct of the perceived system of HRM practices was subject to model testing using structural equation modelling analysis among administrative employees in university-level education setting to test its interrelated and extrapolated nature.

A third contribution is that the final model and the path coefficients using the structural equation model showed that there were a number of causal indicators which are theoretically acceptable. The variable path relationships between the latent and observed variables were examined as hypothesized. The model path relationships indicated that the perceived system of HRM practices scale is fully operationalized for examining the perceived system of HRM practices in higher education institutions.

Finally, the results of this study contribute to the literature on strategic human resource management, employees' attitudes and behaviors, and higher education by opening up the "black box". This has facilitated the explication of the mediating variables associated with the system of HRM practices and performance, namely human capital and employee commitment. In addition, the current study demonstrates the important role that employee commitment holds and enacts in the mechanism that links the perceived system of HRM practices and organizational performance and provides important implications for HRM researchers, university managers, and other HRM practitioners.

Implications for practice

Besides the scholarly contributions, the current research also has important practical implications. The managerial relevance of this research study rests in providing the university HRM professional services with information about how to configure a coherent and consistent system of HRM practices and to link this system with their unique context in order to increase performance. Moreover, the findings of this study provide recommendations about what factors are important, at an initial stage, for achieving a fit between the practices within the HRM system and subsequently, for determining

the factors that are important in achieving a higher level of human capital and in enhancing employee commitment.

A second contribution, pertinent to managers, is extracted from the empirical finding showing that employee commitment is an important driver for both employee and university performance. As employee commitment has significant effects on employee and organizational performance, managers should be alerted to the potential bottom line implications of highly committed university administrative/professional departments. Managers need to recognize that committed employees have a value beyond their immediate and individual performance as these individuals may contribute to the overall departmental level performance; thus a practical recommendation that stems from this research is that managers may use different interventions such as channeling the behaviors of committed employees towards filling gaps in the delivery of service, encouraging synergy between employees and emphasising the achievement of department-level performance targets (Conway and Briner, 2012).

Third, the current research also offers several suggestions for managers to increase the performance of their employees. This could be achieved by ensuring that their employees perceive the system of HRM practices as beneficial by constantly sending signals - internal communication strategy - that employees are valuable as assets for the university and that their contributions make a difference to the success of the university. This should be part of the design and implementation of a coherent and consistent system of HRM practices tailored for the internal and external environment of their university.

Finally, a significant contribution of the current study is that it provides sufficient information to university managers on how to deal with administrative and support staff based on the system of HRM practices employed. Guest and Clinton (2007) state that many line managers in universities find it difficult to be fully responsible because they are still in need of high skills and confidence in handling their tasks. An example is to provide full accountability and responsibility to line managers in order to handle the day to day work, and to effectively implement the HRM practices.

Limitations and conclusion

The results of the study should be interpreted with some caution, given several limitations that also suggest lines of further research. First, the study is based on a cross-sectional design. As with most research in management studies, the cross-sectional design of the current study does not allow for any conclusions regarding causality. Although, a number of procedures have been followed in order to minimize the likelihood of common method variance (CMV) bias and the Harman's one-factor test was performed with results showing that common method variance is unlikely to be a serious

problem, CMV may be a concern as this study used a self-report questionnaire to collect data from the same group at the same time. A third limitation of the study is its focus on the higher education sector that limits the generalizability of the findings. Although similar findings can be expected in other service sector organizations, the findings of the current study should be treated with caution.

Despite these limitations, the findings of the current study provide convincing evidence that the perceived system of HRM practices affects human capital, employee commitment and employee performance which in turn affect organizational performance thus the data offers an encouraging base, for researchers (and practitioners), on which to explore these relationships further. In addition, the findings of the study create opportunities for further research (and comparisons) regarding the relationship between the perceived system of HRM practices and organizational performance in different contexts, such as different sectors of the economy and/or other Euro-Mediterranean countries.

WINE WEB VALUE: WEB MARKETING STRATEGIES FOR FAMILY BUSINESSES

Iaia, Lea; Monica, Fait; Scorrano, Paola; Amedeo, Maizza; Cavallo, Federica

Department of Management, Economics, Mathematics and Statistics, University of Salento, Lecce, Italy

ABSTRACT

The goal of this research project is to deepen and expand the web marketing strategies used by family businesses (FB) and to identify the role assigned to websites and the online communication strategies implemented through them.

In order to examine the content of the information found on the website of selected FBs, an “*ad hoc*” analysis model was designed and validated with the support of marketing and industry experts through an inspecting focus group (Mich, 2007).

The observation of the FB websites showed that family-run Italian wineries use their websites mainly to present information about the business and as a relational tool through edutainment-style activities; FBs yet neglect the potential of e-commerce.

Although this path has allowed the traits essential to launch effective online communications for FBs, the small number of businesses surveyed (10) does not permit a theoretical generalisation of the results. Thus, we expect to integrate the information obtained from this preliminary study with in-depth interviews with the digital strategists for the companies examined or by increasing the number of FBs studied. In addition, the results could be compared with those from Italian businesses in the wine industry which are not family run and which meet the selection criteria (turnover, etc.).

The study highlights the importance and the attention that FBs, among others, should dedicate to the role of web communication within their communications strategy. It also provides a list of contents to consider when creating a website which should be customised with the brand’s specific details.

Keywords: *website; family business; wine industry; web communication.*

INTRODUCTION

Although with a slight delay with respect to foreign competitors, the Italian wine industry has adopted the changes taking place and businesses have, in recent years, begun to use an internet-oriented approach for company communications (FleishmanHillard and the E-commerce Observatory of the Politecnico di Milano, 2015). That innovation, given the strong interference of the decision-

making organ in communications and the high incidence of family-run businesses in the wine industry worldwide (IFERA, 2013; Culasso *et al.*, 2013; Morck and Yeung, 2004; Astrachan and Shanker, 2003; Faccio *et al.*, 2002; Claessens *et al.*, 2000; La Porta *et al.*, 1999) and within Italy (Corbetta *et al.*, 2015), generates an interest in understanding the characterization of *web communication* for the above-mentioned wine producers.

The goal of this research project, then, is the expansion of online communication strategies used by *family businesses (FB)* with the purpose of identifying the role assigned to websites in company communications and the strategies implemented by such businesses, as well as tracing their distinguishing elements.

THEORETICAL BACKGROUND

In order to take advantage of the opportunities which derive from the introduction of the internet in consumers' buying and consumption habits, the company has to be able to design and implement the appropriate *web marketing strategy*, understood as "*the strategic process of creating, distributing, promoting, and pricing products for targeted customers in the virtual environment of the Internet*" (Pride *et al.*, 2007).

The digital strategy has to carry out traditional marketing activities using the web and should be based on a pre-established *voice* and with precise behavioural rules with the intention of increasing *brand awareness*, influencing potential consumers, increasing word-of-mouth marketing and improving the brand's reputation (Fiocca and Sebastiani, 2015).

Although there are numerous tools available for the creation of a business's online communications, the website is often one of the first steps (Rios and Pablo, 2014). In fact, it is the hub as it simultaneously constitutes the company's main promotional "window" and the essence of its *online presence* (Toma and Marinescu, 2012; Kung and Zhang, 2011).

Like other industries, the growing tendency for consumers to use the internet as a means to find information about winemaking brands and products before making a choice has also brought about changes in *wine businesses'* communication strategies. This is also taking into account the fact that the website rises to become the first and only point of contact between the business and current or potential consumers (Velikova *et al.*, 2011).

The academic literature, favouring various analytical methods, often has focused on investigating the strategies implemented by wineries and wine producing regions, examining the way company websites are used in particular (Duquesnois and Gurău, 2008; Begalli *et al.*, 2008; McNeill, 2007; Stricker *et al.*, 2007; Bruwer and Wood, 2005; Sellitto and Martin, 2003; Gebauer and Ginsburg, 2003; Sellitto, 2002; Giraud-Héraud *et al.*, 2001; Stening and Lockshin, 2001).

Such studies have supported the finding that the perceived value of a product increases through use of the internet (Giraud-Héraud et al., 2001), as the company co-creates value for the consumer, acting upon two levers: the wine's quality and direct contact online. Using the tangible and intangible elements of the product (in a *service-dominant* logic; Vandecandelaere, 2006), the business generates a user experience based on his preferences (discoverable thanks to the awareness developed by the company on the web). This allows the company to involve him, satisfy his expectations, create loyalty and establish a long-term relationship (*relational approach*; Prahalad and Ramaswamy, 2004; O'Neill and Charters, 2000).

In particular, Guraū and Duquesnois (2011) summarise the process of co-creation of value through the web, trying to understand how to enhance the commercial offer (focused on various assets, such as the product's quality, the *brand's reputation*, and the *value proposition*) and the value co-creation process. In addition, the authors highlighted a few i) marketing strategies which can be launched through online tools (such as *direct marketing*, *relational marketing* and *wine tourism*) and ii) functionality able to increase the value of the consumer's experience (in internet marketing, it's given a central role, especially in small to mid-sized businesses).

Richardson (2002) posited the existence of three main website types, distinguishable according to their purely informative qualities, on the presence of pre-established *forms* on the site used to request and purchase products, until reaching more complex platforms which allow the consumer to make purchases with entire autonomy. The main goals of the websites studied, then, were divided into four points: i) *direct sales*, although not always measurable; ii) *direct marketing*, in which the descriptions of the wines, the history, the production process and tasting instructions (*value added*) of the product act as support for the representatives for the promotion of the brand and its products, especially in foreign markets; iii) *tourist promotion*, by way of the virtuous circle that connects a visit to the wine cellars and the places of production, as the *wine tourist* is considered "*a valuable potential customer to be educated and exploited*"; iv) *indirect marketing*, in which the web is used as a means to convey up-to-date and credible information, substituting brochures, and thanks to which *wholesalers* can show clients, businesses and the end user what is offered and the winemaker's partners.

According to the strategies that the business decides to implement, summarised above, and the *features* that the website includes (Taylor et al., 2010; Madill and Neilson, 2010; Begalli et al., 2008; Ness, 2006; Winters, 1997; Yuan et al., 2004), its role may vary and can be traced back to a few key objectives (Notta and Vlachvei, 2013; Madill and Neilson, 2010; Palmatier et al., 2006; Heide and Wathne, 2006; Haag et al., 2006):

- a) to provide information, as it is possible to find the brand history, the producer's bio, the company's *mission statement*, the wine production and products (certifications, awards, etc.), news

and *educational opportunity* and more details consumers are interested in (Taylor et al., 2010);

- b) to sell the product without an intermediary (e-commerce), for which companies have to publish privacy and security policies, payment methods and product delivery methods (Nielsen, 2000; Schlosser *et al.*, 2006) as they allow consumers for a proper assessment of the website;
- c) to develop dynamic, creative activities which directly intercept the end consumer to generate *engagement* and then establish a long-term, interactive, loyal relationship with users (Quinton and Harridge-March, 2006) or better with a *community* of company's fans.

The importance of the proper organisation discussed up to this point, in terms content and interaction with the end user, determines the perception that the consumer will have about the website's quality, which is an important *predictor* of the increase in trust in the winemaker and the perception of the quality of its wine (Nowak and Newton, 2008).

1. Informational level				
1.1. Company information	1.2. Wine production information	1.3. Offer information	1.4. News and events	1.5. Awards

Table 1. *Content organisation of the Family Business website*

THEORETICAL FRAMEWORK AND RESEARCH QUESTIONS

Based on an analysis of the academic literature identified in the above paragraph, the elements chosen to evaluate the contents' architecture and the usage level of *wine business* websites have been identified and are proposed below (see table 1).

The presence of the identified elements primarily allows us to understand the strategies adopted by the wine producers, closely linked to the role assigned to the website in company communication (Notta and Vlachvei, 2013; Sun *et al.*, 2012; Madill and Neilson, 2010; Vescovi, 2007; Canavan *et al.*, 2007; Palmatier *et al.*, 2006; Heide and Wathne, 2006; Haag *et al.*, 2006).

So, the role of the website can be categorised as follows:

- **informative** ("1. Informational level" in the table 1): the website supplies information on the business, its production process, its products, as well as news, awards and recognitions, and even offers contact information and the company's location (e.g. telephone number, address, email);
- **interactive** ("2. Interactive level"), by which the business establishes a relationship with the user, offering him the *educational opportunity* to expand his knowledge as *wine enthusiasts*, activities held at the winery to promote wine tourism and activities in the region to incentivise a visit, the subscription to a newsletter and the website's integration with social media to create an online community;
- **transactional** ("3. Transactional level"), in which a platform for the promotional marketing and sales of the winemaker's products is provided.

In accordance with the literature and considering the proposed theoretical framework, this work is thus intended to respond to the following research question: *What are the contents of the Italian, family-run, wine business's websites and the role entrusted to them? What are the communications strategies pursued over the Web?*

EMPIRICAL SURVEY METHODOLOGY

To respond to the research question, the methodology described below was used.

Identification of the businesses to be part of the survey

To define the analysis sample, it was assumed that the adoption of suitable online marketing and communication strategies could increase the visibility and awareness of a brand, in particular, about its highly cognitive products (Notta and Vlachvei, 2013, Stricker *et al.*, 2007, Mattiacci *et al.*, 2006) such as wine, and that the latter reflect upon the business's performance. Adopting a *benchmarking* logic

(Camp, 1989; Lankford, 2000), the top thirty Italian wine producers, those who demonstrated the highest numbers of sales in the industry from 2010-2014, were chosen.

In this regard, the criteria reported below were input into the AIDA database (<http://www.bvdinfo.com>) on 16 May 2015:

1. the ATECO (2007) code 11.02, which refers to companies which produce wine from grapes;
2. the geographical location within Italy.

For each of the years studied (2010-2014, comprehensive) the top 30 businesses in terms of turnover were selected. The dataset returned by AIDA was integrated, where necessary, with data from a report titled "Indagine sul settore vinicolo" (A Survey on the Wine Industry) by Mediobanca in 2015. From that dataset of 30 businesses, those not present in every year of the five-year period studied were eliminated. As such, the sample size was reduced to 22 businesses.

Finally, from the list being examined, only businesses classified as "family owned" were selected, for a final number of 10 cases analysed (see table 2).

	Company name and place	Company website
1	ANTINORI Firenze - Tuscany	http://www.antinori.it
2	CASA VINICOLA BOTTER CARLO & C. Fossalta di Piave (Ve) - Veneto	http://www.botter.it/it/
3	CASA VINICOLA ZONIN Gambellara (VI) - Veneto	http://www.zonin1821.it
4	COMPAGNIA DE' FRESCOBALDI (°) Florence - Tuscany	http://www.frescobaldi.it/it-it/home.aspx
5	CONTRI SPUMANTI Cazzano Di Tramigna (Vr) - Veneto	http://contrispumanti.com
6	ENOITALIA San Martino Buon Albergo (VR) - Veneto	http://www.enoitalia.it
7	FRATELLI MARTINI SECONDO LUIGI Cosasno Belbo (CN) - Piedmont	http://www.fratellimartini.it
8	CAMPARI Group (§) (wines) Milano - Lombardia	http://www.camparigroup.com/it
9	GRUPPO SANTA MARGHERITA Fossalta di Portogruaro (VE) - Veneto	http://www.santamargherita.com/it/
10	MASI AGRICOLA (°) S. Ambrogio Di Valpolicella (Vr) - Veneto	http://www.masi.it

Table 2. *The family-owned wineries examined*

Legend: (°) Consolidated balance.

(§) Wine division, which only includes: «Riccadonna», «Cinzano» (vermouth and spumante), «Mondoro» (spumante), «Odessa», «Sella & Mosca», «Enrico Serafino», «Teruzzi & Puthod», «Château Lamargue» e «Liebfraumilch».

Please note that, in compliance with current legislation on privacy protection (D.Lgs. n. 196/2003 - Codice in materia di protezione dei dati personali), the value of turnover is omitted, although for consolidated groups it is available on their websites.

The organisation of a focus group and analysis of the online communication content

In order to validate the analysis model and the attributes identified in the academic literature (see table 1), adapting them for the cognitive demands of the *case studies* used, an examining focus group was organised (Mich, 2007). A few experts in the winemaking industry (two sommeliers, two entrepreneurs) and in business communications (two university researchers, a sociologist, two *digital strategists*) participated in the meeting, held 5 June 2015. The focus group lasted approximately 90 minutes and involved two *steps*: 1) presentation of the research objectives; 2) discussion and validation of the model to adopt for the websites' analysis (see table 1).

The last step was the analysis of the online communications of family-owned wineries through a study of the contents and organisation of their websites.

FINDINGS

The study of the selected websites (see table 2), was carried out by observing each of the sections found in the table previously analysed (table 1); the presence of the elements proposed in the aforementioned table in at least 50% of the businesses studied allowed for the identification of online communication strategies which are mainly used by *family-owned wineries*.

In relation to the *Informational level (code 1.)*, we focused our attention on the main information categories around which the company website is organised.

The company description (*company information, code 1.1.*) is characterised by the presence of a "Family" section, where one can find the narration of the *history* (100% of the cases; code 1.1.1.) and the explanation of the *mission statement* and of the *vision* (90%; code 2.1.1.2.) which is connected not only to the company, but to the family itself. Antinori, for example, separates the "Family" section from the company section. Zonin, in addition to having "Company" and "History" sections, has another header titled "Family" where the family members and their roles are presented (see figure 1).

Table 3. *The Zonin family*

In terms of the *contacts* category (*code 1.1.4.*), on the homepage, the wineries display the address of their legal headquarters (50%) and supply other details in the dedicated section (called “Contacts”), which contains the business email address also.

The *wine production information* (*code 1.2.*) is concentrated on the initiatives, which create added value for the end consumer, such as certifications (70%; *code 1.2.3.*) or information related to “sustainability” (which thus include the concepts of quality, health, safety, protection of biodiversity, less waste of resources such as water and fewer carbon dioxide emissions).

Campari, for example, under the “Sustainability” header lists “*Sustainable Campari, Marketing and Responsible Practices, QHSE-Quality, [...]*”, considering the concept of the company’s social responsibility (taken up by Enoitalia also). Zonin dedicates a page to “Sustainability” in the “Company” section, dividing it into: “*Water Resources, Co2 Emission Reductions, Biodiversity and Reforestation, Energy Resources, Research and Development*”. Frescobaldi focuses on “Sustainability” (see figure 2), explaining the various certifications held, such as *AgriQualità*, as further proof of the pursuit of “*Sustainable Agriculture*”, and the “*Forest Certification*”. These are joined by the numerous activities undertaken (including the implementation of “*Green Energy Sources*”) which make theirs “*Sustainable Production*”.

Table 4. *Frescobaldi and sustainability*

The *Offer information* (code 1.3.) is focused on the presentation of the product portfolio (70%; *Product information*, code 1.3.1.), in which the main information is reported, such as: type of grape used, origin, alcohol by volume, serving temperature, description of the organoleptic characteristics and food pairings (this is true for Antinori, Fratelli Martini, Contri, Botter and Santa Margherita). The remaining part (30%; *Brand information*, code 1.3.2.), on the other hand, presents the partner brands and the products (think of the Campari Group categories or of Enoitalia brands logos', which act as links to each label's website).

The *News and events* section (90%; code 1.4.) is generally not kept up to date, with two exceptions (Zonin and Masi). This section summarises the events organised by the wineries, initiatives as well as recognitions received. The latter, along with the *awards*, can also be rediscovered in the wine descriptions or, as in 50% of the cases examined, in dedicated sections of the website (*Awards and recognitions*, code 1.5.). In addition, in the *News and events* section, 50% of the businesses examined (Masi, Zonin, Fratelli Martini, Frescobaldi and Antinori) promote visits to their cellars, and only two of them reserve a special section dedicated to wine tourism through a link to an external website.

Moving our attention to the *Interactive level* of the website (code 2.), 60% of the winemakers launched *Educational opportunities* (code 2.1.), focused in particular on proposing food and wine pairings (60%; *Food and wine pairings*, code 2.1.1.) and wine tastings (40%; *Wine tasting information*, code 2.1.2.). The goal being pursued is that of assisting the consumer in the choice of wine, especially if he is inexperienced, supplying selection criteria such as the name of the wine, the *cru* of origin or food pairings, through specialised *tools* integrated with the website or in the form of smartphone apps or tasting videos.

Table 5. *Masi Agricola's customised offer for the consumer*

In this regard, Frescobaldi and Masi's solutions (see figure 3) are similar, as both customise the consumer's search with browsers within the website, called "Find a wine". These browsers allow for the selection of a product offered by the company based on the name, the cru of origin and other characteristics, thereby simplifying the choice the user has to make (especially for non-experts), with an additional criteria: "food pairings" (suggesting, for example, the ideal wines for an aperitif or for meat dishes, fish dishes or desserts).

Finally, it is worth noting the websites' low level of integration with *social networking sites* (*Social media integration, code 2.5.*); from the study of family-owned wine businesses, it is clear that the preferred platforms are Twitter (60%), Facebook (50%) and YouTube (50%) exclusively.

The transactional level is absent in the whole sample examined.

THE COMMUNICATIONS STRATEGIES PURSUED OVER THE WEB

The research carried out demonstrated that family-owned wineries in Italy use their websites to:

- a. Supply general information about the business (*informational level, code 1.*), concentrating on the history, the *mission* and the *vision* of the company, according to its characteristics. The creation of *brand awareness* is based on the typical elements of the wine industry, customised according to the company's essence;
- b. Involve the user (*interactive level, code 2.*), through suggestions for wine tastings and food pairings, especially by way of *edutainment* (Walldén and Soronen, 2008) through special applications for *smartphones* or through *posts* on the main social media websites (Twitter, Facebook and YouTube).

The elements stated above demonstrated that the main goals of the websites (Guraū and Duquesnois, 2011; Richardson, 2002) are, on one hand, the promotion of the brand and its products, domestically

and internationally, using *direct* and *indirect marketing* strategies and, on the other, *relational marketing*. Proceeding in this way, such approaches play a fundamental role in the creation of a high level of satisfaction in the *customer experience* (Shanka and Taylor, 2004; Dodd, 1999) as they allow the company to obtain a high level of involvement with consumers (*Involvement*), based on the needs they express (*Personal needs*). This generates a dialogue which keeps consumers up to date on promoted initiatives, events and products at the winery, which then stimulates them to visit (*Motivation*). In addition, the use of social media sites, useful not only for the presentation of what the company has to offer (Velikova *et al.*, 2011; Pitt *et al.*, 2011; Watts *et al.*, 2008; Olsen *et al.*, 2008), allows the business to intercept the end consumer and establish a long-term relationship with him, creating trust and loyalty to the brand (Quinton and Harridge-March, 2006), thus highlighting the wineries' *marketing oriented* approach (Velikova *et al.*, 2011).

The analysis reveals the absence of a specific call to e-commerce (*transactional level 2.3*), that is, the policy of selling products online (Richardson, 2002). This last aspect seems to be of particular interest since it highlights the modest amount of attention that individual companies pay to online product sales (*transactional level, code 3.*).

CONCLUSIONS, RECOMMENDATIONS AND DIRECTIONS FOR FUTURE RESEARCH

This research project was designed to examine the types of communications found on the websites of *family-owned businesses* in the wine industry, with the goal of understanding the details of the models used and their related competitive strategies.

A close examination of the contributions of managerial literature on the theme (Duquesnois and Gurău, 2008; Begalli *et al.*, 2008; McNeill, 2007; Stricker *et al.*, 2007; Bruwer and Wood, 2005; Sellitto and Martin, 2003; Gebauer and Ginsburg, 2003; Sellitto, 2002; Giraud-Héraud *et al.*, 2001; Stening and Lockshin, 2001) allowed for the creation of an evaluation model to effectively organise the websites' content. This, with the aim to not only provide information about company, products and events to users (*Informational level*), but also to involve them (*Interactive level*) with contents which are able to generate a dialogue that keeps consumers up to date, in order to stimulate them to visit the winery and its website (*Motivation*) and to buy its products (*Transactional level*). Moreover, the application of this model to the *Italian, family-run, wine business*, validated thanks to the support of participating experts, permitted to observe its usefulness as a self-assessment tool for the evaluation of the corporate communicative system; in fact, the analysis highlights that wineries often don't complete the communicative path because of the absence or the wrong collocation of specific contents (e.g. low level of integration with social networking sites, lack of transactional level).

The limits of this study are attributable to the small number of wineries examined (10), which does not allow for a theoretical generalisation of the results. However, the analysis carried out identifies the model of *web communication* adopted by the *family-owned business* in the Italian wine industry. This information may be usefully integrated with an additional level of *web content analysis* based, for example, on the experience – that is, on the textual content of the websites examined (using *text mining*). In addition, it would be useful to compare the results obtained for the family-owned wineries with non-family owned businesses in the industry which have similar characteristics (turnover, etc.) as our sample.

This research leads to the elaboration of a few observations regarding possible managerial implications. The importance and the attention that the wineries should dedicate to the role that *web communication*.

DISCLOSURE OF ELECTRIC MOBILITY IN ANNUAL REPORTS OF AUTOMOTIVE COMPANIES: RISKS, STRATEGIES, AND ENVIRONMENT

Ianniello, Giuseppe; Piccarozzi, Michela; Rossi, Fabrizio

Department of Economics and Management, University of Tuscia, Unitus, Viterbo, Italy

ABSTRACT

This paper intends to use the narrative section of annual reports to capture the role of electric mobility from the perspective of automobile companies. In particular, the explorative analysis focuses on the following aspects of electric vehicles (EV): risks, strategies, and environmental impact. From the analysis of the relation between the disclosure of electric mobility and economic performance, it appears that there is no significant link between company performance and an emphasis on electric mobility. The research method is based on thematic content analysis applied to the narrative section of annual reports. For the empirical analysis, we used a sample of major companies active in the European automobile market. Content analysis shows that automobile companies emphasize the strategic role and the environmental impact of electric mobility, whereas the risks involved are discussed less. The information disclosed is mainly qualitative and non-financial and has a historical time orientation.

Keywords: *electric mobility; electric vehicles; content analysis; annual reports; narrative reporting.*

1. INTRODUCTION

This paper intends to use the narrative section of annual reports to investigate the role of electric mobility from the perspective of automobile companies. Because the electric mobility market is new and rapidly evolving, it may be of interest to investigate the vision communicated in the narrative section of annual reports of car manufacturers. As noted by the European Automobile Manufacturers Association in a press release on 5 February 2015 (www.acea.be), in 2014, approximately 75,000 new electric vehicles (EV) were registered in the European Union, a growth rate of 37% in comparison to the previous year. The largest increment is observed in the UK (+ 300%), followed by Germany (+ 70%), and France (+ 30%). In the EFTA (European Free Trade Association) countries, Norway is at the top, with approximately 20,000 new registrations, which is more than double the EVs registered in 2013 (+ 141%). Table 1 shows the total registration of EVs in 2014, with differences in comparison with the previous year. This explorative analysis focuses on the following aspects of the EV market: risks, Innovation, Entrepreneurship and Digital Ecosystems

strategies, and environmental impact. In addition, an analysis of the relation between economic performance and the disclosure of electric mobility in annual reports is conducted. For the empirical analysis, we used a sample of major automobile manufacturers active in the European market.

*Electrically Charged Vehicles = Pure Electric Vehicles + Extended-Range Electric Vehicles + Plug-In Hybrid Electric Vehicles

This paper draws upon legitimacy theory to develop one testable hypotheses. The research method is based on the thematic content analysis (Krippendorff, 2013; Weber, 1988;) applied to the narrative section of annual reports (Beattie et. al., 2004). This section of annual reports increased its importance in recent years to satisfy the information needs of several stakeholders (IASB, 2010; IIRC, 2013; Teodori and Veneziani, 2013). This paper continues with a literature review, followed by the electric mobility Innovation, Entrepreneurship and Digital Ecosystems

aspects investigated and the research method. Thereafter, the results of the empirical analysis are presented, followed by the conclusions.

2. LITERATURE REVIEW

The relevance of research on the narrative section of annual reports has been shown in its historical evolution by Beattie (2014). From the literature review related to the content analysis of the narrative section of annual reports, it appears that a specific analysis on the electric mobility in automobile companies is missing. However, a common theoretical framework for this type of research can be found in the vision of the annual report as a communication tool, particularly in a context of the growing usage of information technology. The narrative section of annual financial statements has widened its role of annual accounts from the area of financial communication to a business reporting tool covering several aspects of the business activity, which allows a form of integrated communication (e.g., Busco et al., 2013). As observed in the literature on earnings quality (e.g., Dechow et al., 2010), the disclosure process in narrative form can also raise the issue of manipulation, which is considered to be behavior targeted towards hiding results or negative aspects of the business performance (e.g., Adelberg, 1979), or the quality of the linguistic characteristics that influence the understandability of the text (e.g., Jones and Smith, 2014). In theory, the narrative section of annual reports is an opportunity for the management to discuss and analyze financial performance and other aspects of the business activity, such as social and environmental issues. As stated in IASB (2010: §9) “management commentary should provide users of financial statements with integrated information that provides a context for the related financial statements. Such information explains management’s view not only about what has happened, including both positive and negative circumstances, but also why it has happened and what the implications are for the entity’s future”. Using this communication tool, the management sends signals to several stakeholders, revealing key messages they want to divulge. Analyzing the theme of electric mobility, we are able to show what is disclosed; in addition, the less discussed topics may indicate a company approach to the issue under investigation.

3. ELECTRIC MOBILITY: RISKS, STRATEGIES, AND ENVIRONMENT

The orientation towards a green economy and sustainability have stimulated company behavior in the direction of social responsibility, environmental protection, and alternative sources of energy. This general statement can be applied to automobile companies, and in this context, the issue of electric mobility can be analyzed. In particular, we attempt to capture the following aspects as communicated in the annual reports: risks, strategies, and the environmental impact. In general, those aspects are noted in the framework suggested by the IASB (2010) with the purpose to improve corporate Innovation, Entrepreneurship and Digital Ecosystems

communication. IASB (2010) emphasizes the disclosure of risk factors and business strategy: “That type of commentary will help users of the financial reports understand, for example: (a) the entity’s risk exposures, its strategies for managing risks and the effectiveness of those strategies” (IASB, 2010: §14). The notion of business risk is strictly linked to the concept of value creation; maximizing value creation can be viewed as optimizing growth and performance targets with the relative risks (PWC, 2006). From auditing, the standard definition of business risk is “ risk resulting from significant conditions, events, circumstances, actions or inactions that could adversely affect an entity’s ability to achieve its objectives and execute its strategies, or from the setting of inappropriate objectives and strategies” (ISA No. 315, § 4.b). Disclosure of business risks is a key component of financial reporting and strategic planning, in particular, for growing companies willing to communicate with the financial market. Strategic risks applied to electric mobility can be considered in general terms; this is not linked to a short-term performance target but is in relation to the strategic vision and the medium long-term objectives in the framework of corporate mission and values (Coda, 1992). In this aspect, the strategic risk is different from compliance, reporting and operational risks (PWC, 2006). In addition, strategic risks may be internal, which is linked to behaviors, decisions, and circumstances stemming from corporate management, or external, which means stemming from factors not controlled by the management, such as government policy and other institutional changes. Among the types of strategic risk related to electric mobility, we can note the following:

- technological risks, linked to product development and the recharging infrastructure;
- market risk, linked to the market share of EVs;
- financial risk, linked to the return rate on investment in electric mobility.

We attempted to use this framework in gathering information on the risk aspects during the annual reports’ content analysis process. In terms of corporate strategy (e.g., Coda, 1992; Porter, 1985), electric mobility requires complex analysis and a forecast of uncertain scenarios in terms of political and institutional policy and consumer behavior regarding the electric mobility issue. In this respect, content analysis of annual reports can reveal the approaches used by automobile companies. Regarding environmental information, the literature has discussed the relation between financial information and the environmental impact of the business activity (e.g., Al-Tuwaijiri et al. 2004; Catturi, 1993; Endrikat et al., 2014; Matakana, 1984). The focus on social and environmental aspects has been recognized with international standards, such as the GRI (Global Reporting Initiative), which refers to the general notion of corporate social responsibility (e.g., Carroll, 1999; Rusconi and Dorigatti, 2004; Terzani, 1984). In the European Commission Recommendation (2001/453/EC), “the term environment refers to the natural

physical surroundings and includes air, water, land, flora, fauna and non-renewable resources such as fossil fuels and minerals (...) environmental issues should be disclosed to the extent that they are material to the financial performance or the financial position of the reporting entity. Depending upon the item, disclosures should be included in the annual and consolidated annual report or in the notes to the annual and consolidated accounts". In this context, we attempt to capture the environmental aspect of information linked to electric mobility. Overall, our arguments can be framed in the context of legitimacy theory. According to this theory, an organization is unable to develop and survive if its aims and methods are not in line with the expectations of society (economic, social, and political factors). Brown and Deegan (1998), Lindblom (1994), and Patten (1995) are examples of social and environmental disclosure studies in the accounting literature that used a legitimacy framework. In particular, Lindblom (1994) describes various reporting strategies that corporations can adopt in their process of legitimation. In the case under investigation, we can hypothesize that automobile companies may try to manipulate the perception of electric mobility focusing on strategies and environmental benefits for the society, obfuscating issues of concerns such as risks and EVs drivers obstacles. For this reason, we formulate the following hypothesis: (H1) disclosure of electric mobility in annual report of automotive companies emphasize strategies and environmental aspects in comparison to risks.

4. RESEARCH METHOD AND SAMPLE SELECTION

The research method refers to the content analysis (e.g., Krippendorff, 2013) applied in social science. Our research was conducted by searching for certain key words in the text under observation. We selected our sample on the basis of the European car market in April 2014 as reported in a commercial magazine (*Quattroruote*, No. 705/2014), constructed using the database of the European Association of Car Manufacturers (Acea). This choice is motivated by the fact that 2013 annual reports are generally published during that period of time. We considered one year (2013) showing intercompany differences. We used eleven annual reports for 2013 with a closing date of 31 December; however, in seven cases, the closing date was 31 March 2013. For each company, we download the annual report from the corporate website. Because the business entities included in our sample are multinational companies with headquarters in different countries, we used the English version of the website, and the document download is always labelled as the annual report. Using the approach of Beattie et al. (2004), we considered the unit text of a sentence containing a single piece of information as the object of observation. As shown by Jones and Shoemaker (1994), the classification of a text in particular groups can be implemented with reference to specific themes or single words. In the first level of analysis, we attempted to measure the presence or absence of discourses related to electric mobility. As suggested by Beattie (2000), we sought to show certain aspects of the information provided. First, we classified the

information into the framework of general topics (risk, strategy, and environment). Second, for each piece of information, we attempted to show other features: time orientation (historical / forward-looking), financial / non-financial, qualitative / quantitative. This research is focused on the theme of electric mobility (Emobility, sustainable mobility); therefore, the reasoned choice of key words is oriented towards that issue. In particular, to identify such key words, we made reference, in general, to IASB (2010) and specifically, to operative publications showing advantages and disadvantages stemming from the EV market (e.g., IEA, 2013; PWC, 2014). The list of key words is as follow:

- Electric vehicle / EV /EVs / electric car / electric cars: these keywords relate to vehicles (automobiles) operated with a battery. We excluded the specific search of the term 'hybrid', which refers to vehicles operated with a traditional internal combustion engine and a battery.
- CO2: this term relates to the issue of CO2 emissions and the related environmental pollution caused by the circulation of internal combustion engine vehicles, whereas those emissions are zero in the case of EVs.
- E-mobility/ electromobility / electromotive mobility /sustainable mobility: these keywords relate to the theme of electric and sustainable mobility in terms of environmental impact.
- Charging infrastructure / recharging / charge point / charging: these terms refer to the issue of the existence or absence of recharging infrastructure for EVs, the manner in which they work, the charging time; these issues may be an obstacle for drivers or potential drivers of EVs.

The hypothesis implicit in this approach is that the frequency of key words is an indicator of interest towards electric mobility and related issues. The presence or absence of discourses regarding specific themes linked to electric mobility has been the main object of observation. In fact, because the range of information provided in the annual report may be very wide, it is reasonable to focus on specific information. In this perspective, the most relevant examples are known in the research field devoted to environmental and social information (e.g., Hooks and Van Staden, 2010). In our analysis, we considered the frequency number in absolute value terms and in relation to the total number of document pages. In addition, we considered the frequency in relation to the total number of words contained in the annual report. This approach was adopted by Bowman and Haire (1976), Trotman and Bradley (1981); they attempted to measure the social information disclosed in annual reports as a percentage of the total length of the document investigated. We used annual reports in a pdf file format downloaded from each company website. Each pdf file was converted into Word format (or a text file) for subsequent analysis. In particular, the conversion to Word format (or a text file) allowed the counting of words of interest in comparison to the total words contained in the document. Thus, we

may obtain an indicator of the importance of electric mobility in the aspects analyzed. In detail, the methodology is as follows. For each key word, we counted the frequency number. For each occurrence, the entire sentence (single information) was collected and analyzed for its meaning. Thus, for each single information, we implemented two levels of classification. The first level refers to the aspects of risk, strategy, and environmental impact. The second level refers to certain information features: time orientation (historical / forward looking), financial / non-financial, qualitative / quantitative. In accordance with this approach, we are able to gather a series of element that may be present or absent in the narrative section of the annual report. The research method's objective is to show what is disclosed and what is not discussed regarding electric mobility. Moreover, thus, we can show the different approaches followed in the automobile industry. To compare the emphasis on electric mobility, as revealed in the annual report, with economic performance, we gathered certain financial information for each company: return on equity (ROE) before tax, return on sales (ROS), and return on investment (ROI). This information is collected from the Osiris database and manually from the annual report. Using the Spearman's rank correlation index, we tested the relation between economic performance and the emphasis on electric mobility.

5. EMPIRICAL RESULTS

The descriptive analysis of the evidence we obtained is reported in Table 2. Overall, we analyzed 18 annual reports. The average number of pages in the annual reports is 147. The total number of pages is 2,639, with an average number of words of 69,282. The first level of analysis shows the frequency of key words and its relative relevance in the annual report. The total key words frequency is 624. With the exception of Suzuki, Table 2 shows that the theme of electric mobility is discussed in the annual report with intercompany differences. The key words with the highest frequency are CO₂ (48%), which clearly refers to environmental issues, followed by EVs (29%). The issue of the recharging infrastructure (9%), which may be an

obstacle for the circulation of EVs, is nearly neglected. In particular, using the percentage of key words relative to the total number of pages as an indicator of interest, it is possible to identify automobile companies that emphasize the electric mobility theme at different levels. The companies are listed in Table 2 according to the above noted indicator from high to low. It is worth noting that the top companies, Nissan and Renault, have a strategic and investment alliance. Using a different indicator, the percentage of key words relative to the total number of words in the document, the order presented in Table 2 is substantially confirmed. As an additional test, we considered the average number of words (445) per page as a standard page, recalculating the indicator of key words relative to the total number of standard pages. In addition, in this case, we observe similar results; in particular, the top five and the

bottom five companies are the same as shown in Table 2. It would be of interest to compare this scoring with the percentage of EVs production over the total production of cars, but this data is not provided. However, it is worth noting that Nissan writes in its annual report to be the world leader in the EV market (Nissan's Annual Report, 2013, p. 13) and Mitsubishi aims to achieve a 20% or higher total production ratio of EVs (Mitsubishi's Annual Report, 2013, p. 28). The case of Suzuki is of interest because it shows that the pattern towards the electro mobility is not totally accepted in the automobile industry.

Company Name	No. Pages (a)	No. Words (b)	Key Words				Indicators		
			EV	CO2	Electric mobility	Charging infrastructure	Total key words (c)	% (c)/(a)	% (c)/(b)

<i>Total</i>	2,639	1,247,068	181 (29%)	297 (48%)	91 (15%)	55 (9%)	624 (100%)		
<i>Mean</i>	147	69,282							

Table 2 – Description of Annual Report 2013 and frequency of key words

EV = EV, EVs, electric vehicle/s, Electric car/s.

Electric Mobility = e-mobility, electromobility, electromotive mobility, sustainable mobility.

Charging Infrastructure = recharging, charge point, charging.

From the analysis of each key word in the context of the narrative reporting, we identified 189 sentences (Table 3). We define a sentence (single information) as text appearing between punctuation signs, having a meaning, and containing at least one key word. We excluded from the notion of a sentence the cases in which the key words are presented in graphics, glossary, and other notes. It is

possible to note that the theme of CO2 is highly discussed by VW group (40% of words = 119/297; 12% of sentences = 6/49), Mercedes (24% of words = 70/297; 12% of sentences), and BMW group (8% of words = 25/297; 12% of sentences = 6/49); together these German companies reach a total of 74% of words CO2 (214/297) and 36% (18/49) of the sentences on that issue. In addition, considering the relevance of EVs in terms of sentences, it is confirmed that companies in the top positions are Mitsubishi, Renault, VW, and Nissan.

Table 3 – Sentences for each key word

N/A = Information not classified (graphs, tables, and glossary).

EV = EV, EVs, electric vehicle/s, Electric car/s.

Electric Mobility = e-mobility, electromobility, electromotive mobility, sustainable mobility.

Charging Infrastructure = recharging, charge point, charging.

The analysis continues with the classification of the information in the aspects of risk, strategy, and environmental impact. In this segment of the analysis, we focus on the meaning of the sentences in the context of the narrative reporting. Additionally, we observe certain information features: time orientation (historical, forward-looking), financial / non-financial, qualitative / non-quantitative. Regarding this aspect, it is worth noting that each sentence has been analyzed in connection with the immediately preceding and following sentences. Moreover, in certain cases, we counted one sentence, although formally there were two or more, when their meaning was strictly linked. In some cases, a sentence was classified in more than one general topic or features according to its meaning and information content. Table 4 shows that most information regards corporate strategy and opportunity stemming from electric mobility (64%), followed by the environmental impact (32%), and finally the discussion of risks (4%) linked to the EV market. Considering the null hypothesis of identical proportion of the information in the three categories, the disclosure of risks is significantly ($z = -7.78$, $p=0.00$) lower in comparison of the information about strategies and environment. Therefore, we can state that H1 is corroborated. We can sustain that annual reports tend to depict the positive aspect of electric mobility, whereas the story of potential risks (recharging infrastructure, range anxiety, consumers' behavior, market growth, alternative technologies, and new regulations) is discussed less.

KEY WORDS	General Topics				Features								
	Risk	Strategy	Environment	Total	Qualitative	Quantitative	Total	Financial	Non-Financial	Total	Historic	Forward-looking	Total
EV	2	65	19	86	64	15	79	0	73	73	59	19	78
CO2	3	24	39	66	27	26	53	0	50	50	40	14	54
Electric mobility	0	36	15	51	39	5	44	0	42	42	32	12	44
Charging infrastructure	4	20	1	25	20	8	28	0	24	24	18	6	24
Total	9	145	74	228	150	54	204	0	189	189	149	51	201
%	4%	64%	32%	100%	74%	26%	100%	0%	100%	100%	75%	25%	100%

Table 4 – Information features

EV = EV, EVs, electric vehicle/s, Electric car/s.

Electric Mobility = e-mobility, electromobility, electromotive mobility, sustainable mobility.

Charging Infrastructure = recharging, charge point, charging

From the content analysis of annual reports, it is possible to show some of the topics discussed. With reference to the risk, sentences discuss certain fundamental issues for electric mobility: the theme of batteries, in particular, their cost and the weak recharging infrastructure. With reference to the strategy, Innovation, Entrepreneurship and Digital Ecosystems

the topics discussed in the sentences are broad, and the most noted are: objectives in terms of production; interest in sustainable strategies for company growth; and the critical factor of success, such as the manner by which to recharge EVs. Regarding the environmental impact, the discussion of automobile companies is focused on and linked to corporate social responsibility. The topics most analyzed are: reduction of gas emissions; alternative sources of energy; stimulating the culture of the green economy; and the role of government policy and regulation to stimulate sustainable mobility. Examining the information features, Table 4 shows that there is no financial information, whereas there is technical information, such as the level of CO₂ reduction and the range in km per single charge. The time orientation is largely (75%) toward historical information. The forward-looking information (25%) refers to business strategies and opportunities. In addition, there is more qualitative information (74%) than quantitative information. Therefore, there is more of a tendency to describe rather than to provide quantitative information regarding the aspects of electric mobility we searched for. Overall, this evidence shows that there is difficulty in providing quantitative information and future information regarding electric mobility. As additional evidence, we report that the information regarding electric mobility is presented at the beginning of the annual report, in the President's letter and in the Management Discussion and Analysis (or Management commentary in the language of IFRS). Often, this information is included in the section that relates to environmental impact and R&D activities, such as, "Sustainability", "Clean mobility", "Eco friendly car", and "Environmental Initiatives". The final part of the analysis is devoted to the relation of economic performance to the emphasis accorded to electric mobility in the annual report (Table 5, Panel A). Using the Spearman's rank correlation index, Table 5 (Panel B) shows no significant link between financial performance and the disclosure of information on electric mobility. The substantial equivalence between the two indicators (the percentage over the total number of pages and the percentage over the total number of words) that we used to measure the interest toward electric mobility is confirmed. Moreover, using total sales as a proxy for company size, we can observe that the theme of electric mobility is not linked to such firm characteristics.

Company Name	Sales (thousand €)	ROI (%)	ROE before tax (%)	ROS (%)	% of pages	% of words

$\% \text{ of words} = \text{total number of key words} / \text{total number of words in the annual report}$

CONCLUSIONS

The content analysis of annual reports reveals that, with the sole exception of Suzuki, automobile companies discuss the theme of electric mobility in the aspects we investigated. In particular, it appears that a group of companies (Nissan, Renault, Mitsubishi, Volkswagen, and Kia) is highly interested in electric mobility, whereas another group of business entities (Mazda, Fiat, Ford, General Motors and Suzuki) presents a lower level of emphasis on this theme in their annual reports. The information discussed in the narrative section of the annual reports is primarily devoted to business strategies (64%) and environmental impact (32%), whereas the discourse regarding the risk of the EV market (cost of the batteries, recharging point) is nearly neglected (4%). We interpret this evidence in the framework of legitimacy theory, corroborating our hypothesis that automobiles companies may seek to manipulate

the perception of electric mobility focusing on strategies and environmental benefits for the society, obfuscating issues of concerns such as risks and EVs drivers obstacles. Our evidence is in line with studies confirming the validity of the legitimacy framework in interpreting environmental reporting strategies used by management in corporate annual report (e.g., Campbell, 2003; Hooghiemstra, 2010). In addition, the information features are primarily qualitative (74%) and non-financial (100%), and have an historical time orientation (75%). This evidence is explicable because forward-looking and quantitative information may be private information for each company that, to maintain a competitive advantage, the management may not want to disclose. Regarding the relation between economic performance and the emphasis on electric mobility in the annual reports, it appears that there is no significant association. Moreover, company size is not linked to the level of interest in electric mobility, as revealed by the content analysis. Among the limits of this paper, there is subjectivity in the classification process of the information; however, this is in accordance with our research purpose. In addition, the small number of companies analyzed is a consequence of the automobile industry and European car market that we considered when selecting our sample. Future research implications may be a longitudinal analysis, a comparison with EVs produced by each company, and an analysis of related industries, such as manufacturers of batteries and utilities.

E-MARKETING BY ENERGY COMPANIES¹

Iovino, Felicetta; Migliaccio, Guido

Department of Law, Economics, Management and Quantitative Methods
University of Sannio, Benevento, Italy

ABSTRACT

This paper from a brief review of the relevant literature on the energy markets, points out the changes in the relationships between energy companies and customers through the Web. The objective is to highlight the changes of the energy markets thanks to the web demonstrating that it is able to ensure the raising of the switching rates and hence the competition, goal of the liberalization of public services. To this end we will use secondary data from Accenture researches about the perceptions of customers and energy companies around the relations established via the web, and the CUAC for the switching mode performed in the State of Victoria in Australia.

Keywords: *E-marketing; E-commerce; Energy Marketing; Energy Trading; Market Of Energy.*

INTRODUCTION AND MOTIVATION: AIMS AND STRUCTURE OF THE PAPER

The web change radically the social and economic relations. The process of diffusion of the Internet is absolutely unstoppable and promotes the globalization of economies and thus consumption.

The selection of goods and services evolves grafting in this process altering habits and guidelines in the demand for goods and services.

This paper wants to answer certain questions:

- What hinders the growth of commercial relations entered via the Web?
- Has the online channel transformed relations customer-industries also in the energy markets?
- Have these companies hired a relational approach?
- What are the e-marketing policies in the energy companies?
- What does hinder the growth of commercial relations entered via the Web?
- Is the e-marketing a tool to achieve greater competition in energy markets?

The main objective of the paper is to show how e-marketing constitutes a public service such as energy a priority tool to achieve the objectives of liberalization and privatization. In fact, by means of

¹ The paper is the result of a collaborative work. However it is possible to attribute to Felicetta Iovino results and discussion. The other sections are of Guido Migliaccio.

e-marketing it turns the traditional passive relationship company-customer and the latter assumes a central role in the definition of switching processes.

In the following sections a review of literature on e-marketing of energy companies, highlighting especially the typical problems of management resulting from spreading the web, it is presented. Thereafter the methodology, results and implications are discussed.

THEORETICAL BACKGROUND

The recent international literature can be divided into three main tracks of study: the situation of the energy market, evolution of marketing of energy companies and, in particular, e-commerce development in the sector.

There are many contributions that illustrate the market situation in some countries. For example: Giuliotti et al., (2004) on the UK electricity market; Olsen et al., (2006) in relation to the Nordic countries, among the first to develop competition for electricity. Karan and Kazdagli (2011) develop reflections on the energy market in Europe. The theme of the interrelationship between the companies has developed, referring to Spain, Hartmann and Ibanez, (2007).

But the broader and articulated scientific contributions have been the subject of numerous international conferences: the first book of the proceedings of the forum 12TH Croatian energy day about energy consumers in the open market conditions (2003). In it specific references to situations in Spain (Marti, 2003), German (Zijlstra and Čače, 2003), Switzerland (Fuchs, 2003), Bulgaria (Popov et al., 2003), Slovenia (Bakić, 2003) and Croatia (Pešut et al., 2003).

The Book of Proceedings of 12th International Conference on the European Energy Market (2015) with references to Norway (Agrell et al., 2015), Brazil (Kummer et al., 2015), Germany (Metz and Saraiva, 2015), etc. is much more updated, however. Still in the energy market, see: Reyes-Mercado and Rajagopal (2014) which relate about Mexico, and above all, Hollmann et al. (2014) who explaining how the defection decision process unfolds over time in business-to-business relationships. The authors develop a theory on "defection energy". The research offers marketers insights to improve defection management.

There are more, many writings related to the management and marketing issues. For example, Serna-Suárez et al. (2015) propose some considerations on Microgrid's Energy Management Systems. Matusiak et al. (2015) present the results of the work on Business Models for the e-balance project that aims to create an application for balancing local production and consumption of energy in an intelligent and cost-effective environment. Oliveira (2015) examine how price signals affect investment in renewables using a theoretical model in the tradition of Industrial Economics. Papavasiliou and Smeers (2015): in addition to its adverse impacts on power system operations, the large-scale

integration of renewable energy sources presents market design challenges as it exacerbates the missing money problem by moving value from energy to capacity markets. Among the most important items on the marketing and the energy business it is also helpful to read: Lhoest-Snoeck *et al.* (2015), Purkus *et al.* (2015), Iovino (2012), Do Paço and Varejão (2010), Wiser (1998), Malhotra (1984), etc.

There are, however, still many scripts that analyze the potential of the web for trade relations of energy companies; studies that therefore must necessarily develop. The first writings date back to the beginning of the new millennium: Sioshansi (2000) (urging the energy industry to discover the full potential of e-commerce), Fusaro, P. (2000), and Fusaro P.C. and Wilcox J. (2000). More recent, but still dated essays by Romm (2002) and by Corvi and Bonera (2005). Today, however, the reflections of Iovino (2014), although referring only to the Italian situation. This paper is therefore an original contribution to the limited literature on the web marketing in energy companies.

RESEARCH METHODOLOGY

The objectives of this paper will be achieved with some theoretical considerations based on some quantitative researches including an updated conceptualization of the literature review and references to some case studies. In economic sciences, quantitative research is the empirical investigation of observable phenomena via statistical techniques. The objective is to develop and employ statistics models pertaining to phenomena. They will then use the data obtained from Accenture researches conducted in the years 2012, 2013 and 2015 related to the web marketing development in the energy companies to track the main implications of the model of marketing policies to be used and its characteristics. Finally, we will use the data from CUAC relating to the State of Victoria, Australia to demonstrate the main purpose of the paper.

RESULTS AND DISCUSSION

Marketing policies implemented in the web: a model of interpretation

The socio-economic value production over the web has become central to the need of a customer-centric approach rather than content-centric (Rover, 2013). In this way, the customer relationships both current and potential will tend to become long-term relationships that despite temporary interruptions in these relations will continue by virtue of the social bonds created (Havila and Wilkinson, 2002). Relationships may be reactivated subsequently also for the economic aspects due to the business relationship Energy that is not destroyed when the commercial relationship is temporarily suspended. The company that developed positive bonds can be in fact effectively fed with appropriate marketing policies implemented via the web. To this end it has been proposed (Iovino, Innovation, Entrepreneurship and Digital Ecosystems

2012, 2014 and 2015) a unified conceptual model to highlight the main variables implemented in the websites. For mass communication and branding for online businesses also they have to assert its brand targeting all stakeholders, in particular customers. The main elements provided on line are due to institutional communication, general information services, communication and presentation of the company. In this way, the company has the objective of strengthening the brand image (Accenture, 2013) and consolidating the trust in both the enterprise giving up its global offering. This is confirmed by a search Accenture (2012) carried out on a sample of American and English customers, confirming all (with percentages above 50%) of the strong influence of the web on their purchasing habits with an increase of the same and the prevailing positive perception of business presence in marketspace. In fact, the data confirm that internet marketing allows better communication and a greater choice with an obvious increase in the bargaining power of customers, as evidenced by the following figures (Fig. 1-2).

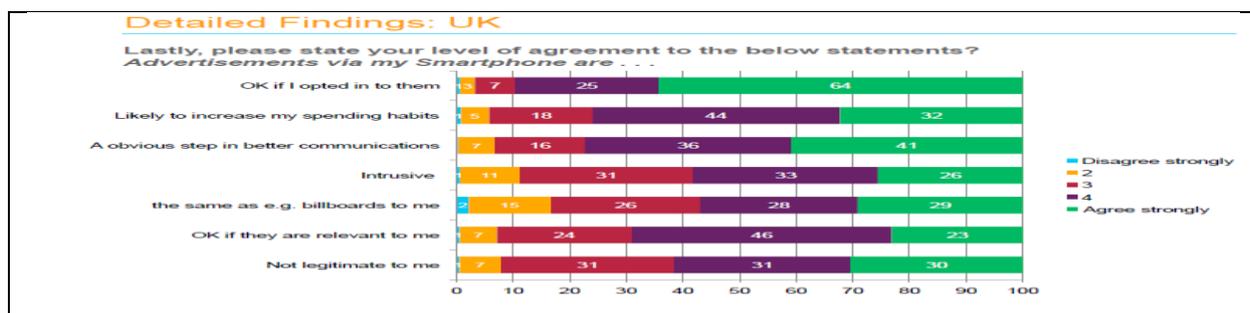

Figure 1 – Source: Accenture interactive survey results, 2012

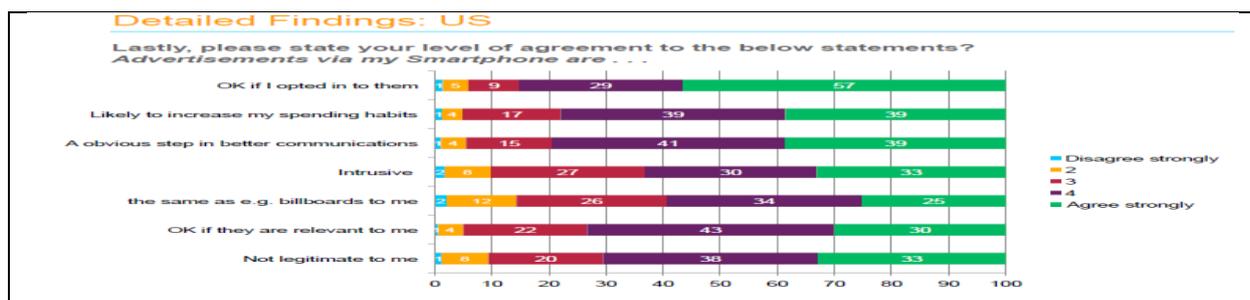

Figure 2 - Source: Accenture interactive survey results, 2012

The same data is also revealed a considerable percentage of customers who negatively perceive the brand policies and mass communication highlighting the need that its design is made in a customer-centric approach rather than firm based. The offering of value and pricing are the other online policies implemented, which is the price and the offer is not limited to the core service, but is characterized by a range of additional services (Mele, 2003) who have the ' goal of creating mechanisms of lock-in (Cerrato, 2004). In this way, the company is able to co-create an personalized offer through the profiling and segmentation of customers as a result of online tracking processes. In this sense, the research Accenture (2012) shows the strong consumers participation in such processes, as almost all, 85%, is aware that the online tracking allows you to receive personalized offers (Fig. 3).

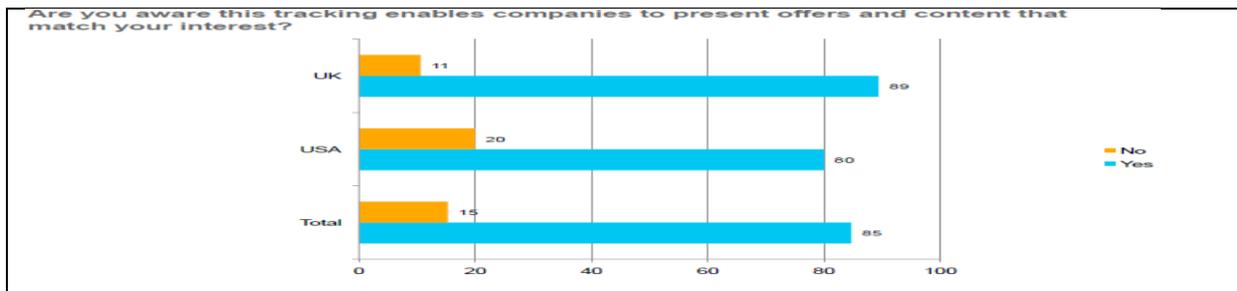

Figure 3 – Source: Accenture Interactive survey results, 2012

However, consumers have a similar extent (86%) concern for their privacy and therefore their overall browsing experience (Fig. 4).

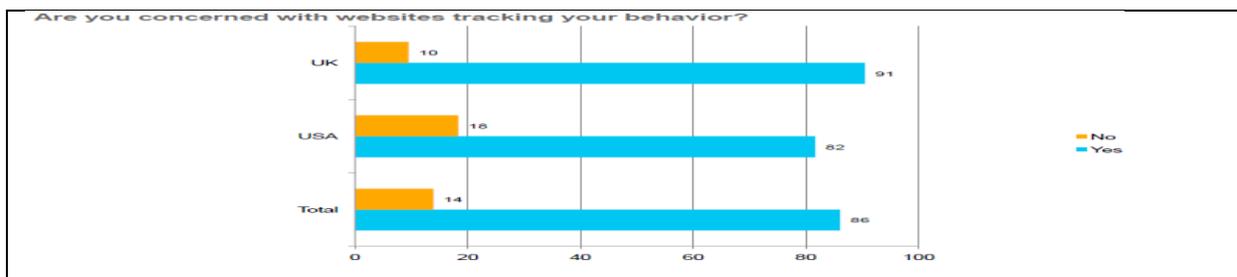

Figure 4 – Source: Accenture Interactive survey results, 2012

However, the web attaches considerable transparency to marketplace compared to the marketplace by allowing customers to make price comparisons in a global market, but also the characteristics of the offer by reducing information asymmetries and transaction costs (Buzzavo, 1999). In this sense, the Accenture research (2012), which notes that 72% of the sample using their electronic devices to perform a price comparison, while in the store. Then, the integrated management of the online channel, with the off-line is critical to increase the levels of fidelity to the company (Iovino, 2014) (Figures 5 and 6).

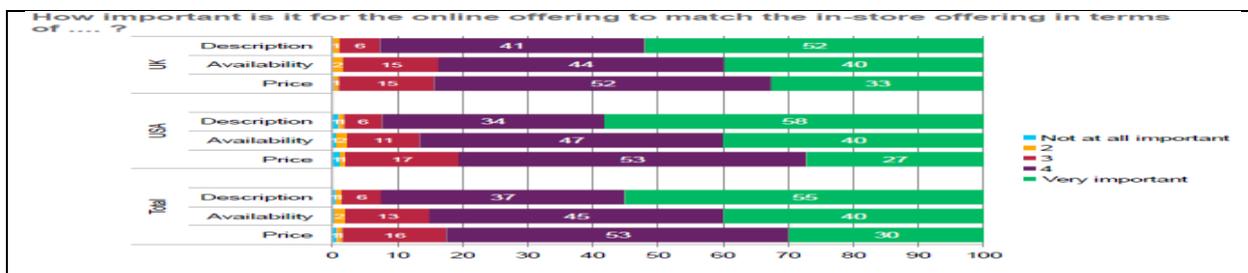

Figure 5 – Source: Accenture Interactive survey results, 2012

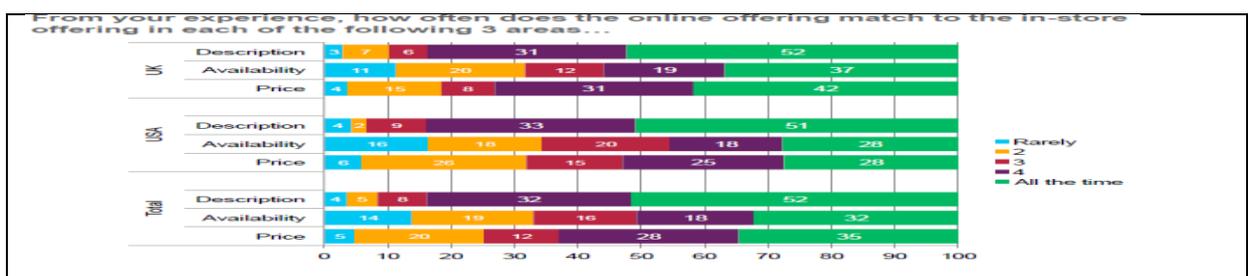

Figure 6 – Source: Accenture Interactive survey results, 2012

The distribution is the other online implemented policy, in fact, next to the physical distribution was accompanied by the virtual possible with new technologies (Heikkila, 2002). In this sense, the web allows a considerable reduction of the costs of coordination, and the transaction and switching costs through a real-time information flow capable of ensuring dynamism and flexibility to the distribution chain and the reduction of lead times (Auramo et al. 2005). The research data Accenture (2012) confirm what the web is through PC through mobile devices ensures an integrated experience for 43% ensuring a higher level of satisfaction compared to traditional media (Fig. 7).

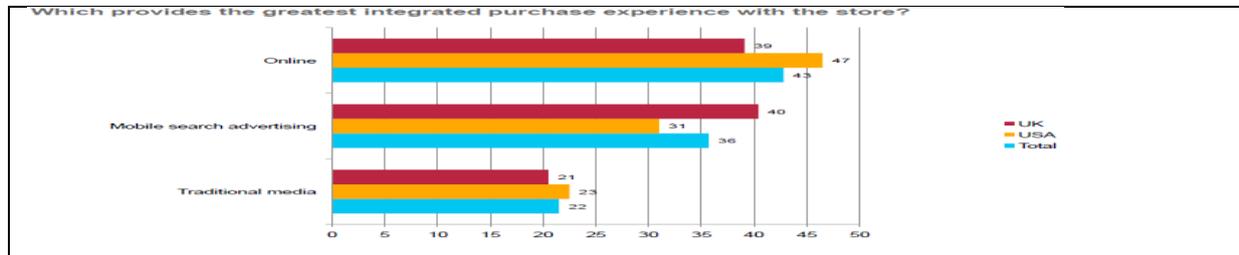

Figure 7 – Source: Accenture interactive survey results, 2012

The customer care, which is the one to one communication is implemented on line. This policy significantly defines the functional quality, ie the way in which the service is offered, a critical variable for consumer choice (Gronroos, 1996). Through the interactions and information collected online the company can also customize the relationship with individualized offers reducing the defection energy (Hollmann, 2014). On the other hand, consumers prefer for 47% the web channel as a link with the company (Accenture, 2012), because it guarantees the autonomy claimed in a complex relationship between customer and company (Fig. 8).

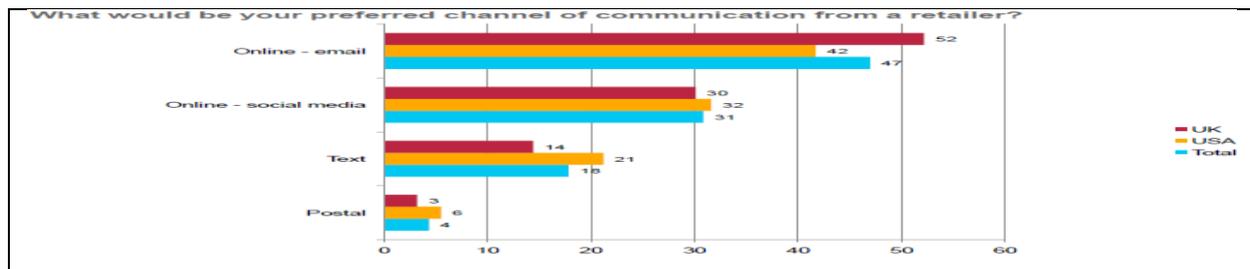

Figure 8 – Source: Accenture interactive survey results, 2012

The implementation via the web marketing policies is also confirmed by further research Accenture (2015) finds that for most managers of content and networking activities have grown considerably compared to the previous two years to 92% and that 83 % believe that the figure is likely to increase further over the next two years. limited, however, is the assimilation of a relational approach of customer-centric essential for proper development of the web marketing policies (Iovino, 2014 and 2015; Wiser, 1998). In fact, the data (Accenture, 2015) which define the effectiveness of the marketing policies of the web is measured primarily by the companies through indicators not focused on the durability of the relationship with customers (Fig. 9).

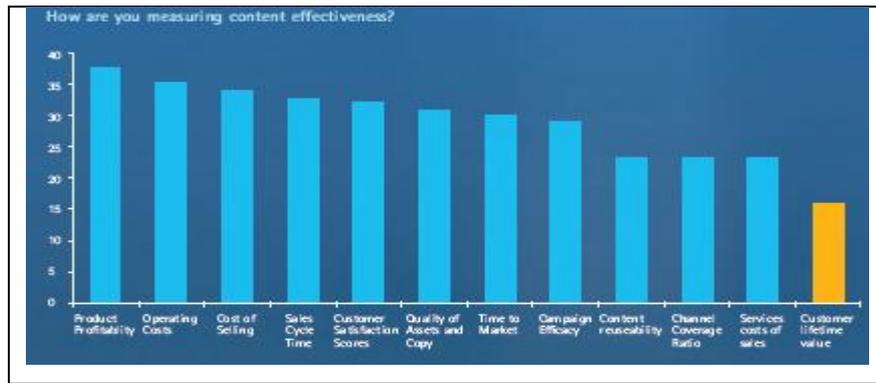

Figure 9 – Source: Accenture Interactive state of content, 2015

E-marketing of energy companies: a tool for switching

E-marketing, which application of the paradigm of relationship marketing, is an indispensable tool for the attainment of the objectives of the various legislative measures implemented (Iovino, 2012, 2014 and 2015). In fact it helps to increase the competition among operators on the energy market and thus to greater efficiency and quality for customers. It is therefore arguable that marketing policy implemented in the web by energy companies are one of the main tools of the competition by determining the elevation of the switching rate.

E-marketing is implemented for this purpose with their sites and partners implementing the web most of the operational and strategic tools of their marketing.

Not allowing the only physical distribution so the core service, the web, can deliver additional services with significant savings of resources. In this way, energy companies have a significant impact on satisfaction and therefore the loyalty of its customers both current and potential.

The interactivity of the web in fact defines the functional quality which is crucial to raise the level of customer satisfaction and loyalty of customers in energy markets, unlike the technical quality deemed acquired (Drummond and Hanna, 2002). Consumer preference for the Web is witnessed by Accenture Research (2012 b), as can be seen from Figure 10.

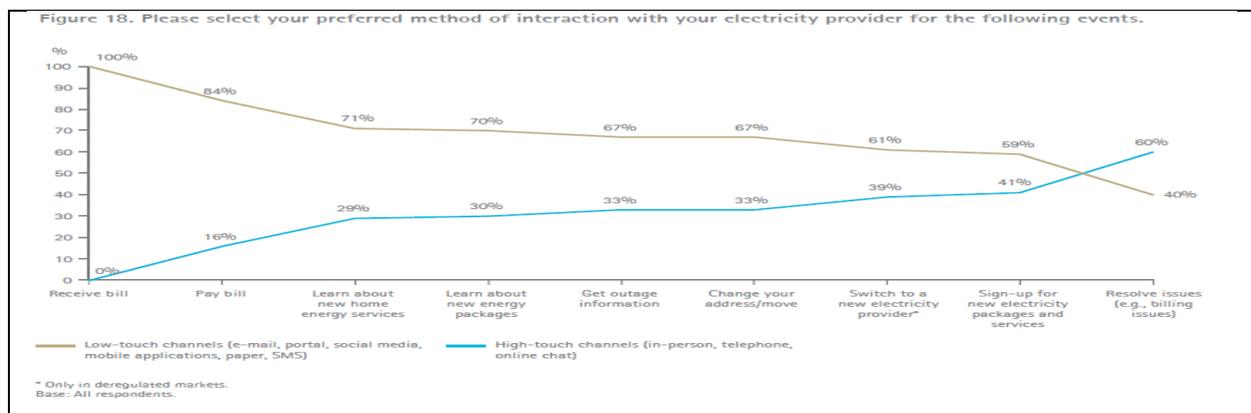

Figure 10 – Source: Accenture actionable insights new energy consumer, 2012

For almost all of the events indicated as we can see is the preferred electronic channel than the traditional, with a percentage of 61% by switching to a new electricity supplier confirming our thesis.

These directions are further confirmed by figure 11 relative to the individual channels, precisely because the switching decisions are determined by a multiplicity of elements related to the complex relationship (Iovino, 2012, 2014 and 2015; Hollmann, 2014).

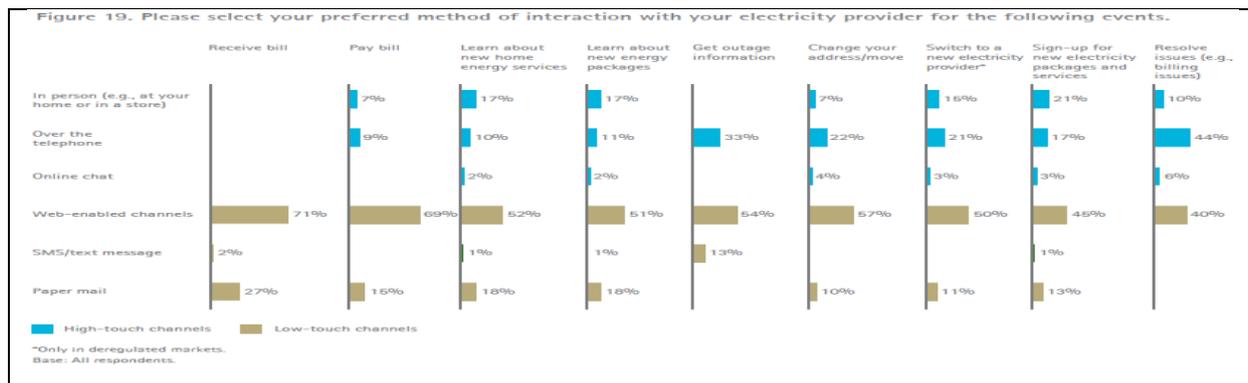

Fig. 11 – Source: Accenture actionable insights new energy consumer, 2012

It is noted however, that for more complex issues such as those relating to billing there is a slight prevalence of telephone contact (44%) and that of the person (10%) compared to the web channel (40%) although whereas, however, with the latter also figures concerning preferences for online chat, the difference between the channel types is reduced significantly. Previous data thus confirm the transformation to energy companies that occurred in the relationship with its customers both current and potential. The web has made it so much dynamic that report. The customer increasingly sophisticated and demanding research to solve their problems and especially the ease of use of technological means employed and the protection of their privacy. Navigability, usability and ease of access to the site are the main characteristics sought (Iovino, 2014) in order to raise the level of customer experience and therefore customer satisfaction that translate into loyalty to the site and therefore the company. In this sense, the data in the figure 12 indicates the main characteristics sought in electronic channels. Levels of satisfaction in fact, have a positive effect on switching (Reyes-Mercado and Rajagopal, 2014).

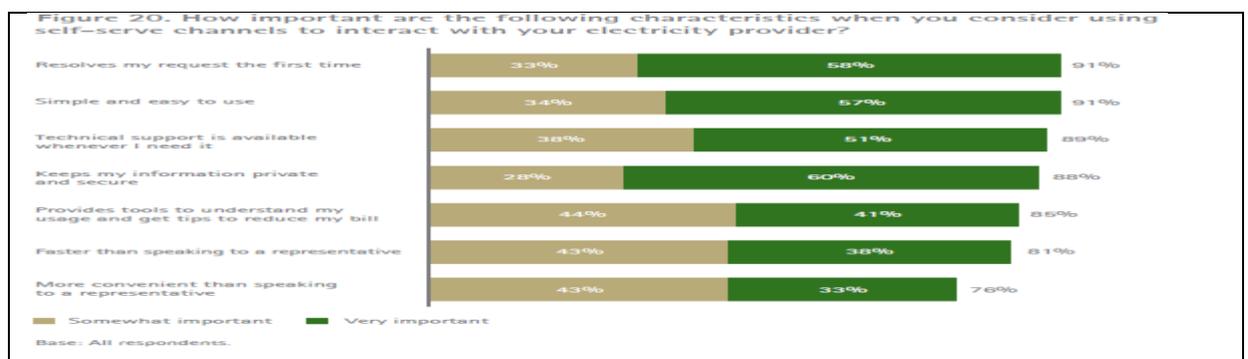

Figure12 – Source: Accenture actionable insights new energy consumer, 2012

Possible interactions through the web are not the only one to one or one to many, but also many to many (Novack, 1996). In fact, in addition to also social media websites have assumed an important

place also for energy companies, its use is around 30% according to Accenture research (2012b) (fig. 13).

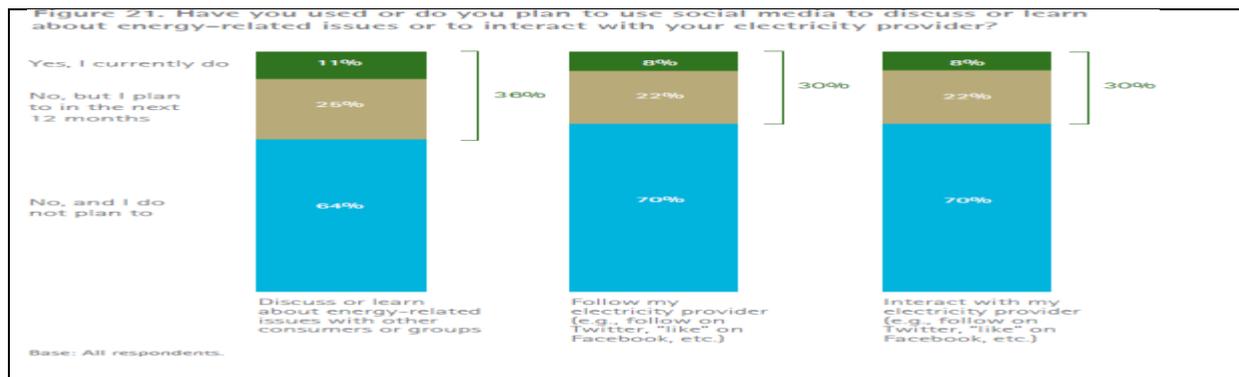

Figure 13 – Source: Accenture actionable insights new energy consumer, 2012

Even with social media the customer search experience where the quality of customer care is prevalent. In fact, as much as 50% considers it a priority the provision of a fast and efficient service from your energy supplier. The other answers point out how relevant additional services also offered in partnership with other companies to increase the overall value of its offer (Iovino, 2012). It is confirmed that the web has taken on a major role in the energy market by improving switching and raising the competition between operators. According to research by CUAC (2012) relating to the energy market of Victoria, which has the highest rate of switching in the world notes that the information collected for switching decisions are made for the 20% by comparison / service switching and for the '11% by the operators sites (Figure 14).

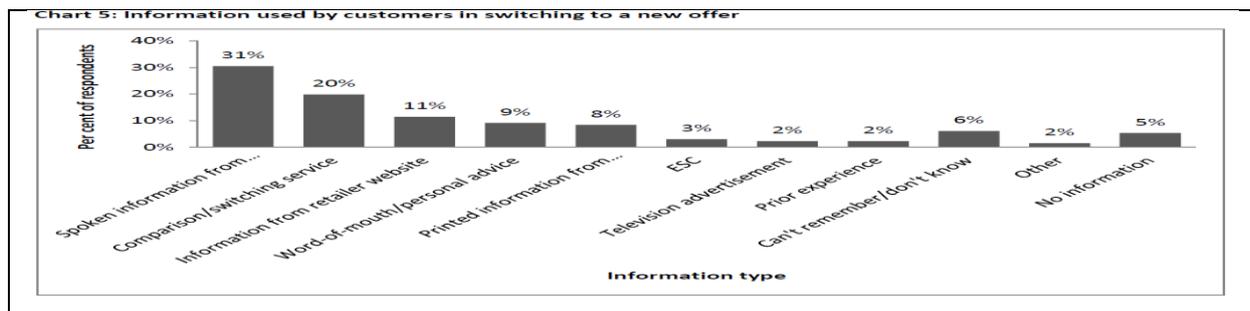

Figure 14 – Source: CUAC, 2012

The main reasons for the switching are made by the will to get a price savings (Iovino, 2012) as shown in Figure 15.

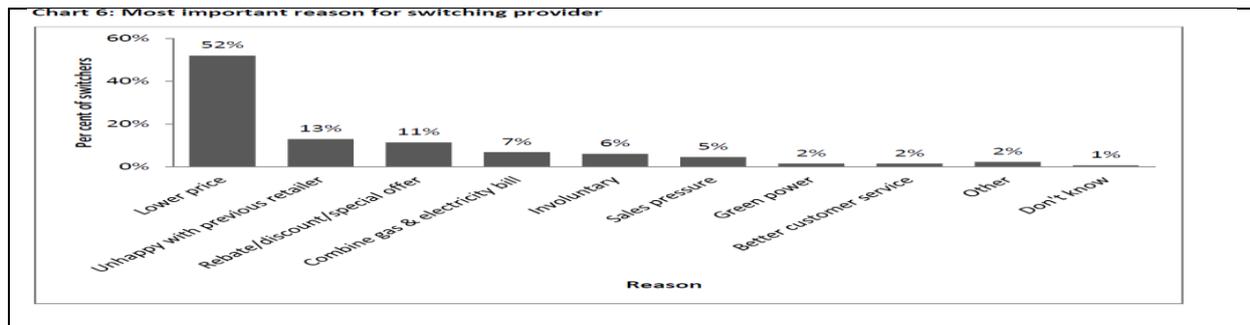

Figure 15 – Source: CUAC, 2012

A significant role in the energy market is therefore assumed by comparison sites of the offers of different operators. These sites and those of energy companies must ensure transparency and completeness of the information provided through appropriate cooperation between market regulation authorities and businesses.

CONCLUSIONS

All major business functions are concerned, for different reasons the use of the web but, probably more than other marketing, considering the numerous channels of communication and relationship that the Web favors. The relationships via the Web in fact, appear for consolidation, despite interruptions and customers also require transparency in prices and terms of sale accessory conditions, together with ease and speed of communication with the tenderers.

However, there are serious concerns regarding the protection of privacy and tools that sometimes appear complex for inexperienced users.

The large availability of information favors the consumer switching to a new supplier quickly, even considering the possibility of adding to the IT channel traditional instruments such as the telephone contact and direct. Energy companies have therefore in web marketing a key competitive tool. In fact, the core service differentiation appears substantially negligible because consumers believe the equivalent supply of electricity and gas of different operators. However through their web marketing companies realize substantial differentiation through additional services and marketing policies implemented by means of the web. In this way, the rate of switching increases mainly determined by savings goals. A growing space are having even social media, contributing to the significant development of social marketing among energy companies. Not everywhere, in fact, the transition from the field "protected" to the free market occurred completely. Numerous legislative and bureaucratic obstacles hinder a constant and growing trend that seems to further disengage from regulatory limits can not be justified.

The paper presents a unified conceptual model in which the main e-marketing policies are located. further investigation will be necessary 'to monitor the choices of operators and customers, especially distinguishing between different geographical areas and customer segments.

CHALLENGES FACED BY NOT-FOR-PROFIT ORGANIZATIONS IN INDIA

Iyer, Radha; Bansal, Aashish

K J Somaiya Institute of Management Studies and Research, Mumbai

ABSTRACT

Not for profit organizations or non government organizations (NGOs) in India play a crucial role in development of the economy. The literature review establishes that a myriad of challenges are faced by them in sustainable growth.

This study focuses on the 'Challenges faced by not-for-profit organizations in India.' The perception amongst the leaders of not-for-profits on various dimensions of the challenges is ascertained through the administration of a primary research. It uses a scale created by the authors, based on the literature review. The exploratory study of 30 founders, found that on various dimensions of challenges faced by them the difference across the age, size & number of employees of the not-for-profit is not statistically different except for a few dimensions.

Keywords: not-for-profit and challenges faced by not-for-profits

OBJECTIVE OF THE STUDY

The paper aims to identify and study the significance of different classes of challenges faced by the not-for-profit organizations. It also aims to study the difference in impact of those challenges towards the not-for-profits of varying demographics.

INTRODUCTION TO NOT-FOR-PROFIT ORGANIZATIONS

'Man is a social animal': A very famous saying explains that human beings prefer to live in groups to fulfill their socio-economic and political interests. As a result, civil society and voluntary organizations (VO) emerged. The most commonly used term for VOs is "Non-Government Organizations" or NFPs. NFPs are agencies formed with a vision by a group of likeminded people, committed for the upliftment of the poor, marginalized, unprivileged, impoverished, downtrodden and the needy. They are close to and accessible to the target groups. They are organized around specific issues, such as human rights, environment, education, livelihoods or health. While most of them work at the grassroots level with the communities, some provide analysis and expertise, serve as early warning mechanisms and help monitor and implement international agreements too. The World

Bank definition used by the Operations Evaluation department defines them as "private organizations that pursue activities to relieve suffering, promote the interests of the poor, protect the environment, provide basic social services, or undertake community development". The non-profit-making qualifier is an important attribute. They display basic characteristics of: being non- governmental, voluntary, non-commercial, accountable & non political (Mustagisur, 2003: 55).

The types and structures of not-for-profits vary considerably. Basically, there are three types: grass-roots organizations, support organizations and intermediary or mid-level organizations (Mustagisur, 2003). With the improvement in communications, more locally-based groups referred to as grass-roots organizations or community based organizations have become active at the national or even the global level. Increasingly this occurs through the formation of coalitions with other similar organizations for particular goals (Mostashari, 2005). Literature reveals that their categorization is still developing and every researcher has his/her own category. They are regarded as a force for good by virtually all nations in the world. As a whole, this sector is considered as the "third sector," while the government and the private sector are the first and second sector, respectively (Brown and Korten, 1989; Mostashari, 2005). It is difficult to categorize them by their specific activities; as many of them perform a variety of activities and often shift the balance of activities they pursue. However, in broader terms, most of them can be classified into two groups: operational and advocacy based. The operational categories have to mobilize resources, in the form of financial donations, materials or volunteer labor in order to sustain their projects and programs. The advocacy related carry out much the same functions but with a different balance between them (Mostashari, 2005). Both of them are under rising pressure to better allocate and manage their limited resources. An effective and common management approach in complex situations is thus crucial. They face complex management issues, both at a personal and organizational level. Some face increasing competition from the private sector and certain member states. Therefore, their role in the developing world is not always as effective as possible (Lewis & Kanji 2009).

The rapid growth of this sector has been clearly revealed in a major multi-nation study conducted in 1997 by Anheier & Sokolowski who find it as a major economic and social force. Their presence, especially those engaged in developmental efforts, has been strongly felt during the past few years. In fact, their involvement in development especially in India has become indispensable today. NFPs have catered to the needs of the marginalized and poor, and entrepreneurial businesses in the NFP sector have fueled economic growth and prosperity in India (Handy et al, 2007). As per one conservative estimate, they total over 0.2 million. This figure excludes organizations like trade unions, schools and hospital but includes only those registered for certification for receiving foreign assistance. The workforce as percent of economically active population in India is 1.55% excluding the

religious worship organizations (Sanders and et.al. 2008). The magnitude of funds this sector handles today is an index to this growth. The annual budgets of these organizations are now not a paltry sum but range from Rupees thirty million to five thousand million (Latha and Prabhakar 2010).

Today, they assume an important role in the various developmental programmes and activities in the country. However, in spite of their achievements in various fields, they face different challenges which differ from organization to organization & region to region. The challenges analyzed widely include: fiscal, competition, effectiveness, technological, accountability, human resource, and identity crisis (Ahmed, 2005). Challenges facing NGOs in resource mobilization are external & internal. Based on the literature review, the authors formulated the following framework depicting different classes of challenges faced by the NGOs.

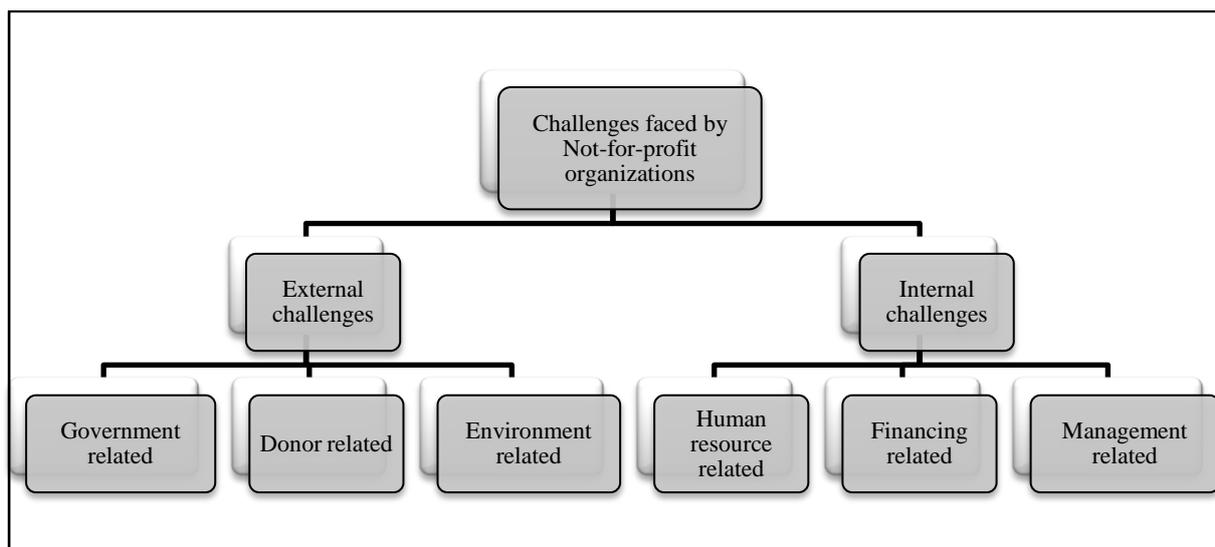

Figure 1 - Framework of challenges faced by not-for-profits

The challenges can be broadly classified into internal and external ones. The external challenges can be related to government, donors or environment. These include donor country priorities changing, criteria being used/applied to organizations, donor's conditional ties, political interference, rules & regulations within a country for accessing government funds, donor prejudices, natural & manmade occurrences, competition from political NGOs, competition from NGOs in the same sector and the type of network involved in.

The internal challenges can be related to human resource, financing and administration. These include capacity limitation within organizations, accountability & transparency, founder syndrome, inadequate strategic and operational plans, inadequate networking skills, inadequate awareness on available opportunities, governance, minimal communication and branding (Batti, 2014).

EXTERNAL CHALLENGES

1. *Government related:-*

1.1. *Problems in registration due to the presence of stringent laws and regulations:* Registration is a key challenge. Hence many of them remain unregistered. Bromideh A.A. (2011) expressed that "... despite the availability of five possible authorities to register, the registration is the most difficult and a bureaucratic process."

1.2. *Relationship with the government:* Maintaining a good relationship and finding support with the government is a critical success factor for them. To facilitate this, they must have a delegate from the government body on their governing board, which undermines their independence. Lu J. (2015) notes that nonprofits with a greater bureaucratic orientation, stronger domain consensus with the **government**, and possessing a longer **government** funding history are more likely to receive **government** grants. Whereas Ahmed 2005 in his study found that public relations was listed as a required competency only by a few organizations, though most not for profits have to liaise with the government & external agencies.

1.3. *Political interference:* Government policies and political climate increase the bureaucratic red tape NFPs face in mobilizing resources from abroad. In case of political instability, donors refrain from providing funds & enforce stringent measures of compliance.

1.4. *Stringent government policies reduce accessibility to funds:* They find it cumbersome to access funds due to stringent government policies. The World Bank operations evaluation department studied and found that the biggest constraint on participation of NGOs was government skepticism about participatory approaches with not-for-profits (World Bank, 2002). Often non-profits compete with for-profits for government grants and contracts, Ahmed (2005).

2. *Donor related*

Several donors insist on special financial controls or management reforms in the organizations they fund (Keating & Frumkin 2003). Donor contributions have been reducing considerably, earlier they would get a significant contribution from a single donor (Katz, R. D. 2005). Study results suggest that dependency and funding source play an important role in non-profit organizations Anheier & Sokolowski (1997). Koenig 2015 states that **applying for grants is hard work. Often** nonprofits don't have their data organized, hence are unable to apply for a grant.

2.1. *Donor country priority:* Donors often dictate areas where funding would be utilized. Hence they find it difficult to obtain these funds. Thomas (2008) noted that they faced shortfalls when the major bilateral donors were shifting priorities towards economic development and to others outside the traditional scope of the organization.

2.2. *Donor preference for area of interest:* Donors' preferences have continued to change and have become increasingly selective. Their sustainability and survival is strongly dependent on a close and trusted donor relationship. Sargeant (2001) states that one in five **donors** might not continue the donation probably due to a change in financial circumstances while others may donate to other organizations. Silke & Scherhag (2014) recommend that managers should work with a few **donor** levels and determine carefully the benefits to be offered to the different levels.

2.3. *Donor conditional ties:* In the donor world, the funding trends are changing. Donors often use basket funding or sometimes prefer funding government institutions. This results in competition among not for profit & the government that have better resources and capacity to mobilize resources. Капырпье, (2013) states that restrictions placed on organizations for example not allowing them to engage with another donor during the period they are funding the organization also affects not-for-profits from diversifying their donor sources. Donors can impose restrictions on how contributions are used. These restrictions often limit the nonprofit. Often they are expected to retain the donation in perpetuity and use only the earnings from the donation.

2.4. *Donor prejudices:* Possessing a good past track record is a prerequisite to easily access resources; here donor recommendations play an important role. Donors lack of awareness about small, unknown not-for-profits results in a skewed funding process. Additionally, the findings of the study by Chelliah, Boersma & Klettner, (2015) suggest that funding dynamics can negatively impact accountability and governance. It often gets complicated when the largest donor is the government. Calabrese, (2011) suggest that donors penalize, when wealth levels are deemed excessive and often future contributions by donors are negatively affected.

One of the recommendations of the operations evaluation department was that the World Bank, develop strategic partnerships (both operational and advisory) with donors, foundations, and others with comparative advantage in knowledge and experience working with NGOs to ensure successful World Bank-NGO collaboration (World Bank, 2002). An example would be the CSR of Tata steel supports NGOs (Kansal & Kaur, 2016).

3. *Environment related*

3.1. *Presence of political not-for-profits:* Both normal & politically backed not-for-profits compete for the same funding, but often political not-for-profits gain an upper hand due to their influence.

3.2. *Intra sector competition:* Many NFPs service similar communities & often compete for funds rather than collaborate. McLeish (2010), states that nonprofit groups compete with each other in roughly four areas: quality of programs or technology, positioning of programs or products, quality of support services and price

3.3. *Lack of public participation:* They fail to engage and attract people, factors responsible for this are; disinterest of the people, over emphasis on targets, time bound programs, political interference, vested interests and easy availability of funds.

3.4. *Lack of volunteerism for social work:* Historically, volunteerism has been high in this sector. With the advent of professionalism, it is taking a backseat. A United Nations development programme report states that, attracting a steady flow of volunteers is a concern, their engagement too is erratic and attrition is high. Youth today have a constant pressure from their families to excel in studies and acquire skills which will generate job opportunities. Hustinx (2001) notes that modernization and individualization has lead to more of an episodic, non-committal and self-oriented types of participation.

3.5. *Centralization in urban areas:* Their presence in urban areas is far more than rural areas. Employee's awareness of rural communities is limited; they refrain from working in rural areas as they are unable to access minimum comfort levels for themselves.

3.6. *Natural calamities and disasters:* Many of them have limited experience in disaster management. Donors abstain from funding countries experiencing disaster and conflict.

INTERNAL CHALLENGES

1. *Human Resource related*

Rodwell & Teo (2004) conclude that, adopting a strategic human resource management could increase organizational performance of NFPs. As non-profits grow and become increasingly complex, the funding organizations demand stringent accountability hence they have to create systems & processes similar for-profit businesses (English, 2016). Borgmann & Bormann (2014) conclude that practitioners first utilize leader member exchange followed by transformational leadership and leader member exchange to improve human resources.

1.1. *Founder syndrome/Monopolization of leadership:* Often authoritarian leaders lead this sector and tend to control & manage rather than encourage democratic leadership.

1.2. *Lack of leadership:* Their success is determined by its leadership team. Mostly they are cause driven & the leaders' skills do not match the expectations of the younger team members' ideas & innovations. The style of functioning of these senior people exhibits authoritarianism and frustrates younger people who are embodiments of new ideas, initiatives and innovation which are not allowed to be expressed and practiced (Mehta et al., 2010). Katz (2005) recommends that not-for-profits change their management like for profits to meet their goals.

1.3. *Inadequate trained personnel:* A large component of employees is volunteers. Rates of pay are often relatively low, necessitating forms of human resource management that emphasize non-financial

means of eliciting employee motivation and commitment (Alatrasta & Arrowsmith 2004). Most resources join the sector with little or no education or training in this sector. Trained professionals have high expectations in terms of salaries, status, opportunities for their career growth and are often poached by others. They do not have budgets for capacity building. Often in human resource management, there exists a barrier in the measurement of performance in this sector (Macpherson, 2001). Ahmed (2005) reports that there is a lack of emphasis on education for CEO roles. D'Cruz (2003) found that Indian women founders in the NFP sector, did not always aspire to be entrepreneurial in fact many of them were not highly educated and had no particular skills in running businesses but acquired skills through learning by doing.

2. *Financing related*

2.1. *Lack of funds:* A major challenge faced by them, are the scarcity of funds. Government does not provide full grants in aid or delays in the sanctions of grants. Additional funding needs to be raised. Organizations & people today are far more stringent in their donations. They have to deal with smaller funding budgets and are feel the pinch as they have to implement business practices that will ultimately make them more accountable, profitable and attractive to prospective business partnerships, hence Goerke (2003), recommends the appointment of a business development manager.

2.2. *Financial accountability and transparency:* They have limited professionalism. Periodic impact measurement also is not conducted. They are more focused on cause-driven activities rather than keeping their financial systems in place. Hence the transparency and trust becomes a challenge. The accountability of nonprofit organizations, particularly the adequacy of current reporting is a concern which has resulted in financial scandals. As they are cash constrained they operate with a small internal accounting staff. Volunteers perform this role regularly. Financial documents are often manual or in low cost software packages and leave a scant audit trail (Keating & Frumkin 2003).

2.3. *Misappropriation of funds:* Handling the finances is a challenge. Rampant misappropriation of funds has been observed resulting in a poor image. Government grants specially are the main culprits. Mixing of foreign and domestic funds or use of the designated foreign contribution (FC) for a different purpose too occurs.

3. *Management related*

3.1. *Scarcity of human resources:* A significant scarcity exists in obtaining human resources, as NFPs have limited funds. People and a good vision are an important element for their improved execution (Katz, 2005).

3.2. *Absence of a focused strategic and operational plan:* Often they tailor make their plans to attract donors, rather than focus on the communities, resulting in a deviation from realistic goals. They are

inclined towards cause driven activities & hence do not focus on the long term planning. This is an irony in not-for-profits. The study conducted by (Keller, 2011) demonstrated that management practices have a "hard impact" on the bottom line.

3.3. *Lack of networking skills:* New donors are keen on funding organizations that are in networks or working together or have a robust impact measurement process or have been accredited by agencies. Miller (2011) recommends that they can focus on building awareness, sharing their story, cultivating donor relationships and establishing an open communication process through social media. The case study by (Mukherjee, 2014) states that the NFP being studied, was not investing to create new relationships; rather it was mining the relationships forged over the past few years.

3.4. *Inadequate awareness on available opportunities:* They fail to utilize opportunities that are available as they are unaware of the opportunities that exist.

3.5. *Governance:* The boards provide limited strategic leadership for their working. The governance structures and instruments such as constitutions, policies and guidelines are required to mobilize resources. Governance requirements and structures have historically tended to be ignored in non profits (Wells, 2012).

3.6. *Modernization:* Grants in aid are used for routine administration and are hardly allocated to introduction of technology & professionalism to support modernization. Schneider, J. A. (2003) argues that staffs of minority not-for-profits have limited familiarity with new **technologies** and this result in them having limited fund raising ability. The National Strategy for Non-Profit Technology report that non-profits are hesitant to use technology and have limited knowledge of its impact (NSNT, 1999). Nonprofit technology network (2015), classify organizations into leading & struggling organizations based on technology. They report that the "Leading" organizations on an average have more total technological staff than those at the lower levels on the technology adoption curve due to the presence of varying technology budgets. Also, there was very little difference in staff expenditure between very large and small organizations with respect to IT.

3.7. *Lack of co-ordination:* They are required to coordinate with various agencies like the central & state government, corporate social responsibility departments of organizations and the community. One sees a lot of duplication & coordination issues in this area. Additionally, the study by (Wang & Ashcraft, 2012) concludes that courses in non-profit management should include areas of financial literacy, verbal and written communication, knowledge of laws and regulations pertain to the nonprofit sector, general leadership skills, information technology, volunteer management, and fund-raising and donor cultivation.

RESEARCH METHODOLOGY

It is estimated that there are thirty one lakh NGO's operating in India, though it is difficult to estimate the exact number (Anand, 2015). Unfortunately, there exists a limited reliable database of NFPs from which to draw such a sample. Existing lists are limited in their scope and tend to contain many inaccuracies thus require considerable purging and correcting. The author sought to identify them by collecting lists from multiple resources and cross checking them. Convenience or judgment sampling was utilized. The sampling frames consisted of websites of; Indianngos.com, lists from Give India, booklets which contained listing of NFPs, participants of conferences on social sector, lists from business associates in the sector and authors personal business contacts. The respondents were selected from these lists.

On the basis of the literature review, sixty challenges were identified and an exploratory research was conducted. A questionnaire was prepared to gauge some basic demographics of the not-for-profits and the perception of the thirty respondents (founders/leaders) towards these challenges was recorded on a five-point Likert scale, where '1' meant strongly disagree, '5' meant strongly agree with '3' being neutral.

For the ease of analysis, on the basis of the literature review, these sixty challenges were then factored into fifteen factors (as per Annexure 1) which represented the major challenges faced by the not-for-profits in India. The reliability of these fifteen factors has a Cronbach alpha / coefficient alpha of .928. So it is concluded that the test is 92.8% consistent in measuring the construct.

Hypotheses were designed and a quantitative analysis was carried out using tools like MS-Excel and SPSS. Demographics like the organization's working age, their annual turnover and the size in terms of total employees were recorded on a ratio scale and later converted to nominal scale for the purpose of analysis.

DATA ANALYSIS

Descriptive analysis

The thirty NGOs under study have been categorized on the basis of age, annual turnover and size. The table 1 below gives the details about the categorization.

Table 1 below gives the categorization of the Not-for-profits under study

Parameter	Basis of categorization	Category	Description
Age	Year of establishment	Old	1990 and before that
		Medium	1991 to 2005 both inclusive
		New	After 2005
Annual Turnover	Annual turnover in INR	Low	Less than and equal to 50 lacs
		Medium	Greater than 50 lacs and less than or equal to one crore
		High	Greater than one crore
Size	Total number of employees	Small	Less than and equal to 100
		Medium	Greater than 100 and less than or equal to 500
		Large	More than 500

Table 1: Categorization of the Not-for-profits under study

Table 2 gives the descriptive analysis of the sample

Sr. No.	Parameter	Categories	Total no.	Percent
1	Age	Old	9	30
		Medium	11	36.67
		New	10	33.33
2	Annual Turnover (in INR)	Low	14	46.67
		Medium	7	23.33
		High	9	30
3	Size	Small	14	46.67
		Medium	11	36.67
		Large	5	16.67

Table 2: Descriptive information of the sample

The authors have taken responses from thirty respondents belonging to NGOs of different size, age and annual turnover. However, they have tried to maintain a balance so that the results are not skewed.

One of the characteristics of this sector is that, it is labor intensive hence the size of the workforce of the not-for-profit was used as a critical indicator of the level of activity of these organizations (Sanders et.al. 2008).

Hypotheses

The following hypotheses have been designed in context to the literature review above. The paper is about identifying the major challenges amongst the pool of challenges discussed above and how several factors impact the significance of those challenges for the not-for-profit organizations.

1. Ho: The average perception of the respondents towards the different challenges is neutral, that is equal to 3

H1: The average perception of the respondents towards the different challenges is not neutral, that is not equal to 3

2. Ho: The average perception towards the various challenges with respect to the age of the not-for-profit is not different

H1: The average perception towards the various challenges with respect to the age of the not-for-profit is different

3. Ho: The average perception towards the various challenges with respect to the turnover of the not-for-profit is not different

H1: The average perception towards the various challenges with respect to the turnover of the not-for-profit is different

4. Ho: The average perception towards the various challenges with respect to the size of the not-for-profit is not different

H1: The average perception towards the various challenges with respect to the size of the not-for-profit is different

1. *Objective:* To identify the favorable and unfavorable perception of the respondents towards the various challenges faced by NFPs in India.

Factor	p-value	Inference
Government policies	0.853	Ho is accepted @ 5% level of significance
Relationship with government	0.661	Ho is accepted @ 5% level of significance
External relations	0.000	Ho is rejected @ 5% level of significance
Global donor country priorities	0.001	Ho is rejected @ 5% level of significance
Donor preferences towards area of interest	0.000	Ho is rejected @ 5% level of significance
Donor prejudices	0.000	Ho is rejected @ 5% level of significance
Competition from other NOT-FOR-PROFITs	0.001	Ho is rejected @ 5% level of significance
Lack of volunteerism/public participation	0.194	Ho is accepted @ 5% level of significance
Centralization in urban areas	0.010	Ho is rejected @ 5% level of significance
Leadership	0.005	Ho is rejected @ 5% level of significance

Human resource	0.001	Ho is rejected @ 5% level of significance
Lack of funds	0.000	Ho is rejected @ 5% level of significance
Financial accountability and transparency	0.000	Ho is rejected @ 5% level of significance
Limited strategic and operational plans	0.010	Ho is rejected @ 5% level of significance
Technology	0.000	Ho is rejected @ 5% level of significance

Table 3: Favorable & unfavorable perception of respondents towards the challenges faced

From the above table, it is noted that the p-value is greater than alpha, that is 0.5 for 3 factors of challenges namely, government policies, relationship with government and lack of public participation/volunteerism. So it can be said that the null hypothesis is accepted and hence it can be concluded that the respondents feel that the challenges related to these 3 factors are insignificant while those related to the rest of 12 factors are significant.

To find out the significance of other factors, the mean values were computed from the one-sample statistics table below.

Factor	Mean value	Inference
Technology	4.26	Most significant
Donor Prejudices	4.17	Highly significant
External relations	3.83	Highly significant
Lack of funds	3.8	Highly significant
Financial accountability and transparency	3.78	Highly significant
Human resource	3.64	Highly significant
Donor preference towards area of interest	3.62	Highly significant
Global donors country priorities	3.55	Highly significant
Competition from other NOT-FOR-PROFITS	3.43	Significant
Leadership	3.42	Significant
Limited strategic and operational plans	3.41	Significant
Centralization in urban areas	3.40	Significant

Table 4: Priority of challenges faced

The above table shows the relative significance of the challenges identified by the authors in the minds of the respondents. The technology stands out to be the most significant one with a mean value of 4.26 (on a scale of 1 to 5, being highly significant), followed by donor prejudices, external relations and funding challenges. All the challenges under study are found to be significant to some level with that related to centralization of NGOs in urban areas as the least significant one amongst them.

This leads to the conclusion that the challenge related to technology is the most significant challenge faced by the founders of Indian not-for-profits, followed by donor prejudices, external relations, lack of funds, financial accountability and transparency, human resource, donor preferences, global donor country priorities, competition from other no-for-profits, leadership, limited strategic plans and lastly centralization in urban areas. (Handy et al, 2007) also report that access to financial capital, or the lack thereof, was not a crucial factor in the decision making for NGO entrepreneurs in India.

2. *Objective:* To study the difference in perception of the 3 classes of age of a not-for-profit towards the different challenges faced by the NFPs.

Factor	p-value	Inference
Government policies	0.360	Ho is accepted @ 5% level of significance
Relationship with government	0.258	Ho is accepted @ 5% level of significance
External relations	0.194	Ho is accepted @ 5% level of significance
Global donor country priorities	0.546	Ho is accepted @ 5% level of significance
Donor preferences towards area of interest	0.625	Ho is accepted @ 5% level of significance
Donor prejudices	0.655	Ho is accepted @ 5% level of significance
Competition from other NOT-FOR-PROFITS	0.027	Ho is rejected, difference in perception
Lack of volunteerism/public participation	0.392	Ho is accepted @ 5% level of significance
Centralization in urban areas	0.933	Ho is accepted @ 5% level of significance
Leadership	0.745	Ho is accepted @ 5% level of significance
Human resource	0.211	Ho is accepted @ 5% level of significance
Lack of funds	0.202	Ho is accepted @ 5% level of significance
Financial accountability and transparency	0.832	Ho is accepted @ 5% level of significance

Limited strategic and operational plans	0.460	Ho is accepted @ 5% level of significance
Technology	0.346	Ho is accepted @ 5% level of significance

Table 5: Perception of challenges based on the age

From the above table, it can be seen that p value is greater than alpha for all except one challenge and hence can be inferred that there is no significant difference in the perception of the founders of different age towards the factors of challenges faced, except for one factor which is competition from other not-for-profits. Whether it is old or new, irrespective of the fact the founders of all not-for-profit face similar level of challenges related to the fourteen factors. Table 5 below shows the results for the factor, "Competition from other not-for-profits."

Factor	Age	Mean value	Inference
Competition from other not-for-profits	Old	2.98	Not significant
	Medium	3.50	Significant
	New	3.78	Highly significant

Table 6: Comparison on the basis of organization age

The above table shows that among the three classes of NGOs classified as per their age, newer not-for-profits find the challenge related to competition from other NGOs as most significant, with a mean value of 3.78 on a scale of 1 to 5, 5 being highly significant. The number for medium aged NGOs stands at 3.50 which again depicts significance whereas that for older NGOs is 2.98 which is less than 3, i.e. neutral. It can be said that older NGOs do not find this challenge as very significant.

3. *Objective:* To study the difference in perception of the 3 classes of annual turnover of not for profit towards the different challenges faced by the NFPs.

Factor	p-value	Inference
Government policies	0.242	Ho is accepted @ 5% level of significance
Relationship with government	0.168	Ho is accepted @ 5% level of significance
External relations	0.355	Ho is accepted @ 5% level of significance
Global donor country priorities	0.302	Ho is accepted @ 5% level of significance
Donor preferences towards area of interest	0.675	Ho is accepted @ 5% level of significance
Donor prejudices	0.090	Ho is accepted @ 5% level of significance

Competition from other NOT-FOR-PROFITS	0.187	Ho is accepted @ 5% level of significance
Lack of volunteerism/public participation	0.133	Ho is accepted @ 5% level of significance
Centralization in urban areas	0.621	Ho is accepted @ 5% level of significance
Leadership	0.785	Ho is accepted @ 5% level of significance
Human resource	0.716	Ho is accepted @ 5% level of significance
Lack of funds	0.126	Ho is accepted @ 5% level of significance
Financial accountability and transparency	0.645	Ho is accepted @ 5% level of significance
Limited strategic and operational plans	0.637	Ho is accepted @ 5% level of significance
Technology	0.462	Ho is accepted @ 5% level of significance

Table 7: Perception of challenges based on annual turnover

From the above table, looking at the p-values (all are greater than alpha, i.e 0.5) it can be said that there is no significant difference in the perception of the founders of different annual turnover towards the factors of challenges faced. Irrespective of the size of turnover, the founders face similar level of challenges related to all the fifteen factors.

4. *Objective:* To study the difference in perception of the 3 classes of size (in terms of human resource) towards the different challenges faced by the NFPs.

Factor	p-value	Inference
Government policies	0.442	Ho is accepted @ 5% level of significance
Relationship with government	0.022	Ho rejected, difference in perception
External relations	0.790	Ho is accepted @ 5% level of significance
Global donor country priorities	0.912	Ho is accepted @ 5% level of significance
Donor preferences towards area of interest	0.959	Ho is accepted @ 5% level of significance
Donor prejudices	0.105	Ho is accepted @ 5% level of significance
Competition from other not-for-profits	0.496	Ho is accepted @ 5% level of significance
Lack of volunteerism/public participation	0.548	Ho is accepted @ 5% level of significance
Centralization in urban areas	0.420	Ho is accepted @ 5% level of significance

Leadership	0.637	Ho is accepted @ 5% level of significance
Human resource	0.884	Ho is accepted @ 5% level of significance
Lack of funds	0.646	Ho is accepted @ 5% level of significance
Financial accountability and transparency	0.718	Ho is accepted @ 5% level of significance
Limited strategic and operational plans	0.961	Ho is accepted @ 5% level of significance
Technology	0.024	Ho rejected, difference in perception

Table 8: Perception of challenges based on size

From the above table, one can understand that there is no significant difference in the perception of the founders of not-for-profits of different size (in terms of human resource employed with them) towards the factors of challenges faced, except the two factors which are relationship with government and technology. Whether the size is small or large, irrespective of the fact the founders face similar level of challenges related to the 13 factors. Table 9 below shows the results for the factors, "Relationship with government & technology".

Factor	Size	Mean value	Inference
Relationship with government	Small	2.52	Not significant
	Medium	3.18	Significant
	Large	3.53	Highly significant
Technology	Small	4.85	Highly significant
	Medium	3.54	Significant
	Large	4.20	Highly significant

Table 9: Comparison on the basis of size

From the above table, it can be said that smaller NGOs feel technology as highly significant challenge with a mean a value of 4.85 which is very close to 5 whereas maintaining relationship with government is seen as a highly significant challenge for large not-for-profits with a mean value of 3.53. Technology is also seen as a significant challenge for large NGOs whereas the medium ones do not find it that significant, though it is a significant challenge for them too.

RESULTS AND DISCUSSION

The study shows that challenges exist in the not-for-profits of differing sizes, ages and turnovers. Amongst the significant challenges, those related to technology are the most significant, followed by donor prejudices, external relations, lack of funds and financial accountability & transparency. Although primarily concerned with “management control”, Anthony and Young (1988) also discussed eight different contextual attributes of nonprofit organizations that affect the control process: absence of profit measure; tax and legal considerations; predisposition to be service-oriented; greater constraints on goals and strategies; source of financial support; dominance of professionals; differences in governance and in senior management; and political influences. Obtaining funding for technology, introduction and training could be the reasons for this being significant.

Newer organizations face higher competition from the established ones, followed by the middle aged ones, whereas the older organizations, do not face significant competition from other NFPs. Irrespective of turnover, all founders face similar level of challenges related to all the fifteen factors. Larger not-for-profits face higher difficulties in maintaining relationship with the government, whereas smaller organizations do not find it as a significant challenge. Newer organizations face higher competition from the older organizations followed by the middle aged ones. The almost equal representation of the sizes of the not-for-profit brings a balanced approach to this study.

CONCLUSIONS AND IMPLICATIONS

Overcoming challenges of technology, donor prejudices, and external relations, lack of funds and financial accountability & transparency are *essential* if the not-for-profits want to grow, succeed and sustain. Increased competition in this sector is hampering growth and performance of these organizations. Training of employees and collaboration between these organizations could help overcome some of these challenges. This study provides a basis for future research to bridge the knowledge gap in the areas of technology, donor prejudices, external relations and funding and there by understand ways & means to overcome them and help build, nurture, and sustain them. (Hackler & Saxton, 2007) conclude that *nonprofits must enhance organizational capacities in long-term IT planning, budgeting, staffing, and training; internet and web site capabilities; and the vision, support, and involvement of senior management to achieve the IT mission impact*. The contribution from this study will help practitioners make sense of the challenges faced in this sector and elucidate efforts to surmount them. As quoted in the literature review, the not-for-profit is a third sector of the economy and it has shown rapid growth over the past years. So, understanding the challenges facing them and devising strategic

policies accordingly is an important aspect contributing towards smooth functioning of these organizations.

The limitations of this study were, it was quantitative in nature, and perhaps a qualitative data collection method would give better results. Additionally increasing the sample size could have yielded better results. Further research may be justified to investigate the perception of the organization employees. Collaborations amongst old & new organizations could probably be studied in the future. The findings and results will be used by researchers and founders who start not-for-profits as the annual budgets of these organizations are now not a paltry sum but range from Rupees thirty million to five thousand million (Latha & Prabhakar 2010).

DIGITALIZATION FOSTERING BUSINESS COOPERATION – REALITY OR FICTION?

Jankowska, Barbara; Polowczyk, Jan

Dept. of International Competitiveness, Poznan University of Economics and Business, Poznan, Poland

ABSTRACT

The goal of the paper is to investigate if and how new technologies and digitalization foster the cooperation in business. To achieve that goal the authors first highlight the significance of the Internet for the growing presence of the cooperative process in the economy, then the concept of the sharing economy is explained and the main manifestations of the sharing economy – new business models, new models of economic organization, are characterized. The paper is more conceptual than empirical in nature. Nevertheless the authors combined the conceptual approach with the case study approach. The second was used to exemplify the new processes in business. It turns out that the new trends are accelerated by digitalization and new technologies and manifest themselves in the prevalence of cooperative elements in business. The business processes presented suggest interesting managerial implications for companies: innovative business models should be based on sharing, openness, transparency and crowdsourcing. Breakthrough technologies enrich and diversify opportunities for value creation by new forms of collaboration.

Keywords: *strategic management, business model, cooperation, sharing economy, digitalization, Internet, crowdsourcing, transparency*

INTRODUCTION

Strategic management has been based for a long time on the assumption of competitive advantage (Porter, 1985). It was assumed that to create and sustain advantage in the market a firm has to compete with other firms. It highlighted the significance of competition and neglected the value of cooperation. The Strategic Management Society (SMS) was established in 1981 and operates in the form of interest groups. SMS appreciated the processes of cooperation only in 2012, when the “cooperative strategy” interest group was created. The „competitive strategy” interest group existed from the beginning of the SMS.

The dynamic economic growth which we have experienced on a global scale for several decades and despite the crises that take place in different parts of the world is to a large extent facilitated by the business cooperation (Nowak and Highfield, 2011; Sennett, 2012). Cooperative behaviours are visible at Innovation, Entrepreneurship and Digital Ecosystems

the macro- and in particular the micro-level. Firms became aware that cooperation is crucial for their business success (Axelrod, 1997; Schmid, 2004).

The structure of the paper is as follows: first, the authors highlight the significance of the Internet for the growing presence of cooperative process in the economy, then the concept of the sharing economy is explained and the main manifestations of the sharing economy are characterized. New business models and the phenomenon of crowdsourcing are described. The paper finishes with conclusions.

THEORETICAL FRAMEWORK

Cooperation in business can be viewed from the perspective of the theory of economics and from the theory of management. Both approaches put emphasis on different aspect of this phenomenon. Nevertheless they do not exclude each other but rather complement one another. For Ronald Coase (1937) cooperation was crucial to decrease the transaction costs related to contractual relations. Cooperation was a kind of governance mechanism that thanks to trust allowed the replacement of pure market price formation with a visible hand of management. The theses of Coase later gave rise to the theory of Olivier Williamson that is called the transaction costs theory. Williamson (1987) presented a firm as a kind of governance structure which exists to minimize transaction costs. He indicated three types of governance mechanisms: the hierarchy, the pure market and between them – cooperation. Cooperation was called a hybrid form of governace structure and manifested itself in the form of strategic alliances amongst organizations. According to Park and Russo (1996, p. 877) cooperation combines market and hierarchy to reduce the negative aspects of both. In their approach cooperation helps to mitigate the asymmetry of information and to reduce the risk of partners' opportunistic behaviour.

During the two last decades strategic management theory was under the strong influence of the resource based view – RBV (Wernerfelt, 1984; 1995; Barney, 1991). RBV associates cooperation with attempts to get access to valuable resources and skills. In this perspective each firm is characterized by a different pool of resources and skills. Cooperation emerges when firms are eager to share knowledge, especially tacit ones and expertise related to the development of products and processes.

Another quite important issue is how to increase the pool of the positive implications of cooperation in business and the question as to which factors are crucial for the creation of advantages of cooperation for incumbents involved in this kind of behaviour and relationships in the market. In a set of factors facilitating cooperative attitudes and behaviours in business we can indicate digitalization. This relatively new trend increases the number of potential beneficiaries of cooperation in business.

According to some experts digitalization fosters business cooperation to an extent so far not encountered in the history of mankind. In the last few years there have been views suggesting even the

transition to an era of abundance of goods and services, which will be almost for free (Diamandis and Kotler, 2014; 2015). Following this the capitalist system of the market economy will evolve in the direction of cooperative communities in which the dominant form of business relations will be the sharing of goods and services (Rifkin, 2014).

The prevalence of Internet use in business resulted in the emergence of the new notion and concept: wikinomics (Tapscott and Williams, 2006; 2010). Wikinomics is defined as a new art of cooperation amongst organizations and individuals who use Internet. This is a new way of creating innovation and value based on cooperation of “peers”. Tapscott and Williams (2006; 2010) indicate four principles of wikinomics in enterprises: openness, partnership, sharing and global action. In short it can be described as follows:

Openness – the past confidentiality gives way to increasing transparency. The new rules apply to the openness of human resources, innovation, industry standards and communication. Information that used to be kept in secret is now becoming more widely available.

Partnership (peering, peer-to-peer, P2P) - is a form of organization combining elements of hierarchy and self-organization. It is based on the principles of meritocracy which means that the most talented and experienced community members are leaders and perform the functions of integration. Working in partnerships is more effective than hierarchical management because it is based on voluntary motivation. People alone accept tasks that require creativity and knowledge. They are therefore more likely to do the work better than if they had to follow the command manager. This applies particularly to areas requiring creativity, such as scientific research, software, education, entertainment, or culture.

Sharing - traditional business wisdom says that you should protect intellectual property. Digital recording introduces new challenges. It is easy to share, process, or copy. Companies need to protect just their fundamental intellectual property. Sharing their own intellectual property is not an altruism. This is often the best way to build ecosystems of cooperation.

Global action (acting globally) – a truly global company has no physical or regional boundaries. It builds its ecosystem for the design, supply, production and distribution of products on a global scale.

The four concepts of wikinomics that govern business reality nowadays manifest themselves in the development of new business models and new business processes like prosumption (Toffler, 1980), crowdsourcing (Howe, 2006), user contribution systems (Cook, 2008), or Internet collaboration platforms, e.g. InnoCentive, or NineSigma.

METHODOLOGICAL APPROACH

Our paper is based on secondary sources and we follow the inductive rather than deductive approach. The key assumption within this methodological approach rests on the significance of observations

amongst others as a foundation for further generalization if any (Neuman, 2003, p.51). According to Bernard (2011) at the beginning in this kind of study is the observation which is to provide the researcher with any patterns. Then the researcher looks for explanations and further theories for those patterns. The challenge of detection of the signals of the impact of digitalisation on cooperation in business being a relatively new phenomenon and still calling for research justified the avoidance of any preconceptualization. The type of analysis implemented in the study can be called narrative description. However we embed our study not only in conceptual issues but in an attempt to provide exemplification of particular phenomena referring to real-life cases of firms. The cases we indicated are rather more exploratory than explanatory in nature since they are a kind of pilot study to provide some foundations for a more complex research framework in the future.

SHARING ECONOMY

The sharing economy (also known as peer-to-peer economy, or collaborative economy, or collaborative consumption) is a new economic and social phenomenon based on the sharing of human and physical resources. It includes the shared creation, production, distribution, trade and consumption of goods and services by different people and organizations. Although it is a relatively new phenomenon it has been widespread across the globe in the form of peer-to-peer ride-sharing, accommodation-sharing, or renting household items, etc.. (The Economist 2013a).

The proliferation of Internet and mobile devices has accelerated a digital evolution and it serves as a growth catalyst. Technology is crucial to the growing concept of a sharing economy to enable scale and enhance economic impact. A number of Internet sharing platforms have emerged which enable individuals to share goods and services such as houses, cars, garden tools, professional skills and so on (Botsman and Rogers 2010).

The main advantage of the sharing economy is the fact that the sharing platforms create a win-win situation for all the stakeholders. The amenities of the sharing economy are diversified: on-demand access to goods and services, efficient utilization of unused assets, leading to a multiplier effect such as increased employment and the rise of micro-entrepreneurship. Enterprising citizens can now generate income by renting assets as varied as furniture, camping equipment, or even parking spots.

The sharing economy is a hybrid form of economic and social organizations between private ownership and peer-to-peer-based sharing of access to goods and services. New firms are experimenting with new organisational forms. The main difference lies in ownership. At the beginning of a company's life the founders and first employees own a majority stake—and they motivate people with ownership stakes or performance-related rewards. That has always been a

practice in start-ups but today the rights and responsibilities are precisely defined in contracts. This aligns interests and creates a culture of hard work and friendship.

Start-ups used to face difficult choices about how to invest in large assets such as property and computer systems. Currently young companies exploit new technology which enables them to be global without having big assets. They can develop very fast by buying in services as and when they need them: „*They can incorporate online for a few hundred dollars, raise money from crowdsourcing sites such as Kickstarter, hire programmers from Upwork, rent computer-processing power from Amazon, find manufacturers on Alibaba, arrange payments systems at Square, etc.*” (The Economist, 2015).

Sharing, openness and transparency have become new business rules. For example Tesla Motors, Silicon Valley’s electric carmaker, in the spirit of the “open source” movement, shares patents that cover its electric vehicles technology for free. Tesla believes that applying the open source philosophy to its patents will strengthen rather than diminish its position. E.Musk, Tesla founder and CEO, is convinced that other companies making electric cars will benefit from a common, rapidly-evolving technology platform. Technology leadership is not defined by patents but rather by the ability to attract and motivate the world’s most talented engineers.

Tesla’s strategy is imitated by the more „traditional” carmaker Toyota. Toyota is focused on making longer-range hydrogen-fuel-cell vehicles, the future standard for clean transportation, and is working with the Japanese government to build a fuelling infrastructure for hydrogen. Toyota shares its 5,680 patents related to its new Mirai car for free to promote hydrogen-powered vehicle technology. This is the first time the Japanese carmaker has released patents to competitors without charging a royalty fee.

Sharing and openness are present in many very different industries such as: gold mines (Tapscott and Williams, 2006), software (Meyer and Kirby, 2012), or robotics (The Economist, 2014a). The Open Source Robotics Foundation (OSRF) has been created and it supports development of Robot Open Source (ROS). ROS is free to use and easily customised and is being taken up by more and more researchers, many of whom happily share their ideas (Pratt, 2015). Using a ROS navigation and a Kinect it is now relatively easy to build a simple robot.

NEW BUSINESS MODELS

The business model is a key element of each business strategy. It is a set of assumptions about how an organization will perform to create value for all stakeholders (Magretta, 2002, p.44). Each business model should describe the rationale of how an organization creates value. According to Magretta (2002, p.46) the business model is a story of how an enterprise works and makes money. Many great

business models began not with the analytic efforts of a planning committee but were developed through serendipity and experimentation.

Literature on the newest business models is quite dispersed. Academics are trying to follow and present a new explosion of business models. A common conceptual base is still lacking (Zott, Amit and Massa, 2010). In this paper we have tried to capture and describe new business phenomena which are based on Internet technology.

There are two companies, both created in San Francisco, which are regarded as the pioneers of the sharing economy: Airbnb created in October 2008 and Uber founded in March 2009. Uber a taxi operator is now the most valuable American company of the newest generation. Uber is a private company and its capitalization is estimated to be above \$60 billion at the beginning of 2016. That is higher than 80% of the firms in the S&P 500 index, many of which are decades old. Uber's value has grown faster than those of Facebook and Twitter in their early years.

In 2016 Uber operates in more than 450 cities in about 70 countries providing more than 1 million rides each day. Consumers like Uber because its cars are cheaper than conventional taxis, clean and reliable. Uber's freelance drivers, who typically pay it around 20% of their fares, enjoy flexible working hours and are spared the formalities of qualifying as a conventional taxi driver. Uber has an advantage that most transport firms lack: it does not have the cost of maintaining and insurance its own fleet of vehicles because its drivers supply their own (The Economist, 2015b).

Uber can be used as a case study presenting how to construct a platform for a digital service on top of which other businesses can be built. As it arrives in a city it launches a vigorous recruiting programme for drivers by offering them incentives to sign up. Its fares are flexible - they undercut conventional taxis most of the time but go up when it is snowing or when there is some other reason why demand for rides is growing (The Economist, 2015a).

Airbnb an Internet holiday accommodation company currently has about 1,400 employees and operates 1,5 million listings in 33,000 cities and 190 countries. Airbnb owns no physical assets and is worth more than \$20 billion. That is more than the value of Hyatt Hotels, which has 45,000 employees spread across 549 properties and whilst Hyatt's business is comparatively flat Airbnb's activity indicators are growing exponentially (Gallagher, 2015).

The story of Airbnb versus Hyatt Hotels presents a fundamental difference in the approaches to ownership. Hyatt Hotels spent enormous resources to purchase and own billions of dollars in physical assets whilst Airbnb connects users with property to rent (hosts) with users looking to rent the space (guests). Airbnb runs its business without owning any rooms itself. Such platforms disrupt traditional industries by creating new sources of supply and rely on customer reporting to develop

quality. Unlike traditional hotels Airbnb develops not by scaling assets but by increasing the hosts and travellers and matching them with each other using Internet tools (The Economist 2013b).

The main competitor of Airbnb is Couchsurfing, also from San Francisco, but it works on the basis of a slightly different business model. The company started as a nonprofit organization. Currently it also does not charge for any service, but users can pay a one-time fee of \$ 25, which is also a membership fee. Members of this organization provide each other with services of rental housing. Couchsurfing is distinguished from its commercial competitor Airbnb, through its mission statement which is more social than commercial, which expresses the slogan: "Stay with locals for free". Another company in this industry is HomeAway, an American public company established in Texas.

The above-mentioned companies (Uber, Airbnb and their competitors) are private companies operating as intermediaries in the provision of services. Their income partially comes from the fees that the recipient pays to the service provider. They are for-profit companies. It binds them with the traditional economy. Using the Internet capabilities they built a business model based on outsourcing not investing in material assets. They created the ecosystems of cooperation with external partners based on a voluntary basis and mutual trust. Trust is possible thanks to the transparency obtained through the profiles of the participants and the mutual evaluation. This transparency is provided by the use of the Internet and telecommunication technologies.

CROWDSOURCING

The rise of crowdsourcing is connected with Linux which is the pioneer and most prominent example of open-source software and self-organizing power in the Internet (Surowiecki, 2005, pp.72-74). Today Linux is used by tens of millions of people around the world. It consists of more than 100.000 volunteer programmers building and improving the software. They are united by a common goal: to create the world's best operating system. Linux open projects appeal to volunteers' need for individuality and autonomy and at the same time provide a sense of community.

The Linux concept was developed in the 2000s and was adopted by business. In a short period of time crowdsourcing became an important form of business cooperation. The term "crowdsourcing" was coined by Jeff Howe (2006) and it is a fusion of two words: "crowd" and "outsourcing". Crowdsourcing is a widespread problem-solving method that involves outsourcing tasks to a network of people, also known as the crowd. The difference between crowdsourcing and ordinary outsourcing is that a task or problem is outsourced to an undefined public rather than a specific organization.

Thanks to Internet technology millions of people make different kinds of voluntary contributions to companies every day. Volunteers create significant value for those firms and, as a result, for their

shareholders. Many companies owe much of their success to the contributions made by anonymous people from outside their firms. There are many different examples: Facebook profiles, eBay goods, YouTube videos, Wikipedia entries, the aggregated buying behaviour underlying Amazon recommendations, etc. (Cook, 2008).

Traditional companies can use this emerging source of value by creating their business models based on so-called 'user contribution systems'. The user can be a customer, employee, supplier or someone with no previous connection to the company at all. The contribution can actively offer expertise, work, or information as well as passive or even unknowing contributions, such as behavioural data that are collected automatically as a by-product of a transaction or any activity. The system is the method, usually Internet based, by which contributions are aggregated and made useful to others. Such 'user contribution systems' create value for a business as a consequence of the value they deliver to customers.

Crowdsourcing may produce solutions from amateurs or volunteers working in their spare time or from experts or small businesses which were unknown to the initiating organization. Crowdsourcers are motivated by the two main benefits of crowdsourcing: they can gather large numbers of solutions or information and it is relative inexpensive. Users (crowd) are motivated by: intrinsic motivations (such as social contact and passing the time – emotions), or extrinsic motivations such as financial gain.

Enrique Estellés-Arolas and Fernando González-Ladrón-de-Guevara (2012), after studying more than 40 definitions of crowdsourcing, propose an integrating description: *„Crowdsourcing is a type of participative online activity in which an individual, an institution, a non-profit organization, or company proposes to a group of individuals of varying knowledge, heterogeneity, and number, via a flexible open call, the voluntary undertaking of a task“*.

Crowdsourcing systems are used to accomplish a variety of tasks. Traditional companies employ user contribution systems in a wide variety of business activities and functions: customer service, marketing, employee support, capital resources, design, production, etc.. The crowd may also be invited to develop a new technology. The last mentioned activity is supported by independent internet platforms, e.g. InnoCentive or NineSigma.

InnoCentive is a Massachusetts-based crowdsourcing company that accepts, by commission, research and development problems in engineering, computer science, maths, chemistry, life sciences, physical sciences and business. The company posts tasks (challenges) to its global solver community.

InnoCentive's solver community consists of over 355,000 people from nearly 200 countries. More than 50% of registered solvers come from Russia, India and China. Most of the problem solvers are well-educated, with a majority (66%) holding a PhD. InnoCentive posts its clients' problems on its website, without a crowdsourcer identity together with a financial reward for the best solution delivered within a given timeframe. The cash prize can range from \$10,000 to \$100,000 per challenge. Seeker companies, such as Procter & Gamble, Eli Lilly, Dow or BASF, have their own large R&D departments. They use InnoCentive when they are looking for new approaches in technology, especially when they are stumped in a particular research area. Using this approach seeker companies get access to the specialized talents of tens of thousands of scientists without adding to their fixed costs (Huston and Sakkab 2006).

NineSigma is a Cleveland-based open innovation service provider that connects organizations with external innovation resources to accelerate innovation in private, public and social sectors. It is a leading crowdsourcing supporter which has run contests for NASA, GE, BASF and many other companies. NineSigma has more than 2,5 million network members.

There are many examples of profitable crowdsourcing results. One of the most spectacular is the Goldcorp case (Tapscott and Williams, 2006). The crowdsourcer Goldcorp is a gold producer headquartered in Vancouver, Canada. Goldcorp's operating assets include goldmines in Canada and the U.S., in Mexico and in Central and South America. Its present strong position was created by Robert McEwen. McEwen was fascinated by the Linux model of cooperation with volunteers. His intention was to attract the best experts in the world to find more gold in Red Lake field in Canada, just as Linux managed to attract world-class programmers to create software.

In March 2000 McEwen announced the Goldcorp Challenge. It was an extraordinary challenge to the world's geologists. Goldcorp presented online data on the Red Lake mine. The prize was a total of \$575,000, with a top award of \$105,000. More than 1,400 scientists, engineers and geologists from 50 countries downloaded the company's data and started their virtual exploration. The top winner was a partnership of two firms from Australia: Fractal Graphics in West Perth, and Taylor Wall & Associates in Queensland. Together they had developed a powerful 3-D graphical depiction of the mine. From a remote site the winners were able to analyze a database and generate targets without ever visiting the Goldcorp property in Canada.

Crowdsourcing is also used by the PKN Orlen, the major Polish oil refiner and petrol retailer and the biggest Polish company. In 2015 PKN Orlen announced "The Waste Heat Recovery Innovation Contest" regarding technological solutions for efficient recovery and utilisation of low-temperature Innovation, Entrepreneurship and Digital Ecosystems

heat from distillation columns - to improve the energy efficiency in production processes at the refinery. It was the first global project of that scale launched by a Polish company. Proposals were submitted by companies, universities and research centres from all over the world. The best three solutions were selected. The winners each received prizes of EUR 10,000 and were invited to discuss further cooperation.

User contributions are fuelling some of the world's fastest-growing and most competitively advantaged organizations – in some cases revolutionizing the economics of entire industries by radically shrinking their cost structures. For example eBay was opened as an online store with no inventory leaving it up to customers to fill its “shelves” with goods to sell.

Skype incurs almost no capital costs because its Internet based phone system is built on the unused processing capacity of its customers' personal computers. Google too is built on user contributions: Its search engine relies on the algorithmic aggregation of links created by others between websites and its advertisement placement system relies on data from people's click behaviour (Iyer and Davenport, 2008).

A user community can answer difficult questions that even the firm's staff cannot. Hyatt Hotels and Resorts has launched an online service called Yatt'it. It reduces the work of hotel personnel and gives travellers tailored information. Yatt'it is an online community for Hyatt concierges and Hyatt Gold Passport members. The community offers travellers advice and inside knowledge with a unique advantage - credibility. The system reduces the burden on concierges. It also improves customer satisfaction by providing better and easier to access suggestions.

In Japan Honda captures real-time traffic data from GPS systems that Honda owners buy from the company. Reports from each vehicle contribute to a data stream that Honda aggregates with other traffic data to provide information on traffic jams and other conditions to Honda drivers who subscribe to the company's InterNavi service. Users benefit from enhanced traffic updates; the company can offer a superior subscription service without having to pay for the capital infrastructure.

In creative arts the Threadless company that manufactures T-shirts relies on a community of volunteer designers and artists to submit designs and a community of customers to select those that will go into production. Both of the user groups, as well as the company, benefit. The designers get free exposure for their work and a chance of monetary compensation: they receive \$2,500 plus a percentage of sales if their design is chosen by Threadless customers. The customers get distinctive T-shirt designs that

they have collectively selected. Threadless gets inexpensive design services and an unusually engaged customer base minimizing: inventory, cost promotions and other margin-eroding practices.

Most contribution systems offer no financial compensation to contributors. In fact payment can destroy participation by undermining a sense of collaboration and trust. Rather they rely on personal motivation or involve contributions that require no motivation at all because the user contributes without realizing it. Some systems collect participants' resources or data of things people are doing for other purposes. As shoppers buy from Amazon - they automatically contribute to its recommendation engine which suggests products based on purchase decisions of other customers. Many systems provide the benefits of interaction with others: being part of a community with a common interest, generating business prospects – these are the drivers behind social networks such as Facebook and LinkedIn.

Crowdsourcing creates two big challenges for executives. Firstly, they must learn how to spot opportunities for creating value from volunteer contributions and secondly, in acting on these opportunities, executives must overcome natural organizational resistance to the idea of relinquishing significant control to people outside the company.

CONCLUSIONS

The above findings have confirmed that new technologies impact economic and social development processes. Internet creates new opportunities and accelerates the growth of new business and economic organization models which include strong cooperative elements. Thanks to the Internet the spread of best practices is possible. The new approach to business activity is often based on the principles of open source and peer-to-peer cooperation.

The sharing economy is a new economic and social phenomenon based on the sharing of human and physical resources. It is a relatively new process but it has been spreaded widely across the globe in the form of carsharing, ride-sharing, accommodation-sharing, etc. It is possible thanks to the development of innovative technologies. After more than 20 years of the Internet new firms emerged with their online platforms efficiently matching supply and demand for goods and services. They do this without expanding their assets, merely using free or redundant assets on the supply side. What is more they create new opportunities for consumption because they increase transparency in social and economic interaction. It is reality, not fiction.

From a managerial standpoint this study offers specific guidelines to business executives. The business processes presented suggest that innovative business models should be based on sharing, openness,

transparency and crowdsourcing. Breakthrough business models diversify opportunities for value creation by new forms of cooperation.

THE EFFECTS OF FOREIGN DIRECT INVESTMENT ON THE ECONOMIC GROWTH IN RUSSIA

Kapustina, Larisa¹; Falchenko, Oksana²

²International Activity Dept., Ural State University of Economics, USUE, Yekaterinburg, Russia

ABSTRACT

The paper considers the role of foreign direct investment in the host country economy in the example of the Russian Federation. Positive and negative macroeconomic effects of foreign capital in national economies were marked. In the paper there was made an analysis of the country economy development through internal and investment resources. The analysis showed that the country economy was not too dependent on the foreign direct investment inflows. The econometric analysis confirmed the hypothesis of a positive, but weak impact of foreign direct investment on economic growth in Russia. The results of the calculations for the Russian economy showed that gross domestic product growth is more dependent on domestic investment in fixed assets than on foreign direct investments and labour.

Keywords: *foreign direct investment, FDI, economic growth, host economy, effects of foreign direct investment, gross domestic product, GDP.*

INTRODUCTION

In the global economy multinational corporations (MNCs) are the leading subjects of production, trade, monetary and financial, scientific and technological processes. They affect the host country's economy through the movement of capital in the form of foreign direct investment (FDI), exports of goods and services, and also play an important role in the transfer of know-how, technology and innovation. According to the UN Conference on Trade and Development (UNCTAD), in 2014 multinationals accounted for about 2/3 of the world's foreign direct investment and more than a half of world exports of goods and services.

Russia faces the goal of improving the investment and innovative mechanisms to solve socio-economic problems and to increase economic growth. This problem can be solved by using the potential of domestic enterprises, as well as through the expansion of cooperation with foreign companies, by means of state regulation of FDI. In this context it becomes urgent to evaluate the macroeconomic

effects of FDI in the Russian economy, as well as measurement of FDI contribution to the gross domestic product (GDP) of Russian Federation.

The main purpose of the paper is to investigate a significance of the factors of production on economic growth in Russia in the years 1992–2014, with particular attention given to the influence of FDI net inflows. A decision to take FDI inflows into account as an explanatory (independent) variable of changes in the GDP value resulted from a number of preconditions including increased FDI inflows as well as outflows in Russia, especially in the period of the financial crisis, slowly growing significance of Russian foreign investments and the process of disinvestment.

The paper took advantage of the methods used in scientific literature and empirical studies. Investigation of the FDI impact on growth of the GDP value was carried out with the use of the Cobb-Douglas production function. Statistical data came from the OECD and UNCTAD databases.

It should be noted that the impact of FDI on the host countries is ambiguous. After analyzing the existing methodological approaches to the assessment of the FDI effects on the host country economy, we have distinguished econometric models which considered the economic effects of FDI impact on the host economies. These models have been tested on the examples of developed and developing countries, including China, Africa, Latin America, Central and Eastern Europe, Venezuela and Russia.

In the literature a lot of attention was paid to the study of the FDI impact the host countries. According to some economists, FDI is an important factor in the host countries and regions development (Kadochnikov *et al.*, 2011; Mantaeva and Bolaev, 2010; Boush *et al.*, 2012; Rakhmatullayeva *et al.*, 2015). FDI may be sent for reconstruction, diversification and modernization of production.

During the last decades, the relation between FDI and economic growth has been extensively discussed in the economic literature. There are different empirical studies assessing the impact of FDI on the growth factors of the host countries. They may be divided into two main directions: the first direction has searched the positive impact of FDI and economic growth, the other – a negative one.

Positive effects from the FDI on the host country growth factors are considered by some scientists (Mansfield and Romeo, 1980; Findlay, 1978; Borensztein *et al.*, 1998; Rappaport, 2000; De Gregorio, 2005; Sun, 1998). FDI through a “contagion” effect increased the rate of technical progress in host country from the more advanced technology, management practices, etc., used by foreign firm (Findlay, 1978). FDI, as an important vehicle for the transfer of technology, has contributed to the growth in larger measure than domestic investment (Borensztein *et al.*, 1998). They developed a research of 69 developing countries confirms that FDI contributes towards the economies of the less-developed countries, if they have the capabilities to absorb advanced technologies. FDI may improve the productivity not only of the firms receiving investments, but also of all firms of the host countries as a consequence of technological spillovers (Rappaport, 2000). Technologies and knowledge that are not

readily available to host country investors may be brought to them along with FDI, and in this way led to productivity growth throughout the economies (De Gregorio, 2005).

FDI may also boost exports for the host countries (Sun, 1998). Using the regression model and panel data, Sun has found out a high and significantly positive correlation between FDI and domestic investment in China. Higher levels of FDI are consistent with higher provincial exports in China (Zhang and Song, 2000). It is worth noting that the positive effect of FDI on exports in China has mostly been due to the fact that China has largely been used as an export platform by MNCs.

Goldberg and Klein analyzed the impact of FDI from the United States in the manufacturing sectors of individual Latin American countries on the net exports of those and other sectors (Goldberg and Klein, 1999). The results vary across sectors and host countries, reflecting the importance of the specific conditions in individual countries and industries. The fact that the results are mixed makes it impossible for the authors to draw a strong and clear conclusion on the relationship between the FDI flows and trade. Barry and Bradley analyzed the effects of FDI on Irish exports in a more descriptive way (Barry and Bradley, 1997). They concluded that there had been a significant direct contribution of foreign producers to increasing Irish exports because the FDI in Ireland had mostly been export-oriented.

The other group of researchers revealed the negative impact of FDI on the host country growth (Haddad and Harrison, 1993; Mansfield and Romeo, 1980; Lipsey, 2002; Mansfield and Romeo, 1980; Haddad and Harrison, 1993). They have also found no positive effect of FDI on the rate of economic growth in developing countries. According to the empirical research, a consistent relation between the size of inward FDI stocks or flows relative to GDP and growth did not exist (Lipsey, 2002).

Some researchers consider the positive or negative impact of FDI to correlate the conditions and the economy development level of the host country. A positive growth-effect of FDI may be real if the country was sufficiently rich (Blomstrom *et al.*, 1994). However, Carkovic and Levine take into account an interaction term from income per capita and FDI (Carkovic and Levine, 2002). FDI inflows did not exert an exogenous impact on growth in financially developed economies. FDI had a positive growth-effect in countries with sufficiently developed financial markets (Alfaro *et al.*, 2003).

Empirical studies have showed to conflicting results regarding the role and impact of FDI on host states (both positive and negative). In our opinion, the positive and negative effects of FDI on the host country economy can be classified as follows (Kapustina and Falchenko, 2015):

a) *the impact on economic growth*: FDI has a positive impact on economic development, contribute to the accumulation of fixed capital formation and GDP growth; on the other hand, the excess of the profits repatriation above FDI has a negative impact on economic growth of a host country and its regions;

b) *the impact on the efficiency of the production factors*: foreign MNCs shift production factors from less efficient sectors to more productive ones; on the other hand, low localization of foreign production does not stimulate the development of local production;

c) *the impact on employment and the labor market in a host country*: the employment is increasing by creating new jobs in a host country and the number of skilled workers is increasing; on the other hand, FDI reduced employment in a national economy due to the labor reallocation in the transnational sectors;

d) *the impact on the host country trade balance*: there are the import substitution effect due to the organization of production in a host country and the export-promotion effect by focusing of production for the foreign market; on the other hand, the volume of foreign trade of a host country are reduced due to the transformation of foreign trade flows in MNCs intra-operations;

e) *the impact on the level of technological development*: foreign MNCs through FDI carry out the transfer of new technologies in a host country, stimulate the technological development of a host region and contribute to the growth of labor productivity; on the other hand, MNCs may transfer obsolete technologies in a host country in accordance with the theory of product life cycle, as well as investment in obsolete industries that reduce the innovation potential of a host country.

In each host country, the positive effects of FDI may prevail over the negative ones or may not compensate the negative effects, that a reasonable assessment of the contribution of FDI to the economic development of a host country is required.

METHODOLOGY

The reason for which the research into the FDI influence on economic growth in Russia was undertaken was to define the impact of these investments on economy over the transformation period of 23 years. The aim of these investigations was to determine whether the FDI impact on economic growth was positive or not.

Hypothesis

H1: There is positive relation between FDI and GDP in Russia.

H0: There is no greater positive impact of FDI on GDP in Russia.

Model specification

In this paper the Cobb-Douglas production function was used to analyze the effect of domestic expenditure and foreign investment on changes in the GDP value. The Cobb-Douglas production function is expressed by the following formula:

$$Y_t = A_t K_t^\alpha L_t^b \quad (1)$$

The aggregate production function links output Y_t (GDP) in period t to two factors of production, the capital stock K_t and the size of the labour force L_t , as well as to total factor productivity A_t . Any increase in either amounts labour or capital or increase in both of them will result increase in the level of output in the economy assuming that the level of technology remains constant. This production function was further enhanced in the new growth theory (Barro and Sala-i -Martin, 1995).

The theoretical framework of the study derives from the Cobb–Douglas production function, which is consistent with the specification used in several previous studies (for instance, Ramirez, 2000; Dutta and Ahmed, 2006; Gaikwad and Fathipour, 2013; Kosztowniak, A. 2014). The link between foreign direct investment and the growth rate of GDP is verified by using an aggregate production function framework. Following us, specify a gross domestic production function for a host country in the following way:

$$Y_t = f(L_t, K_t, FDI_t) \quad (2)$$

Wherein the above mentioned function Y represents the output level or GDP, K represents the amount of capital which is measured by Gross Fixed Capital Formation (GFCF), and L represents the amount of labour, FDI represents the impact of foreign capital which is measured by foreign direct investment inflows. Some empirical studies (for example, Carkovic and Levine, 2002) suggest that a positive constructive role performed by FDI is well recognized. FDI exerts positive impact on the economic growth of the host countries.

Specifying the production function in log-linear form, the following equation may be written:

$$\ln GDP_t = \alpha + \beta_1 \bullet \ln GFCF_t + \beta_2 \bullet \ln Labour_t + \beta_3 \bullet \ln FDI_t + \varepsilon, \quad (3)$$

Where: $\ln GDP$ - the natural log of gross domestic product; $\ln Labour$ - the natural log of total employment in the country; $\ln GFCF$ - the natural log of gross fixed capital formation; $\ln FDI$ - the natural log of the foreign direct investment inflows; α – constant; $\beta_{1,2,3}$ – coefficients; ε – balances; t – analyzed period.

Specifying the production function in log-linear form for the first differences, the following equation may be written:

$$\Delta \ln GDP_t = \alpha + \beta_1 \bullet \Delta \ln GFCF_t + \beta_2 \bullet \Delta \ln Labour_t + \beta_3 \bullet \Delta \ln FDI_t + \varepsilon. \quad (4)$$

Data

The sources of the data were time series database of the UNCTAD and OECD databases (table 1).

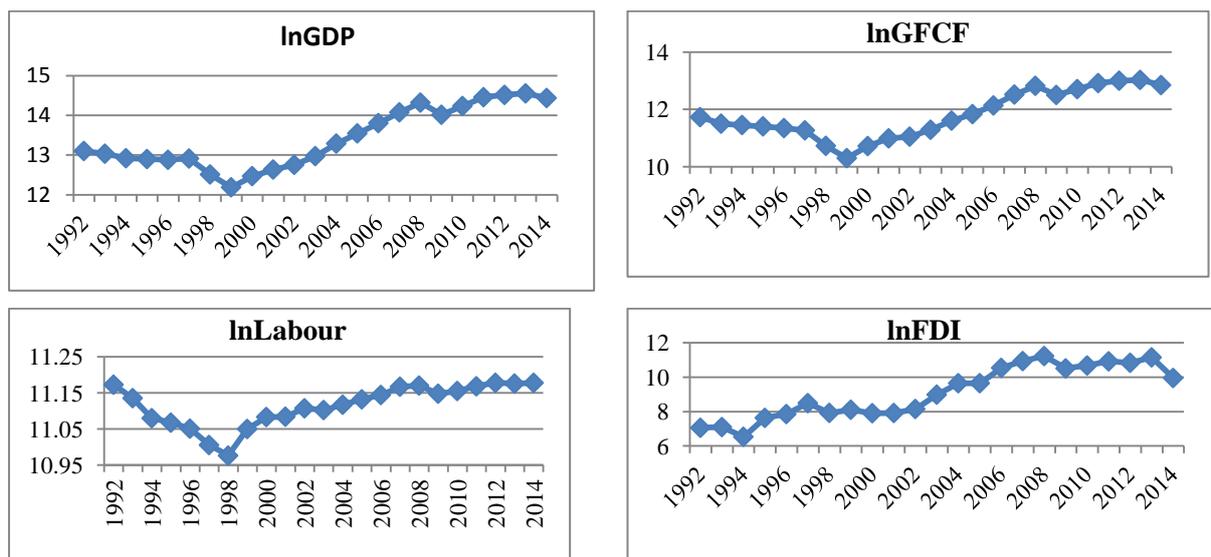

Parameters		Measure	Analyzed period	Source of information
GDP	Gross Domestic Product	million USD at current prices	1992-2014, annual data	UNCTAD Database
GFCF	Gross Fixed Capital Formation	million USD at current prices	1992-2014, annual data	UNCTAD Database
Labour	Labour Force	Persons, thousands	1992-2014, annual data	OECD Database
FDI	Foreign Direct Investment: Inward Flows	million USD at current prices	1992-2014, annual data	UNCTAD Database

Table 1. *The sources of the data*

Results

To assess the impact of FDI on the host country economy we apply regression analysis adapting known econometric models for the Russian economy.

Prior to the estimation of the model the significance of structural parameters was examined as well as the goodness of fit of the model and selection of variables for the model (Figure 1).

Source: authors' own calculations on the basis of OECD and UNCTAD statistics, MS Excel program.

Figure 1. *Changes of GDP value, GFCF, Labour, FDI inflows in Russia in the period 1992-2014 (million USD, thousand persons, in logarithms data)*

Firstly, the descriptive statistics of all variables are computed. The descriptive statistics (table 2) shows the summary of the variables used in the regression equations. In descriptive statistics authors computed Minimum, Maximum, Mean, Kurtosis, Skewness and Standard Deviations values.

Variable	lnGDP	lnFDI	lnLabour	lnGFCF
Mean	13.4144203	9.115658444	11.11524019	11.81280876
Minimum	12.18540006	6.536074016	10.97616646	10.29894101
Maximum	14.55591063	11.22234462	11.1780819	13.02627403
Kurtosis	-1.441782559	-1.514628961	0.038887525	-1.200233774
Skewness	0.221301251	-0.027027154	-0.847280177	0.064670962
Std.Dev.	0.766234623	1.524090574	0.057680216	0.831436844

Source: authors' own calculations on the basis of OECD and UNCTAD statistics, MS Excel program.

Table 2. *Descriptive Statistics*

Kurtosis Analysis: Kurtosis is defined as a statistical measure which is used to describe the distribution of observed data around the mean. The kurtosis values for Foreign Direct Investment, Gross Domestic Product and Gross Fixed Capital Formation is observed to be negative. This indicates a low kurtosis implying that the distribution of the above mentioned variables is concentrated towards the mean and a chart with skinny tails. In comparison to the others, the only variable that has a positive kurtosis value is Labour. This indicates a high kurtosis portraying that the variable has a low and even distribution and a chart with fat tails.

Skewness Analysis: Skewness is defined as an asymmetry from the normal distribution in a given set of statistical data. It can be negative or positive depending on whether the data points are skewed to the left (negative) or skewed to the right (positive) of the mean of the distribution. It can be observed from the table that the Labour and the Foreign Direct Investment are negatively skewed implying that it can be estimated that the future data points of the two variables will be less than the mean. The variables Gross Domestic Product and Gross Fixed Capital Formation show a positive skewness indicating that estimation can be made of the future data points of these variables will be more than the mean.

In order to analyze the relationships between the dependent variable being GDP and independent variables, Pearson's correlation coefficient was calculated by the authors (table 3). The highest positive linear correlation occurred between GFCF and GDP, at the level $R^2=0.992$. The positive linear correlation also exists between FDI and GDP at the level of $R^2=0.867$.

Variable	Means	Std.Dev.	lnGDP	lnFDI	lnLabour	lnGFCF
----------	-------	----------	-------	-------	----------	--------

lnGDP	13.41442	0.766235	1	0.867498	0.808941	0.992231
lnFDI	9.11566	1.524091		1	0.629795	0.812798
lnLabour	11.11524	0.057680			1	0.819973
lnGFCF	11.81281	0.831437				1
Note: Marked correlations are significant at $p < 0,05$. $N=23$.

Table 3. *Correlation coefficient of GDP, GFCF, Labour, FDI inflows in Russia in the period 1992–2014*

The purpose of the empirical investigation is to estimate the effects of (FDI) on economic growth (GDP) in Russia along with other explanatory variables, namely the working labour force in the domestic economy (Labour), the Gross Fixed Capital Formation (GDCF), and the foreign direct investment inflows (FDI). The study employed the Least Square Method in which several statistical tests were conducted with the help of MS Excel program. The authors used the regression equation to draw the results about all variables. The main results of the statistical tests are given in table 4.

Regression Summary for Dependent Variable: lnGDP				
Variables	Coefficients	Standard Error	T-static	P-value
Intercept	2.554	3.744	0.682	0.50
lnFDI	0.091	0.013	6,791	0.00
lnLabour	0.079	0.359	0,221	0.83
lnGFCF	0.775	0.033	23,317	0.00
Summary Statistics				
No. of observations	23	F	1402,2	
R	0.99774921	Adjusted R ²	0.99479352	
R ²	0.99550349	Std. Error of estimate:	0.05529	

Source: authors' own calculations on the basis of OECD and UNCTAD statistics, MS Excel program.

Table 4. *Regression Coefficients(Dependent Variable - lnGDP) and Summary Statistics*

Since the factor lnLabour was not significant (T-static < 2; P-value = 0.83), we have excluded it from the regression model. Thus, the results are as below (table 5):

Regression Summary for Dependent Variable: lnGDP				
Variables	Coefficients	Standard Error	T-static	P-value
Intercept	3.379486	0.197	17.129	0.00
lnFDI	0.090391	0.013	6.976	0.00
lnGFCF	0.779744	0.024	32.830	0.00
Summary Statistics				
No. of observations	23	F	2208.256	
R	0,995492	Adjusted R ²	0.995041	
R ²	0,995492	Std. Error of estimate:	0.053958	

Source: authors' own calculations on the basis of OECD and UNCTAD statistics, MS Excel program.

Table 5. *Regression Coefficients(Dependent Variable - lnGDP) and Summary Statistics (Model Correction)*

A unit root test has been performed to check the stationary of the variables. The results are as below (table 6):

Variables	Level	Variables	First difference
	T-static		T-static
lnFDI	-1.308966	Δ lnFDI	-4.377649**
lnGFCF	-0.192907	Δ lnGFCF	-3.034261**
lnGDP	0.028020	Δ lnGDP	-3.065528**
** And * indicate significance at the 5% and 1% levels, respectively.			

Source: author`s calculations on the basis of MS Excel program.

Table 6. *Results of Augmented Dickey-Fuller test*

The results of the above table 6 reveal that GFCF, FDI, GDP and are stationary at first difference 5% level of significance, so appropriate technique for estimation is co-integration (table 7).

	Coefficient	Standard Error	T-static	P-value
Intercept	0.018	0.010	1.693	0.11
Δ lnFDI	0.044	0.021	2.096	0.05
Δ lnGFCF	0.733	0.043	16.942	0.00
Durbin-Watson statistic	1.849			

Source: author`s calculations on the basis of MS Excel program.

Table 7. *Normalized Equation Results*

The table 7 shows that the value of t-static for all independent variable is greater than 2, these variables have significant relation with dependent variable (GDP). Gross fixed capital formation and foreign direct investment have positive relation with GDP in the long run.

The actual value of the Durbin-Watson test for this model is $DW = 0,079620918 / 0,043064592 = 1.85$ (table 7). We formulated a hypothesis: H_0 - no autocorrelation in the residuals; H_1 - in balances

is a positive autocorrelation; H_1^* - in the residues have a negative autocorrelation. Define the level of significance $\alpha = 0,05$. In the tables of Durbin-Watson test values we determine critical $dwL = 1.17$ and $dwU = 1.54$ for the number of observations $n = 23$ and the number of independent variables in the model $k = 2$. We obtained the following intervals: $dwL = 1.17$; $dwU = 1.54$; $DW = 1,85$; $4-dwU = 2,46$; $4-dwL = 2,83$. The actual value of $DW = 1,85$ falls in the interval from dwU to $4-dwU$. Consequently, there is no reason to reject H_0 hypothesis about the absence of autocorrelation in the residuals. The magnitude of the Durbin-Watson statistic can help to make a conclusion about the absence of autocorrelation in the residuals.

The regression analysis revealed the fact that FDI has the positive linkage with GDP as hypothesized by H_1 . FDI and Gross Fixed Capital Formation relation with GDP are positive that explain their positive impact on the GDP. During the econometric calculations the conclusion was derived that the gross fixed capital formation has the greatest impact on Russia's GDP growth rates. Russia's GDP has been increased by 0.733%. FDI inflows also have a positive effect on GDP growth rate. Due to a growth of

FDI inflows in the Russian economy by 1%, Russia's GDP grows by 0.044%. In brief, the hypothesis H1 of this study is proved and has the predetermined relation and impact on each other.

CONCLUSION

In empirical research and scientific literature there are many different explanations of the role and impact of FDI on host states. Empirical studies in the 1980-1990s showed mainly a positive FDI impact on economic growth. But that research concerned developed countries. Instead, empirical researches in the 2000s involving both developed and developing countries showed different effects: positive, negative, bi-directional as well as no effects.

The research conducted in Russia reveals that in the period 1992–2014 a linear correlation existed between the FDI inflows and growth rates (Pearson's coefficient $R^2=0.867$). The research results obtained that FDI has positive relation with GDP in Russia. In the examined period 1992–2014 FDI net inflows had a weak positive impact on changes in the GDP value.

In our opinion if we want to increase the Russian's GDP and make economic progress then there is a need to attract foreign investors because foreign investment increase gross domestic product and economic growth. FDI stimulate human resource development through investment in education and training. This enhances the stock of human capital and increases productivity of labour and other factors of production.

CAN PRODUCTION TECHNOLOGIES HELP COMPANIES SURVIVE A RECESSION? A WOOD PROCESSING COMPANY SAYS YES!

Karagouni, Glykeria

Technological Educational Institute of Thessaly, Larissa, Greece

ABSTRACT

Production technologies and more generally, the management of new technologies are lately receiving increasing attention in strategic management research. This paper discusses the diverse and complex role of production technologies in low-technology industries and more precisely regarding the different types of performances in times of prosperity and crisis. It examines the importance of selection and/or development of production technologies and their impact on competitive advantage, exports, innovation and financial performance.

The paper then outlines a longitudinal study of a Greek wood-processing firm from its strategic decision to turn to global markets in 2005; times of prosperity and rapid growth rates for Greece; up to 2015, after seven years of severe socio-economic crisis. Manufacturing industries, and more precisely of the wood and furniture sector, have been severely hit by the recent crises and have faced a significant drop in the number of companies, jobs, and turnovers. Using this extended case method, the study argues that production technologies may support the sustenance of competitive advantage and survival in manufacturing industries even in times of severe economic crisis. The case company was selected because of its exceptional strategy regarding its choices of production technology, the competitive advantage and its extroverted strategies as well as its performance before and within the crisis.

The study advances production technologies theory by confronting it with an empirical case. The analysis provides rich insights into the role of production. It also seems to contradict the common belief that low-tech companies are just “passive technology adopters.

Keywords: *production technologies, Wood processing industry, innovation, low-technology, competitive advantage, performance, crisis, recession, Greece*

INTRODUCTION

In her seminal work, Joan Woodward (1965) pointed out that production technologies shape the organizational structures in manufacturing organizations. Technology and technology relationships have been connected to innovation and strategy (e.g. Arnold and Thuriaux, 1997) while the discipline Innovation, Entrepreneurship and Digital Ecosystems

ISBN: 978-9963-711-43-7

of management of technology and its impact on competitiveness has expanded with great speed during the last ten years including the so-called low-technology industries. Seminal works put actually emphasis on traditional business such as Virginia Acha's (2000) focus on the importance of production technologies and operational performance in the case of the petroleum industries.

Production technologies and more generally, the management of new technologies are lately receiving increasing attention in strategic management research either as important factor of innovative efforts and firm performance or as core elements of technological capabilities. Leonard-Barton (1995) has also described the technological competencies that enabled Chaparral Steel to develop its near-net-shape casting process

However, understanding between business and technology seems to be still lacking (White and Bruton, 2010) especially in cases of low-technology industries". More precisely, it appears that theoretical and empirical work providing evidence on the exact role and significance of production technologies in the survival and the several types of performance of low-technology companies is still at a rather embryonic stage. The paper takes up the challenge to examine in depth the impact of decisions and their implementation regarding production technologies on a wood processing firm's course during a critical decade in its life; from its decision to become mainly an export company, in times of prosperity for Greece, and through the deep recession that Greece faces the last eight years. In doing so, it adds to the scarce existing theoretical efforts and, most interestingly, provides useful empirical evidence on how low-technology firms which are extremely vulnerable to crises may use production technologies to effectively develop competitive advantages and differentiate in a changing environment.

The paper begins with a theoretical discussion on production technologies and a brief introduction to wood industry, followed by the research design and the experimental setting. The longitudinal study of a Greek wood-processing firm is then presented and discussed in order to produce useful insight and concluding remarks.

THEORETICAL BACKGROUND

According to the Encyclopedia Britannica, "Technology may be defined as the systematic study of techniques for making and doing things. [...] In the early 20th Century, technology included a growing range of means, processes, and ideas in addition to tools and machines" (p. 451). Britannica continues by claiming that in the second half of this century technology is defined by terms like "The means or activity by which man seeks to change or manipulate his environment" (Ibid. p. 451). The development of needed technologies entails "an act of discovery, a speculation on the future, but also the creation of a new path through the distributed efforts of many" (Berglud, 2010). Idea

implementation rests on combinations of activities which range from pure novelty to modest adaptation but in their essence “they reflect the pragmatic nature of most expressions of technological knowledge” (Pavitt, 1984).

Layton (1971) had viewed technology as a spectrum, with ideas at one end, techniques and things at the other with knowledge to be the intermediate link. This is referred as technological knowledge; i.e. “knowledge associated with products, technologies, and/or processes” (Burgers et al., 2008).

Technology and technology relationships have been connected to innovation and strategy; according to Grant et al., (1991) “optimal” technology for a business is contingent upon the firm’s strategic goals, its available resources, and the nature of its product–market environment. Especially in the case of low-technology manufacturing industries, process innovation has been mainly associated with flexible, advanced manufacturing technology (e.g. Raymond and St-Pierre, 2005) and information technology (e.g. Zhang, 2006).

According to a stream of relevant literature, technological resources have a significant influence on the internationalization of firms (Rodriguez & Rodriguez, 2005; Tsang et al., 2008). Production technologies constitute a type of technological resources of a critical role in this value-generating cycle being responsible for the successful application of the work of researchers and industrial practice in order to offer commercial products covering technologies for an extremely varied range. Empirically, this has been investigated by a significant number of scholars such as Tseng, Tansuhaj, Hallagan, and McCullough (2007), and Kafouros et al. (2008).

The production process refers to the operational way in which inputs are combined and transformed into output, only once this process has been organized. Production process’s organization and mechanisms have been called *production technology* by Woodward (1965) and Lin and Germain (2004) and have been treated as contextual variables of organizational design in general. Production technologies may cover the technological know-how, technologies and manufacturing capabilities, processes and methods, production management systems as well as design, materials and even R&D. Especially in the case of manufacturing industries, competitiveness depends heavily on the ability to access and use technologies. However, because of increasing technology convergence, the scientific fields that offer the necessary technological knowledge may often be relatively different even from the core industry technologies (Garcia-Vega, 2006), and this puts further emphasis on the importance of successful technology exploitation (Patel & Pavitt, 1997). Thus, technological know-how and technological capabilities are clear performance characteristics by means of which companies can distinguish themselves from the competition (e.g. Klocke, 2009).

Therefore, the choice of production technologies constitutes a significant strategic decision for manufacturing companies. Technology evolves in certain path dependent ways while technological

progress “builds on what went before” (Teece, 1996, p.195), indicating that it usually has significant organization-specific dimensions. Investments in production technologies and machinery and equipment have been argued to impact firms’ performance (e.g. Meliciani, 2000). Sohn et al. (2007) linked strategic investment decisions with financial performances, while DeLong and Summers (1992) and later Sala-i-Martin (1997) found strong links between equipment investment and economic growth. The same year, Sargent and James (1997) empirically exploring the impact of machinery and equipment on firm’s performance conclude that knowledge and experience of managers / entrepreneurs have a direct and significant impact on the investments on machinery and equipment. According to a recent stream of literature, production technologies constitute the media through which high-tech industries develop co-operations with low-tech ones with mutual benefits such as the exchange of knowledge, common R&D and even the mutual progress of firms and sectors within a dynamic- interactive supplier-customer framework. The supporters of this view advance the former traditional perspective according to which, manufacturing industries, such as wood and furniture or textiles and clothing ones were thought of as “passive borrowers” of technology produced in other, more research-intensive sectors such as machinery, ICT and novel raw material producers (Hirsch-Kreinsen and Schwinge, 2011) known as “technology suppliers”. In such cases, advanced production technologies and the level of the technology provider - user relationship could enable “the firm to capture lucrative and more value added markets for growth” (Evers, 2011).

This relationship has changed significantly mainly since the new millennium. Focusing on the empirical case of the food industry, Trippel (2010) provides evidence that the link between old industries and their high-tech contexts may be more complex than commonly thought. Habets, Van Der Sijde, and Voordijk, (2007) provide insights into the adoption processes of novel production technologies in the Dutch road construction industry. Recent research and empirical findings regarding LT-KIE indicate that today, manufacturing companies of low-technology industries appear to have complex links to science and technology, unique forms of knowledge creation and a rather unexplored system of applying innovative production technologies and creating unique competitive advantages. Many times low-technology firms decide even to produce their own complex machinery in-house in order to protect proprietary process technologies that constitute a significant part of the firm’s competitive advantage.

Researchers on the impact of production technologies in performance have explored several forms of rents such as the financial performance (Fuentelsaz et al., 2012), the strategy of the firm (e.g. Chari et al., 2008; Henderson and Venkatraman, 1993) and the innovation performance (e.g. Damanpour et al., 2009). Hussain and Isa (2015) empirically investigate the relationships of export performance and

technological advancement within the Malaysian manufacturing sector. Araújo and Salerno (2015) conclude that technological strategies improve the productivity and size of all firms.

WOOD SECTOR

Wood industry is one of the most representative traditional low-tech industries worldwide with a significant share of employment and value-added for the global manufacturing industry and economy.

The wood product manufacturing industries or woodworking industries include the production of sawn wood, wood-based panels, joinery and carpentry materials, containers packaging and other wooden articles. Woodworking companies are considered highly innovative and knowledge-intensive (Smith, 2008); they build high-quality innovation systems regarding mainly production technologies which result in both novel products and processes. Sectoral research and technological development knowledge centers, global machinery manufacturers, suppliers, the chemical industry, and Universities develop synergies with firms of the sub-sector. Innovations turn around engineered wood products, wooden composites, novel fittings and other wooden products or issues such as productivity increase and quality improvement.

Woodworking and furniture industries play a significant role in Greek economy, with a turnover in 2008 of around €2 billion, an added value of around €1 billion and an employment rate of 35.000 people in more than 15.000 companies (Eurostat, 2009).

The vast majority of Greek woodworking companies is micro-companies, with the wood-based panel sub-sector and sawmills to be the exception. Indicatively, in the good pre-crisis times, there were no more than five large firms in Greece which would cover more than 80% of the domestic production of wood-based panels. 66% of the firms are less than 30 years old and cover mainly the domestic market, as exports are rather insignificant. They are the main suppliers of the furniture and construction industries with sawmills (sawn wood) to compete wood-based panels.

In the context of the wider socioeconomic crisis in Greece, the decrease of the building activities and the crisis in the furniture sector caused significant problems and shrinkage. The lack of demand, liquidity and confidence leads to the shut-down of many well-known enterprises. A typical example is the case of Shelman; one of the biggest and strongest wood-based producers which supplied almost 100% of plywood in the domestic market. The company was sold and then bankrupted.

The industry faces growing competition from low-cost, emerging economies and a growing number of technical trade barriers. Lately, the competition is focused on the level of prices, with extremely limited mixed margins of profits

METHODOLOGY

This study sought to investigate the diverse and complex topic of the role of production technologies in the different types of performances of a low-technology company in good- and crisis-times. The issue touches on a variety of factors, such as technology, processes, strategy, market development, innovation, as well as management and organizational issues, in different national and global environments. Given the nature of the problem being investigated, the qualitative approach and more precisely the single case study method was employed. This methodology was considered suitable as the research related to a complex series of events that took a long time to unfold (Yin, 2003). The longitudinal study was undertaken as it was considered that the process of production technologies development consists of a series of decision – making commitments which depend on a number of factors including the national and global context, the position of the firm at different chronological times its foreign market commitments etc. Furthermore, as Harrison and Easton (1998) comment “any single case study can be regarded as a set of case studies at different time periods”.

The data was gathered by in face-to-face, in-depth interviews with entrepreneurs and key personnel involved in the production technologies development, implementation and operation at various stages over a ten year period (2005-2015). Multiple other sources of evidence were used such as plant visits, company reports, press reports, awards and company websites.

CASE DESCRIPTION

The case company was selected because of its exceptional strategy regarding the choices of production technology, the competitive advantages and its extroverted strategies as well as its excellent performance before and within the crisis in Greece. In addition, the firm was personally known to the author due to her involvement with the wood industry.

By way of background, the company is a highly successful woodworking firm established almost 100 years ago. Actually it is the oldest Greek wood-processing company and the largest export one today in its sector. It is a medium sized family owned company that specializes in marine plywood which is an expensive, water-resistant grade that is more tightly constructed and glued than ordinary plywood. M.M.P. SA sells to shipyards in Greece and abroad, as well as high-end constructors and traders all over the world. It is located close to Athens with its own port in front of the plant.

Back in the 90s, the new generation took over. Targeting the demanding markets of Western Europe, the company focuses on the production of high quality certified marine plywood. At that time it develops its own trading channel of Okoume logs from West Africa. Today (2016), the company is one of the most important and well known manufacturers of high spec Okoumé at least in Europe.

THE ROLE OF PRODUCTION TECHNOLOGIES

Production Technologies and competitive advantage

In 2005, external messages of the increasing weaknesses of the Greek market and the shutdown of many Greek shipyards troubled the M.M.P. SA's entrepreneurs who decided to invest in quality and sustenance as their core competitive advantages in order to reach foreign markets and establish a strong brand name.

Their new vision towards top quality marine plywood concentrates on innovative process technology with the development of novel stitching technology developed by a Swiss machine manufacturer. The pilot use of the innovative machinery created many technological problems that were solved by an excellent co-operation between the two teams. *"We had to specify technological parameters and conditions, to achieve the best quality after severe quality controls and to have the best behavior in the extremely expensive yachts it is intended to".* (Note: stitching is very important to secure zero "voids," the micro-spaces in between layers, to tightly adhering joints that do not let destructive moisture in. All parameters of finishing, grinding and cutting are done with closer tolerances than standard plywood, accounting for the very high cost of marine plywood). The whole procedure of *déroulage* veneer stitching took about two years to finish with decorative veneer stitching to follow in 2008.

In order to realize their new strategy, novel production technology was accompanied with handling machinery and SCADA in the existing production lines in order to increase productivity capacity, new store rooms. *"Quality is the spearhead of our competitive advantage – we produce the most expensive plywood in the world. The best raw material should be stitched with the best technology!"*

Today, M.M.P. SA produces one of the best and most expensive marine plywood globally and possesses the 4th position in the Greek wood-processing sector (2013). It is also one of the most advanced companies in quality and leadership worldwide. The company was awarded the International Star or Quality Award, Gold Category in 2010 given every year by BID Organization awarding cutting edge companies from around the world for their firm commitment to excellence, innovation and leadership.

In parallel, the entrepreneurs build the eco-character of the company. The entrepreneurs use raw material originating from sustainable and well managed forests and select their suppliers that meet the criteria set by the PEFC certification (Program for the Endorsement of Forest Certification), while building the firm's eco-image (e.g. participation in WWF actions). However, production technologies are also involved. Initially, they apply all prevention and safety measures and one year later they apply modern methods and continuous inspections, for a comprehensive environmental policy system. Two years later they invest in new technologies to eliminate water and waste while they develop their photovoltaic systems to produce the energy they need for the plant in terms of

sustainability. Machinery and production methods are adjusted in order to suit to the new ecological demands of the production; for instance, machinery and production lines have to be adapted to the formaldehyde-free, eco-glues.

Within the decade, the firms gradually obtain the FSC® certificate (Forest Stewardship Council) for the production process, thus fulfilling also the production side of the deep commitment to ecology. It is also certified with ISO 9011: 2008 (TUV Germany) and has obtained various quality Certificates due to the different specification of the various countries.

It can be therefore assumed that production technologies played a core role in the achievement of the competitive advantage of top quality and sustainability as set by the entrepreneurs.

Production Technologies and innovativeness

Innovativeness has been considered by many theorists and practitioners as a fundamental determinant of competitiveness. M.M.P. SA's efforts were concentrated in the provision of better and better quality of their product. *"We are constantly improving and modernizing our facilities and techniques, so that the final product meets the high quality standards set by international organizations",* says the entrepreneur. After the initial investment in machinery and production lines, the company invested significant amounts in technology upgrading: *"In our business, quality is 50% the raw material and 50% the technology used. If a competitor makes a significant investment in novel technology we have to learn it soon enough! For example stitching is of enormous importance in our area. This is why we invested there! It actually controls the level of quality!"*

However, in 2007, the firm tried to produce plywood covered with melamine film which actually meant an innovative production technology. They co-operated with a French producer of melamine films and together they developed the base panels with a significant durability. *"We made several tests regarding durability. When we thought we were ready we certified the promised durability by offering guaranty."* This became the most profitable product for the following years and supported exports (especially shipyards in Holland) during the first difficult years in Greece.

In 2010, the firm works on the development of pre-varnished wood flooring while the same year they develop a novel line of fine-line veneers. During the recession years, the firm goes on investing in innovative efforts and optimization of the infrastructures; eco-efficiency and sustainability, incorporation of new materials, innovative adhesives, novel machine parameters and enhancement of mechanical processing are some of the areas woodworking the firms has invested so far.

Investments on innovative technology seemed to be a yearly basis: novel machinery for veneer stitching, development of novel decorative technology, a novel handling system with relevant handling and packaging machinery, the innovative base line production line (which turned to a big

success), and the engineering parquet investment were the most important ones within the decade under investigation. The firm uses reverse engineering, prepares business plans before the innovation project, and secures its efforts by registered trademarks.

It can be therefore assumed that production technologies play a core role in the innovation performance of the company whether in prosperity or crisis times.

Production Technologies and exports

In 2000 M.M.P. SA exported less than 20% of its production mainly in Arabic countries. As mentioned above, the new investment in production technologies took two years to finish; in 2008-2009 it started paying back while new investments in production technologies strengthened the extroversion of the company: *“Our extensive experience on the exploitation of production technologies and our product lines allowed us to adapt our complete production process to international quality standards and to produce plywood certified by Lloyd’s of London, Dutch KOMO, Italian CATAS, BS 1088 & CE, as well as the FSC ecological certification”*. Success supported the orientation to exports targeting at the global high-end markets.

In 2015, exports accounted for over 70% of the company's gross sales with the main export market to be the building construction and yacht building sector in a number of countries around the globe such as the Netherlands, Italy, Switzerland, Germany and the USA.

It can be therefore assumed that production technologies play a core role in the export performance of the company whether in prosperity or crisis times.

Production Technologies and financial performance

Did the investment on innovative production technologies pay back? *Yes!* according to the entrepreneurs' opinion. *“They boosted our extroversion and this meant loyal customers worldwide.”* According to the company's balance sheets, yearly turnover was increasing at rates around 10% per year until 2009. In 2009 the entrepreneurs feel the global crisis with a significant decrease in sales. However, they manage to keep losses lower than 5% yearly. The entrepreneurs become more cautious with their investments regarding technology. However they have to confront the severe socio-economic crisis in Greece; 2012 will be the worst year for the majority of the Greek entrepreneurial world. M.M.P. SA presents the worst turnover since 2000; the same year, its main competitor and actually the leading organization in the wood sector, went bust. M.M.P. SA seems to recover; turnovers of the following years present a gradual turnover increase.

It can be therefore assumed that production technologies play a core role in the financial performance of the company whether in prosperity or crisis times.

DISCUSSION - CONCLUSIONS

The paper discusses the diverse and complex role of production technologies in low-technology industries and more precisely regarding the different types of performances in times of prosperity and crisis. It examines the importance of selection and/or development of production technologies as well as their relationship to competitive advantage and innovation performance and their impact on exports and financial performance.

It appears that production technologies are of core importance for M.M.P. SA. The company has established long-lasting relations with its machine and raw material suppliers for New Product Development (NPD), production and process advancing purposes; research focuses mainly on experimenting with innovative material elsewhere produced, and alternative processes following mainly the try-and-error method. There seems to be an embedded culture of constant experimenting, while know-how is achieved by technology transfer and development. In all individual cases of production technologies' projects wood processing technology, wood behavior science, chemistry, mechanical engineering, material engineering, ICT and automation technology are engaged.

The case analysis highlighted the fact that the transformation of the innovative business concepts into marketable products and competitive advantages presupposes the choice and set up of the suitable production technologies which seem to act mainly as a vehicle to create niche and sub-niche markets. The investigated firm turned to innovative technologies and machinery in order to incorporate novelty and develop technological capabilities for high-level differentiation. Continuous investments in technology enhance the firm's innovativeness, export and financial performance. Advanced production technologies enable the capture of lucrative and more value-added markets avoiding obsolescence. This means significant revenues and new markets in times of prosperity while secure market position and controllable losses in times of crisis.

It is quite interesting to mention that in many cases, production technologies appeared to be results of co-development covering technologies and knowledge from a significantly varied range. The novel stitching technology was achieved after active cooperation with machine makers and significant try-and-error efforts. In 2007, the plywood covered with melamine film plywood was actually a collaboration product with a French technology producer and a raw material provider. Thus, the case confirmed recent theories, according to which low-tech companies are more than just "borrowers" and passive adopters of technology (Hirsch-Kreinsen and Schwinge, 2011, Karagouni et al, 2013).

According to the case study, competitive advantages in manufacturing companies are built on production technologies, which impact significantly the various types of the company's performance. *"Lately we were awarded among the most developed firms regarding quality and leadership worldwide. The*

criteria were the rate of growth during the last years and the market shares it has acquired. The ceremony will take place this summer in Genève” (the entrepreneur, spring, 2010).

The study is, to our knowledge, among the very first to explore the role of production technologies regarding the different types of performances in low-technology industries. It is also among the first – if not the first one – to explore the topic in the prosperity/crisis framework. It is also among the first to explore the relationship between production technologies and performance in the wood sector.

The present study contributes to the literature of industrial dynamics in general, and more precisely to the specific stream that focuses on the relationship of plant heterogeneity and in particular of production technologies with various economic phenomena, Inquiries at the intersection between operations management and entrepreneurship are relatively scarce (Editorial of the special issue on operations management and entrepreneurship, *Journal of operations management*, 2011). It can also be assumed to advance discussion on the need of a theory on the interrelationships between technology and entrepreneurship especially for the pre-firm formation stage (e.g. Tan et al., 2009).

The study can be also considered a contribution of endogenous character; the understanding of the phenomenon within the Greek borders highlights problems and indicates solutions assisting the development of policies for low-tech industries which constitute a very important but volatile part of the Greek economy. The coincidence of the Greek depression stressed further the particular value of the evidence (although not initially intended).

In spite the study's limitations regarding the single case-study research design and the focus on the wood industry in Greece, some managerial implications can be reasonably drawn. Entrepreneurs and managers should put emphasis on developing innovation regarding technological aspects and more precisely production technologies in order to sustain strong competitive advantages and enhance performances. Taking into account the fact that the sector of wood and furniture was hit rather hard by the crisis with losses of more than 30% for the wood sector, investments on production technologies' innovation seem to provide a solution to crisis periods, especially for SMEs and a media to leadership in prosperity times.

ABSTRACT

In Greece the majority of rural holdings are located in mountainous and rather problematic areas. According to literature, the study on the entrepreneur in the economic sense and, especially, the sub-issue of rural entrepreneurship are subjects of significant theoretical production and empirical analysis.

The present field research focuses upon the individual rural entrepreneur of the mountainous Pyli area, in Greece including one third of the existing enterprises of the area and thus providing an adequate sample for its purposes. The data of the study was captured using structured questionnaires and analyzed via the statistical package SPSSWIN ver 20.0.

Rural entrepreneurs are locals that run mainly family business. However, they lack relevant entrepreneurial knowledge and culture; they own underdeveloped entrepreneurial skills, are introvert and seem to depend on subsidies. They are not willing to innovate but they are hard workers who focus on the everyday living. On the other hand, a small but critical percentage of the respondents appear to be very active and invest in differentiation in an effort to resist the long-lasting socioeconomic crisis in Greece. These constitute the dynamic part of rural entrepreneurs of the area extracting real value from their mountainous environment against business owners who merely subsist. However, they still act in a rather closed entrepreneurial eco-system characterized by a myopic approach of the entrepreneurship issue in total.

Findings confirm existing literature and contribute to efforts for the development of policies to regenerate rural areas in Greece which is still in the severe fiscal crisis. They further add to the empirical evidence on the traits of rural entrepreneurs and their clear distinction from business owners.

Keywords: *rural entrepreneur, rural regions, mountainous areas, rural entrepreneurship, AITHIKOS project*

INTRODUCTION

Research on entrepreneurship in rural areas remains relatively sparse especially within a crisis framework which produces further constraints in rural regions. Relevant literature is so far replicate of directions, policies and views while a recent but emergent stream focuses on the actual actor of rural entrepreneurship; i.e. the rural entrepreneur (Stathopoulou et al.,2004; Mitchell, 1998). For example, Lockie and Kitto (2000) explore the personality of those able to promote their business objectives and achieve the best results in rural areas; the authors conclude that rural entrepreneurs delve into the strategies or practices they use, the technologies they adopt and the forms of institutions they develop. In spite the recent efforts, there are admittedly significant knowledge gaps regarding the reality of rural entrepreneurship addressing agricultural and non-agricultural entrepreneurs and particularly the ones in the less favored mountain areas.

Using a field study approach and encompassing a complex set of traits and individual issues, the present paper purports to add to the knowledge on the driving force of the rural economy; i.e. the actual entrepreneur. Specifically, the research maps the characteristics and traits of rural entrepreneurs in the mountainous area of Pyli in Central Greece. Findings confirm existing literature and add to the empirical evidence on the traits of rural entrepreneurs and their clear distinction from business owners. Therefore, it contributes to the better understanding of who the real rural entrepreneur in mountainous areas is and what the identical type should be. EU political practice should pay more attention to the suggestions of this, as well as similar empirical efforts, in order to decode the real needs and address critical issues such as the multi functionality of the agriculture-bases entrepreneurship or the variety of the non-agricultural business. Policies should be further specified at national and even regional level.

The following section of this work contextualizes the study in the literature. Section 3 introduces the reader to the methodological considerations and presents the area of investigation. The empirical part constitutes actually a mapping exercise placing the rural entrepreneurs of the specific Greek mountainous area (Pyli, Region of Thessaly) under the microscope within the current and long-lasting crisis framework. Statistical data will be discussed in order to produce useful insights and observations about the future of rural entrepreneurs and ways of advancing their entrepreneurial behavior, culture and identity. The concluding section includes future research, limitations and some policy recommendations.

LITERATURE REVIEW

The Rural Entrepreneur

Rural entrepreneurship constitutes a subset of the entrepreneurship literature and an emerging area of research (McElwee and Smith, 2014). According to an epitome of relevant literature, population density in combination with percentage of people in rural communities and in contrast to the size of urban centers may define the “rurality” of an area (OECD, 2005; Skuras, 1998). Furthermore, rurality, as defined by Stathopoulou et al (2004), reflects a “territorially specific entrepreneurial milieu with distinct physical, social and economic characteristics in which location, natural resources, the landscape, social capital, rural governance, business and social networks exert dynamic and complex influences on entrepreneurial activity”. Besides its name as “rural entrepreneurship” the field covers “a myriad of other activities (namely industrial activities)”, according to Miljkovic et al. (2010). In essence, rural entrepreneurship is keen to offer added value to rural resources rendering in this process rural-based human resources (North & Smallbone 2000).

In the same vein, it is quite problematic to define rural enterprises too. In general and according to the relevant definition of McElwee and Smith (2014), rural enterprises are located in rural settings, employ local people and generate income flows to the local environments. Business in rural areas are usually small ones with a more personal image; they are mainly one-person or micro-firms and although called “rural” they actually cover a large variety of farm, re-creation and non-farm activities (Whitener, and McGranhan, 2003).

However, even in such cases, profitable entrepreneurial choices are strongly related to social capital and more precisely the rural entrepreneur (e.g. Agarwal et al., 2004). In spite the quite vast literature on traits and characteristics of entrepreneurs in general, rural entrepreneurs’ profile remains a highly under-researched research topic. Hoy (1983) delineated their profile as “. . . independent, risk-taking, achievement-oriented, self-confident, optimistic, hardworking and innovative”. Stathopoulou et al (2004) note that rural entrepreneurs choose to derive personal satisfaction from business, while, according to Mitchell (1998), they can “trade” the countryside as 'culture' either by idealizing the rural lifestyle as a promotion strategy or by re-creating landscapes of preindustrial form, and reproducing pre-industrial goods, services and leisure activities as a diversification strategy. On the other hand, Smith (2008) suggests that they adopt slow paces of life and run relatively stable business. McElwee and Smith (2014) highlight the need of further research on the background of the rural entrepreneur and whether growing up in a rural area influences the entrepreneurial characteristics. Another stream of literature draws attention on the capabilities issue (Winter, 2003; Teece, 2007). Rural entrepreneurs seem to be unable to cultivate entrepreneurial capabilities or absorptive capability or even a

strategically based mindset in order to address the environmental dynamism and achieve business growth.

In general, rural entrepreneurs have been studied in regard of distinct but in many ways interrelated topics: a) the research on 'entrepreneurs' demographic traits' includes aspects such as age, gender or origin of the entrepreneur (Pato and Teixeira, 2014); b) research on the 'entrepreneurial psychological traits' regards mainly motivation and lately lifestyle (e.g. Hollick & Braun, 2005), tendency for innovation and marketing (Polo-Peña et al., 2012). A recent stream has also focused on the role and importance of embeddedness as the identification of the relation of rural entrepreneurs with their location, the networks they develop and the collaborations they build (e.g. Kalantaridis and Bika, 2006; Gerasymchuk, 2009).

Regarding the human aspect and thus the entrepreneurs' issue, in-migrants have also received considerable research attention. Several recent studies have highlighted and attempted to understand their skills, expertise, resources and network relationships that they bring. A number of studies have focused even in differences and similarities between them and locally-born individuals (Kalantaridis, 2010).

In addition, the exceptional characteristics of rural areas and more precisely of mountainous areas appear to set a quite different background than the usual one where usually the entrepreneurship issue is examined. Rural economy is constantly changing and is vulnerable to global changes. The ageing population is not normally replaced while outcomes of relevant policies do not seem to pay back (McElwee and Smith (2014). The authors argue that due to the lack of specific entrepreneurial culture and the existence of strong introversion, rural entrepreneurs do not trust advisors for financing or strategy or other issues. On the other hand, family is central to the rural business; support is sought in family, or business is "inherited" by family members.

Rural entrepreneurship especially in mountainous areas is quite under researched but it has started attracting the interest of researchers (e.g. Moreira et al., 2000; Meccheri and Pelloni, 2006) mainly after 2000. Furthermore, sustainable mountain development has remained marginal in the international development agenda and in national and sectoral policies (e.g. Jodha, 2008). Mountain communities and their environments are still vulnerable to growing demand for natural resources, expanding tourism and the pressures of industry, mining, and agriculture.

Mountainous Greece

In general, rural regions represent more than half (57%) of the European territory and 24% of its population (EC, 2012). Especially mountain regions are dominated by the agricultural sector, present a rather poor socioeconomic environment and a rapid decline in employment (López-i-Gelats, Tàbara, and Bartolomé, 2009), while they suffer from distance to markets and services.

Greece is largely mountainous; actually 80% of the country is covered by mountains making the country the third most mountainous country in Europe after Norway and Albania. The main sources of wealth are agriculture and livestock (around 61.7%) as well as tourism especially after 1995. However, the population of these areas suffers of isolation and remoteness, with direct effects on their economic and social development. According to Sergaki and Iliopoulos (2010), the main weaknesses for the development of mountainous areas in Greece are the intrinsic geomorphic conditions; the structural problems of local economy and the institutional and organizational weaknesses, which affect competitiveness of these areas. The mountainous topography and the spatial distribution of natural resources define the structure and location of manufacturing activity (Kiritsis and Tampakis, 2004). The ageing of the primary sector's workforce, the infrastructure deficiencies of the secondary sector, the inadequate use of natural resources, the increase of part time-employment and the decrease in competitiveness of locally produced goods and services, the rural depopulation and the high dependence of rural income on subsidies constitute significant problems of the Greek rural entrepreneurship (e.g. Papadopoulos and Liarikos 2003). For example, extremely high transportation costs enhance isolation and remoteness with negative impact on workforce mobility as well. On the other hand, the same disadvantages, i.e. remoteness and isolation, have favored the preservation of the natural environment, the unique landscapes and basic traditional production methods. In the less developed mountainous areas, cultural traditions can be found, while social trust, solidarity rules, cooperation networks and support mechanisms are absent. Rural entrepreneurs have a quite significant role to play as contributors in new venture creation, as well as catalysts in enhancing prosperity in these areas while preserving the untouched beauty of the environment.

EMPIRICAL PART

The socio-demographics of the Pyli area

The investigated mountainous area is situated in the rural heartlands of the Municipality of Pyli, at Trikala Prefecture in the Region of Thessaly, Central Greece. The area is characterized mountainous or highland (percentage 87.38%); it is comprised by a 9.90% of cultivated land, a 12.55% of grassland and a major 75.95% of woodland. It has a population of approximately 14,000–15,000 (HEL.STAT., 2011) and it has thirty-three distinct rural districts. Besides the natural beauty and attractions of the mountain, a significant number of sparsely monuments of historical, cultural and aesthetic significance enhance the touristic value of the area. At times of prosperity (2000-2008), the increased domestic tourism led to a significant increase of tourist accommodation units supporting the development of other entrepreneurial activities in the area, as well. The area was not considered an economically fragile community before the severe socio-economic crisis; on the contrary it was an

example of a prosperous rural entrepreneurial eco-system based mainly on primary sector, handicraft and tourism. However, the eight years of recession have caused significant negative changes in the area's entrepreneurial life. Today, forest exploitation is limited to the production of forest products, especially timber and forage production, with 24 wood and wood products micro and small firms, 24 furniture manufacturers and one paper pulp- paper and paper-products plant which serve mainly the local and national market. The majority of the rest manufacturing business belongs to the food sector; they are small family enterprises that satisfy the local needs. Tertiary sector still constitutes the 43.8% of the entrepreneurial activity; however, the severe decrease of domestic tourism caused the ceasing of tourism operations.

Methodological approach

The research followed the quantitative research approach under the positivistic research philosophy. Research was conducted in 2015-2016 i.e. the seventh year of the severe socio-economic crisis. The population of the study consisted of around 300 enterprises as registered by the relevant authorities. The sample was chosen to include the primary, secondary and tertiary sectors of the local economy. In order to collect the necessary data, a structured questionnaire was prepared and random sampling was engaged. Likert scale was used for the majority of the questions. The research was conducted by skilled researchers who addressed the entrepreneurs of the firms by personal face-to-face interviews. Although the research targeted at a sample of 100 respondents (1/3 of the total population), the response rate was 87% yielding a quite satisfactory sample. A pilot study confirmed the reliability of the constructs.

The data were recorded, processed and analyzed via the statistical package SPSSWIN ver 20.0 and the appropriate tests for frequency (Frequencies), descriptive statistics (Descriptives) and variable comparison analysis (Crosstabs), were conducted. When correlation tests were required logistic regression was used since the response variables were bivalent categorical. The statistically significant -or non- effect of factors was estimated, based on the p-value (sig.) at 5% significance level and the related odds ratio was estimated, too. The goodness of fit of the models to the questionnaire data was tested by conducting Hosmer-Lemeshow tests. Additionally, the predictive ability of the models was estimated via validation tables (Classification Tables).

For the processing of responses to questions measured in Likert scale, methods of graphical visualization were used, as well as non-parametric tests (e.g. Friedman Test) to evaluate the statistical significance -or non- of the differences presented in the graphs. Non-parametric tests were conducted, due to the normality test resulting in that the data were not normally distributed, an outcome that was expected.

RESULTS - DISCUSSION

Sampled firms represent quite satisfactorily rural entrepreneurship in the selected mountainous region; services appear to be the dominant economic activity area and more specifically tourism (mainly accommodation, restaurants and bars) with a 55,7% and trade with 21,4% while manufacturing companies are really scarce (4.6%). The primary sector covers an 8%, while a 6% falls under the special group called “mixed activity” and regards firms that combine the above sectors (e.g. farming and hospitality). Almost half of the enterprises were established before 1990 and one quarter of them before the new millennium. Most of them are run by the second or third generation.

Mountainous Greece is not famous for its strong enterprise culture - few Greeks purported to know an entrepreneur. While most of them possess entrepreneurial skills and are indeed hard working by nature, they seldom present as stereotypical businessman-entrepreneurs. Especially those working in the primary sector; they work hard in order to produce and sell quality goods but they cannot see the entrepreneurial side of their activities. It is quite interesting the fact that 95% have stated above average satisfaction from the course of their business (Likert scale, 1 to 5) while no-one stated “not satisfactory at all” (Figure 1). Taking into consideration that the year of the field research is the eighth year of the severe crisis in Greece, these answers denote the lack of entrepreneurial attitude and culture, as well as the lack of specific business targets and strategies. This view was further confirmed by the fact that no statistically significant relation was found between the level of satisfaction and the yearly turnovers. It appeared that rural entrepreneurs were very satisfied no matter the turnover level they belonged (even with turnovers less than 100.000€).

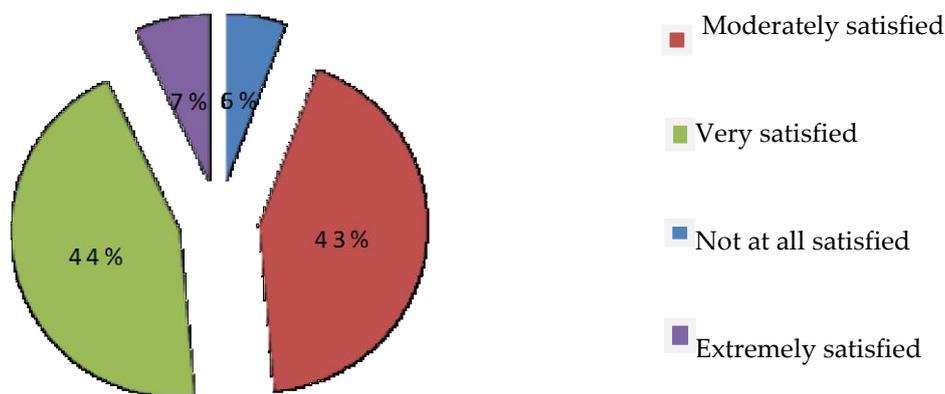

Figure 1: *Level of satisfaction of the business's course*

The majority (70%) of the respondents state that they are not intending to add or diversify products or expand the business in the following three years, indicating a rather passive attitude against the crisis framework that imposes the need of action. It is only an 11% of respondents that indicated their new product / service orientation by marking 4(=strong) and 5(=very strong) in Likert scale. This

result, in combination with the satisfaction levels discussed above, seems to explain the main difference between entrepreneurs and mere business owners; the first group decodes the dynamics of the environmental uncertainty while the second ones are just happy to earn their everyday living and remain static. Going even further, adherence to local conditions and markets (65,7%) and the non-existent exports denotes the intense introversion. On the other hand, those that extend at least at national level appear to seek out opportunities and act in more entrepreneurial ways. It should be mentioned that all of respondents are of a good reputation, known as diligent agents who contribute significantly to the local community; however not all of them are conscious of the entrepreneurial side of work.

However, the large percentage of the passive respondents may also reflect to a certain point, the general defensive behavior against the decline of viability of the mountainous areas in general, the closure of public infrastructure such as local post offices and tax offices due to the crisis as well as the closure of pubs, hotels and shops. Yet, against the threats of the deep recession, 80% record no intention to cease their business supporting further the good image of the sample as hard-workers and people of strong will. Retirement constitutes the most reported reason of ceasing business (n=9) well ahead of the other reasons mentioned; i.e. financing difficulty (n=3), a new job in another place (n=2) and personal reasons (n=2) while all other reasoning was reported by only one respondent each.

Why, then, these individuals run their own business? Besides the 4% of new businesses started by immigrants, the rest of the sampled firms were well-established ones. According to the results, people were rural entrepreneurs in the area they were born and grown up (85,7%) to continue their family business (30%), increase their income while still living with their family (21,4%) or become independent within the wider family environment (a sum of smaller percentages of different reasoning, Figure 2). The finding confirms relevant literature (e.g. McElwee and Smith, 2014); regarding the lack of conscious development of entrepreneurial culture, the existence of strong introversion, and, eventually, the core role of family. It is worth mentioning that necessity entrepreneurship seems to be non-existent.

The importance of family is also highlighted by the fact that the 95% of the sampled firms are micro-firms occupying only family members. This is in line with relevant literature; e.g. Smallbone (2009) states that rural areas are dominated by micro businesses and they mostly consist of solo owner/managers.

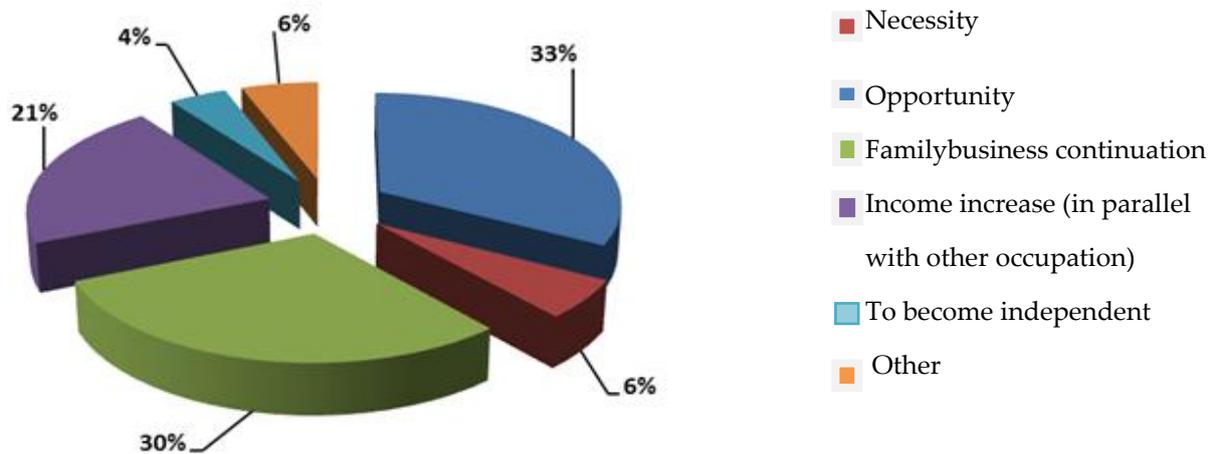

Figure 2: *Reasons for entrepreneurial activity*

Within this framework, it is worth noting the lack of knowledge regarding entrepreneurship and entrepreneurial skills. A significant percentage of 58.6% stated that they have received no education or any kind of training regarding their business or any type of managerial and entrepreneurial knowledge. According to the results, lack of proper education is mainly due to the non-existent relevant infrastructures in mountainous areas. Under this general umbrella, the need for entrepreneurial knowledge as well as more special knowledge issues (e.g. hospitality) has been mentioned. However, it is important that the respondents could locate the relevant weakness. This denotes that the questioned entrepreneurs are not the “narrow-minded” rural agents described in several papers and have definitely leaved behind the rural “comfort zone” (Smith, 2008). They appear to have recognized the local socio-economic dynamics and the deep recession has surely played its role in overcoming them. Cooperation with knowledge agents and access to information and advice have been recognized as critical ways to enhance the local ability to enlarge business activities. This is in line with relevant findings in other countries as well; for example, North and Smallbone (2006) suggested the creation of an appropriate entrepreneurial education infrastructure in rural regions of Portugal. Therefore, investment in building the necessary entrepreneurial culture appears to be in top priorities of the local business population of the mountainous Pyli area; the development of entrepreneurial skills and capabilities was among the higher rated proposals for the improvement of the community’s wellbeing (rated second after the taxation reduction proposal).

A significant finding regards the tendency for innovation. The majority of the respondents (88%) consider innovation and marketing as vital for the creation and sustenance of strong competitive advantages and a means to reach foreign markets. The respondents consider the use of ICT as well as the development of differentiated products and services as their most powerful innovative efforts so far. However, they appear to hand on the state support since the last decades subsidies (mainly programs such as Leader and Leader+) have been the main financing sources for rural mountainous

investments. Some of them take advantage of the exceptional countryside and the combination of cultural-religious-social environment of the mountainous area and create innovative activities overcoming the disadvantages of location. Then the mountainous lifestyle becomes “an experience” translated into leisure activities for all seasons for those involved in tourism or it becomes the background for the reproduction of pre-industrial goods and services promoting retro-innovation as the core diversification strategy. Furthermore, the majority of the respondents think positively on greening their current enterprises in order to enhance growth and competitiveness. Actually, more than the half of them believe that they own green business although it was quite obvious that they were not well acquainted with the concept.

According to the field research findings, a small but critical percentage of the respondents appear to constitute the dynamic part of rural entrepreneurs of the area extracting real value from their mountainous environment against the percentage of business owners who merely subsist. However, they still act in a rather closed entrepreneurial eco-system characterized by small-scale nature of most business, a high degree of locality, interconnectedness of personal, business and social life and a myopic approach of the entrepreneurship issue in total.

CONCLUSIONS

This research has been conducted within the framework of rurality, as defined by Stathopoulou et al (2004), i.e. “a territorially specific entrepreneurial milieu with distinct physical, social and economic characteristics in which location, natural resources, the landscape, social capital, rural governance, business and social networks exert dynamic and complex influences on entrepreneurial activity”. The study purported to contribute to the understanding of the actual profile of active entrepreneurs in rural and more precisely in mountainous areas which are far more disadvantaged than the rest, for a series of reasons such as accessibility, whether conditions, cultivation opportunities and so on. A deeper knowledge of necessary traits, behaviors and skills fostering or inhibiting rural entrepreneurship will bridge the existing research gap and will certainly assist the design and implementation of future development policies.

It appears that in mountainous Greece there is no cultural affinity to the entrepreneurial ideal. Local people invest on the business they found by their families such as livestock and farming or they exploit EU initiatives and subsidies to expand their residences to agro-tourism lodgings. Businesses are in their majority family affairs that grow and mature together with the owners and cease working when the owners are too old and have no descendant to take over.

According to the results, all rural entrepreneurs are hardworking actors. It is actually the entrepreneurial spirit that is missing and most of them are actually passive business owners that

genuine active entrepreneurs. Therefore, it appears that the most important challenge to tackle is the creation of distinctive entrepreneurial identity. Practicing and perpetuating entrepreneurship in this context requires the initiation of new behaviors, values and practices. This can be done by building “entrepreneurial capacity” (North and Smallbone, 2006); i.e. by training people on entrepreneurial skills and attitudes, offer well-organized knowledge on entrepreneurship and relevant capabilities as well as create links and easy access to knowledge providers. On the other hand, the organization of a rural enterprise incubation park, the upgrade and further support of the necessary infrastructure and the creation and sustenance of a relevant business association could create the necessary dynamism for the local rural entrepreneurs to transcend local borders and export or attract the interest of other countries’ consumers as well.

In a more general approach, the study contributes to entrepreneurship theory by examining rural entrepreneurs within their mountainous entrepreneurial eco-system in which they put effort in creating and extracting value from an environment in perpetuity. Consequently, a main contribution of the study seems to be its indication that there is a significant difference or rural entrepreneurship even at local level which is highly influenced by specific individual characteristics instead of only the territorial ones suggested by Stathopoulou et al (2004).

According to the findings, economic development seems to reside essentially in the actions of this particular type of genuine economic agents. This can form a critical mass to lay the foundations for novel types of entrepreneurship such like innovation-based, network-based or social entrepreneurship. Here comes also the role of the State and the EU; the transformation of business ownership to actual entrepreneurship requires the implementation of actual, precise, integrated and competent policies.

Admittedly, the results are tentative since the research bears certain limitations. In the first place, a significant drawback was the lack of sample diversity since the analysis was limited to only one geographically bounded sample limiting the generalizability of the findings. However, this choice enabled the control for potential confounds due to cross-region differences, increased the internal validity and provided the main contribution of the study highlighting the significance of bottom-up approach of every single area of interest when regarding rural entrepreneurship and policy making.

Furthermore, surveyed businesses have survived the long severe socio-economic Greek crisis; this might cause survival bias while the absence of a longitudinal analysis derives our research by a more evolutionary perspective and relevant useful insights. In addition, it appears that the questionnaire did not address the critical issues of embeddedness, networks and collaborations which have been addresses as significant components in the relevant literature. Furthermore, this research could not

assess the role of immigrants in local rural entrepreneurship since it appeared that the eligible percentage in the sample could not allow for useful insight.

Consequently, further research could attempt to replicate similar analyses in different geographic, sectoral and territorial contexts, enrich the content of the questionnaire and explore reasons of failure. Researchers are also encouraged to explore the issue at case study level and from a longitudinal/historical perspective.

ACKNOWLEDGMENTS

The research leading to these results has received funding from the EEA Mechanism 2009-2014, under Project Contract n° 3580 and under the title “Establishment of a Supporting Mechanism for the Development and Promotion of Social Entrepreneurship for Populations of Mountainous Areas”.

ENTREPRENEURIAL FEATURES OF THE CREATORS OF INNOVATIVE ENTERPRISES

Kchaich Ep Chedli, Mariem

Bucharest University of Economic Studies, Romania

ABSTRACT

This study aims to deepen the knowledge of innovative entrepreneurs and what motivated them to establish their businesses in an environment full of rapidly changing technology and economic globalization. Particular attention has been paid to the creation and development of innovative enterprises with high knowledge content. In this study about the creators of innovative enterprises, it is necessary to consult the literature on innovative entrepreneurship. To reach this goal, we begin by questioning the concept of innovative enterprises and showcase their particularities. Then, we turn our attention to the specific qualities of the innovative entrepreneur. Finally, we will try to identify the decisive environmental determinants advanced by the work carried out on innovative entrepreneurship and determine their influence on the creation of innovative enterprises.

Keywords: *Entrepreneur, Environmental determinants, Innovative companies, Social Innovation Particularity.*

INTRODUCTION

Leave Currently, countries are looking for innovative companies, citizens, modern and satisfying for job creation needs and collective wealth (Gasse, 2004). These companies have an incontestable contribution to regional development and economic dynamics (Borges, Simard and Filion, 2005). From that moment; many authors have retained special attention to technological entrepreneurship by focusing on the particularities of creating innovative companies and especially their entrepreneurs.

It should be noted, however, that the creation of a technology company is a particularly delicate exercise because of the risk on its activity and the uncertainty of the environment (Bernasconi, 2003). This has led many authors to ask this question: What leads some individuals to create innovative enterprises? What specific determinants in the creation of this type of enterprises?

In this regard, the aim of this article, first, is to present the particularities of these enterprises and second to study the determinants leading the individual to create an innovative company. These determinants are linked to the innovative entrepreneur and the environment in which it is inserted.

INNOVATIVE COMPANIES

Definition of an innovative company

Many studies conducted on innovative companies, indicated a number of criteria differentiating these enterprises from other forms of companies including traditional companies. Hedlund emphasized the need to distinguish between a traditional enterprise and innovative enterprise as much as the first has a form oriented towards rational and appropriate goals for a stable environment, against the second has a form suitable to changing conditions and problems and unpredictability of the action (Hedlund, 1994).

Similarly, Albert makes a distinction between traditional enterprise and innovative enterprises in terms of uncertainty. He stated that while uncertainty is huge for high-tech companies, it is less for traditional companies that operate in a more stable environment and for large companies with a portfolio of activities allowing them to diversify their risks.

In the literature, several names have been given to innovative companies. We mainly cite High-Tech enterprises, advanced technology companies, innovative companies (according to the French translation) or High Tech Firm, Knowledge-Based Firm or New Technology-Based Firm (NTBFs) in English (Albert, 2000).

Albert and Mougnot propose a classification of these companies into three groups, based on the technological intensity of the change introduced. Thus, they distinguish innovative companies, having a general feature of innovation, the two other subset have a special feature of the innovation (Albert and Mougnot, 1988). Innovative companies include the two other types of companies namely, innovative firms and advanced technology companies (ETA).

- Enterprises advanced technology: these are companies that develop and / or exploit new technologies in different applications for different markets.
- Innovators Businesses that launch new products or new processes with technological content, from classical and advanced technologies.
- Innovative companies: These are companies launching new products or new services or using processes, new marketing or new modes of management without technological content.

Park (2005), on his part, defines a high-tech enterprise like an enterprise that uses or invests in an emerging technology or rapidly evolving as a key factor in the development of its product, its production and its marketing strategy (Park, 2005).

For their part, Ayadi, Arlotto and Jourdan propose a wider definition of the innovative company by adding other features such as: age, size and the existence of a technological nonindustrial innovation (in the service sector). Thus, they specify that innovative company is a young company (under the age of 10 years), medium-sized or using or significantly invests in emerging technological innovations or

rapidly growing as key part of its development process, of its production, its delivery or its service (Ayadi, Arlotto and Jourdan, 2005).

Specificities of innovative companies

High-tech companies allow specific studies to address a number of specificities distinguishing them from other more traditional companies. Albert illustrates these specificities in five principal characteristics, namely (Albert, 2000):

- They operate in very unstable sectors of activities because of the rapid evolution of technologies such as electronics, computers and telecommunications. Due to the speed technology combined with the new products, the emerging markets and the unpredictability of the competition these companies face considerable some uncertainty like a common feature.
- Their research and development budgets are more important than of other enterprises. They are related to the high level scientific community. These companies' products and/or services have a high added value and often a (quite) short life cycle.
- They disturb the market balance by introducing innovations and changes in offer/demand and by creating new markets.
- They are characterized by specific needs and financing methods involving very specific actors (Venture Capital, Business Angels, etc.).
- Their activity requires higher investments than other non-innovative companies.

After presenting the main definitions and specificities of innovative companies, it seems important to study the peculiarities of their creative process.

Features of the process of creating innovative companies

Some authors have shown that the process of creating high-tech enterprises have certain features including high needs in terms of resources, a significant dependence on knowledge and new technologies, a remarkable difficulty for the development and commercialization of product / service, considerable existence of entrepreneurship team and the presence of partnerships with other social actors (Albert, 2000; Benavent and Verstraete, 2000; Bernasconi, 2000; Samuelson, 2001). Indeed, in their comparative study of 77 technology companies and 115 traditional companies, Borges, Filion and Simard showed that the process of creation of technology companies is longer and more difficult because of the need to develop the technology, features of their market and their increasing resource needs (Borges, Filion and Simard, 2006).

A similar result was found by Samuelson in his study of 233 companies in Sweden. It indicates that the process of creating this type of enterprises is longer and less linear. The author stresses that traditional companies usually imitate the creative process of existing companies, while innovative companies must find their own path and even invent new markets (Samuelson, 2001).

In that vein, we note that innovative companies and their creative process differ from other companies. Therefore, it is legitimate to try to explain the phenomenon of creating this type of enterprises. To this end, we discuss in what follows the theme of the actor of this phenomenon who is the innovative entrepreneur and the specific environmental determinants in the creation of innovative companies.

THE INNOVATIVE ENTREPRENEUR

In the literature on the creation of innovative companies, the character of the innovative entrepreneur is considered central. Very particular characteristics have been given to this individual. In what follows, we try to present studies interested in the profile of innovative entrepreneur and typologies that can be mobilized to better understand its course.

The particular profile of innovative entrepreneurs

Gender and age. The creation of technology companies interested in men more than women, such as highlighting Ayadi, Arlotto and Jourdan (Ayadi, Arlotto and Jourdan, 2005). According to these authors, technological entrepreneurs are men in 80% of cases. These entrepreneurs are relatively young (Danjou and Dubois-Grivon, 1999; Blais and Toulouse, 1992) and are generally aged 30 to 40 years (Ayadi, Arlotto and Jourdan, 2005) and 35 to 44 years for (Borges, Filion and Simard, 2006).

Level of Education. Many studies have shown that innovative entrepreneurs are distinguished from other creators by their high quality education (Bernasconi, 2000). In fact, in their exploratory study of 22 innovative companies, Danjou and Dubois-Grivon found that 95% of them have at least a level Bac + 5 and half are doctors or engineers Drs. Similarly, Ayadi, Arlotto and Jourdan note that in 2005 and in the national competition for the creation of innovative technology companies in France, 50% of promoters are PhD students and 34% are engineers. In the same vein, Borges, Filion and Simard confirm that the creators of technology companies are more educated than the creators of traditional companies. In fact, technology entrepreneurs with a bachelor's degree or more represent 67% against 39% only for other entrepreneurs. In addition, 26% of technology entrepreneurs hold mastery or doctorate against 9% other (Danjou and Dubois-Grivon, 1999; Ayadi, Arlotto and Jourdan, 2005; Filion and Simard, 2006).

Experience. According to Tesfaye and Fayolle, technology entrepreneurs create their enterprises after working in related sectors of the industry in the new company which they acquired their skills and experience with the product and the technology used (Tesfaye, 1997; Fayolle 1999). So they have a good knowledge of markets, technologies or industry (Gasse, 2002). This professional experience can last an average of 12 years (Danjou and Dubois-Grivon, 1999). For Borges, Filion and Simard these entrepreneurs have a 16 years' experience on average in the labour market, 9 years in the business sector created, 8 years in a management position and more than half (54.5%) have created already another company (Filion and Simard, 2006).

Team contractors. Several authors have recognized the collective character of the creation of innovative companies (Bernasconi, 2003). In fact, these authors showed that the majority of entrepreneurs in high technology create a team (Borges, Bernasconi and Filion, 2003; Cooper and Daily 1997; Cooney, 1999; Gasse, 2002). This team is formed by an average of three people who are usually family members, friends or co-workers (Prevezzer, 2001; Reynolds et al, 2004). Martinez Sanchez and Urbina Perez found that 91% of technology companies located in the north of Spain is created by more than one contractor. They stressed that the partners are highly qualified and are able to complete the contractor's competences (Urbina Perez, 1998). The formation of a team allows, according to Bernasconi to entrepreneurs to join resources and complementary skills (Bernasconi, 2000). Oahey confirms this reality by focusing on the need to bring together expertise and managerial skills to successful high-tech companies (Oahey, 2003).

Motivations. There are several motivations leading to create technologies enterprise. They borrow some motivations related to the creation of Non-technology Company such as the need for independence (Urbina Martinez Sanchez and Perez, 1998), the need for achievement and family background (Park, 2005; Danjou, 1999; Albert and Mougnot, 1988). However; other specific motivations to technology entrepreneurs have been demonstrated. Park speaks of the desire to achieve innovation, Colombo Delmastro highlight the conviction to introduce something new. This view is similar to that of Schumpeter (in Mustar, 1997) that an individual will engage in entrepreneurial path if it is safe to be able to reward his efforts and enjoy a monopoly, even temporary (Park, 2005; Colombo Delmastro, 2002). Vesper, Blais and Toulouse, on their part, note that individuals passionate about technology development are more likely to create technology companies, as well, Bruno and Mcquarrie Torgrimson in their study of 250 new technology companies in northern California, have compiled loyalty to a product or technology as a particular motivation for innovative entrepreneurs (Vesper, 1980; Blais and Toulouse, 1992; Bruno and Mcquarrie Torgrimson, 1992).

Typology of innovative entrepreneurs. The study of typologies of entrepreneurs is interesting in that it allows a better understanding of technology entrepreneurs and pathways leading to undertake (Bernasconi, 2003). The typology the best known is that of Bernasconi offers five types of configurations of entrepreneurs in high technology (Bernasconi, 2000):

Orchestra man. It is an engineer or a scientist who, alone, is launching a project based on a technology that he overcome. Dynamics of the project will depend on the qualities and skills of the entrepreneur. This type of entrepreneur is now quite rare due to the need to form a team for the creation and development of a high tech company.

Essaimage of researchers. This type is for researchers who create their enterprises in order to valorise the work that they have made in their research laboratories (public or private). The control of the most

advanced technologies allows these researchers to initiate and develop highly innovative projects. *Essaimage* is through the creation of a new enterprise agreement with the laboratory.

Professional Essaimage involves the creation of a new company by a team that pilots an activity in an existing enterprise. The expertise of the team members has already been acquired and initial costs and risks are often supported by the company left.

The orchestra professionals correspond to the formation of a team of professionals in order to launch a project recognized as especially innovative. The team is formed by individuals with complementary skills. The proper functioning of the founding team will give credibility to the project and reduce risk.

Young adventurers are young entrepreneurs who have created their enterprises, just after graduation or two or three years after or even before completing their training through an opportunity that has appeared particularly in new technologies and the Internet. These young entrepreneurs lack the skills related to the field of management, marketing and finance.

This typology is close to that one proposed by Jones-Evans, based on four types of entrepreneurs *technologically built* on their previous experience:

- *The researcher*, issued from public laboratories and university research environments.
- *The producer* belongs to the areas of production or product/process development, often within a large company.
- *The user* performs a peripheral role in the development of a technology (for example, in sales or marketing).
- *The opportunistic* usually is an entrepreneur with little or no experience in the technology field but has identified a technological opportunity.

Once this job on innovative entrepreneur, the specificities of environmental determinants leading to the creation of innovative companies should be considered and addressed (Jones-Evans, 1995).

ENVIRONMENTAL DETERMINANTS OF THE CREATION OF INNOVATIVE COMPANIES

The characteristics of a dynamic environment that attracts and facilitates the creation of innovative companies have been the subject of several theories; the most important are the clusters or innovative environments.

The innovative environment

The theory of innovative environments was developed by the work of GREMI (European Research Group on Innovative Environments) to explain the spatial concentration of innovative companies in very specific areas (Aydalot 1986; Quevit 1991; Perrin, 1991; Maillat, 1992). These areas that may be techno polis (Zghal and Labidi, 2007) consist of technology companies, research centres, universities

and support structures for the creation of companies such as incubators and financing networks (Bernasconi, 2003) and whose principle is based on the notion of proximity (Gilly and Torre, 2000; Rallet and Torre, 2001). This latter generates synergy effects (Haddad and Poncet, 2006) to develop interaction between these actors and therefore the dissemination of knowledge and access and exploitation of technological complementarities (Mezouaghi 2002).

Bernasconi illustrates the benefits of innovative environments in five main families (Bernasconi, 2003):

- Advantage in terms of experience and motivation for the entrepreneur (entrepreneurial culture success stories, favourable policies);
- Advantages in terms of costs (land economy);
- Advantages in terms of resources (human, financial, contracting);
- Advantages in terms of access to the first customers;
- Advantages in terms of learning and innovation.

The region of Silicon Valley in the US is the ideal model of an innovative environment consisting of a large number of companies with high technological potential and supporting a dynamic regional economy and rapid growth (Collinson and Gregson, 2003; Castells, 1998).

Thus, the existence of such an environment offers special attractions to potential entrepreneurs and encourages them to create technology companies. Besides this environment, it is also necessary to highlight the role played by the supporting devices to enterprise creation.

The devices support business creation

Verstraete and Saporta emphasize that support mechanisms for entrepreneurship have overriding objective to promote the creation of new enterprises in a well-defined territory (Verstraete and Saporta, 2006). According to these authors, these devices are structured in three main axes: financial support, development consulting and training networks (in order to reduce information asymmetry and reduce the risk of failure of young entrepreneurs) and logistical support (through the creation of structures accompanying such as nurseries and incubators).

Financial support may be manifested by the participation of specific factors such as capital investment companies risk (SICAR) and individual investors called Business Angels. The SICARs are specialized in corporate finance through participation in capital and the sharing of risks and opportunities, and Business Angels are former entrepreneurs who aim to bring money and advice to young entrepreneurs. Conversely other investors, Business Angels do not seek immediate returns.

Jacquemin gives the example of the French government has taken several fiscal and regulatory measures in order to encourage the creation and development of innovative companies. He cited mainly the impetus of the law on Innovation July 1999 (which aims to increase support for innovation), the foundation of regional incubators and research networks and technological innovation, creating seed funds (these are funds for financing the first phase of the business creation process, including the

design and maturation of ideas) and the contest for the creation of innovative technology companies (Jacquemin, 1999).

Research into innovative entrepreneurship, dealing with devices supporting entrepreneurship, however, paid particular attention to the role of nurseries and incubators hatch innovative companies.

The importance of the role of incubators and innovative business incubators

Messeghem and Sammut state that incubators and business incubators are support structures whose mission is to ensure the reception, accommodation and support for project managers and business leaders. They add that in addition to these missions, nurseries should facilitate the creative integration in his environment by putting it in relation to the different actors from the technology community, economic (customers, suppliers...) and institutional (access to devices aid, subsidies, public procurement, venture capital, legal knowledge...).The nurseries also provide management training to improve the profile of a technician to become an innovator responsible for Business (Messeghem and Sammut, 2007)

Cullière concluded that to enrol in a nursery or incubator can contribute to the credibility of the creative project and increase its legitimacy and therefore the legitimacy of his business with external actors (Cullière, 2005).

All these findings led some to characterize this type of accelerator structure or catalyst of the entrepreneurial process. Indeed, Colombo Delmastro notes that the technology incubator is a catalyst for the decision to embark on the creation of an innovative company (Colombo Delmastro, 2002). Similarly, Berger-Douce points out that the regional incubator has an entrepreneurial (Berger-Douce, 2003). Les results process enabling character of a qualitative study by Fitzgerald, Murphy and O'Connor, confirm this reality showing that the specialized training, availability of resources and the existence of incubators have a major role in facilitating the creation and development of technology companies (Murphy and O'Connor, 1984).

The importance of environmental determinants inherent in the creation of innovative companies is thus undeniable in the development of a positive perception of the environment surrounding the contractor and the impetus of innovative business initiatives.

CONCLUSIONS

This study had the ambition to explore the factors stimulating the emergence of innovative entrepreneurs. The findings reveal that prepared the courses leading to the creation of innovative companies interact with factors related to the contractor and external factors inherent in its environment.

Regarding technological entrepreneur, the literature reveals the existence of some special features on it that prompt start a business. It appeared that there was consensus among researchers about the importance of education, experience, motivation and the existence of an entrepreneurial team. As an illustration, let us remember that technological entrepreneur is a man in the majority of cases, highly qualified, with previous experience in the field of activity of the new company and that often begins by forming an entrepreneurial team. This individual is generally passionate about the development of technology. All these make the innovative entrepreneur has some expertise in its field allowing him to bring something new.

To these individual characteristics, literature proves the importance of the environment surrounding the creator in favouring and facilitating the creation of innovative companies. Thus, innovative environments as technology parks and support mechanisms for the creation (such as financial institutions, consulting and training networks, nurseries and incubators) developed to mitigate the risks inherent to the particular of these companies and boost entrepreneurial initiatives.

CONCEPTUAL REVIEW OF DAIRY CO-OPERATIVES IN INDIA, AS AN IDEAL ECONOMIC MODEL: THE CASE OF DAIRY CO-OPERATIVE FROM WESTERN MAHARASHTRA

Khamkar, Samadhan K; Bobade ,Anita P

University of Mumbai, NMITD, India

ABSTRACT

Cooperatives, as a form of business organisation, play a meaningful role in uplifting the socio-economic conditions of their members and their local communities. In Indian context, co-operatives, have run as a member centric, democratic organisation, focusing on economic and social development and transformation. Challenges of the 21st century for all corporation include, turbulent financial markets, unstable economies and financial systems, rising levels of unemployment; no government protection, competitive markets, dumping of foreign goods, growing disparity, and environmental concerns. In this globalised economy, cooperatives have played a pivotal role in offering a financially viable and socially responsible business organisation .

The paper documents the evolution and remarkable growth of the Indian dairy co-operative, over the last few decades. The White revolution, in India, was promoted by the Government of India, through Operation Flood, establishment of NDDDB. The paper documents the success of dairy cooperatives in Western Maharashtra, India, which has played a key role in the social transformation.

Keywords : *Dairy Co-operatives, Operation Flood, White Revolution, Anand Pattern, Milk Marketing Federation, Western Maharashtra*

INTRODUCTION

Although the word “co-operative” is a word that can be used for any group activity with a common purpose, it is a formal business organization, which has its origins in Europe and North America in early 18th century. It was further strengthened in England, by the founding fathers of the Rochdale Consumer Co-operative in 19th century. Even today, the guiding principles and laws governing the co-operatives which foster economic and social development are based on Rochdale principles.

According to the International Co-operative Alliance,(ICA) a non government organization having membership of 230 organisations, 800 million members, from over 100 countries, is a recognized

association of co-operatives. It has defined, co-operatives as, "A autonomous association of persons, united voluntarily to meet their economic, social and cultural needs and aspirations through a jointly owned and democratically controlled enterprise." Further, according to Zeull and Cropp, (2004), the evolution of the co-operative movement and establishment of co-operative form of business organization, can be traced to the social and economic factors. They were created, sustained and grew in times of economic slowdown, distress and social turmoil.

Further, a co-operative is like any other corporation, which has a perpetual existence, a separate legal entity, limited liability of its members and common goals and set of principles and is governed by an elected Board of Directors, on behalf of its members. In order to survive and grow, it should also make enough earnings to meet and its expenses sustain, thus it must be a financially viable organisation. However, the striking difference is that, co-operatives are member oriented and member centric, and not investor oriented. Thus profit and wealth maximization is not pursued the way it would be pursued by a corporation (Zeull and Cropp, 2004).

MILK COOPERATIVES- GLOBAL SCENARIO

About 700 billion liters of milk is processed each year by dairy companies around the world and the global demand for dairy products is increasing (Mani,2013). The reasons for the growth in demand are population growth, increased disposable incomes and preference for dairy products as part of diet (Mani,2013). Further, cooperatives play a very important role in the milk dairy sector. Half of Europe's top 10 dairy companies are cooperatives. Nestle and Danone are companies in the private sector. FrieslandCampina from Netherlands, Germany and Belgium is the biggest dairy cooperative in the world. In terms of revenue, Nestle, a Switzerland based company is the largest in Europe followed by Danone from France. Aria Foods, Denmark is the 4th largest dairy cooperative in the world in terms of revenue.

FDB or The Danish Consumers Cooperative Society is a consumer cooperative based in Denmark. FDB is the largest member and consumer organization in Denmark with more than 1.6 million members. In western countries, milk has been a staple part of the daily diet. In these countries people eat and drink the equivalent of 240 to 250 kilograms per person per year.

Fonterra is global milk cooperative in New Zealand who collect 22 billion liters of milk every year and share it with the world. Fonterra is the world's largest global milk processor and dairy exporter. Through their integrated supply chain popularly called "grass to glass", they deliver high quality dairy products and a portfolio of consumer brands to customers around the globe. Over the last 140 years, their over 10,500 farmer shareholders have built up their cooperative to be a world leader in dairy excellence, and produce 16 billion liters annually. Organic Valley, a dairy cooperative with

headquarters in Wisconsin is one of the major players in USA having over 1723 farm members as of 2012 (Mani,2013).

If the growth of dairy cooperatives is spectacular in Europe and USA, it was mainly sponsored by government in developing countries. For instances, in India, cotton textiles, sugar and dairy cooperatives were success stories. In Tanzania and Kenya, coffee cooperatives were also effective. In Bangladesh, textile cooperatives and self-help groups (SHG) were becoming financially viable business units. In India, after liberalization and globalization, the dairy cooperatives survived and were effective even after withdrawal of government support.

EVOLUTION OF DAIRY COOPERATIVES IN INDIA

In over 100 years of their existence, cooperatives have emerged as a distinct sector of Indian economy. India is not only the largest milk producer but also one of the most economical producers in the world. According to statistics, the cost of 100 liters of milk production in 2005 in India is 20.54 USD against 21.10 USD in New Zealand, 41.00 USD in United States and 52.00 USD in Canada (Mani,2013). India's milk production continues to increase and as of now is over 90 MMT. The per capita consumption of milk doubled from 111 grams per day in the early 1970s to 222 grams per day in 2000. Hence these dairy cooperatives have played a major role in the economic and social development of rural India and has also provided vital ingredient for improving the health and nutrition of the Indian population. With more than 6 lakh cooperatives and having 98% coverage in the rural areas, they are the "development agent" in the rural area and also the booster centers of other small co-operatives such as textile, poultry, and agriculture. The cooperative model has proved to be most reliable in the times of economic recession when other organisations have come under lot of pressure; It has the ability to build umbrella brands, have line and product extension, so as to survive in unstable markets and economies.

In India, cooperatives have been favoured and encouraged by Government. The political parties saw cooperatives as instruments, for furthering their political agendas where they could reach out to masses and local communities, and garner subsidies and funds which could be siphoned off for their political interest. There were success stories in sugar and cotton cooperatives in India. However, after 1990's liberalisation of Indian economy, withdrawal of government support and subsidies, many co-operatives could not withstand the competitive forces of the market and had to be shut down. However one co-operative, which has always been successful from its establishment and also made a steady profits and as also contributed to its members welfare is the dairy co-operatives.

GENESIS OF DAIRY CO-OPERATIVES IN INDIA:

Indian agriculture is an economic symbiosis of crop and cattle population. Dairying has become an important secondary source of income for millions of rural families and has assumed a most important role in providing employment and income generating opportunity (Nargunde, 2013). India has the largest population of cattle in the world. More than fifty percent of the buffaloes and twenty percent of the cattle in the world are found in India and most of them are milch animals (Mani,2013). As of 2012, there were 22 State Cooperative Federations, 170 Milk Producer Unions and over 70,000 Village Dairy Cooperatives in the country. The milk production is close to 96 million tonnes. This is supplied by millions of rural smallmilk producers contributing 62 % of total milk produced in the country. Further, the milch animals are fed on crop residues and milchanimal dung is used as manure for crops (Nargunde, 2013). The dairy sector today provides 80 million farm householdsthe triple benefits of nutritive food, supplementary income and productive employmentfor family. Animal husbandry provides self-employment tomillions of households in rural areas. Dairying with crossbred cattle and high-yieldingbuffaloes has become a lucrative business.

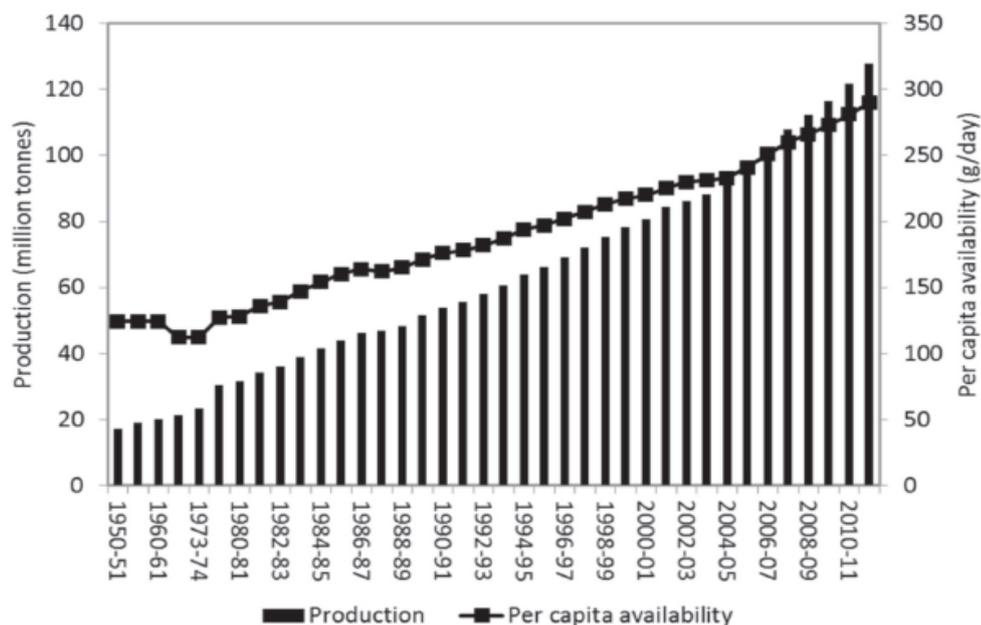

Figure 1. Trends in milk production and per capita availability of milk in India: 1950-51 to 2012-13
 Source: GoI (2014)

Figure 1 : Trends in Milk Production in India from 1950-2013

Source : Sharma(2015)

Milk production was more or less stagnant during the 1950s and 1960s and annual production growth was negative in many years (Figure 1). The per capita availability of milk declined which concerned the policy makers. During the second-half of the 1960s, the Government of India made major policy changes in the dairy sector. Milk production in rural milk sheds through milk producer

cooperatives and movement of processed milk to urban demand centres became the cornerstone of government policy for dairy development. This single policy initiative of the government gave a boost to dairy development through (i) linking-up rural producers with the urban consumers through pricing, procurement, processing and marketing, which reduced transaction costs, and (ii) large public investments in the milk processing sector (milk procurement centres, chilling plants, milk processing and product manufacturing plants) through cooperatives, which acted as a catalyst to bring about the white revolution in the country (Sharma, 2015)

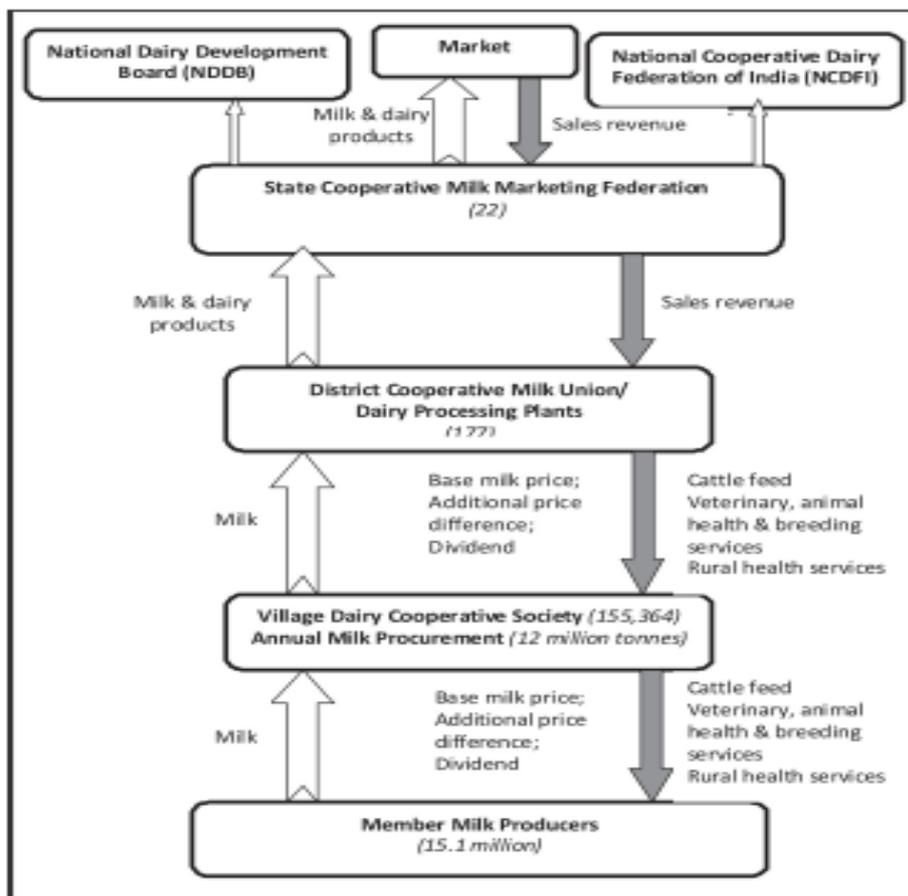

Figure 2. Three-tier "Anand Pattern" of dairy development in India

Figure 2 : Three Tier " Anand Model of Dairy Development in India

Source :GCMMF (2012) and NDDB (2013)

Anand pattern, as is popularly known is one of the earliest dairy cooperatives in India and is based at Anand in the state of Gujarat. The cooperative was formed in 1946 and today managed by the Gujarat Cooperative Milk Marketing Federation Limited (GCMMF) which is jointly owned by 3.03 million milk producers in Gujarat. The revenue in 2010-2011 was U.S\$ 2.15 billion. The Anand model is a 3 tier model (Figure 2) consisting of Dairy Cooperative Societies at the village level affiliated to Milk Unions at the district level which in turn is part of a Milk Federation at the state level. Further, the Milk Marketing Federation, which has the technology and the expertise for milk marketing and is an Innovation, Entrepreneurship and Digital Ecosystems

important chain in the distribution of fresh milk or processed milk products. Apart from this, there is an unorganised channel, where the milk production, collection, processing and distribution is done locally.

Year	Production (Million Tons)	Per Capita Availability (gms/day)
1991-92	55.7	178
1992-93	58.0	182
1993-94	60.6	187
1994-95	63.8	194
1995-96	66.2	197
1996-97	69.1	202
1997-98	72.1	207

Table I Production of Milk in India from 1991-2012

Source: Department of Animal Husbandry, Dairying & Fisheries, Ministry of Agriculture, Government Of India Statistics (2013)

BUSINESS MODEL OF DAIRY CO-OPERATIVES IN INDIA

Dairy Farmers, in Anand, Gujrat, first joined together as a village level dairy cooperative, whose chief objective was to collect, milk; the next level was the District level cooperative – Kaira District cooperative, which stored, and processed it. The same was then marketed through another organization, which was at the apex – namely Gujrat Milk Marketing Federation. They undertook

the storage in silos, logistics, and distribution across the state and sometimes across other states and also export to different countries.

One of the success factor for Anand Pattern is the Marketing strategy, which starts with the pricing strategy. The purchase price is based on the fat content of the milk, which is fixed at Rs.18 per liter (US\$ 0.265) for cow milk, whereas for buffalo milk it is a bit higher at Rs.22 (US\$ 0.324) per liter. The unique feature of this scheme is that, this price is assured to the dairy farmer and is unchanged, irrespective of demand and supply. The private players keep changing the price of milk, as per dynamics of demand and supply.

Indian dairy co-operatives has made remarkable progress over the last two decades as is depicted in Table I. The evolution of the dairy co-operative, specially Operation Flood, has been an important driver of this progress and has played an important role in facilitating the participation of small dairy farmers in this expanding sector (Sampathkumar and Anbu,2012). Trends indicate that, the unorganised channel of dairy farmers continue to play its dominant role in milk marketing as out of the 3700 cities and towns in India, organized channel of dairy co-operatives serve only 778 cities, towns and villages. It is therefore the urban demand that is the primary source of revenue for rural milk producers. Only 15% of the milk marketed is packed, of which 94% is in pouches (Sampathkumar and Anbu,2012).

India is the world's largest milk producer, accounting for more than 13% of world's total milk production. It is the world's largest consumer of dairy products, consuming almost 100% of its own milk production. According to Nargunde(2013), Dairy products are a major source of cheap and nutritious food to millions of people in India and the only acceptable source of animal protein for large vegetarian segment of Indian population, particularly among the landless, small and marginal farmers and women. Indian Dairying is unique in more than one ways. Contributing about 5.3 per cent to India's agricultural GDP, milk is a leading agricultural produce. The value output from milk at current prices during 2006-07 has been over Rs.144386 crores which is higher than the output from paddy (Rs.85032 crore) alone and is also higher than the value output from Wheat (Rs.66721 crore) and sugarcane (Rs.28488 crore), put together (Nargunde,2013). It is heartening to note, that dairy industry in India, is generating employment for 120 million rural households and is a vehicle of social and economic development as depicted in Figure 3.

INDIAN CO-OPERATIVE MOVEMENT - A STATISTICAL PROFILE 2012

Employment in Organised Sector		
	2008	2010
	(in million)	
• Public Sector (Govt.+Quasi+local)	17.674	17.862
• % of Female In Public Sector	17.20	17.89
• Government Sector (Central + State)	9.910	9.905

Further , the milk procurement, production and its reach to the urban and the remotest part of the country, is also enhanced. Dairy co-operatives have given a fresh lease of life to farmers in drought-prone areas. Milk production and its transparent marketing system through the cooperatives are providing an assured source of income to farmers helping them sustain themselves against recurring drought. The migrating population is settling down. About INR 20,000million (US\$ 300 million) is the income generated from dairy farming business in the country. Operation Flood has, therefore, emerged in India as the largest rural employment scheme. It has been able to modernize the dairy Industry and also created opportunity for marketing its dairy products globally.

DAIRY CO-OPERATIVE IN WESTERN MAHARASHTRA

In 1958 Dairy Development department was established in the State of Maharashtra with the objective to increase the production and procurement of milk in the rural area of Maharashtra with a view to ameliorate the economic condition of the rural farmers and to supply wholesome and hygienic milk to the city consumers at a fair price.

Maharashtra is the seventh largest producer of milk in the country, accounting for 34.76 lakh kgs per day, in 2014-15. About 75 lakhs people depend on the dairy sector in Maharashtra state for their livelihood. However, per capita milk availability is lowest in the state, which was 196gmsper day in 2010-11 has increased to 219 in 2014-15. Changes in demographic pattern, education, income structure, lifestyle, changing aspirations, cultural orientation, increasing awareness about nutritive value, Innovation, Entrepreneurship and Digital Ecosystems

changes in consumer behavior, introduction of new technologies, new expectations of consumers and other such factors have influenced the demand for milk & milk products. The livestock population and milk production has increased significantly over the years in the state due to the implementation of various dairy development programmes.

Table 7.31 Milk production and per capita availability

Year	Milk production (MMT)		Per capita availability (grams per day)	
	State	All-India	State	All-India
2010-11	8.0	121.8	196	281

Table III : Comparative Statement of Milk Procurement in India

Source : NDDB (2015)

During 2013-14, there were 108 milk processing plants and 118 chilling centres with capacity of 45.31 lakh liters and 30.79 lakh liters per day respectively under government and co-operative sectors together. The average daily collection of milk by the government and co-operative dairies taken together was 39.19 lakh litres during 2013-14 and 43.33 lakh litres during 2014-15. There are 194 cold storage centres with capacity of 6,115 MT, of which 170 cold storage centres with capacity of 5,550.5 MT are with private sector.

Like the Anand Pattern, Dairy cooperatives of Western Maharashtra is made of small dairy co-operatives at the village level, clubbed into district co-operative and at the apex – Maharashtra Maharashtra State Milk Marketing Federation called Rajya Sahakari Dudh Mahasangh Maryadit (MRSDMM). A list of the various dairy cooperatives in western Maharashtra is given below including their total sales – in litres per day for all district level cooperatives. The demand for low-cost milk is in urban areas, whose individual household requirement is small, nevertheless, it adds up to a sizable volume of 22 -25 million liters per day. An estimated 50 % of the total milk produced by Western Maharashtra dairy co-operatives is consumed in urban areas and metros. Presently, the organized sector both cooperative and private and the traditional sector cater to these markets like Mumbai, Navi-Mumbai and Thane, which are in close proximity to their districts of western Maharashtra.

S.No.	Name of dairy Co-ops. / Private dairies	Location	Brand name/Product name	Total sales in lpd (Litres Per Day)
01	Kolhapur zillasahakaridudhutpadaksangh	Kolhapur	Gokul	465361 lpd

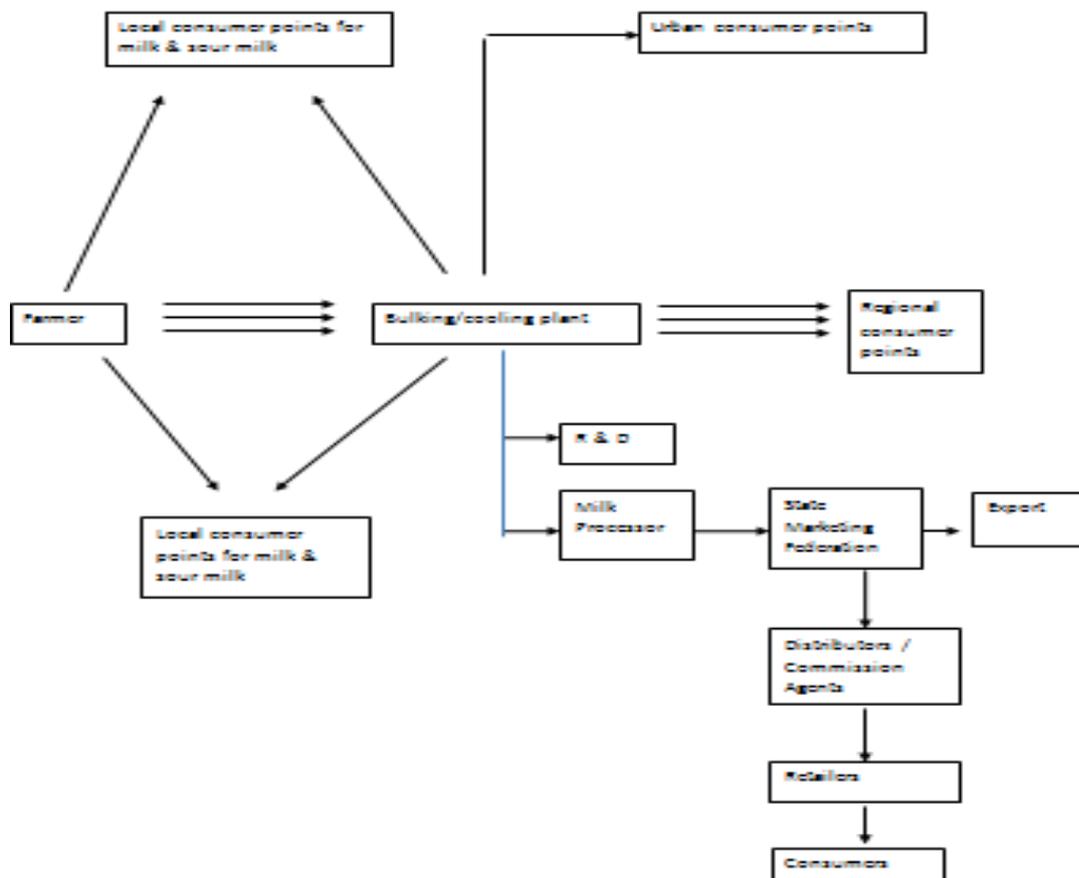

Figure 4 : Proposed Model for Dairy Co-operatives in Western Maharashtra

Source :Khamkar(2014)

The proposed model suggest that every farm would be connected to chilling plants which will accept the milk from the all the dairy farmers, irrespective of whether the farmer belongs to that particular district dairy co-operative or not. All dairy co-operative are registered with the apex state level federation namely – Maharashtra Rajya Sahakari Dudh Mahasangh Maryadit (MRSDMM) and even though they belong to different district level co-operative, they can give their milk supply to the nearest chilling plant. This would increase the shelf life of milk, reduce logistics and marketing cost, and also further, brand management. MRSDMM would also have common R & D, processing units and umbrella brand entitled, “Mahananda”. MRSDMM has as per this model, created a broad distribution network including commission agents, who would supply to various retailers so as to reach the ultimate consumers in urban areas including the major metros like Mumbai and Pune in India. MRSDMM is also tapping the export opportunities, for “Mahananda” abroad. MRSDMM is thus working as a vital link between the milk producers and consumers and working for the economic development and upliftment of the farmers in the rural area.

The dairy co-operatives are important contributor in Maharashtra State's economy. The milk production is set to achieve a new boom and hence the need for marketing through apex organization (MRSDMM), and use common facilities like chilling plants, use aggressive marketing through umbrella branding and skimming pricing policy. Dairy Cooperatives of western Maharashtra's major contribution is in providing newer avenues for employment, both direct and indirect, and its role in improving the nutritional standards of our people. With proper encouragement and member support, cooperative can scale new heights in the near future.

CONCLUSION

Dairying has been considered as one of the activities aimed at alleviating the poverty and unemployment especially in the rural areas in the rain-fed and drought-prone regions. In India, about three-fourth of the population live in rural areas and about 38% of them are poor. Further, in 1986-87, about 73% of rural households own livestock. Small and marginal farmers account for three-quarters of these households owning livestock, raising 56% of the bovine and 66% of the sheep population. According to the National Sample Survey of 1993-94, livestock sector produces regular employment to about 9.8 million persons in principal status and 8.6 million in subsidiary status, which constitute about 5% of the total work force. The progress in this sector will result in a more balanced development of the rural economy (Nargunde, 2013). The ANAND pattern of dairy development, has evolved and been refined over the last 50 years. Operation Flood has also been successful programme, especially for rural development and employment generation. Liberalization of world trade in dairy products under the new trade regime of the WTO poses new challenges and has opened up new export opportunities for the dairy industry in India. It is observed that, in co-operatives in western Maharashtra, need to control their higher transaction costs, improving milk marketing infrastructure to compete in the market place. It also has the potential to tap large international market. It must focus on innovative marketing strategy for brand building and line extension like Amul – through the Anand Pattern.

THE IMPACT OF THE COMPANY'S POLICIES AND THE LEADERS ON EMPLOYEE BEHAVIOR – A CA MODEL

Kowalska-Styczeń, Agnieszka; Owczarek, Tomasz

Faculty of Organisation and Management, Silesian University of Technology, Zabrze, Poland

ABSTRACT

In this study we examined how the density of ties between workers and the size of non-formal groups affect employees behavior in the presence of three mechanisms: the influence of leaders, company's encouragement policy and company's punishment policy. To analyze the dynamics of changes in views and attitudes in social groups based on local interactions between workers the cellular automata (CA) model was used. The employees' environment was modeled as a discrete two-dimensional space, which consists of a finite square lattice of cells. Informal groups of employees were represented as the von Neumann's neighborhood of radius $r = 1$ (4-elements neighborhood) and von Neumann's neighborhood of radius $r = 2$ (12-elements neighborhood). The main results are that (1) greater network density and bigger size of non-formal groups cause more workers to adapt behavior supported by the management and (2) the impact of punishment policy is smaller than the leaders and encouragement policy.

Keywords: *employee behavior, leadership, organization, complexity theory, cellular automata, simulation*

INTRODUCTION

The contemporary organization (work-place) is an ever-changing environment of high diversity stemming both from the management as well as the employees. It is a very complex non-linear behavior system where even a small change in one or two parameters can result in enormous changes in the entire system. It can therefore be regarded as complex adaptive system (CAS) (Anderson, 1999). Gell-Mann (2002) describes complex organizing by distinguishing between events or interactions that occur among individuals at the "fine-grained" level (micro level) and emergent regularities that can be observable at the system level (macro level). CAS allows, basing on local behaviors, generate global changes, which in turn change the local behavior (Burkhart, 1996). Such phenomenon in which the effect of the elements' interaction at the local level is a surprising result (something new or unexpected) at the global level is called emergence and applies particularly to such processes in organizations as leadership (Hazy, 2007), organizational culture (Axelrod, 1997) or susceptibility to changes in the Innovation, Entrepreneurship and Digital Ecosystems

organization (Brown and Eisenhardt, 1997). Many works appearing in the past decade have shown the usefulness of agent based models (ABM) in the field of modeling various aspects of an organization's management systems as complex adaptive systems (Fioretti, 2013). An example of simple agent models that can be used in the study of processes in organizations are cellular automata (CA).

In this work we are interested in employee behavior in the organization under the effect of company policies and leaders. Our goal is to use CA model to gain insights into the global behavior of the analyzed system based on local interactions within groups of employees and between employees and organizational environment. We study behavior of employees, because many research show, that employees are interested in participating in decision making (Parnell and Crandall, 2001). Employees' participation in decision making in organizations is considered as helpful in achieving goals of both employees and organizations. For an employee, participation can enhance his or her self-realization, self-esteem, satisfaction and sense of fairness (Ornoy, 2010). We use the CA model to simulate employee behavior in an organization in order to analyze how employee behavior evolves and how encouragement rules, punishment rules and leaders influence employee behavior. Employees in the organization are modeled as CA space, and each employee is a cell. Each cell is influenced by its neighbors, and at the same time it influences others. This causes updates in employees behavior and as a result – change in the entire system. In particular, we analyze the impact of the leaders on the behavior of employees. Leadership is understood here as the ability of one or more people to influence the group (Bogdanor, 1993). An example of the analysis of leadership in this perspective is the work of Lichtenstein *et al.* (2006) and DeRue (2011).

The implementation of CA technique to study workers' behavior was proposed in work Jiao *et al.* (2007) and Saravakos and Sirakoulis (2014). Similarly to the article Jiao *et al.* (2007) we define three kinds of employee behavior called positive behavior, neutral (zero) behavior and negative behavior. Positive behavior is an employee's behavior which is encouraged and propitious to the management. Behavior forbidden by the rules or the culture of the organization is called negative, and neutral behavior is neither encouraged nor forbidden. Additionally, in our model, we use the influence of leaders on employee behavior. In the CAS perspective leaders in organization base their action on the interactions among and within organizational ensembles (Marion and Uhl-Bien, 2002). Leaders follow the company policy and encourage employees to positive behavior. The performed simulation experiments was to answer the question how the density of ties between workers and the size of non-formal groups affect employees behavior under three mechanisms: the influence of leaders, company's encouragement policy an company's punishment policy.

MODEL

The model used in our studies is a two-dimensional CA with periodic boundary conditions. It is represented as a square grid with $L \times L$ cells. Each i -th cell ($i=1,2,\dots,L^2$) can be in one of the four states: empty, positive (P), negative (N) or neutral (Z). Non-empty cells (from now on called agents) represent employees and the state of non-empty cell represents the behavior of the employee. Initially a cell is non-empty (i.e. occupied by an agent) with probability p . The total number of agents N can therefore be calculated as pL^2 . Value of p can be treated as an average concentration of agents, but it can also be equated with access to information and communication with other agents (the greater p – the more contacts between agents).

In this model special kind of agents is also used – leaders (Kowalska-Styczeń, 2012, 2014). Leaders can only be agents with positive behavior. In the beginning lN agents with positive behavior are chosen (randomly) as leaders (l is the fraction of leaders in the entire population of agents).

In each iteration agent's behavior can be affected by its neighbors. Neighbors of the given agent are agents that occupy cells surrounding this agent. They represent co-workers (non-formal groups) whose opinion can influence employee's behavior. In each iteration agents simultaneously update their state according to these rules:

- agent changes its state if most of the neighbors are in one of the different state (fig. 1a),
- agent stays in its state if the number of its neighbors in different state is not greater than the number of its neighbors in its current state (fig. 1b),
- if the number of neighbors of the same state as agent's state is smaller than the number of neighbors in other states and the number of neighbors in both other states are the same then the agent randomly changes its state to one of the other states with 0.5 probability (fig. 1c),
- agent always changes its state to P if at least one of its neighbors is a leader (fig. 1d),
- a leader never changes its state (fig. 1e).

Following Jiao *et al.* (2007) two additional parameters were considered:

- α ($\alpha > 1$) – which represents the intensity of company's encouragement policy for positive behavior and
- β ($0 < \beta < 1$) – which represents the intensity of company's punishment policy for negative behavior.

The number of neighbors in state P is adjusted by α , e.g. when $\alpha = 1.1$ that means that 2 neighbors in state P are accounted as 2.2 neighbors. Analogically, the number of neighbors in state N are adjusted by β , i.e. when $\beta = 0.9$ that means that 2 neighbors in state N are accounted as 1.8 neighbors (smaller value of β means greater intensity of company's punishment policy for negative behavior).

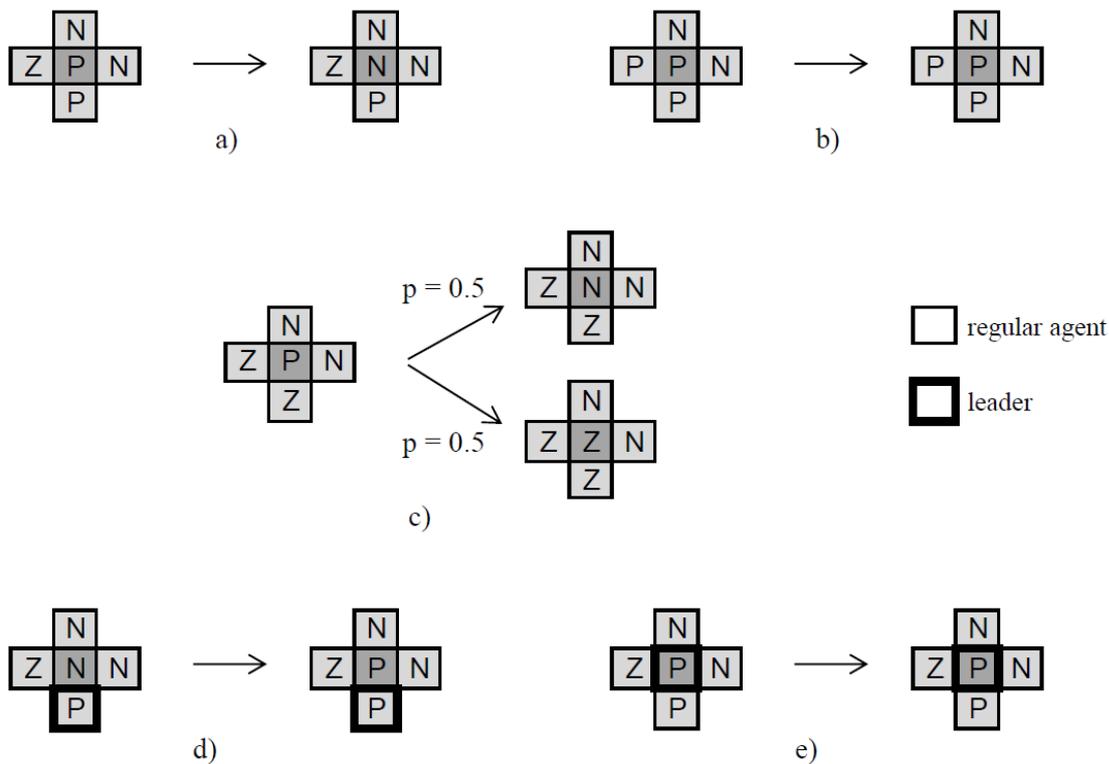

Figure 1. RULES OF TRANSITION IN THE MODEL FOR VON NEUMANN'S NEIGHBOURHOOD OF RADIUS $R = 1$

EXPERIMENTS

Experiment design

In each experiment it was assumed that in the beginning the proportion of each type of agents (positive, negative and neutral) is equal, that is $N_P : N_N : N_Z = 1:1:1$ (where N_X means the number of agents with X behavior).

Experiments that have been conducted were designed to investigate the impact of the leaders, the company's encouragement policy and the company's punishment policy on the employees behavior. The parameters affecting the employees behavior, were changed by following independent variables:

- p – population density,

- r – neighborhood size (see below),
- l – fraction of the leaders,
- α – the intensity level of encouragement policy,
- β – the intensity level of punishment policy.

Additionally two variants of leaders were considered: with movement (lm) and without movement (lwm). Leaders with movement randomly change their cell after each iteration (move to randomly chosen empty cell). This rule was added to represent that leadership in complex organizations requires managing networks and interactions through communication with different groups of employees (Marion and Uhl-Bien, 2001).

In the study, two levels of the first two parameters were assumed:

- $p = \{0.4, 0.8\}$,
- r – von Neumann's neighborhood of radius $r = 1$ (4-elements neighborhood) and von Neumann's neighborhood of radius $r = 2$ (12-elements neighborhood) – (see fig. 2).

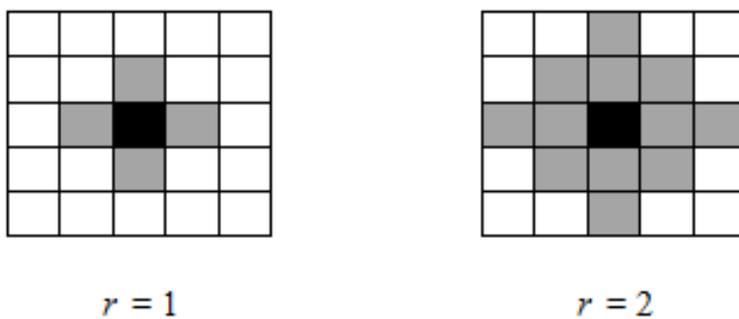

Figure 2. VON NEUMANN'S NEIGHBORHOOD OF RADIUS $R = 1$ (LEFT PANEL) AND $R = 2$ (RIGHT PANEL)

The leaders fraction level was changed from 0% to 5% with the step of 0,5% (leaders were chosen from agents with positive behavior). The encouragement policy intensity level and punishment policy intensity level were changed from 1,1 to 1,5 and from 0.9 to 0.5, respectively (with the step of 0,1).

As the dependent variable the average number of agents with P, Z and N behavior at the end of each simulation was adopted. This average was calculated after 1000 simulation runs. Each simulation run lasted 1000 iterations.

Simulation results

Initially, an analysis of the leaders impact on the employee behavior was studied. Population densities $p = 0.4$ and $p = 0.8$ were adopted to see how the leaders work in the network of sparser and denser ties between employees. This density allows leaders to move in the lattice, and at the same time there are many contacts with employees. Simulations have been carried out for the lattice size of $L=50$, because, as it was shown in Kowalska-Styczeń (2012), the size of the lattice does not affect the results. Leaders represent the views consistent with company policy, so they reinforce positive behavior. Figure 3 shows the number of employees representing each of the three behavior under consideration at the end of simulation runs (average number for positive behavior, negative behavior and neutral behavior), depending on the percentage of leaders, their ability to move, different population density and different neighborhoods described earlier.

As can be seen in Figure 3, the leaders impact is more effective in the case of a larger network density ($p = 0.8$). In this case smaller value of l has a bigger impact on accepting policy proposed by the leader (which is consistent with the company’s policy) than for $p = 0.4$. At the same time, the number of agent with negative and neutral behavior decreases more rapidly.

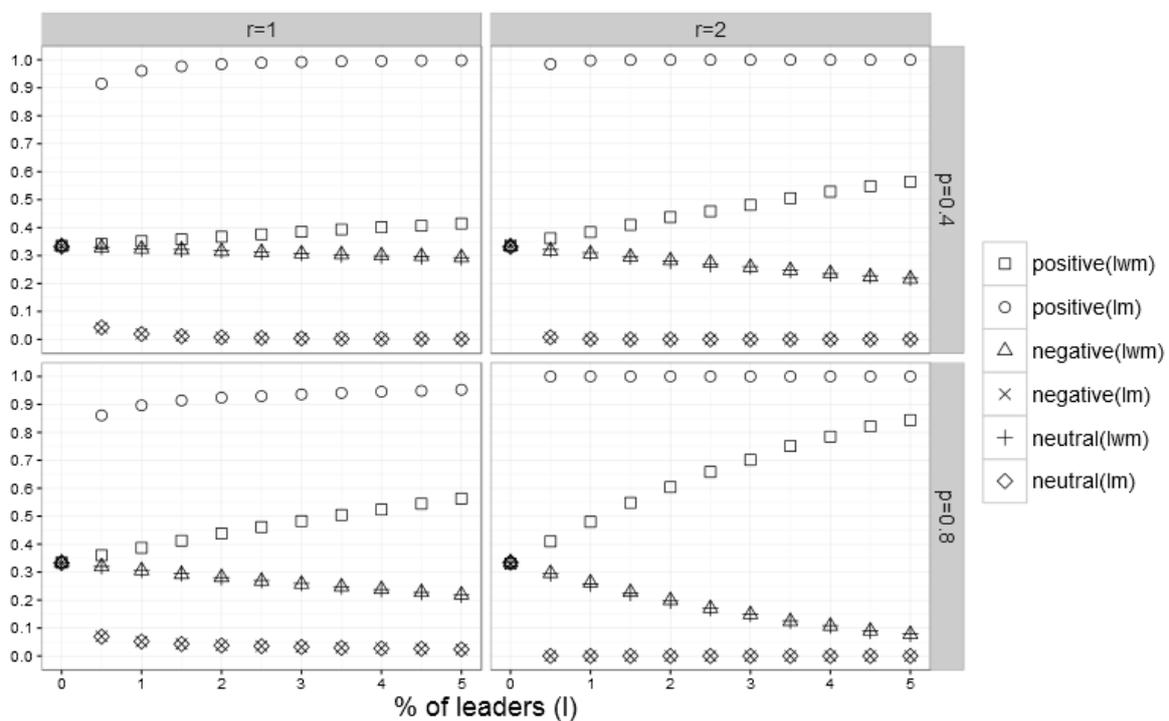

Figure 3. FRACTION OF EMPLOYEES DEPENDING ON THE PERCENTAGE OF LEADERS, p , NEIGHBORHOOD, AND LEADERS ABILITY TO MOVE

Moreover, leaders efficiency depends on the neighborhood size. The larger number of the employees group ($r = 2$), the greater effectiveness of leaders, that means larger number of employees representing positive behavior and fewer workers representing (N) and (Z) . The willingness to accept the leaders

policy is also modified by the leader communication with different groups of employees (modeled by leaders' movement). The movement strongly increases the efficiency of leaders.

The second analysis performed was to examine how the encouragement policy and the punishment policy impacted the employee behavior. Similarly, population densities $p = 0.4$ and $p = 0.8$ have been adopted. Simulations have been carried out for the network size $L = 50$, for 4-elements ($r = 1$) and 12-elements ($r = 2$) neighborhoods. Figure 4 shows the number of employees preferences, depending on the intensity of company's encouragement policy for positive behavior – α (alpha). As can be seen in Figure 4, greater α causes bigger percentage of people with a positive behavior and smaller percentage of people with negative and neutral behavior. The larger network density ($p = 0.8$) and larger neighbourhood size ($r = 2$) are conducive to the propagation of positive behavior among employees, while the number of people with negative and neutral behavior decrease.

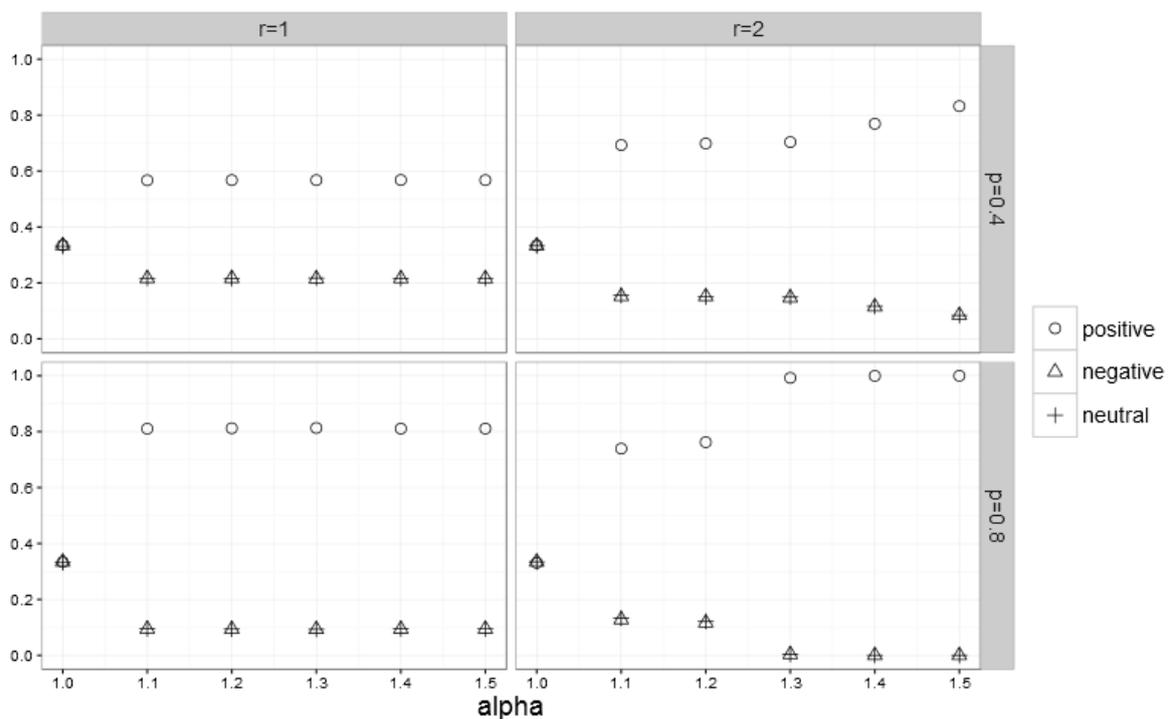

Figure 4. FRACTION OF EMPLOYEES DEPENDING ON α (ALPHA), p AND NEIGHBORHOOD

The impact of the company punishment policy on negative employees behavior is illustrated in figure 5. As can be seen, the greater punishment intensity (smaller β), the bigger percentage of people with a positive and neutral behavior and the smaller percentage of people with negative behavior. Moreover, a punishment policy is more effective for the larger number of informal contacts in employees groups ($r = 2$), the network density is not as important as in the previous simulations.

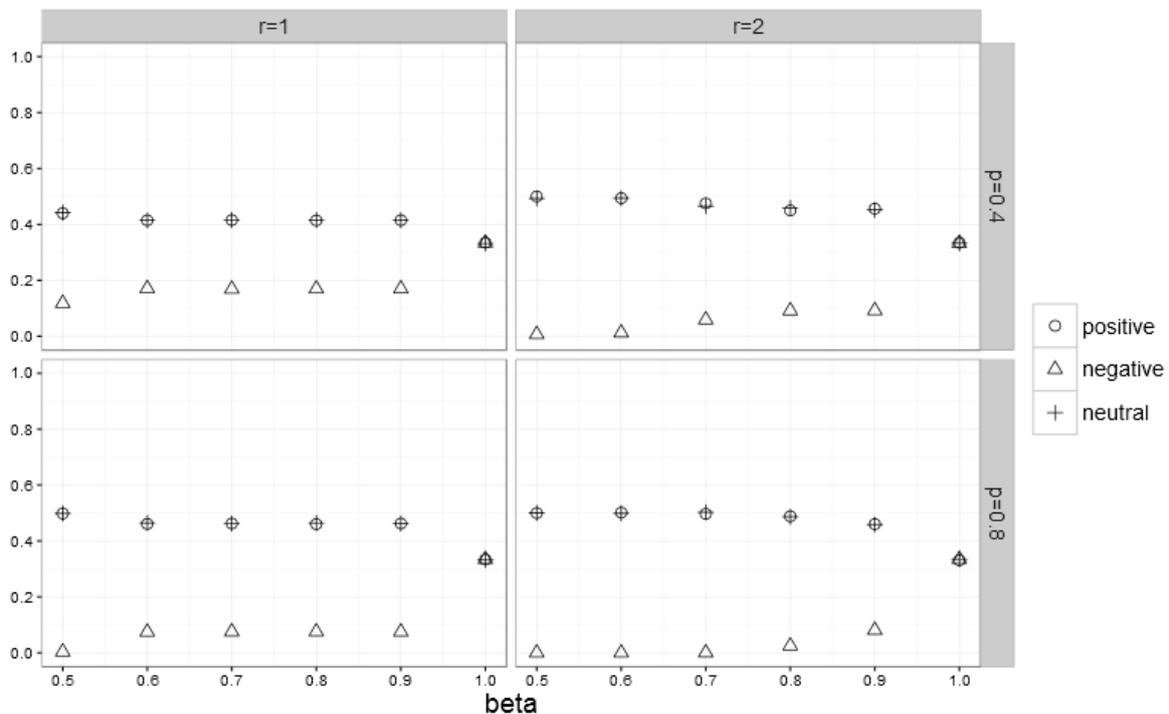

Figure 5. FRACTION OF EMPLOYEES DEPENDING ON B (BETA), P AND NEIGHBORHOOD

SUMMARY AND CONCLUSIONS

The purpose of this article was to examine the impact of the leaders and company's encouragement and punishment policy on the employees behavior. Behavior that arises from the interaction of individuals and groups is characterized by complexity, dynamics and non-linearity, and because of that it is difficult for empirical research. Therefore, to examine the dynamics of employee behavior we used computer simulation. Parameters affecting the communications between employees were modeled by the different neighborhood size and by different population density. Fleming *et al.* (2007) has shown that the high level of the network consistency increases the chance of adapting innovation, and a greater number of connections between agents facilitates the exchange of knowledge in organization. Therefore, in our work we conducted research for two network density. For $p = 0.8$ there are more connections between employees than for $p = 0.4$. The obtained results show that high level of the network consistency contributes to greater effectiveness of convincing employees to positive behavior by leaders and this is also true for company's encouragement policy. Additionally, the size of employees' groups, where the above-mentioned processes (the impact of leaders, the encouragement policy and the punishment policy) take place, is very important. In this model, the size of employees' groups was modeled by neighborhood size ($r = 1$, $r = 2$). The diverse neighborhood, modeled also by different network density, reflects the number of informal contacts in groups of employees. Results of the presented simulations generally supports the findings of Fleming *et al.* (2007).

In this work, employees in addition to a neutral and positive behavior (that are compatible with the company policies), represent also negative behavior. Deviant behavior is a recurring problem in workplace. This type of behavior represents the acts that are contrary to the values and norms of the organization (Appelbaum *et al.*, 2007). An appropriate attention to employees behavior is necessary, because this problem brings harmful effects to the organization, economically and socially. According to simulations presented in the previous section, leaders who convince employees to positive behavior in accordance with company policy and encouragement policy to positive behavior have greater impact on increasing the number of employees with positive behavior than punishment policy. Our results are consistent with studies of Abdullah and Marican (2014), who postulate, that negative behavior is a response to un-favorable work environment and that higher presence of control and flexible leadership reduces deviant behavior. Thus, it appears that the company's policy of supporting positive behavior is more effective than the policy of punishing negative behavior.

Our studies indicate a strong influence of the size of groups of employees and the density of their contacts network, particularly in the context of the company's encouragement policy. This may be an indication for the management to pay attention to informal groups in organizations. Since the simulations show that the size of such informal groups significantly influences on the spread of positive behavior, i.e. consistent with company's policy, management should create the atmosphere and conditions for development of such informal groups.

Our research shows that an important role in the dynamics of employees behavior can also play leaders. In our opinion, further research of this process would be interesting, especially in the context of distributed leadership and bottom-up approach to the organization. A leader could also be considered as an informal leader, who could sometimes act as a follower, depending on the situation. Leadership is an important area in which complexity theory can offer a new perspective and approach (Hazy, Silberstang, 2009). It should be emphasized that the complexity does not mean multiple pieces or parts, and their complexity (as in the traditional sense), but the interrelationship between components of an organization and its dynamic interaction (Uhl-Bien *et al.*, 2007). As pointed out by Uhl-Bien, Marion and McKelvey (2007), the concept of leadership as an adaptable complex process draws attention to the social complexity and its emergent properties. Interactions between members of the organization are mostly of an informal nature, and an increasingly important role is attributed to such relationships, since it is clear from the work of Ibarra (1993) that they are the main sources of influence in organizations and explain many organizational processes such as learning organization, innovation and adaptive processes. As the works of Johannessen and Stacey (2005), Marion and Uhl-Bien (2001) and McKelvey (2008) show, the complexity and dynamic nature of leadership requires the

development of models which more accurately reflect its complex nature. One such tool is simulation, and its popularity as a methodological approach is increasing in the study of organizations (Davis et al., 2007). Moreover, as emphasized by Miller and Page (2007) simulation is naturally adapted to solve problems, which are characterized by dynamics, heterogeneity and the occurrence of interacting components. This technique can also be used as an in-depth look at the complex relationships between elements, especially when there is lack of empirical data (Zott, 2003), and can also reveal the results of the interaction of many elements, especially when they change over time (Rudolph and Repping, 2002).

The presented model is a simplified version of reality, but despite that it shows interesting emergent behavior. It seems that such simulation studies are a valuable addition to empirical research, which can be difficult to perform in real organizations. In further studies, we intend to focus on distributed leadership and study this phenomenon in the context of organizational changes. An interesting addition to the model may be considering the theory of strong and weak ties (Granovetter 1973, Granovetter 1983) and their impact on employee behavior.

BARLEY: A SUSTAINABLE CROP FOR THE MEDITERRANEAN REGIONS

Lamonaca, Emilia; Tricase, Caterina; Ingraio, Carlo; Contò, Francesco

Department of Economics, University of Foggia, Italy

ABSTRACT

This study aims to provide the analysis of the different benefits associated to barley (*Hordeum Vulgare* L.), a widespread grain in the European territories, to point out its relevance and to provide the analysis of the environmental impacts associated to its production, in order to demonstrate the sustainability of this cereal for the Mediterranean regions. Barley is a self-sustainable crop, thanks to its nutritional value and to its adaptability to Mediterranean pedo-climatic conditions. In order to contribute in increasing case studies on this issue, an analysis of barley cultivation, based on the analysis of organic production regime of a farm located in Apulia, a Southern region of Italy, is proposed, using a Life Cycle Assessment (LCA) methodology. Although the study is ongoing, the first results put on evidence that organic barley production system is more sustainable in the Mediterranean regions with respect to other areas.

Keywords: *Barley, Sustainability, Environment, Mediterranean Regions, Life Cycle Assessment (LCA).*

INTRODUCTION

Nowadays, in order to reach a socio-economic efficiency, the European context is oriented towards the achievement of more sustainable and ethic production, in the logic of doing more and better with less. This tendency is imposed by several reasons, such as food safety and security, customization of food styles, environmental and socio-economic changes, etc. Consumers tend to pay an ever increasing attention towards the relationship between nutrition and health, while the challenge of governments, in the perspective of Europe 2020, is to quickly assure a more sustainable agriculture. The change in food preferences and the environmental awareness highlight the needs to improve a better evaluation of impacts, risks, and opportunity for food production and consumption, through a life cycle approach.

The scope of this study is to highlight the diverse advantages associated to organic barley (*Hordeum vulgare* L.) and its importance for the Mediterranean regions, and to provide the analysis of the

environmental impacts associated to its production, in order to prove that the production of organic barley results more sustainable in the Mediterranean regions with respect to other areas. In reality among grain, barley deserves a particular attention, due to its nutritional value and to its adaptability to Mediterranean pedo-climatic conditions, that make it a sustainable crop (Marconi and Bruno, 2012; Moresi and Valentini, 2010).

BARLEY: A WIDESPREAD CROP IN THE MEDITERRANEAN REGIONS

Barley is the fourth most important cereal in the world, following wheat, corn, and rice (Lamonaca and Tricase, 2015; Sullivan *et al.*, 2013; Baik and Ullrich, 2008). Currently, world production of barley is approximately 1.4 Gt. For the last 55 years, the leading producers of barley include the European Union (EU-28) with a production of 587 Mt, the Russian Federation, that yearly produces about 165 Mt of barley grain, following Australia and Canada (Figure 1) (USDA FAS PSD, 2016). Data highlight the prominent role of the European Union as major supplier for this crop and the broad diffusion of this cereal all through the European territories. Actually, around half of the European cultivated area is used for cereals production, where barley occupies the 21% of the cereal crop area of the EU-28 (Tricase *et al.*, 2016).

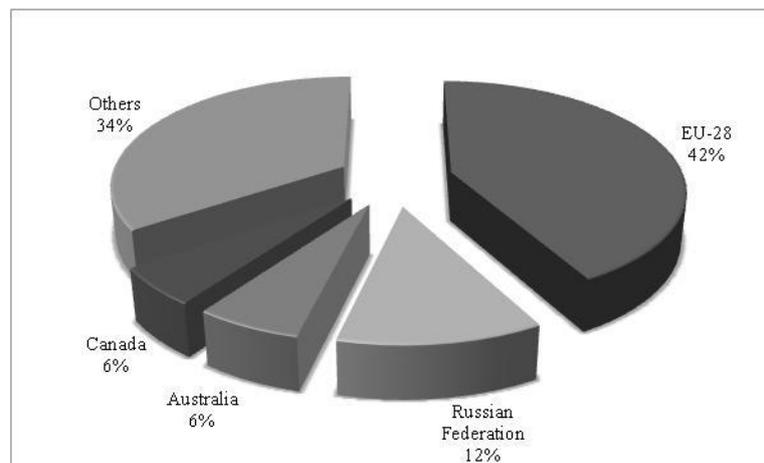

Figure 1. Major producers of barley at world level. Source: Authors' elaboration on USDA FAS PSD, 2016.

During the last decades, the major part of the production has been concentrated in Germany (19.4%), France (19.1%), and Spain (11.4%), according to the most recent data for each country of the EU-28 (FAOSTAT, 2016).

Worldwide and for thousands of years, barley has always been used as a source for human diet (Sullivan *et al.*, 2013). Actually, approximately the 80% of the current international consumption of barley, intended to human nutrition, is divided between barley grain as it is and barley processed into grits, flakes, flour, and so on (FAOSTAT, 2016), as reported in Figure 2.

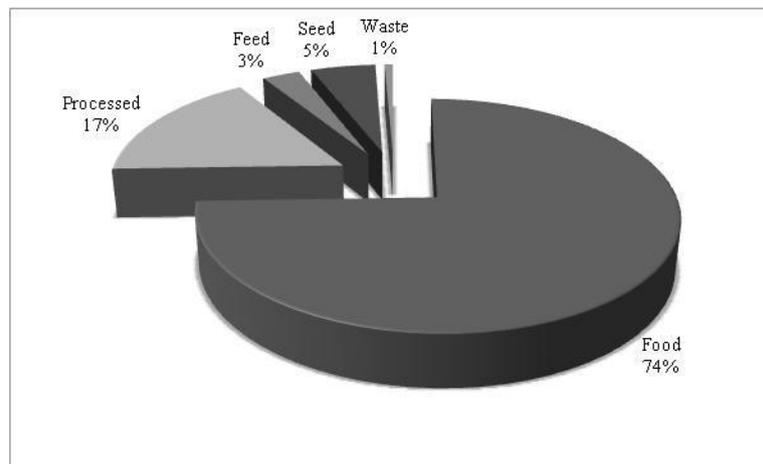

Figure 2. Current intended uses of barley world production. Source: Authors' elaboration on FAOSTAT, 2016.

The current appreciation of barley as a food source is due to its potential health benefits: barley kernels naturally contain many bioactive compounds (Table 1), especially a high percentage of β -glucan, a soluble fiber (Marconi, 2012; Sullivan *et al.*, 2013).

Compound	Location	Activity
Beta-Glucan	endosperm/aleuronic layer	cholesterol-lowering/hypoglycemic
Tocopherols	germ/aleuronic layer	antioxidant/cholesterol-lowering
Tocotrienols	germ/aleuronic layer	antioxidant/cholesterol-lowering
Folate	aleuronic layer/germ	reduction of neural tube's defects/reduction of cardiovascular conditions and of colon cancer
Phytosterols	germ/aleuronic layer	cholesterol-lowering
Polyphenols	pericarp	antioxidant
Phytates	pericarp	reduction of colon cancer
Policosanols	pericarp	cholesterol-lowering
Pentosans	pericarp	cholesterol-lowering
Arabinoxylans	pericarp	cholesterol-lowering
Lignans	pericarp/aleuronic layer	reduction of cardiovascular conditions/reduction of malignancies
Alkylresorcinols	pericarp	antioxidant

Table 1. Compounds with biological activity in barley caryopsis. Source: Authors' elaboration on Marconi, 2012.

According to the Food and Drug Administration (FDA), a daily consumption of barley β -glucan, equal to 3%, could help to decrease the risk of chronic heart disease by lowering blood cholesterol (FDA, 2005). Several academic researches on this issue confirm the FDA's statement. Actually, nutritional studies into barley β -glucan have shown a link between its regular consumption and a number of health benefits, including a decrease in the risk of chronic heart disease by lowering blood cholesterol (Önning, 2007) and an increased insulin response in diabetics (Poutanen *et al.*, 2007; Wood *et al.*, 1994).

For this reason, barley is a crop of niche for the functional food market, in response to increased consumer awareness and demand (Lamonaca and Tricase, 2015; Sullivan *et al.*, 2013). Moreover, barley is a self-sustainable crop. Actually from an environmental perspective, due to its reduced water necessities and its short life cycle, it can be cultivated also into marginal and unfavorable areas, where constant yields could be obtained in any case (Tricase *et al.*, 2016; Lamonaca and Tricase, 2015; Francia *et al.*, 2011). On the other hand, from an economic point of view, barley is a low input agricultural raw material and, as a result, a crop techniques enhancement could be a further occasion to specialize barley for human nutrition and, therefore, to increase farmers' profitability (Tricase *et al.*, 2016; Lamonaca and Tricase, 2015; Marinaccio *et al.*, 2015).

MATERIALS AND METHODS

Life Cycle Assessment (LCA) methodology is a technique that aims to quantify the potential environmental impacts associated to a product system's inputs and outputs during its life cycle, through the implementation of the following phases: Goal and Scope definition; Life Cycle Inventory (LCI); Life Cycle Impact Assessment (LCIA); and Life Cycle Interpretation (ISO, 2006a; ISO, 2006b). LCA methodology has been extensively used for evaluating the environmental impacts of food production systems, and specifically organic agri-food productions, representing one of the most effective tools to design a more sustainable production systems (Tricase *et al.*, 2016; Fedele *et al.* 2014; Tidåker *et al.* 2014; Niero *et al.* 2015; Van der Werf *et al.* 2014). LCA studies in agri-food production points out that pedo-climatic conditions of a specific area could have significant influences on the results of the analysis. This is particularly true for the organic production. Actually, there is a strong dependence among local dynamics, regional geo-climatic and site specific factors and the cultivations' environmental performance. Therefore, specific farm site characteristics, such as climate, soil properties and crop management, are all important features that may have a important impact on the product (Tricase *et al.*, 2016; Fedele *et al.* 2014). This methodology has been applied to several empirical studies related to the conventional barley production, but few are those related to the organic barley cultivation (Tricase *et al.*, 2016; Niero *et al.* 2015a; Fedele *et al.* 2014).

Goal and scope definition

For the correct development of the LCA analysis, an explicit statement of the study's goal and scope was carried out. In particular, the goal of this study is to apply the LCA methodology for identifying and analyzing the main environmental impacts associated to the cultivation of organic barley grain in Apulia, a Southern region of Italy, which is a large producer of this crop. Moreover, it is well acknowledged that agricultural production, although essential for human health and nutrition, is

responsible of great environmental impacts (Tricase *et al.*, 2016; Niero *et al.*, 2015a; Van der Werf *et al.*, 2014; Hörtenhuber *et al.*, 2014). A way to support more sustainable agricultural practices and to attempt to reduce environmental impacts is to implement an organic production regime (Tricase *et al.*, 2016; Niero *et al.*, 2015a; Niero *et al.*, 2015b; Fedele *et al.*, 2014). The analysis of the existing literature on this issue highlights a lack of empirical studies on the environmental impacts related to organic barley production (Tricase *et al.*, 2016; Fedele *et al.*, 2014; Niero *et al.*, 2015a; Niero *et al.*, 2015b). For this reason, such study could contribute to enriching the international knowledge on organic grain production by providing reliable information on inventoried data and obtained results.

For this case study, it was essential to take into account the annual production values (expressed as kg/ha*y), registered by the involved farm for a time frame of three years (since 2012 until 2014), in order to calculate the arithmetic average production. Meetings with farm's manager and agronomist took place in May 2014, when the last year of full production was in progress. The study started in June 2014, after the harvesting activities for barley.

According to the ISO 14040:2006 and 14044:2006, it is necessary to choose a functional unit (FU), which is theoretically defined as a measure of a system's performance, while in practice it is an equivalent amount of a product, service or process function (Krozer and Vis, 1998). In the present study, a land-based functional unit were adopted and it represents the land management function of agriculture (Hayashi, 2013; Cerutti *et al.*, 2013; Nemecek *et al.*, 2011). Therefore, the environmental impacts were related to the management of one hectare of land, involved in barley cultivation. This FU is not commonly used in LCA, because land use does not provide a productive function, but it can provide remarkable results (Cerutti *et al.*, 2013).

The production phases, considered in this study, are derived from the activities of a specific farms located in Alta Murgia Park, in the Bari Province (Italy). Figure 3 shows the defined system boundary, which refer to an average year among those of full production and involve main inputs and outputs of the process, such as raw materials and related transportation from the manufacturing factories to the field, co-products, energy demand, etc..

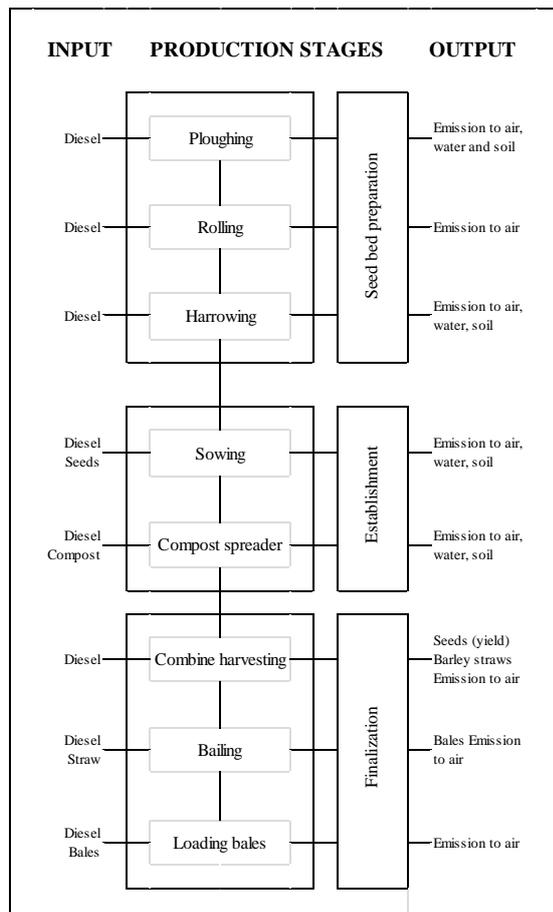

Figure 3. Main resources, materials and operations included within the system under study.

The three phases, included in the system boundary (seedbed preparation, establishment and finalization), are field related processes, generally considered in cradle to farm gate for the implementation of the LCA studies on barley (Tricase *et al.*, 2016; Niero *et al.*, 2015a; Fedele *et al.*, 2014). The first step of seedbed preparation involves the processes of ploughing, rolling and harrowing. The following step of establishment includes the phases of seeding and post-seeding fertilization. The last field related process consists of harvesting, baling and loading of bales. All these steps are the most impacting phases for barley production, in terms of air, water and soil emissions from the field (Niero *et al.*, 2015a; Fedele *et al.*, 2014).

Life Cycle Inventory (LCI) analysis

LCI analysis quantifies the input flows associated to the utilization of resources and materials, the consumption of energy, and the transports, within an entire life cycle of a product. Because of the needs to assess and reproduce several activities involved in a product's life cycle, and to collect and compute all the data related to the environmental impacts, LCI is considered the most important step among LCA phases (Lo Giudice *et al.*, 2016; Zhang *et al.*, 2015). Therefore for this phase, input and

output flows were analyzed starting from data collection, performed by using Ecoinvent v.2.2 (Ecoinvent, 2010) within SimaPro v.7.3.3 (SimaPro, 2006).

Data in terms of input material typologies and amounts used, based upon information provided by the farms, were essentially primary data, because this study is based on the evaluation of a particularly specialized system. According to Ingrao *et al.* (2015), Siracusa *et al.* (2014), Frischknecht and Rebitzer (2005), also secondary data, collected from Ecoinvent v.2.2, were used, based on the scientific importance and reliability of such international data source. In particular, the processes used for representing resources and raw materials, such as organic barley seeds and compost, the energy consumed during each agricultural activity, as well as the use of transport means, are completely modeled using the Ecoinvent background data. Therefore, agricultural machinery and other used equipment were involved using Ecoinvent v.2.2 models, taking into account their life cycles, from production to final disposal at the end-of-life. Table 2 lists all the data used for the evaluation.

All input flows were allocated to the different phases of organic barley grain production using appropriately defined procedures and tools. Meeting with the farm's manager during the production site visit was made and check lists were implemented and used for recording data and information. This phase was performed also through in-depth interviews with farm's agronomist in order to assure common understanding of the questions asked.

Input flow	Physic amount	Measur e unit	Comment upon the use of the related module available in Ecoinvent v.2.2 (Ecoinvent, 2011)	Remarks
Resources				
Occupation, arable, non-irrigated	2.083	ha*y		
Transformation, from arable, non-irrigated	2.083	ha		
Transformation, to arable, non-irrigated	2.083	ha		
Energy, gross calorific value, in biomass	113,325.000	MJ		
Carbon dioxide (CO ₂), in air	9.750	t		
Raw materials and fossil fuels				
Organic barley seeds	416.600	kg	The seed produced at the farm is transported to the processing centre, treated (pre-cleaning, cleaning, eventually drying, and bag filling), stored and afterwards transported to the regional storage center. No data on wastewater production were available. The reference is to 1 kg of barley seed (fresh weight), with a maximum water content of 15%.	

Compost, at plant	14.730	t	Energy demand for operating a compost plant was included as well as process emissions, infrastructure of the compost plant and transports related to the collection of the biogenic waste. Values refer to compost with a water content of 50% by weight. Compost inventory refers 1 kg fresh weight of compost.	
Main processes and phases				
Ploughing	2.083	ha	The inventory takes into account the diesel fuel consumption and the amount of agricultural machinery and of the shed, which has to be attributed to the single activity. Also taken into consideration is the amount of emissions to the air from combustion and the emission to the soil from tyre abrasion during the work process. The following activities were considered part of the work process: preliminary work at the farm, like attaching the adequate machine to the tractor; transfer to field (with an assumed distance of 1 km); field work (for a parcel of land of 1 ha surface); transfer to farm and concluding work, like uncoupling the machine. The overlapping during the field work is considered. Not included are dust other than from combustion and noise.	Four-furrow plough.
Rolling	2.083	ha		Rolling, working width 3m.
Harrowing	2.083	ha		Rotary harrow, working width 3m.
Sowing	2.083	ha		Seeder, working width 3m, seed not included.
Combine harvesting	2.083	ha		Combine harvesting, working width 4.5m, grain production and straw treatment not included.
Baling	11.580	p		Round baler for round bales of 1.4m ³ , silage with wrapping foil, 700kg. Time need for baling and wrapping, without loading and transport. Wrapping foil (PE-film) included, fodder production and cutting not included.
Loading bales	11.580	p		Loading of straw bales with bale gripper onto trailer. Without transport to farm and discharging, straw production not included.

Compost spreader	14.730	t		
Transports				
Transport, lorry 7.5-16t, euro 4	270.790	t*km	Included processes are operation of vehicle; production, maintenance and disposal of vehicles; construction and maintenance and disposal of road. Inventory refers to the entire transport life cycle.	Organic barley seeds transport
Transport, lorry 3.5-7.5t, euro 5	1473.000	t*km		Compost transport
Emissions to air				
Ammonia (NH3)	459.000	g		
Dinitrogen monoxide (N2O)	1.280	kg		

Table 2. *Main input inventory-data related to the production of 1 ha of organic barley grain and 1.083 ha of organic barley straw bales. Source: Personal elaboration of LCIA results from Impact 2002+*

In order to obtain a well-fitting environmental impacts allocation across the main processes for the production of one ha of organic barley, in accordance with the ISO standards, an allocation between organic barley grain and straw was applied, using a criterion based on the economic value of product and co-product. Actually, 76% of the environmental impact of the cultivation process was attributed to grain, while the remaining 24% was destined to straw. As a matter of fact, straw could be used as positive contributions to soil organic matter improvement and, thus, as co-products for more sustainable agricultural production, but it also could be sold for animal feed industry.

RESULTS AND DISCUSSION

Life Cycle Impact Assessment (LCIA)

The purpose of the LCIA is to understand the potential environmental impacts of the system, given the LCI results (Niero *et al.*, 2015a).

In order to provide a straightforward identification of the higher impacting phases, Figure 4 shows the impacts, for each of the process related to the organic barley cultivation, expressed as weighing points and classified by damage categories. It is clear that the greater environmental impacts are related to the production and usage of raw material (organic barley seeds and compost), as well as to their transportation.

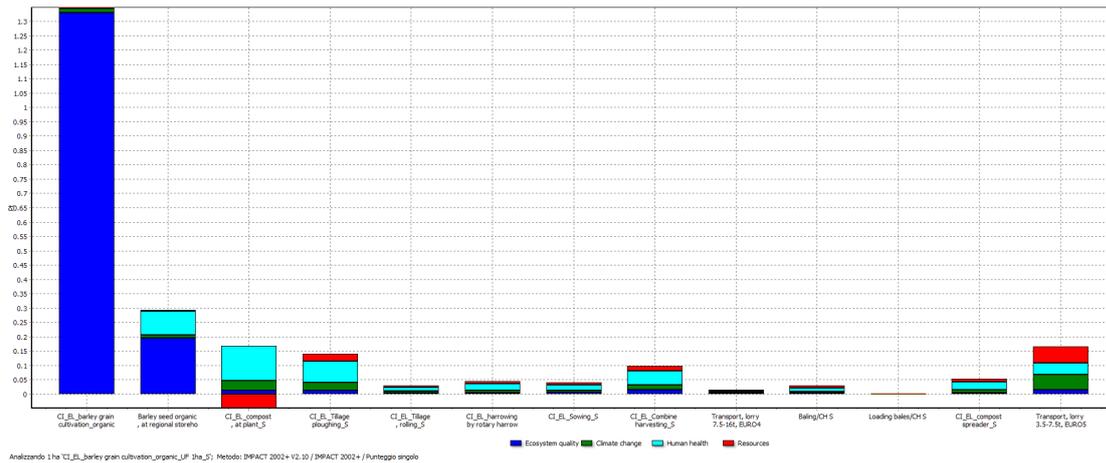

Figure 4. Organic barley cultivation phases and related caused-damages (weighing points). Source: Personal elaboration of LCIA results from Impact 2002+

The total impacts, associated with input raw materials (0.412 pt) and transportation (0.182 pt), was due to consumption of fossil fuels and to emissions of GHGs coming from the production, use and maintenance activities and, also, from the end-of-life management of used equipment and other materials. With regard to the compost contribution, a negative value is documented: therefore, an avoided damage is found and attributed to avoided natural resource exploitation.

In addition, the total damage is divided as follows among the damage categories considered by Impact 2002+:

- 1) 67.59% Ecosystem Quality;
- 2) 19.72% Human Health;
- 3) 8.25% Climate Change;
- 4) 4.44% Resources.

In this regard, in Table 3, each of these categories is associated with both weighing point and damage assessment value, computed by using conversion factors, specifically assigned in Impact 2002+.

Damage category	Weighing (pt)	Damage assessment	Unit
Ecosystem quality	1.606	22005.492	PDF*m2*yr
Human health	0.469	0.003	DALY
Climate change	0.196	1940.891	kg CO2 eq
Resources	0.106	16048.184	MJ primary

Table 3. Damages assessment and weighing e Impact 2002+. DALY (Disability-Adjusted Life Year): a measure of the overall severity of a disease, expressed as the number of years lost due to illness, disability or premature death. PDF (Potential Damage Fraction): the fraction of species that have a high probability of not surviving in the affected area due to unfavorable living conditions. Source: Personal elaboration of LCIA results from Impact 2002+

This phase shows a total damage for organic barley cultivation equal to 1.349 points (pt), principally due to the organic barley seeds contribution. Other influences came from production and usage of compost and, additionally, from their transportation.

Impact category	Weighing (pt)	Characterization	Unit
Land occupation	1.381	18,916.342	PDF*m ² *yr
Global warming	0.196	1,940.891	kg CO ₂ eq
Respiratory inorganics	0.400	262.775	PDF*m ² *yr
Terrestrial acid/nutri	0.019	2,813.303	PDF*m ² *yr
Non-carcinogens	0.064	13.072	PDF*m ² *yr
Terrestrial ecotoxicity	0.205	0.003	DALY
Aquatic ecotoxicity	0.001	0.000	DALY
Mineral extraction	0.000	25.751	MJ primary
Non-renewable energy	0.105	16,022.433	MJ primary
Respiratory organics	3.732E-04	2.647E-06	DALY
Ozone layer depletion	2.234E-05	1.584E-07	DALY
Ionizing radiation	0.001	5.577E-06	DALY
Carcinogens	0.004	2.540E-05	DALY

Table 4. *Characterization and weighing e Impact 2002+. Source: Personal elaboration of LCIA results from Impact 2002+*

As far as the impact categories are concerned, the most significant were listed in Table 4, indicating for each of them the weighing points and characterization values.

Life Cycle Impact interpretation

In order to assess the results of both the inventory analysis and impact assessment of the product system, the last phase of the LCA, interpretation, draws conclusions and recommendations from all of the foregoing results in accordance with the goal and scope of the study (Ingrao *et al.*, 2015; Niero *et al.*, 2015; De Benedetto and Klemeš, 2009).

Regarding the inventory analysis, organic barley cultivation is a great inventory process, due to the huge number of data and information needed for its implementation. Likewise, the LCIA showed that most of the environmental impacts are due to raw materials and transportation. Lesser impacts are associated to the manufacturing processes for barley straw (e.g. bailing of straw and loading of bales). The "Ecosystem Quality" is the most affected damage category, while the most impactful categories are Land Occupation (LO), Global Warming (GW) and Respiratory Inorganics (RI).

Comparing these results with those of Niero *et al.* (2015a, 2015b), which present LCA results for organic barley produced in Northern European regions, it is clear that it is lesser impacting the cultivation of organic barley in Mediterranean regions. These findings confirm that the environmental assessment of agricultural systems are strongly influenced by the correlation between the environmental performance of cultivations and the specific regional pedo-climatic factors (Tricase *et al.*, 2016; Fedele *et al.*, 2014). Indeed, site-specific data are necessary to describe operations in the field (e.g., differences in fertilizer use generally depend on the location, and above all on soil conditions) (Tricase *et al.*, 2016; Niero *et al.*, 2015b; Fedele *et al.*, 2014).

CONCLUSIONS

Among grain, barley deserves a particular attention, due to its nutritional value and to its adaptability to Mediterranean pedo-climatic conditions. These peculiarities make it a sustainable crop from different perspectives. Through the analysis of the diverse advantages associated to barley, this study has highlighted the importance of this crop for the Mediterranean regions, where barley is broad spread. The valuable qualitative and nutritional features of barley, that make it a crop of niche for the functional food market, and its high self-sustainability, emerged by the analysis, are the starting point to extend the system boundaries of the LCA analysis to the production of an organic barley-based food products, in order to estimate not only the environmental, but also the socio-economic impacts associated to the entire organic barley supply chain. Although this analysis is ongoing, first results, compared with those of the existing literature, put on evidence that the processes associated to organic barley production system in a Mediterranean region are more sustainable than the same agricultural practices applied in Northern Europe.

In order to take advantage from barley features of sustainability and healthiness, farms and processing firms could to invest more effort into improvement of intended land to its cultivation and new healthy product development. Better understanding of the relationships between these two characteristics is essential and will set the future trends in barley utilization in the Mediterranean areas.

A METHODOLOGY FOR MEASURING THE EFFICIENCY OF THE DIFFUSION OF INNOVATION IN THE SUPPLY CHAIN

Laskowska-Rutkowska, Aleksandra

Logistics and Innovation Center, Uczelnia Łazarskiego, Warsaw, Poland

ABSTRACT

This is a conceptual paper, based on literature review. The purpose of this theoretical study is to propose a methodology for measuring the efficiency of the diffusion of innovation in the supply chain. Based on the analysis of existing literature, a new original methodology for measuring the efficiency of the diffusion of innovation in the supply chain – including a measurement matrix and a synthetic indicator – has been developed. The contribution of this paper consists in providing a framework for the development of indicators that can be used to measure the efficiency of the diffusion of innovation in specific industries and companies. Therefore, this is a conceptual paper and research based on the proposed methodology has not been done yet; neither has the usefulness of the proposed measures been demonstrated in practice. However, it is hoped that the paper will stimulate a scientific debate on two questions: firstly, whether the availability of a common methodology may ensure comparability of data within an industry, as well as between industries, taking into account their distinguishing characteristics; and, secondly, on whether the above data will prove useful in the development of a set of best practices for the diffusion of innovation in the supply chain. The proposed model needs to be applied in practice, as only this can test its usefulness.

Keywords: *innovation diffusion, supply chain, methodology, efficiency of innovation diffusion*

INTRODUCTION

The overall improvement in the competitive position of an entire supply chain depends crucially on the diffusion of innovation (Teece, 1980). Despite this, as CH. Gan, M. Clemens, T. Hui Kao and V. Xin, (Gan *at al.*, 2007) have pointed out, little has been written on the diffusion of innovation in the supply chain, while research on the diffusion of innovation in logistics has largely focused on the diffusion of specific technologies. More in-depth research on innovation diffusion in logistics is needed, including the diffusion of innovative processes and services (Grawe, 2009). Several recent publications on innovation in the supply chain notwithstanding, no methodology for the measurement of the efficiency of the diffusion of innovation in the supply chain has been developed.

This is a conceptual paper, based on literature review; its purpose is to propose a methodology for measuring the efficiency of the diffusion of innovation in the supply chain. Based on the analysis of existing literature, a new original methodology for measuring the efficiency of the diffusion of innovation in the supply chain – including a measurement matrix and a synthetic indicator - has been developed. The contribution of this paper consists in providing a framework for the construction of indicators that can be used to measure the efficiency of the diffusion of innovation in specific industries and companies.

According to the interpretation adopted by the Oslo Manual, diffusion is the way in which innovation is propagated from the first implementation through market and non-market channels, to various consumers, countries, regions, industries, markets and companies (Oslo Manual, 2005). Without diffusion, innovation could have no impact on the economy. Diffusion is also an indicator of the acceptance or rejection of the implemented innovation by the broadly understood market.

The diffusion of innovation can be discussed on the following planes:

the proliferation of ideas within a unit (a unit can be either a company or an individual consumer),
the proliferation of innovation between units in a system or systems,
international (global) diffusion (Wiśniewska, 2004).

The present paper is concerned with the diffusion of innovation among companies in a supply chain (therefore, the diffusion of innovation among units belonging to a single system).

The diffusion of innovation in a supply chain is understood as the process through which innovation spreads in the supply chain of one company, the leader of the supply chain (Laskowska-Rutkowska, 2013). It may be assumed that the process of innovation and decision-making occurs also in the supply chain, and that it consists of the following stages: knowledge, persuasion, decision, implementation and review. This also means that the diffusion of innovation in the supply chain can be an intentional process, and can be managed (Rogers, 2003).

The process of innovation diffusion is managed by the supply chain leader and has a deliberate character; as such, it is expected to produce certain predetermined outcomes. Therefore, the problem of defining measures of the efficiency of the diffusion of innovation in the supply chain needs to be solved. Since these issues have not been addressed in the logistics and supply chain literature, contributions to the development of methods of measuring the efficiency of supply chains will be analysed instead. Based on this analysis, a methodology for measuring the efficiency of the diffusion of innovation in the supply chain will be proposed.

EFFICIENCY AND EFFICIENCY INDICATORS

Efficiency is defined as a “positive outcome, effectiveness, efficacy, productivity” (Słownik Języka Polskiego, 1982) and can refer to “the best outcomes of production, distribution, sales and promotion.” Efficiency can also mean “the evaluation of outcomes with respect to the purpose and utility of action (Blaik, 2001).”

Economic efficiency is defined as the outcome of activities undertaken, and is characterized by the relation between the results obtained and the outlay (expenditure); it can be expressed as the ratio:

$$W = E : N$$

where:

W - efficiency

E – the effect of the company's operations

N – the expenditure associated with the company's operations

Two important aspects of efficiency are distinguished in the systemic formula expressing the efficiency of logistics:

- the market aspect, which captures the optimal value for the client, and
- the economic aspect, which expresses the development of an optimal structure of operations and costs in the process of value creation (Blaik, 2001).

For the sake of the present study, efficiency will be understood in the sense of “a positive outcome, effectiveness”, rather than a ratio of outcomes to expenditure.

In order to determine whether the process of diffusion has been completed successfully, appropriate *measures* are needed. To measure performance, indicators are used. Indicators are numbers that tell us unequivocally whether certain key criteria have been met (Suerle and Wagner, 2002). Indicators can be absolute (eg. net income, employment) or relative ratios (Suerle and Wagner, 2002).

It is difficult to measure the outcomes of diffusion directly, since there are no uniform measures that could be applied to processes of an arbitrary type. International methodological standards include the following measures of the outcomes of innovation: the share of new products in sales, the share in sales of products in the launch phase, the effects of the efforts to promote innovation, and the impact of innovation on the efficient use of factors of production (Wiśniewska, 2004). These indicators cannot be used to evaluate the impact of innovation on the supply chain. Indicators measuring the impact of innovation on the general operation of an enterprise are also used.

These include, among others: sales, profits, expansion to new markets (Wiśniewska, 2004) and positive change in the effective use of production factors: labour, raw materials, energy, fixed assets (Moszczyński, 1994).

Increase in sales or profits is too general a notion to serve as an adequate measure of the efficiency of the diffusion of innovation in the supply chain. Indicators of the efficiency of the diffusion of innovation in the supply chain should be tailored to the specific nature of the supply chain, and should enable the measurement of positive changes in the supply chain. Therefore, in seeking to develop a methodology for measuring the efficiency of the diffusion of innovation in the supply chain, publications on the measurement of the efficiency of supply chains should be consulted.

In the past, efficiency indicators were based on financial data, since such data is readily available. Recently, non-financial indicators have been gaining in importance (Kaplan and Cooper, 2000) (Maskell, 1991). Quality and time are the two most important categories of non-financial indicators. Those who advocate the use of non-financial indicators believe that they are particularly suited to measuring efficiency at the operational level, where the level of management is closer to physical action, and when the market becomes increasingly dynamic, requiring aggressive competition between companies and their supply chains (Nani et al, 1990). In the case of supply chains, non-financial measures can also be used at higher levels of supply chain management, eg. on the process level (for example, the indicator reflecting the speed with which a supply chain reacts to changes in demand).

Furthermore, non-financial measures are the right solution for the supply chain, since clients – as well as integration and coordination of organizational units – are the main focus of attention for the supply chain. Naturally, this does mean that financial measures should not be used.

It is essential to select the right performance indicators, those that enable the measurement of those factors which play a key role with respect to the issues under study (Enkel et al, 2007). Supply chain efficiency measurement requires comprehensive indicators, reflecting the performance of entire supply chains, rather than their individual elements.

METHODS FOR MEASURING THE EFFICIENCY OF SUPPLY CHAINS

Dimensions of efficiency, such as quality, costs and time, are commonly employed in studying supply chains. This is entirely natural, as every supply chain is a megaprocess. Processes that convert “input resources” into “output resources” and meet client expectations can be described by the following three parameters: quality, reaction time and costs (Kaplan and Cooper, 2000).

Authors of the A.T. Kearney report entitled “Insight to Impact” distinguished traditional and “new” efficiency categories. They listed the following traditional categories of efficiency: quality, time and operating costs. To this list they added new supply chain efficiency categories, the result of interactions between the traditional categories. These include: responsiveness, leanness and agility, that is, the speed with which the system, supported by the intelligent use of information, is able to

attain the optimal cost structure (A.T. Kearney, 1999). Two approaches to the measurement of the efficiency of supply chains are dominant in the literature: the Balanced Scorecard adapted to the needs of supply chains, and SCOR (Suerle and Wagner, 2002). The application of the Balanced Scorecard approach to the evaluation of supply chain performance has been proposed by P. C. Brewer and T. W. Speh (Brewer and Speh, 2000) and by H. J. Bullinger et al (Bullinger et al, 2002). The indicators relate to four Scorecard perspectives and three levels of the supply chain, namely, operations, processes and the supply chain. However, analysis of the literature has shown that most of the indicators constructed in this way relate to logistics internal to the organization, while ignoring the achievements of the entire supply chain. Among the 83 indicators analysed in the framework of the European BestLog project, only 3 were considered applicable to the entire supply chain: faster reaction to changes in fashion, total process time (from design to delivery), and earlier warning of potential problems with delivery (Cuthbertson and Piotrowicz, 2008).

The SCOR (*Supply Chain Operations Reference*) model consists in comparing standard supply chain processes with the best practices established on the basis of the experience of SCC companies. SCOR was developed to analyse supply chains and enable the participants (manufacturers, suppliers, distributors and retailers) to assess their efficiency and to introduce improvements in the flow of goods, labour and information (Dobrzyński, 2005). SCOR is based on six distinct management processes: Plan, Source, Make, Deliver, Return, and Enable. Supply chain performance measures can be built on the basic SCOR processes. A. Gunasekaran and others have created supply chain performance indicators by considering the processes of planning, purchasing (supply), production and delivery on the operating, tactical and strategic levels of the supply chain (Gunasekaran et al, 2001).

Shepard and Gunter have used the processes of planning, purchasing and delivery in connection with the categories of costs, time, quality, agility and innovation.

A review of supply chain case studies produced in the framework of the European BestLog project shows that most of the indicators (48) are tactical or operational. Only 21 indicators can be considered relevant to the strategic level (Cuthbertson, Piotrowicz, 2008). This is unfortunate, since a comprehensive evaluation of the achievements of supply chains should be based on information about all the levels of supply chain management. The authors of this report also point out that none of the supply chain efficiency indicators pertain to environmental or social aspects.

The SCOR model uses a supply chain strategic matrix to identify the strategic features of a given supply chain (Curley, 2011). Within this matrix, two perspectives can be distinguished: the client's perspective and the internal perspective of the supply chain. The matrix helps determine the current and target states for each performance attribute (property) of the supply chain. It is considered normal

that a supply chain can achieve top scores only for some performance attributes. These should be the attributes that are most important from the perspective of the given supply chain.

Most publications on supply chains focus either on the dimension of innovation, or on the dimension of efficiency. There is a dearth of studies combining the two perspectives. The exception is the work of J. Trienkenes and collaborators. (Trieneken et al, 2008). The authors of this study have developed an innovation-efficiency matrix. It contains the main innovation and efficiency categories for a fruit supply chain. The innovation categories (product, process, marketing and organizational innovation) are based on Eurostat and OECD data. Efficiency categories for the fruit supply chain – efficiency, responsiveness, quality and agility – are based on research done by other authors. Efficiency indicators depend on the specific nature of a given industry, company, client or key success factors. Because of the diversity of conditions affecting the supply chain, the choice of the key success factor depends on the specific supply chain and its unique features.

METHODOLOGY OF MEASURING THE EFFICIENCY OF THE DIFFUSION OF INNOVATION IN THE SUPPLY CHAIN

Analysis of the studies mentioned above leads to the formulation of several assumptions concerning the methodology of measuring the efficiency of the diffusion of innovation in the supply chain:

- The efficiency of the diffusion of innovation in the supply chain is understood as a positive, effective outcome of the process of spreading innovation in the supply chain.
- To measure the efficiency of the diffusion of innovation in the supply chain, “output” indicators are used to measure the impact of innovation on the achievement of the supply chain's targets. To obtain reliable information about the efficiency of the process of diffusion of innovation in the supply chain, it is necessary to collect “input” category measurements.
- Indicators reflecting the efficiency of the diffusion of innovation in the supply chain are qualitative.
- In order to measure the efficiency of the diffusion of innovation in the supply chain, it is necessary to define efficiency criteria and determine supply chain levels, on which efficiency is to be measured. Efficiency criteria were developed on the basis of the literature mentioned above and materials provided by the Supply Chain Council. A new efficiency criterion was added, namely the “ecological footprint”. Due to difficulties of quantification, the feasibility of a criterion reflecting the impact of the supply chain on society is dubious, though such an addition would be desirable. The levels of the supply chain on which efficiency is measured – resources, operations, processes (logistics) and the business model – were described in previous chapters.

- Since efficiency criteria should take into account the specific nature of a given industry and supply chain, as well as the success factors specific to the supply chain, arbitrarily chosen weights (from 0 to 1) are assigned to the criteria. To ensure that the measures are comparable, it is also assumed that the dimensions of the efficiency of supply chains are always the same, regardless of the specific features of the supply chains. Only the weights are used as a differentiating factor.
- The results of a measurement of the efficiency of the diffusion of innovation in the supply chain are given in the form a matrix, with the efficiency criteria along one axis, and the level of supply chain management at which innovation can manifest itself on the other. The cells of the matrix contain indicators of the efficiency of the diffusion of innovation in the supply chain, based on the literature cited above.

THE EFFICIENCY OF THE DIFFUSION OF INNOVATION IN THE SUPPLY CHAIN MEASUREMENT MATRIX

Three efficiency perspectives are assumed in the construction of the measurement matrix: the client's perspective, the supply chain's internal perspective and the environmental perspective.

- The client's perspective concerns those features of the supply chain, which determine the efficiency of creating value for the end customer of the supply chain. This perspective is characterized by the following factors:
 - reliability, understood as the supply chain's ability to ship the right product to the right destination at the right time in the right condition and packaging, in the required amount, with the required documentation, to the right customer.
 - speed, defined as the speed with which the supply chain delivers products to customers,
 - agility, understood as the flexibility with which the supply chain responds to changes in the marketplace, so as to maintain or gain competitive advantage (Culey, 2011).
- The internal perspective concerns those parameters of the supply chain, which determine the cost efficiency of supply chain management. The following categories (dimensions) are distinguished within this perspective:
- costs associated with the operation of the supply chain, and
 - assets. This dimension is interpreted as the efficiency of the organization in managing fixed assets and working capital in order to meet demand.

- The environmental perspective concerns the natural environment, in which the supply chain operates. Only one category (dimension) is considered under this perspective, namely:
 - the ecological footprint, understood as the impact of the supply chain on the environment.

The efficiency of the diffusion of innovation should be assumed to manifest itself on the levels of the business model, process, operations and resources.

- The business model level relates to the level of supply chain management in the “logistics stream” layer, which B. Mahadevan calls “one of the three main components of the business model, pertaining to various issues connected with the design of the supply chain for business. (Mahadevan, 2000)”. The process level concerns innovation on the level of processes in the supply chain. Within the SCOR model, the following processes in the supply chain are distinguished: purchasing, production, delivery and returns. These processes have also been incorporated in the proposed measurement matrix.
- The level of operations comprises the day-to-day operations of the company related to the supply chain, which transform “inputs” into “outputs”. The notion of “inputs” refers to materials, intangible needs and information. The processes of transformation include production and the provision of services. The notion of “outputs” refers to material goods, satisfied needs and satisfied customers (Bozarth, Handfield, 2008)
- The level of operations may include the manner in which orders are filled and customers are served or any other activity performed by the enterprise.” The level of resources is the lowest level in the classification of innovation in the supply chain. One school of strategic thinking, namely, resources-oriented thinking, sees the unique configuration of resources and competences as the foundation on which companies build their competitive advantage. Innovation on the level of resources in the classification of innovation in the supply chain includes innovation in the area of material and intangible resources. For example, it may include innovative IT solutions or innovative “human resources”, that is, employees who generate new ideas.

The efficiency of the diffusion of innovation in the supply chain measurement matrix shown in Fig. 1 represents a synthesis of the research methodology under discussion

		CRITERION of EFFICIENCY	SUPPLY CHAIN MANAGEMENT LEVEL			
			Resources	Operations	Processes	Business model
Efficiency perspective	CLIENTS	RELIABILITY	Performance of the supply chain (on the levels of resources, operations, processes and the business model) in delivering: the right product to the right destination at the right time in the right condition and packaging, in the required amount, with the required documentation, to the right customer			
		SPEED	The speed with which the supply chain delivers (on the levels of resources, operations, processes and the business model) products to customers			
		AGILITY	The agility with which the supply chain (on the levels of resources, operations, processes and the business model) responds to changes in the marketplace, so as to maintain or gain competitive advantage			
	INTERNAL	COSTS	The costs associated with the operation of the supply chain (on the levels of resources, operations, processes and the business model)			
		ASSETS	The efficiency of the organization in managing fixed assets and working capital (on the levels of resources, operations, processes and the business model) in order to meet demand			
	THE ENVIRONMENT	ECOLOGY	The ecological footprint of the supply chain (on the levels of resources, operations, processes and the business model)			

Fig. 1. The efficiency of the diffusion of innovation in the supply chain measurement matrix
Source: original research based on: (Culey, 2011), (Trienekens et al, 2008), (Laskowska-Rutkowska, 2015).

- An importance factor (weight) needs to be assigned to each efficiency measure, with 0 indicating the lowest level of importance, and 1 the highest level. The sum of the weights for all the criteria must be equal to 1.

The importance of a given efficiency criterion for a supply chain in a specific industry should be assessed on the basis of a study carried out on a group of clients, supply chain managers and experts. Thus, in the case of innovative products, agility and speed are important. In the case of functional goods, the most important criteria are reliability and the cost-oriented perspective. Efficiency measures can thus be adjusted to the specific characteristics of the industry, in which a given supply chain operates.

The selection of efficiency indicators should also take into account social factors, that is, the impact of the supply chain on human behaviour, since “the subject of measurement will strive to attain the highest possible level on this dimension (Ariely, 2010).” The indicators selected will focus the efforts of employees on achieving the best possible results in the measured categories. The most reasonable course of action is to adjust the measures to the requirements of a given industry, the market and the

mission of the company, and to measure not that which is easiest to measure, but rather that which the company is supposed to achieve. When selecting the measures of the efficiency of the diffusion of innovation in the supply chain one should start with the question of what should be maximized (what results the supply chain is expected to achieve). Next, one should ask what should be measured and how.

USING THE EFFICIENCY OF THE DIFFUSION OF INNOVATION IN THE SUPPLY CHAIN MEASUREMENT MATRIX

Two matrices should be generated. The first should contain “input” data, reflecting the state before the process of innovation diffusion commenced, and the second should contain “output” data, reflecting the state after the process of innovation diffusion in the supply chain under analysis has run its course.

This requires that information on the achievements of each supply chain be classified according to efficiency dimensions. Figure 2 shows a matrix, in which achievements of supply chains for the category of “reliability” should be entered.

SUPPLY CHAIN MANAGEMENT LEVEL		LEVEL OF			
		Resources	Operations	Processes	Business model
Efficiency criterion	Reliability	The speed with which the supply chain delivers (on the levels of resources, operations, processes and the business model) products to customers			
		Performance of industry leader			
	Average performance in the given industry				
The perspective of the client		Weakest performance in the industry			

rement matrix for the effects of the supply chain in the category of “reliability”

Source: original work.

Such matrices should be created for each dimension of the efficiency of the diffusion of innovation in the supply chain, that is, for speed, agility, costs, assets and the environment. Effects achieved in a given dimension/dimensions by leading supply chains will become a model for other supply chains, trying to implement the innovations. Once a sufficient quantity of data on the efficiency of the diffusion of innovation in the supply chain has been collected, it will be possible to create a database, which can be used to create scales for the evaluation of the efficiency of the diffusion of innovation in the supply chain for each efficiency dimension.

A SYNTHETIC INDICATOR FOR MEASURING THE EFFICIENCY OF THE DIFFUSION OF INNOVATION IN THE SUPPLY CHAIN

A synthetic indicator that incorporates all the dimensions of efficiency is proposed as a measure of the efficiency of the diffusion of innovation. For each level of the supply chain, its efficiency E_i^j needs to be defined, where the subscript i denotes the supply chain, and the superscript j denotes the level of innovation, and takes on the values 1, 2, 3 and 4 for the levels of resources, operations, processes and business model respectively. Considering the different dimensions of efficiency, the following components of the synthetic indicator are proposed:

EN_i^j – reliability, j th level, i th chain,

ES_i^j – speed, j th level, i th chain,

EE_i^j – agility, j th level, i th chain,

EK_i^j – operating costs, j th level, i th chain,

EA_i^j – the organization's efficiency, j th level, i th chain, in the management of fixed assets and working capital for the purpose of meeting demand,

ESR_i^j – ecological footprint, j th level, i th chain.

In order to represent the numerical values of these quantities, it is necessary to define, for each dimension, a variable which increases with the increasing quality of the supply chain in terms of reliability, speed, efficiency, etc. For example, $x(EN_i^j)$ denotes the values of a variable associated with reliability, and if the reliability of the k th chain is higher than the reliability of the i th chain for the j th level, then the following inequality holds:

$$x(EN_k^j) > x(EN_i^j) \quad (*)$$

In order to develop a synthetic measure of supply chain efficiency, it is necessary to reduce the components of the measure to commensurate values. Two alternative ways of defining the component associated with the dimension of speed can therefore be proposed (for any other dimension the component is defined in the same way):

$$(x(ES_i^j))$$

and

$$ES_i^j = \frac{x(ES_i^j) - \bar{x}(ES^j)}{s(ES^j)}$$

where:

I is the set of supply chains, $\bar{x}(ES^j)$ is the average speed of the supply chains, and $s(ES^j)$ denotes the standard deviation from the mean speed of delivery.

These operations, which lead to commensurate efficiency indicators for different dimensions, make it possible to define a synthetic measure of efficiency in the following way:

$$E_i^j = w_1 EN_i^j + w_2 ES_i^j + w_3 EE_i^j + w_4 EK_i^j + w_5 EA_i^j + w_6 ESR_i^j, \quad (**)$$

where the weights are chosen arbitrarily and satisfy the following conditions:

$$\sum_{i=1}^6 w_i = 1,$$

$$0 < w_i < 1, \text{ for } i=1,2,3,4,5,6.$$

CONCLUSION

The general methodology described above provides a framework for the development of indicators that can be used to measure the efficiency of the diffusion of innovation in specific industries and companies. This is a conceptual paper, and the ideas put forward in it will require empirical research to prove the practical applicability of the proposed measures. However, it is hoped that it will stimulate a scientific debate focusing on two questions: firstly, whether the availability of a common methodology may ensure comparability of data within an industry, as well as between industries, taking into account their distinguishing characteristics; and, secondly, whether the above data could become the basis for a set of best practices for the diffusion of innovation in the supply chain. When data has been collected for a sufficiently large number of supply chains to consider it a representative sample, it should be possible to compare superior and inferior outcomes of the diffusion of innovation in the supply chain. Such a comparison will in turn enable the creation of a database of “best practices” for the management of the diffusion of innovation in the supply chain. The term “best practice” signifies the best way of doing something, comprising procedures and actions that have turned out to be most effective in practice. The availability of a database of best practices relevant to the diffusion of innovation in the supply chain would bring about greater awareness of the ways in which innovation can be fostered in supply chains and the ability to measure the efficiency of innovative solutions. This would also lead to increased innovation in other supply chains, whose managers would be prepared to transfer the best practices to their supply chains.

A PREDICTIVE MODEL OF CONSUMER-LUXURY BRAND RELATIONSHIPS

Lee, Jung Wan¹; Becker, Kip²; Nobre, Helena³

¹Administrative Sciences Department, Metropolitan College, Boston University

²GOVCOPP, DEGEIT, University of Aveiro, Aveiro, Portugal

ABSTRACT

While research on consumer-brand relationships has matured over the past decades this variable has yet to be operationalized in the consumer-luxury brand field and, while extensively used, a parsimonious definition of what constitutes a luxury brand has not been developed. This paper intends to provide a definition of the luxury brand and examine a predictive model to better understand the consumer-luxury brand relationship, which describes its product characteristics and behavioural components. A survey was conducted in Europe (i.e., Portugal) and featured 16 well known luxury brands from the Best Global Brands 2013 as well as trade industry information concerning the luxury Portuguese market. A sample of 381 luxury brand consumers was selected in a random manner by surveyors in two major cities in Portugal. This study employs factor analyses in a two-stage process (exploratory and confirmatory factor analysis) and structural equation modelling techniques. This study examines a predictive model of the consumer-luxury brand relationship between four main characteristics (quality, price, aesthetics, rarity and uniqueness) of luxury products and psychological bond of consumers (brand commitment, brand intimacy, brand self-connection, brand partner-quality and satisfaction). The results of this study find that the quality, aesthetics, and rarity and uniqueness of products are positively associated with brand commitment, brand-intimacy, self-connection, partner-quality, and satisfaction while the three latent variables representing the consumer-luxury brand relationship play an important role in strengthening the consumer-luxury brand relationship.

Keywords: *luxury brand, luxury brand model, brand personality, brand relationship, symbolic consumption, brand commitment, brand intimacy, brand self-connection, partner-quality*

INTRODUCTION

Today, 'luxury' remains one of the most problematised terms in business language. Conversations around what luxury means will range from the external to the internal, from statements of status to a deeper sense of discovery and learning, from the superficial and superfluous, to truly unique products

Innovation, Entrepreneurship and Digital Ecosystems

and experiences that will be treasured for a lifetime. The world still has a love-hate relationship with luxury. What is consistent through the ages is that we understand luxury differently dependent upon culture.

In the last two decades, the luxury construct has gained relevance in the literature due to the creation of conglomerates such as LVMH, Gucci group and Richemont (Okonkwo, 2009) as well as the importance that luxury brands have assumed in contemporary consumption and communication activities (Chevalier and Manzalovo, 2008). The significance of luxury as a distinct entity was highlighted in 2013 when the “European Commission acknowledged luxury as a sector in its own right, instead of part of another industry such as textiles, cars or leather goods” (Daneshkhu, 2013). This is described as “our first public achievement” by Armando Branchini, president of the European Cultural and Creative Industries Alliance (ECCIA), a lobby group. For the first time, the EU’s executive body had “recognised ... the high-end industry as the pillar of cultural and creative industries”, said Mr Branchini, who is also head of Altagamma, Italy’s luxury goods association which created the ECCIA in 2010, together with France’s Comité Colbert, the UK’s luxury body Walpole, Meisterkreis in Germany and Spain’s Circulo Fortuny.

It is, however, unfortunate that the EU commission did not build on their recognition and pursue a definition of what product classifications actually constitute the sector. Without such an understanding it is likely that some firms will seek to have their products/services (for writing flow and readability, forward products will generally be understood to represent both products and services) listed as luxury to accrue whatever benefits such recognition offers while others may seek to dissociate with the luxury title to avoid potential negative consequences such as barriers to markets or additional taxes.

The study of consumer-brand relationships toward the end of the twentieth century has resulted in research which generally implies brand personification (i.e., a brand has a personality). The interpersonal metaphor approach used by Fournier (1998) for conceptualizing consumer-brand relationships built on this foundation (Keller, 2003). The Fournier (1998) study furthered the understanding the use and experiences with familiar brands, whether functional or symbolic in nature, have an important role in building consumers’ daily life stories. The research also offered a typology of consumer-brand relationships broader in scope than the common approaches. Extending the idea of personification of brand Aggarwal (2004) states that “Once, products and brands are associated with human qualities people may interact with them in ways that parallel social relationships, and their interactions are guided by the norms that govern these relationships” (p. 88). The understanding that a consumer-brand relationship is a social bond reinforces that it is reasonable,

and makes sense, to study consumer-brand relationships under the umbrella of the theories relating to social relationships.

To this end, the first section of this paper reviews prior research pertaining to the characteristics of a luxury brand definition to formulate a better understanding of the key dimensions behind a luxury brand choice and usage. A luxury brand carries out important symbolic meaning that fulfills consumers' psychological needs. This leads to an emphasis on psychological benefits versus functional benefits as one of the features that characterizes luxury brands and distinguishes them from non-luxury brands (Vigneron and Johnson, 2004). As such, the study of luxury brands is an attempt to understand the meanings that consumers bring to their lives when involved in relationships with luxury brands. Using five distinct parameters Shukla and Purani (2011) comparing the importance of luxury value perceptions in cross-national contexts support the notion that several luxury value perceptions may be highly influential among all cultures and countries. However, their degree of influence may differ dramatically. To this end, the second section of this paper examines a conceptual model that this multinational research underlays the importance of assuring that a consistent definition of luxury brands across not only products but nations as well. From an applied perspective at the managerial level a clear definition of luxury brands will allow practitioners to define strategies and actions to address lasting consumer-brand relationships. In this vein a predictive model of luxury brand relationships is proposed.

LITERATURE REVIEW AND HYPOTHESES

Luxury Brand Characteristics

The luxury product characteristics are controlled by the luxury product manager where at the foundation the luxury product delivers a quality offering with high price as well as charming and different product aesthetics. The product manager (service provider) drives the product further to exclusivity by making it hard to attain by a general public adding extraordinariness to its features. At the highest level the product has matured to signal a well-respected, firmly established sign of its luxurious characteristic to the consumers.

Allison and Uhl (1973) noted that the perceived quality, rather than the actual quality, of a product is what is meaningful in consumer preferences. Numerous studies (Bilkey and Nes, 1982; Rasky, 1986) have explored the "made in" implications to consumers as they relate to country of origin and its effect on the consumer's perception of quality. Understanding the importance of origin of country is paramount when attempting to market against foreign competition whose goods are perceived by the consumer to be of superior quality. It would appear then that product value is not only a function of price and actual quality but also the quality as well as what is perceived (Vigneron and Johnson, 2004).

High price is also frequently perceived as a differentiator of social status, where conspicuous consumption of luxury is frequently used for the purpose of signalling social status (Eastman and Eastman, 2011). Price has proven to be the most objective characteristic in evaluating the luxuriousness of a product (Heine and Phan, 2011) and requires no psychological perceptions other than one knows the price. Price alone does not create a prestigious image (Eastman and Eastman, 2011), as not all expensive products are considered luxury. Low-priced products are rarely recognized as luxury, and therefore price forms a fundamental and mandatory requirement for luxury. Clements and Gao (2012) introduce two related measures based on the luxury/necessity distinction. One is an index of the extent to which the prices of luxuries change as compared to necessities, while the second indexes the change in spending.

Aesthetic design and ideology is often an extension of highly creative individuals, and the aesthetic characteristics they imbue into a product brand frequently resemble works of art, inducing emotions of exclusivity and superiority (Dion and Arnould, 2011). Dion and Arnould (2011) further state that luxury draws on the principles of art and magic to enlist magical and aesthetic principles within and without the store to achieve these ends. They note that luxury retail strategy differs from other retail in that it increasingly stands or falls on the legitimacy of a charismatic creative director who seeks to generate awe rather than community.

Consumers use the extrinsic product characteristics of rarity and uniqueness, as well as the concrete or abstract connections with luxuriousness, to exhibit social status and association, or in some cases dissociation, from social groups (Han, Nunes, and Dreze, 2010). Han et al. (2010) provide additional insight that majority of consumers actively signal to others that are equal and above their perceived social status their personal use and consumption of prominent luxury brands. Social association (Wilcox et al., 2009) and social dissociation (Han et al., 2010) are consumer aspirational goals, where some consumers of perceived higher social status consume luxury to dissociate from those of perceived lower status, and vice versa.

An inference that can be made between extrinsic luxury product characteristics and extrinsic luxury brand consumer psychological attributes is that the more rare or more unique a product characteristic is perceived to be the higher will be the perceived social value and thus the higher price premium and luxuriousness that can be attained. Luxury product brand consumers deriving social status from the ownership of a rare or unique product can drive price in some sorts of products, such as a treasured paintings. Some would argue these objects have basically limited actual physical product value and only derive additional value from the extrinsic qualities awarded by individuals or groups. As such, the value of this classification of products is not related to physical properties but defined as a

distinction of perceived social values within a socioeconomic context by those that covet them (Vigneron and Johnson, 2004).

Luxury product brands laden with subtle symbolism and heritage can be related to emotional qualities of personal indulgence and a self-expression (Eastman and Eastman, 2011). Due to the transcendence of these intrinsic characteristics from functionality and social pursuits, the value attributable to symbolism and heritage defy traditional means of price valuation (Kapferer, 2012) As such their value driven to be significantly greater than their cognitive and extrinsic characteristics. It is interesting that in pursuit of a luxury brand definition that “currently both consumers and advertisers describe luxury products in more abstract language than they describe ordinary products, and that abstract product descriptions are perceived as more luxurious than concrete product descriptions” (Hansen and Wänke, 2011).

Hypotheses

A luxury product’s physical characteristics can be considered as a varying range of dimensions that increases proportionately with perceived luxuriousness. The major characteristics can be further categorized into concrete and abstract features, with quality having many sub-characteristics. Price is recognized as the function of physical costs of production plus consumer’s perceived value. It is the most basic requirement of luxury definition in the current socio-economic context because wealth remains the only consistent differentiator of social status.

At this high level of interaction between luxury product characteristics and luxury brand consumers a strong relationship is created based on the luxury product characteristics of quality, price, aesthetic design, and rarity and uniqueness. This research intends to examine how the physical characteristics of luxury products are related to the psychological bond of luxury brand consumers to the consumer-luxury brand relationship strength. In extending and integrating the highlighted literature this study intends to examine the following hypotheses:

Hypothesis 1: Luxury product characteristics (i.e., quality) are likely to have a positive effect on the consumer-luxury brand relationship strength.

Hypothesis 2: Luxury product characteristics (i.e., price) are likely to have a positive effect on the consumer-luxury brand relationship strength.

Hypothesis 3: Luxury product characteristics (i.e., aesthetics) are likely to have a positive effect on the consumer-luxury brand relationship strength.

Hypothesis 4: Luxury product characteristics (i.e., rarity and uniqueness) are likely to have a positive effect on the consumer-luxury brand relationship strength.

RESEARCH METHODS

Survey and Sample Characteristics

A survey was conducted in Europe (i.e., Portugal) and featured 16 well known luxury brands: Chanel, Armani, Calvin Klein, Ralf Lauren, RayBan, BMW, Audi, Mercedes, Hugo Boss, Moët et Chandon, Burberry, Dior, Gucci, Aramis, Pousadas de Portugal, Ermegildo Zegna. The selection of these brands, representing different product categories and brand personalities, was guided by information from the Best Global Brands 2013 (Interbrand, 2013) as well as trade industry information concerning the luxury Portuguese market.

A sample of luxury brand consumers was selected in a random manner by surveyors at different department stores, premium outlets, and shopping malls in two major cities in Portugal. Out of the 523 consumers approached 418 luxury brand consumers responded to the survey. Of the 418 that filled in questionnaires in the survey 37 questionnaires were removed from the data set as they had missing data, and thus resulted in a final sample size of 381 cases. Table 1 describes descriptive statistics of luxury brand experience of the respondents.

	Male (n=177)	Female (n=194)	All (n=381)	All (n=381)
Brand Name	Percent (%)	Percent (%)	Percent (%)	Frequency
Chanel	8.5	29.9	19.7	75
Armani	4.5	5.2	5.2	20
Calvin Klein	6.8	11.3	8.9	34
Ralf Lauren	11.3	8.2	9.4	36
Ray Ban	10.2	8.2	8.9	34
BMW	7.9	2.1	5.8	22
Audi	5.6	2.1	3.7	14
Mercedes	23.7	20.6	21.5	82
Hugo Boss	7.9	3.1	5.8	22
Moet et Chandon	3.4	2.1	2.6	10
Burberry	2.3	1.0	1.6	6
Christian Dior	1.1	3.1	2.1	8
Gucci	0	1.0	0.5	2
Aramis	2.3	0	1.0	4
Portugal	3.4	2.1	2.6	10
Zegna	1.1	0	0.5	2
Total	100	100	100	381

Table 1. *Descriptive Statistics of Luxury Brand Experience of the Respondents*

The sample represented the population in gender as 47.7% of male and 52.3% of female participated in the survey. It was found that the demographics of the sample were consistent with the population of the nation in terms of age and sex. The average age of the respondents was 34 years old (standard deviation = 14.032) with a minimum of 18 and a maximum of 69 years old, 1% less than 20 years old, and 57% more than 30 years old. Unlike the general population but indicative of luxury buyers more than 75% of the respondents reported that they finished university or college education.

Survey Items and Instruments

Given that the empirical model in this study embeds complex relationships between consumer expectations and their perception for luxury brands, the study collected self-reported consumer's perceptions. A structured questionnaire, based on a study of existing literature, was developed. The modified short version of survey items of measuring consumer-brand relationships was developed and derived from the relationship ideals scale (Fletcher et al., 1999), which included 23 items relating to various constructs discussed in this study. The respondents were asked to describe their luxury brand relationship with a set of attributes characterizing themselves. For example, "If luxury brand is a person, how would you describe your relationship with the luxury brand?" A seven-point scale was used to collect responses of those twenty-three items, ranging from 1 "least adequate" to 7 "most adequate". To analyse consumer-brand relationship strength, the relationship strength indicators and partner quality scale (Aaker et al., 2004) were used. The respondents were asked to describe their luxury brand relationship strength with a set of attributes for characterizing their relationship. A seven-point scale was used to collect responses of the survey items, ranging from 1 "completely disagree" to 7 "completely agree".

Factor Analysis and Internal Consistency Reliability Test

Construct validity embraces a variety of techniques for assessing the degree to which an instrument measures the concept that it is designed to measure. In order to ensure the construct validity of the measurement instrument, factor analysis was employed in a two-stage process. First, exploratory factor analysis with a varimax rotation procedure was employed to identify underlying predictors based on an eigenvalue cut-off of one. Second, confirmatory factor analysis using structural equation modelling techniques was employed to confirm that the identified predictors are fitted the items correctly and reliably.

To identify underlying predictors of consumer-luxury brand relationship strength, factor analysis with a varimax rotation procedure was employed. The exploratory factor analysis was used to uncover the underlying structure of a large set of items and identified five components based on an eigenvalue cut-off of one: component one with five items (eigenvalue = 3.761), component two with five items (eigenvalue = 3.465), component three with four items (eigenvalue = 2.489), component four with three items (eigenvalue = 2.456), and component five with two items (eigenvalue = 1.722). This resulted in the retention of 19 items out of 25, which represented the five components. Afterward, the five components were used for following analyses. To test the appropriateness of factor analysis, two measures - the Kaiser-Meyer-Olkin and the Bartlett's test - were used. The Kaiser-Meyer-Olkin overall measure of sampling adequacy of 0.887 falls within the acceptable significant level at $p < 0.001$. The Bartlett's test of sphericity of 4575.602 at 171 degree of freedom shows a highly significant correlation among the survey items at $p < 0.001$. The sums of squared loadings from the five components have the cumulative value of 73.122 percent in explaining the total variance of the data. The results of exploratory factor analysis using principal component analysis extraction method are reported in Table 2.

Item Code	Factor Loadings	Eigenvalues	% of Variance	Construct Name	Cronbach α	Item-total Correlation
BA2	0.633	2.489	13.101	Commitment	0.794	0.669
BA3	0.827					0.615
BA4	0.551					0.486
BA6	0.686					0.651
BA9	0.624	2.456	12.927	Brand Intimacy	0.865	0.622
BA10	0.893					0.836
BA11	0.877					0.764

BA25	0.721					0.617

Table 2. Results of Factor Analysis for Consumer-Luxury Brand Relationship Strength

Internal consistency reliability is a measure of how well a test addresses different constructs and delivers reliable scores. The most common method for assessing internal consistency is Cronbach's alpha. This form of intra-class correlation is closely related to convergent validity, i.e. the extent to which the items in a scale are all highly inter-correlated. For example, the survey items are divided into the five constructs. The internal consistency reliability test provides a measure so that each of these particular constructs is measured correctly and reliably. The results of internal consistency reliability tests for the five constructs of consumer-luxury brand relationship strength are reported as follow: self-connection (5 items, $\alpha = 0.895$), partner quality (5 items, $\alpha = 0.886$), commitment (4 items, $\alpha = 0.794$), brand intimacy (3 items, $\alpha = 0.865$), and satisfaction (2 items, $\alpha = 0.721$). The detailed results of internal consistency reliability tests, including item-total correlation coefficient values, are reported in Table 2.

Hypothesis	Path	Male(177)	Female(194)	All(381)	Decision
H1	Quality → Commitment	0.497***	0.355***	0.471***	Accept
	→ Brand Intimacy	0.563***	0.099***	0.415***	Accept
	→ Self-Connection	0.282***	0.227***	0.351***	Accept
	→ Partner Quality	0.571***	0.339***	0.465***	Accept
	→ Satisfaction	0.497***	0.062	0.388***	Accept
H2	Price → Commitment	0.279***	0.324***	0.226***	Accept
	→ Brand Intimacy	0.031	0.064	-0.054	Reject
	→ Self-Connection	0.018	0.002	-0.052	Reject
	→ Partner Quality	0.025	-0.158	-0.087	Reject
	→ Satisfaction	-0.117	0.044	-0.095	Reject
H3	Aesthetics → Commitment	0.266***	0.189***	0.306***	Accept
	→ Brand Intimacy	0.264***	0.321***	0.303***	Accept

H4	Rarity → Commitment	0.357***	0.265***	0.381***	Accept
	→ Brand Intimacy	0.211***	0.067	0.278***	Accept
	→ Self-Connection	0.835***	0.157***	0.475***	Accept
	→ Partner Quality	0.131	0.215***	0.218***	Accept
	→ Satisfaction	0.728***	0.322***	0.562***	Accept

Note: Numbers in the cells are standardized regression weights. Probability values for rejection of the null hypothesis of zero coefficient are employed at the 0.05 level (***) $p < 0.01$.

Model fit summary: The minimum value of the sample discrepancy, CMIN (= 869.782), degree of freedom, DF (= 616), CMIN/DF (= 5.008).

Model fit measures: The goodness of fit index, GFI (= 0.928), the adjusted goodness of fit index, AGFI (= 0.903), the parsimony goodness of fit index, PGFI (= 0.895), the root mean square residual, RMR (= 0.043).

Baseline comparisons measures: The Bentler-Bonett normed fit index, NFI (= 0.913), the Bollen's relative fit index, RFI (= 0.903), the Tucker-Lewis coefficient index, TLI (= 0.935), the comparative fit index, CFI (= 0.942).

Parsimony-adjusted measures: The parsimony ratio, PRATIO (= 0.925), PNFI (= 0.872), PCFI (= 0.895). The

estimate of the non-centrality parameter, NCP (=2468.948), the root mean square of approximation, RMSEA (= 0.036), the Akaike information criterion, AIC (=3258.948), the Browne-Cudeck criterion, BCC (=3278.281) and the Bayes information criterion, BIC (=3601.972).

Table 3. Results of Structural Equation Model Estimates

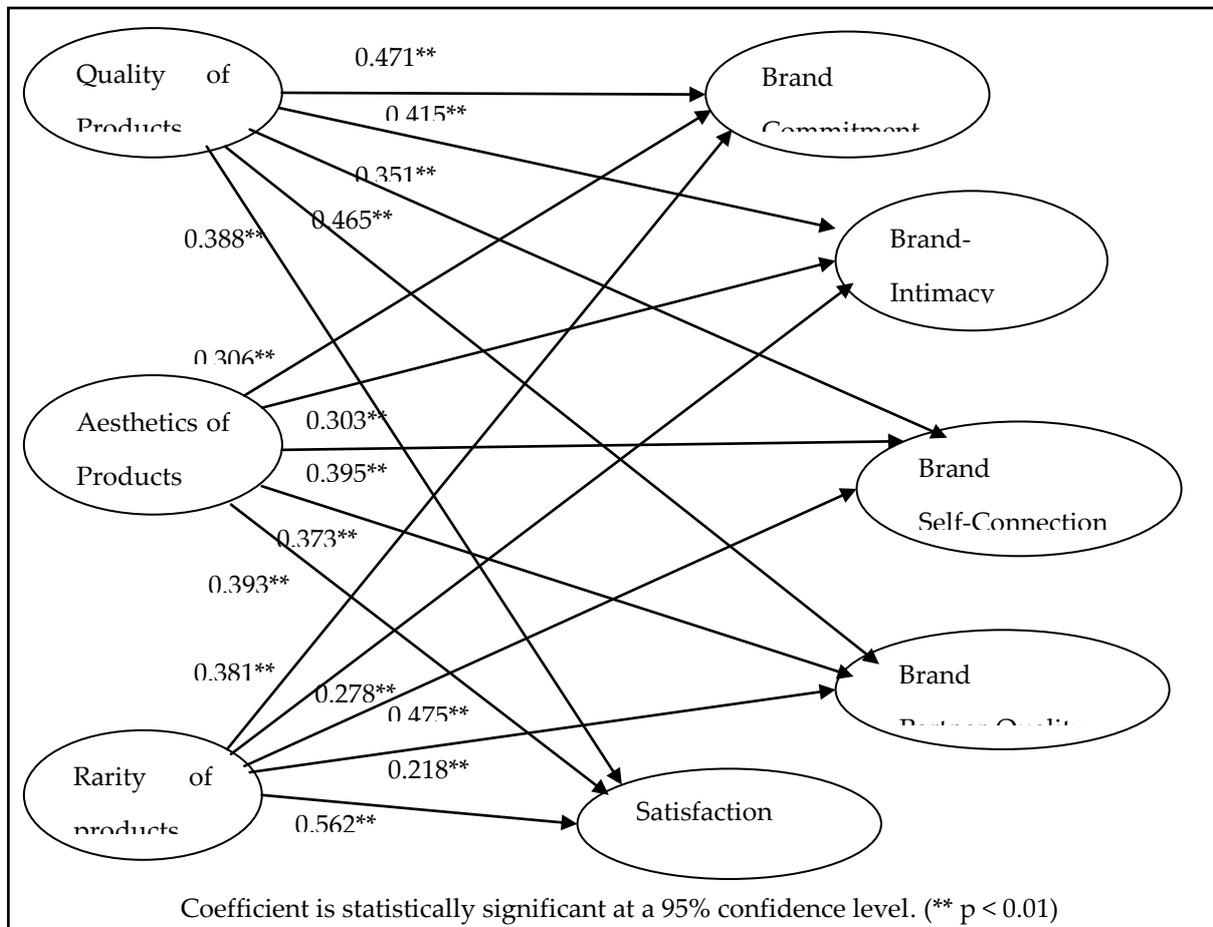

Figure 1. Path Diagram of Consumer-Brand Relationship and Its Strength

RESULTS

Structural Equation Model and Estimates

The results of the analysis of moment structures generally achieve acceptable goodness-of-fit measures, see Table 3. For example, the index of the goodness of fit index (= 0.928) indicates that the fit of the proposed model is about 93% of the saturated model (the perfectly fitting model). The index of the normed fit index (= 0.913) indicates that the fit for the proposed model is about 91%.

In testing hypothesis 1 that the quality of products is likely to have a positive effect on the consumer-luxury brand relationship strength, Table 3 shows that there is a positive relationship between the latent variables and statistically significant at a 99% confidence level ($p < 0.01$). However, in testing hypothesis 2 that the price of products is likely to have a positive effect on the consumer-luxury brand

relationship strength, Table 3 shows that there is a negative relationship between the latent variables, but statistically insignificant at a 95% confidence level ($p > 0.05$). In testing hypothesis 3 that the aesthetics of products is likely to have a positive effect on the consumer-luxury brand relationship strength, Table 3 shows that there is a positive relationship between the latent variables and statistically significant at a 99% confidence level ($p < 0.01$). In testing hypothesis 4 that the rarity and uniqueness of products are likely to have a positive effect on the consumer-luxury brand relationship strength, Table 3 shows that there is a positive relationship between the latent variables and statistically significant at a 99% confidence level ($p < 0.01$).

Figure 3 displays a path diagram of the consumer-luxury brand relationship strength. Overall, the quality, aesthetics, and rarity and uniqueness of products are positively associated with brand commitment, brand-intimacy, self-connection, partner-quality, and satisfaction while the three latent variables representing the consumer-luxury brand relationship play an important role in strengthening the consumer-luxury brand relationship.

DISCUSSIONS

Four main characteristics of luxury products were tested each exploring how the consumer has developed a psychological bond to a specific aspect of the consumer-luxury brand relationship with a set of relationship strength measurement variables. These were how a main characteristic of products had an effect on: 1) brand commitment, 2) brand intimacy, 3) brand self-connection, 4) brand partner-quality and 5) the extent the attribute had an effect on consumer satisfaction to the luxury brand.

Recognition of the importance of the consumer-luxury brand relationship, how they are established and factors that might influence the psychological bond during situations of brand disruption are of increasing importance. The results of this study find that the quality, aesthetics, and rarity and uniqueness of products are related to the psychological bond to maintain the consumer-luxury brand relationship through brand commitment, brand intimacy, brand self-connection, brand partner-quality, and brand satisfaction. One might argue that in the consumer-luxury brand relationship the quality of the brand adds value to the consumer through partner quality in a manner similar to the way that the aesthetics, rarity and uniqueness of products add value to the self-connection (personal) relationship. They provide a type of psychological glue that secures the bond between luxury brands and consumers in the emotional luxury brand experience. When difficulties arise it is the glue that serves to secure relationships, whether personal or brand.

This research was conducted in Europe and there is always a potential criticism concerning the ability to generalize the research results of one study to a broader (and in this case international) population. Addressing that potential criticism it is noteworthy that a survey was conducted by Webo (Webo is

China's major text messaging similar to twitter) in 2011 and again in 2012 to determine the consumer's perspective of top ten brands in China. Six of the top ten Chinese brands (Chanel, BMW, Audi, Mercedes, Burberry, and Dior) were on the author's European research list of 16 companies demonstrating that even without a clear definition of what encompasses the luxury brand there appears to be international consumer consensus on what companies represent a top luxury brand. In addition a seventh company (of 10) on the Webo survey list, Coach, is in the same classification as the firms Gucci, Aramis, Zegna and Hugo Boss, which were on the research list which further illustrates the universality and, due to the time frames involved, sustainable nature across of the international luxury brand.

CONCLUSIONS

The research has demonstrated that a predictive model of the consumer-luxury brand relationship is valid and helps to organize meaning in a consumer's mind. The study has provided implications of a practical nature. The successful application of an interpersonal relationship inventory in a branding setting would be of particular interest to marketers, and it may provide a basic and a user friendly framework that might be useful in the development of a relationship brand strategy.

This study also emphasizes the role of the consumer-luxury brand relationship in appreciating and defining multi-brand and symbolic consumption. In addition, the results of the study offer a more holistic perspective to better understand luxury brand personalities. One contribution of the study is to promote the understanding of how the consumer-luxury brand relationship such as self-connection and partner-quality can stimulate sales but the relationship such as intimacy can contribute to business continuity during times of brand disruptions. This is directly relevant to how a firm should position in the consumer-luxury brand relationship with the understanding that factors such as brand commitment that may have immediate sales consequences.

ASSESSMENT OF TAX BURDEN ON THE OWNERSHIP AND USE OF ROAD FREIGHT TRANSPORT IN RUSSIA

Leontyeva, Yulia¹; Mayburov, Igor²

¹dept.Graduated School of Economics and Management, Ural Federal University, UrFU, Ekaterinburg, Russian Federation

²dept.Graduated School of Economics and Management, Ural Federal University, UrFU, Ekaterinburg, Far Eastern Federal University, FEFU, Vladivostok, Russian Federation

ABSTRACT

The article looks at how taxes influence tax payers' decision as to whether to own and use road freight vehicles. Types of taxes and fees imposed on the purchase and operation of road freight transport as a business are described in detail. Substantiation is provided for an idea that it might be useful to introduce a classification that divides taxes into fixed, variable, and operating ones with regard to the intensity of road freight vehicle use. Fixed transport taxes are viewed as a tax price that is paid for owning a vehicle. Variable transport taxes are viewed as a tax price paid for using the road network. Operating taxes are viewed as a tax price that is paid for running a road haulage business. The study examines the share of fixed, variable and operating taxes in the cost of owning and using a road freight vehicle. A conclusion is made that the total amount of all taxes grows in absolute values for vehicles with a bigger payload capacity, but declines per tonne-kilometre of travel. A conclusion is made that the total amount of all taxes on the use of road freight transport is much lower than the amount of taxes paid on transporting cargo by automobile. The purpose of this research is to assess how the Russian system of road freight transport taxation aligns with global and European trends and to identify areas of further improvement to the truck tolling system.

Keywords: *fixed transport taxes, variable transport taxes, operating transport taxes, road freight cost of owning*

INTRODUCTION

Road freight transport plays a very significant role in the economy of any country. This type of transport generates positive externalities that are important for the economy as a whole and for each household. Road freight transport provides the transit of raw materials and finished products between economic entities. Additionally, road freight transport supports the operation of households by delivering goods they consume and transporting products they turn out.

The operation of road freight transport also creates substantial negative externalities that cannot be ignored. More specifically, road freight transport occupies a lot of road and parking space; it inflicts excessive damage to the road surface, causing it to wear out faster; it has a noticeably negative impact on the environment and is a source of noise. These negative externalities need to be compensated for by means of transport taxes.

At the same time, road freight transport is not homogeneous. Different types of freight transport have different effects and the tax burden on each of them should vary. Such differentiation must not, however, distort competition in the hauling industry.

Two substantial types of competition have now taken shape in the freight industry: (1) external competition between road freight transport and other means of transport (rail, maritime, air); (2) internal competition between various types of road freight transport (light duty, medium duty, and heavy duty). This study aims to establish the role of taxes in a taxpayer's decision as to whether to own and commercially operate a freight vehicle in Russia.

1 THEORETICAL AND METHODOLOGICAL ASPECTS OF ROAD FREIGHT TRANSPORT TAXATION: EXPERIENCE OF OTHER COUNTRIES

It has to be noted that scholars across the world have made considerable progress in the study of the size of charges levied on the operation of various vehicles (including freight ones). Meanwhile, Russia has been lagging behind in research on the matter.

The European Commission has been the key source of initiative for such research, actively providing funding for it over the past two decades. The research sought to harmonize taxation across the European Union and to reduce the discriminatory potential of road haulage regulations in different EU member states.

The most comprehensive take on the matter can be found in works by Nash, Link et al. (Link, 2006), (Link at all, 2014). There are two approaches to charging for the use of road freight transport. The first one is to factor in marginal external costs imposed by the use of road freight transport. The second one is to charge for rectifying the impact of using road freight transport. The first approach is more common of the two. The estimation of externalities on the basis of marginal external costs in European countries made it possible to identify and quantify six key elements.

(1) Additional wear and tear on road infrastructure. The marginal costs of this element were estimated by Link, Nilsson, Lindber (Link, 2006), (Nilsson, 2006), (Lindberg, 2006).

(2) Time lost due to congestion. The marginal costs were estimated using imitation modelling that pull together speeds, flow, substitute routes etc. (Bickel et al., 2006).

(3) Road traffic injuries. The estimation of marginal costs is based upon the value of a statistical life (VSL), that is, the willingness to pay a price in order to reduce the probability of casualties (Bickel et al., 2006), (Lindberg, 2006).

(4) Noise costs are measured using the hedonic price method that measures a change in the price of a property (e.g., a house) caused by higher levels of transport noise (Nellthorp et al., 2007).

(5) Air pollution is measured through the costs inflicted by a higher mortality rate or ill health.

(6) Global warming driven by the emission of greenhouse gases and the monetary value of climate change (Parry et al., 2007), (Lemp and Kockelmann, 2008), (Delucci and McCubbin, 2010).

Median marginal costs of these elements were revealed in a study by Ricci (Ricci et al., 2008) and range between 0.435 and 0.535 euros/vkm during nighttime off-peak hours, which, with certain reservations, can be considered an equivalent of 30 to 37 RUB per tonne-km at 2007 prices.

The theoretical estimations provided a ground for an effective cargo vehicle taxation system that takes into account marginal external costs and includes country-specific annual duties (licenses) and dual taxes as well as toll charges that vary by country. This provides for harmonization of road haulage charges across Europe.

Most European countries have introduced HGV fees that are based on the number of axles and/or the vehicle's weight and its emission class. This makes it possible to factor in two key elements of externalities: wear and tear on the road surface and the cost of air pollution. The size of the fee varies from 0.081 euro/km to 0.4473 euro/km, which is an equivalent of 6.5 to 31 RUB per km. The tolling system in use has, however, some issues: the electronic toll collection system is costly to run; if the cost of administering the fee collection is acceptable, the system is unable account for such factors as the time of the day, road characteristics (such as pavement thickness), and only covers a limited number of roads (Litman, 2011), (Levinson, 2010).

2 TAXES PAID BY ROAD FREIGHT TRANSPORT

The system of transport taxes and levies that are paid by hauliers in Russia was created in the mid-1990s and encompasses a number of elements that were in use in the transport taxation system back in the Soviet period. Back then, the main goal of the system was to encourage car ownership, fleet renewal and an increase in cargo shipment volumes. It is practical to divide taxes and levies paid by transport operators into three groups.

Fixed taxes. For these taxes, the rates are not pegged to the intensity of car use. These are taxes on owning a vehicle. They are paid on a one-time basis when a vehicle is purchased and then on a regular basis regardless of how often the vehicle is used. The size of the taxes is a determining factor of the

affordability of a car and, consequently, of the ease of entry into the road haulage market. The payment of fixed transport taxes is therefore viewed as the tax price of owning the vehicle. In Russia, fixed transport taxes include VAT, registration fees, the recycling fee, and annually paid vehicle tax. In Russia, no stamp fee on the purchase of a commercial vehicle is levied.

Variable taxes and levies. These taxes depend on the intensity of vehicle use and are taxes on vehicle use. The payment of the taxes is viewed as the price paid for using the road network. In Russia, variable taxes include fuel excise duties and a toll charge levied on lorries weighing over 12 tonnes for using federal motorways.

Taxes on financial results. These are taxes on business activities. They are viewed as the tax price that is paid for running a road haulage business. In Russia, taxes on financial results include income tax, the single tax on imputed income, and the road haulage operator license fee (Litman, 2011).

3 METHODOLOGY

Under the proposed methodology, only obvious costs of owning and operating freight transport are quantifiable (Mayburov, 2015). To analyze the cost of ownership, we selected three truck models that account for almost 60 percent of the road freight fleet in Russia (Table 1 and 2).

Type	Payload capacity	Model	Share in vehicle fleet
light duty	1.4 t	GAZelle Next A21R22	27.1
medium duty	8.2 t.	ISUZU FORWARD 12.0 NORMAL FSR90SL-NCUS	23.1
heavy duty	36.5 t.	KAMAZ 6460RP L360	9.1

Table 1. Selection of road freight vehicles for calculating cost of ownership

No	Indicator	GAZelle Next A21R22	ISUZU FORWARD 12.0	KAMAZ 6460RP L360
1	Price, thousand RUB.	1,055	3,375	2,740
2	Fuel mileage, liter/100 km	10.3	16	55
3	Maximum engine power, horsepower	120	210	360
4	Engine	diesel	diesel	diesel
5	Depreciation, %	16	22	60

Table 2. Brief characteristics of the selected vehicles

To calculate the costs, we assume that an average mileage of a vehicle is equal to 60,000 km/year; the price of diesel fuel is RUB35.56/liter, including a fuel excise duty of RUB2.76/liter. The recycling fee is calculated on the basis of the baseline rate of RUB150,000 and the gross vehicle weight rating (over 20 tonnes - 4.79; 8 to 12 tonnes - 2.21; under 3.5 tonnes - 1.32).

The following assumptions provided a framework for calculating taxes on financial results of hauling business operations: (1) a business entity owns 10 vehicles; (2) as a rule, light duty vehicles are owned by self-employed individuals, the business license fee being the most suitable form of taxation for them;

(3) medium duty vehicles are owned by small businesses that are entitled for imputed taxation; (4) heavy duty vehicles are in most cases owned by companies that pay standard corporate taxes; (5) all taxes are calculated for the situation of a major industrial region.

The profit of haulage companies is calculated on the basis of the balanced financial results of shipping businesses in 2013 (RUB7.7bn), and the number of such companies (609,000) (that is, the financial result per entity was RUB12,643/year). When calculating the federal road toll (RUB3.5/km), we proceed from an assumption that federal motorways account for 70 percent of the total mileage of heavy duty vehicles. To calculate shipping volumes we use the load factor of 0.85 and the load mileage rate of 0.82.

The development of the transportation system has given rise and subsequently aggravated problems that are similar to those being experienced by the transportation systems of European countries.

Today, the priority of transportation system development in Russia is to strike the balance between a high level of mobility that is provided by road cargo transport and offsetting external costs of transport use.

4 ANALYSIS OF THE COST OF OWNING A ROAD FREIGHT VEHICLE

Tables 3 and 4 give an overview of the results of calculating the average annual cost of owning and operating a road freight vehicle.

The structure of some expenses broken down by type of costs is shown in Table 4.

Indicator	GAZ	ISUZU	KamAZ
Depreciation	56.27	247.50	548.00
recycling fee included	10.56	24.31	143.70
VAT	8.58	37,75	83,59
registration fee (yearly average)	1.00	1.00	1.00
Fuel	219.76	341.38	1,173.48
excise duty included	17.06	26.50	91.08
Mandatory and voluntary insurance	46.00	190,00	124.00
Taxes, duties and other levies	1.40	4.01	20.23
vehicle tax included	1.40	4.01	20.23
Maintenance	33.00	51.00	90.00
Other expenses	10.55	33.75	27.40
Federal road toll	0.00	0.00	147.00
TOTAL EXPENSES excluding taxes on financial results	366.98	867.64	2,130.11
Taxes on financial results of business operations:	58.1	77.7	25.3
TOTAL EXPENSES including taxes on financial results	425.08	945.31	2,155.40
taxes included, thousands of roubles.	96.70	171.24	364.89
Estimated tone-mileage, thousands of tons - km/year	58.548	342.924	1526.43
Unit expenses on freight vehicles, RUB/ton-km	7.26	2.76	1.41
taxes included, RUB/ ton-km	1.65	0.50	0.24

Table 3. *Cost of owning and commercially operating a freight vehicle, thousands of roubles/ year*

Indicator	GAZ	ISUZU	KamAZ
Depreciation	13.2	26.2	25.4
Fuel	51.7	36.1	54.4
Mandatory and voluntary insurance	10.8	20.1	5.8
Maintenance	7.8	5.4	4.2
Vehicle tax	0.3	0.4	0.9
Federal road toll	0	0	6.8
Taxes on financial results	13.7	8.2	1.2
Other expenses	2.5	3.6	1.3
TOTAL EXPENSES	100	100	100

Table 4. *Structure of vehicle ownership costs, %*

The analysis leads to a conclusion that the cost of fuel prevails in the cost of owning a road freight vehicle. For GAZ vans and KamAZ trucks the share of fuel expenses exceeds 50 percent. The share of mandatory and voluntary insurance tends to go down for heavier vehicles. The share of maintenance costs tends to fall even further for heavier vehicles: from 7.8 percent for a light duty vehicle to 4.3 percent for a heavy truck. Depreciation varies in reverse proportion to the gross vehicle weight rating. The share of depreciation in the cost of ownership grows from 13.2 percent for lighter vehicles to 25.4 percent for heavier vehicles. Other expenses, such as the cost of buying winter tires and other expendables needed for the day-to-day operation of a vehicle are insignificant and do not exceed 4 percent of the total ownership costs.

The efficiency of using vehicles with various load capacities is indicated by total costs per one ton-kilometer (in RUB), which is the cost of moving a ton of cargo one kilometer. The indicator drops for heavier vehicles: from RUB7.3 for light duty vehicles to RUB1.4 for heavy duty vehicles. Per unit costs of freight companies are another good indicator. It compares easily with corresponding prices charged by the companies. For example, the price of transporting a ton of bulky cargo for one km by road costs RUB4.3 in Russia, which is triple the actual per ton-km cost. A rough comparison of the indicator with theoretical estimations conducted in European countries indicated that it is much lower in Russia. For example, the cost of transporting one tonne of cargo over one km by truck is 4 to 30 times lower than marginal external costs, with the tax component in the costs that is meant to be the price paid for causing the externalities being still lower. The share of taxes in total per ton-mile costs is also lower for heavier vehicles: it goes down from RUB1.7 for light duty vehicles to RUB0.2 for heavy duty vehicles. We suppose that because of such a light tax burden there is still room for increasing the share to taxes in the cost of owning heavy duty trucks. It is still possible to further increase taxes even after the introduction of the Platon toll collection system that affects freight vehicles with a gross weight exceeding 12 tons.

5 ANALYSIS OF TAX BURDEN ON OWNERSHIP AND OPERATION OF ROAD FREIGHT TRANSPORT

The structure of various taxes in the cost of owning and commercial operation of road freight transport is outlined in Table 5. The analysis of the results shows that the tax burden on owning a freight vehicle is lower for heavier trucks. This is a pretty weird phenomenon because heavy duty vehicles generate a lot more negative externalities than lighter ones. For example, the Bridge Formula that is commonly used in the USA shows that a 36-tonne nine-axle heavy truck running at 120 km/h is 3,200 times more damaging to the road surface and bridges than a one- or two-tonne car. Consequently, the tax burden should increase in line with the payload capacity.

Indicator	GAZ	ISUZU	KamAZ
Total costs of owning and commercially using a freight vehicle	100.0	100.0	100.0
including taxes and other mandatory charges	22.8	18.1	16.9
fixed	5.1	7.1	4.6
variable	4.0	2.8	11.1
on financial results	13.7	8.2	1.2

Table 5. *Structure of taxes in ownership costs, %*

The share of fixed taxes exhibits practically no dependence on the payload capacity of the vehicle. The share of taxes on financial results goes down substantially along with an increase in payload capacity. Such a reverse correlation is completely illogical. It turns out that self-employed owners of light duty vehicles shoulder a heavier tax burden than haulage companies that use heavy duty vehicles. This happens because self-employed operators pay a fixed business license fee that does not depend on the actual volume of services provided. Haulage companies, by contrast, pay the tax on the profits they actually earn by providing haulage services. Only the share of variable taxes in costs grows in line with an increase in the payload capacity of vehicles. An additional federal motorway toll imposed on vehicles with a weight exceeding 12 tones is the only thing that creates the correct correlation. The introduction of the Platon toll collection system appears to be in line with European trends of levying tolls on the haulage industry, but the size of the fee poorly reflects marginal external costs. As the size of the fee only depends of the weight of the vehicle, it can, at least to some extent, compensate for wear and tear on the road network. The fee rates are, however, much lower than marginal external costs because rapid transition to the tolling system could lead a public outcry.

CONCLUSION

The taxation of road freight transport in Russia needs improving. There should be a correlation between variable transport taxes and the amount of damage imposed by trucks on roads and the environment. The size of variable transport taxes should grow significantly in line with an increase in

the payload capacity. It is also necessary to improve taxation of the financial results of freight businesses. Currently, the taxation of financial results is distorted in favor of large haulage companies. A reform of the system of taxation of road cargo transport that is being conducted in Russia at the moment is in line with global trends and practices, but it has to be noted that the system should take better account of marginal external costs. The next stage of the vehicle taxation system in Russia should focus on refining external cost estimates by each key element, while attention to country-specific issues. As a result, a system of variable transport taxes should be created. At the same time, the user-pays principle should be applicable to all types of freight vehicles and private cars.

RELATIONSHIP QUALITY, COOPERATION AND PERFORMANCE: THE SPECIFIC CASE OF PORTUGUESE COMPANIES OPERATING IN ANGOLA

Maia Alves, Gisela Maria

CECS- University of Minho- Portugal

ABSTRACT

This research encompasses the main concepts of relationship marketing in order to develop a model that explains the different factors preceding the export performance of Portuguese companies operating in Angola; it particularly seeks to understand the relationship between exporters and their local intermediaries from a relationship point of view.

This study is particularly relevant because studies on emergent markets are scarce.

The conceptual model presented is based on the relationship marketing literature, specifically the Morgan-Hunt Model (1994), named *KMV (Key Mediating Variables)*.

It intends to analyse how trust influences both commitment and cooperation. Similarly, it examines how commitment influences cooperation. Finally, this study aims to analyse the association between cooperation and export performance based on the last and next three years.

Concerning the methodology adopted questionnaire and interviews that have been chosen. The study sampled 102 Portuguese companies at FILDA (International Fair of Luanda). Thirty questionnaires were fully completed and the data was analysed through SPSS. Meanwhile, some Portuguese companies' managers were interviewed so that questions related to «how» and «why» could be clarified.

All in all, it was possible to acknowledge a positive association amongst trust, commitment and cooperation. Likewise, it was confirmed that there is also a positive association between cooperation and export performance.

Suggestion for future research is analysis of matched pairs, that is, the Portuguese exporting companies and their distributors in Angola.

Keywords: *International marketing, relationship marketing, commitment-trust theory, trust, commitment, cooperation, export performance.*

INTRODUCTION

In context of the global crisis, the Portuguese market is increasingly becoming a smaller market share for Portuguese companies, therefore it is necessary to take advantage of the installed capacity in Portuguese companies and explore new markets.

In order for production levels to return to its normal level because of the strong current crisis, in order to ensure Portuguese companies their survival, have been seeking new markets, such as the specific case of the Angolan market.

The choice of the Angolan market for this study is due to the fact that the country is outside the European Union and because Angola is the country to which Portuguese companies export more.

In this sense, the weight of Angola in the Portuguese economy has been increasing in recent years.

According to studies of the International Monetary Fund (2008), despite the international economical crisis, Angola is one of the countries with the highest potential for growth in the next ten to fifteen years.

A potential that many Portuguese companies recognize and are strengthening as demonstrated by the increase in the level of Portuguese exports, as stated above.

The Angolan market is a very specific market and trust is a core value in trade relations. We could say that without trust, no one comes to the deal.

An example is that Angolan companies are expecting that representatives from Portuguese companies will go to Angola to establish personal contacts.

Although this behavior goes against the establishment of a personal / business relationship, it will contribute positively to dispel any suspicions and develop a human contact between exporters and potential local intermediaries.

Trust is a concept that has been treated in the context of relationship marketing and constitutes the basis for this study. According to Abosag, Tynan & Lewis (2006) existing theories of relationship marketing have been developed and tested in predominantly social, cultural Anglo-Saxon, but is yet to be tested in other cultural contexts. The inclusion of Portugal and Angola meets this concern.

This study seeks to examine the extent to which the quality of the relationship established between Portuguese companies and intermediaries in Angola contributes to increased cooperation between exporters and intermediaries and in turn, how this is reflected in Performance Export of Portuguese companies to Angola both from the perspective of the past, as well as the future.

In short this research is highly relevant since, Portuguese companies are increasingly not confined only to the domestic market but looking for new markets to ensure their survival.

Thus, it becomes important to analyze the quality and the cooperation in the relationship between the Portuguese exporting companies and their intermediaries in Angola, as well as their impact on export

performance. For this purpose, we resort to a part of the Morgan & Hunt model (1994) by designating KMV (Key Mediating Variable) (Morgan & Hunt, 1994) including the concepts that explain the commitment, trust and cooperation.

The analysis of this issue is relevant to understand how exporting companies should have access to international markets for direct export route and to evaluate the network of relationships and inter-relationships they establish with their intermediaries located in the destination country.

LITERATURE REVIEW

The concept of internationalization

There are various international settings. According to Meyer (1996), internationalization is a process by which a company increases its level of value-added activities outside their country of origin. However, according to Calof and Beamish (1995), it is the process of adapting the company's operations (strategic, structure, resources, etc.) to international environments. From the point of view of Freire (1997), the internationalization of a company consists of the extension of its product-market strategies and vertical integration to other countries, resulting in a full or partial replication of operational chain. As for Chetty & Campbell-Hunt (2001), internationalization cannot be seen only as a process of "growing progression" but as a phenomenon with setbacks, in which companies can be "de-internationalize" or leaving to work a product or giving up foreign direct investment (FDI) and refocusing on export mode reducing (or stopping) its international activities. For Fernández & Nieto (2005), this is the most complex strategy that a company can implement, since its entire supply chain is geared to particular market.

When a company decides to internationalize itself, the first step is to study and choose the target market. Later they need to determine the best way to enter that market. This is a critical decision in international marketing (Viana et al., 2005).

Selecting the correct input mode is essential because a bad decision at this level leads to possible losses and the company is liable to cause an unfavorable image with its potential consumers and, consequently, damage the growth potential (Viana et al., 2005). This implies that additional efforts will be required to renew its image.

Also according to these authors the most common way for a company to develop its international business is export, which can be considered direct or indirect. With regards to indirect export, the company sells through an intermediary located in the country of origin which could be active or casual. Casual export occurs from time to time to take advantage of a possible request. The costs of direct export are higher than that of indirect export. However, both forms of export, direct and

indirect, are not mutually exclusive since the company can export directly to the most important markets and indirectly to the less significant markets (Viana et al., 2005).

Since the direct export may explain the existence of a local intermediary, it is essential to determine the nature of the relationship that the company establishes therewith. In this sense, it was decided to include relationship marketing concept that refers to all commercial activities directed to establish, develop and maintain the success of relational exchange (Morgan & Hunt, 1994).

Marketing relationship according to Miguel-Romero, Capture-Ginger and Adame-Sánchez (2014) aims to generate profitable relationships in the long run, between partners. To Brito and Lancaster, 2014, relationship marketing manages relationships and their goals are loyal customers, monetize them and create a customer base, while the transactional marketing manages resources and its sales objectives, product profitability and market share. The Relationship Marketing brings stability and reduced uncertainty in business, acting as a barrier to entry for competitors and maintaining a stable and solid base (Alexander and Colgate, 2000 cited by Gupta and Sahu, 2012).

According to this, Grönroos (1994) states that the relationship marketing aims to "establish, maintain and improve relationships with customers and other partners, as well as maintenance of business profit, so that all the objectives of all the parties are satisfied." So there is a mutual and reciprocal exchange of keeping promises.

One of the templates referenced in relationship marketing literature referred to as KMV model (Mediating Key Variables) has been proposed by Morgan and Hunt (1994). According to these authors, relationship marketing implies a positive relationship between commitment and trust.

The commitment in a relationship is defined as a persistent desire to maintain a valued relationship "(Morgan & Hunt, 1994). So the commitment exists only when the relationship is considered important.

The theory of social change explains the causal relationship through the principle of reciprocity, which holds that "distrust generates suspicion" and as such, it also serves to reduce the commitment and change in the relationship leads to operation of another barter short deadline (Morgan & Hunt, 1994).

Trust is the major determinant of relationship commitment (Morgan & Hunt, 1994). According to Morgan & Hunt (1994) is the expectation of lower total costs that produces a commitment relationship, thus have an effect on the customer-supplier relationship.

Partners in turn, should avoid opportunistic behavior that could harm either party.

Assuming that the commitment and trust are the key to a relationship, how can these characteristics be developed?

These develop when companies focus on relations, providing resources, opportunities and profits that are higher than the offer made by other parties; maintain high standards of values and allying

themselves to other partners with similar values; communicate important information including expectations, marketing intelligence, and assessments of the performance of the partners; avoid taking advantage of their partners in a way detrimental to them. These actions enable companies and their networks, have a competitive advantage over their competitors and their networks in the global market.

Morgan & Hunt (1994) tested the KMV model under the relations of commitment and trust in the context encouraged by a distribution channel. However, the authors concluded that there is still much to do.

It therefore concludes that the theory of Morgan & Hunt (1994) is assumed to be relevant in explaining the relationship between exporters and local intermediaries based on the concepts of trust (trust) and commitment (commitment). The key concepts for the development of activities - business in establishing, developing and maintaining successful relational exchanges.

In this sense, it can be concluded that the relational exchanges successfully contribute to the cooperation between the parties involved, and this in turn has repercussions on export performance of the parties.

Relationship between trust and organizational commitment.

In relationship marketing trust has been recognized as an important concept (Lagrosen, S. and Lagrosen, Y. 2012). The authors, Morgan & Hunt (1994) theorize that the success of relationship marketing requires commitment and trust relationship. The purpose of this relationship is to gain preferred supplier position (being developed trust) over a period of time. From the point of view of these same authors, the commitment reduces total costs.

Competition, especially in the global market requires companies to continually look for products, processes and technologies that add value to their own offerings. In this sense, partnerships that offer superior benefits are valued thus, companies undertake to create, develop and maintain relationships with partners that when operating together, can offer superior benefits compared to other options. In short, the beneficial relationships are highly valued as they contribute to higher profitability and customer satisfaction.

There are some reasons that cause the decrease of trust. The opportunistic behavior occurs when there is self-interest on the part of one of the partners involved, a fact which results in decreased trust (Morgan & Hunt 1994).

These authors further state that opportunistic behavior and commitment ratio result in a decrease of trust ratio since the partners believe they can no longer trust each other. They also consider that the trust decreases with a partner uncertainty decision.

That is, if one partner is uncertain about the other partner's behavior, this fact alone leads to a decrease in trust in the same partner.

It is important to highlight the positive impact that triggers trust in relationships. The trust takes a partner to realize that future controversial episodes will be functional.

It is understood that by employee conflict, disagreements are resolved amicably therefore, helps prevent stagnation, stimulate interest, curiosity and provides a means by which the problems can find solutions, in the opinion of Morgan & Hunt (1994).

The results of Morgan & Hunt (1994) in their study reveal that trust influences how disagreements and arguments are perceived by partners.

That is, when trust is present, the parties perceive the conflict as functional conflicts. Thus, they can discuss problems openly, because they do not expect harmful actions from their partners.

The trust contributes to reduce the risk of opportunistic behavior on a long term relationship and therefore positively contributes to long-term exposure to the customer. In addition, the trust increases buyer confidence that the short-term injustices will be resolved and reduces transaction costs in exchange ratio (Ruiz-Molina and Gil-Saura, 2012).

Some authors analyzed the trust and commitment bearing in different countries.

According to Abosag et al. (2006), the trust and commitment drivers vary in different countries. Some studies have proven empirical evidence on the nature of the trust and commitment in different countries. These authors encountered that the perception of trust and commitment in Serbia is based on the social and cooperative aspect of the relationship because the culture of Serbia (affective dimension) is of a collective nature while in Croatia, trust and commitment are based on the economic relationship and self-realization (instrumental dimension).

In short, when trust and commitment are present, they produce results that improve the productivity and efficiency that result directly in cooperative behaviors that favor the success of relationship marketing which in turn lead to business success.

The relationship between cooperation and trust

The theoretical arguments of this relationship are classified by Abosag et al. (2006), the trust is felt internally however, is manifested in external actions (behaviors) in the form of cooperation.

For Abosag et al. (2006), the theory of trust and commitment Morgan & Hunt (1994) introduced much cited aspects of relationship marketing. These authors argue that trust and commitment are the main variables that lead to building a relationship of "cooperation". Still with these authors, the growth of various forms of relationship is due to the trust which is essential to establishing cooperation relations.

When trust is established, businesses learn that the coordination of joint efforts will lead to results that the company could not reach if they acted only based on their own individual interest (Anderson & Narus, 1990 p. 45).

The functional conflict, that is, when the differences are resolved amicably, can enhance relationship marketing in productivity and should be seen as "just a part of doing business" (Anderson & Narus, 1990 p. 45). In this sense, it can be deduced that the functional conflict is beneficial in a relationship; thus being assured trust; the conflict itself is perceived as an integral part of the relationship and accordingly, lead to cooperation of the parties.

Aulakh et al. (1996) indicate an order of causality between trust and a cooperative orientation to the extent that trust allows the bilateral domain that meets individual goals for independent companies through joint achievements, shared beliefs, mutual interest and long-term benefits.

Using the prisoner's dilemma game, Rokkan et al. (2003) show that the expectation of future multiple interactions makes cooperation more attractive choice. Moreover, Heide & Wathne (2006) argue that in long-term relationships with high social content, the parties adopt systematic cooperation. Obadia (2008) defines commitment expectations as the belief of the parties that the relationship is stable and safe (Johnson et al., 2004). As mentioned by Obadia (2008), trust enables companies to have access to crucial information needed to cooperate.

In addition, trust and commitment encourages companies to participate in idiosyncratic investments cooperation requires.

Finally, the companies involved in a long-term relationship tend to seek mutual goals (Heide, 1994), which summarizes a cooperative norm.

The relationship between commitment and cooperation.

Secondly, Obadia (2008) stresses that the impact of cooperation in organizational performance is based on social relations; these are based on the understanding that the partners get involved in a long-term commitment. Gilliland & Bello (2002) state that in this type of relationship, the social goals are more important than economic objectives. Therefore, Heide (1994, p. 77) adds that the parties "renounce rewards present in the base of a long-term equity anticipation".

In case of low economic performance, such partners respond by strengthening ties and fighting for the survival of a long-term relationship.

In the case of exporters and importers, there is a special incentive to cooperate to revive a failed relationship: both companies are aware that they will face high transaction costs ex ante, and start looking for a new partner.

In reality, when the switching costs are high, the partners tend to be more concerned with the relationships (Dwyer et al., 1987).

To Ambler and Styles (2000), cooperation between partners allows an intensive exchange of valuable information and to solve problems together.

Thus, the importer knows he can count on the exporter for help in case of difficulties (Obadia, 2008) and vice versa. On the other hand, the cooperation implies that the exporter and importer have a set of common objectives and understand that they can only reach them working together (Bello et al., 2003). Thus, the importer enjoys all the benefits you can take from the exporter's suggestions and tends to receive them and vice versa is also true. If the partners do not raise important issues, it is likely that problems are not solved.

One can even say that an insufficient level of surveillance from distributor (importer) takes the seller (exporter) to overlook potential problems which prevents the vendor from proposing appropriate solutions to these same problems. Furthermore, the benefits of cooperation are based on the two parts pro activity.

Each party proposes its solutions to the many problems that must be solved together.

If socialization process results in a "fusion" which causes both partners think and act the same way, the advantage of being two separate entities to own ideas and experiments disappears.

This decreases the quality of debate among trading partners and, in turn, leads to a lower quality of cooperation. According Obadia (2008), cooperative standard plays an essential role when there is adversity because the parties determine how to solve problems together.

The partners believe that the cooperation is crucial. Each partner offers the most effective solutions to deal with the problem. In short, according to Obadia (2008), in the case of low performance, more effective cooperation emerges. Palmatier et al. (2007) states that the literature has shown that various forms of adversity can strengthen the effect of relational standards.

In short, we can thus conclude that there is a positive relationship between trust and commitment just as there is a positive relationship between trust and cooperation.

There is also a positive relationship between commitment and cooperation on the basis of Morgan & Hunt (1994).

Cooperation and export performance

There are several authors exploring the importance of cooperation under the export performance. To Obadia, (2008), the relationship between cooperation and performance is important regardless of the performance context. Exporters can improve the performance of its international activity and promoting the development of behavioral norms.

This means that a standard cooperation helps coordinate the behavior of partners in the international context.

The effectiveness of such a rule increases in difficult times, which support the idea that cooperation can be seen as a tool (Obadia, 2008).

Unlike previous studies on the relationship between exporters and importers, Obadia (2008) conceptualize and operationalize cooperation as a norm of behavior.

This new conception of cooperation makes it possible to assess the impact on the importer's distribution Performance and what the conditions of success of the export company are. It is revealed that the cooperation can be used to improve non-commercial relations.

Thus, the cooperation can be an alternative to expensive formal management mechanisms and time-consuming searches for new foreign representatives.

To be the source that sustains the performance above average, the funds must meet three criteria. Must be: (1) valuable; buyers are willing to buy the output capabilities at significantly higher prices than its costs (2) rare; so that buyers can't go back to the competitors with the same resources or substitutes (3) inimitable; which means it is difficult for competitors, to either emulate or acquire the resources (Combs & Ketchen, 1999). Moreover, the ability of a resource to meet these criteria depends mainly on industry characteristics affecting the value of a resource (Amit & Schoemaker, 1993).

Brand reputation, for example, may be more valuable in experiential service industries than in industries where quality can be determined before buying (Nayyar, 1990). Features that are rare, inimitable and entitled to create value "strategic resources" (Chi, 1994).

Based on Combs & Ketchen (1999) cooperation between companies offers this kind of incentive because the rewards of cooperation partners are largely dependent on their own performance results.

Secondly, Obadia (2008) in the context of casual exports believes it is worth investigating if the cooperation works only when the performance is good or whether it can be effective even when the past economic performance is low.

In short, the trust and commitment foster the development of a cooperative norm which in turn improves the performance of importers' distribution (Obadia, 2008).

Based on what was said, then it presents the assumptions and the conceptual model guiding this research work.

Based to the literature presented above, the working hypotheses are as follows:

H1: The greater the trust between the exporter and agent / distributor the greater the commitment tends to be.

H2: The greater the trust between the exporter and agent / distributor the higher cooperation tends to be.

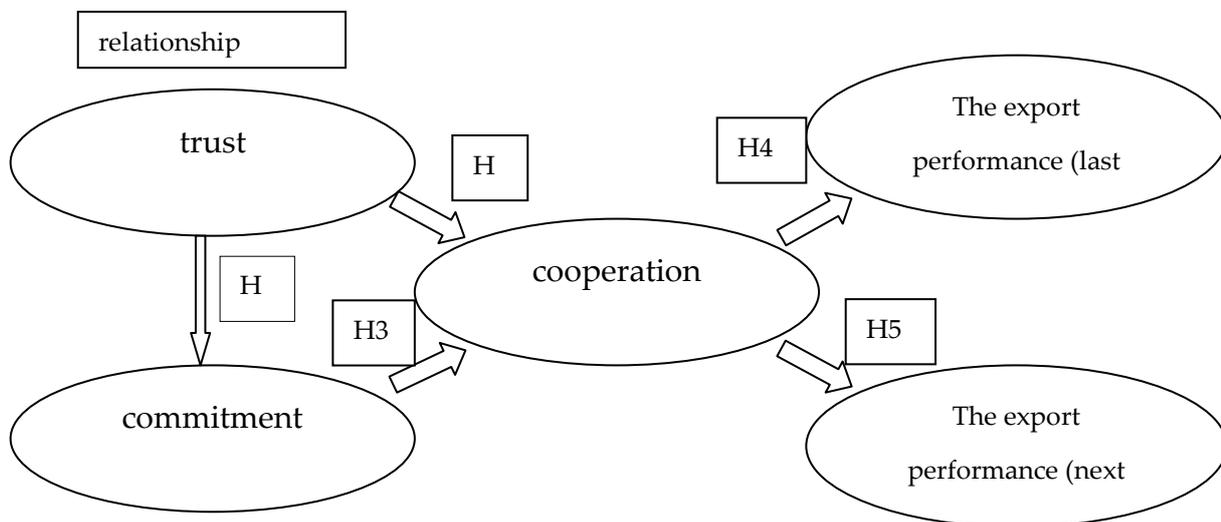

H3: The greater the commitment between the exporter and agent / distributor the higher cooperation tends to be.

H4: The higher the cooperation between the exporter and agent / distributor the more likely the export performance tends to be.

H5: The greater the cooperation between the exporter and agent / distributor the more likely the export performance tends to be.

These hypotheses are represented in the following model (Figure 1).

Figure 1. Conceptual Model

METHODOLOGY AND DESIGN STUDY

As regards the "Study design", this research is highly exploratory but quantitative. However, given the nature of the object under examination, it will also use the qualitative nature of methodologies including interviews based on unstructured questionnaires.

The questionnaire will be aimed at analyzing the association between a set of independent and dependent variables. The geographical context of the state, as mentioned, is the Angolan market. Given the nature of this study (cross-cultural), it will take into account the specific nature of that market.

Given the apparent difficulty of collecting data, a material event where there are the most Portuguese companies present including an international trade fair (FILDA- Luanda International Fair, 2009) were identified. The population in question shall consist of all Portuguese companies exporting to the Angolan market. The sampling process will be for convenience since only companies present in Angola FILDA will be considered for this study.

With regard to the proposed theme, our belief is that the relationship marketing area is a scarce study comparing different international contexts. Therefore, our goal at the time of this study is to fill this gap in research since there is no scientific study to examine the quality of the relationship, cooperation and performance in the specific case of the Portuguese companies operating in Angola.

The purpose of this study is to investigate and contribute to a better understanding of this issue that has become increasingly important.

See in appendices 1 the measuring instrument development and the operationalization of concepts adopted in this study and in appendices 2 the Interview guide (exporters vs. agents / distributors).

Samples and data collection procedures

The questionnaires were applied directly to a population of 102 Portuguese companies that were presented at the International Fair of Luanda - Angola; FILDA 2009; 14-19 of July 2009 under the flag of Portugal.

Of these 102, 30 valid questionnaires were given, which corresponds to a response rate of 30/102 (29.4%) which is acceptable for such a study.

Of these 30 questionnaires, it was decided to eliminate 9 for not meeting the criteria stipulated by the investigator as regards the existence of a relationship with a local intermediary.

After the data collection, we proceeded to the preparation and analysis of the data which were then entered into the SPSS statistical program, presented the methodology and research design, then proceeded to the analysis and discussion of the data.

DISCUSSION AND ANALYSIS OF DATA

Sample profile

There is a range of activities (NACE) in the study sample, although there is a clear predominance of the industrial sector companies.

Almost 67% of the key clients in international markets of companies in the sample develop a wholesale business.

Regarding the percentage of sales in international markets 38.1% ranges from 5% to 25%; 23.8% sell between 26% to 50%; 19% is from 51% to 75%.

Regarding the percentage of sales in international markets, 38.1% ranges from 5% to 25%; 23.8% sell between 26% to 50%; 19% is from 51% to 75%.

Finally, 4.8% have a percentage of less than 5% sales, an identical value to companies that have a percentage of sales from 76% to 95%. Similar value is presented by companies that have a higher percentage of sales up to 96%. Finally, 4.8% of companies do not know and / or do not answer the question.

In summary, almost 24% of companies have a percentage of sales for international markets exceeding 50%, which means a high degree of internationalization.

With regard to direct export, the sample shows the following results: 47.6% of the sample confirm that this type of export is very significant; 23.8% are indifferent; 9.5% of this type of export is something significant; with similar percentage this type of export being nothing significant; 4.8% is negligible. Finally, 4.8% did not respond or did not know. In short, up to 57.1% of the companies' direct export is something meaningful and significant.

In regards to the indirect export, this sample shows the following results: 38.1% of the sample confirms that this type of export is something meaningful; 19% of companies stated that it is very significant. In contrast, 14.3% of companies stated that this type of export is negligible and 4.8% is nothing significant. Finally, 4.8% did not respond or did not know.

In short, for 23.8% of companies, the indirect export is something meaningful and significant.

Preliminary analysis of the concepts and reliability of measurement scales.

Through the reliability of the analysis, the internal consistency of the scales or the degree of homogeneity of the items making up the scales of measurement were examined and the extent to which it was free of random error was found¹.

The Cronbach's alpha (α), is a commonly applied estimation (Hair et al., 2006) to analyze the degree of internal consistency of an aggregate scale, based on the average correlation between pairs of

¹ It should be noted that the term of validity reliability differs, the latter being wider, indicating the degree in which the measurement process is free of both systematic errors like random errors.

indicators¹. It proceeded to an item-total correlation analysis corrected, in which the correlation coefficients between each item and the corrected score (group score minus the score of the item) of their group were used. Thus, in order to ensure internal consistency and homogeneity of the respective dimensions of each scale, items that in aggregate have a low correlation with the total score (ie, $r < 0.25$) were eliminated (Nunnally, 1978).

These items show from the start a low degree of internal consistency, it means that it does not have a covariance that is consistent with the total score or other items.

Those whose correlation, were less than 0.25, or whose elimination would allow obtaining a considerably higher alpha were removed from the analysis items.

Discussion of Results

Descriptive data analysis (Average and Standard Deviation)

With regard to trust dimension, as we can see, the item that has a higher Average is: "It's a correlation based on high integrity" (M = 4.30; SD = 0.64). In contrast, one that has a lower mean is "Our main agent does not take advantage (or advantage) of our company if they have that opportunity" (M = 3.53; SD = 1.16).

With regard to commitment dimension, the item having a higher average is "This correlation is very important to us" (M = 4.64, SD = 0.57). In contrast, one that has a lower mean is "This correlation is almost like belonging to a family" (M = 3.42; SD = 1.11).

With regard to cooperation dimension, the item that has a higher Average is: "Strategic information marketing (eg new products, market trends, sources of supply.)" (M = 4.05; SD = 0.74). On the other hand, one that has a lower mean is "Inventory Policy" (M = 2.71; SD = 1.37).

With regard to Performance (last 3 years) size, the item that has a higher Average is: "New Products" (M = 4.15; SD = 0.65). On the other hand, one that has a lower mean is "Market Share" (M = 3.21; SD = 0.93).

As regards the size Performance (next 3 years), the item having a higher average is "Volume" (M = 2.8; SD = 0.51). On the other hand, one that has a lower mean is "Profit" (M = 2.45; SD = 0.74).

Composite model variables

As regards the composite variables from the model, the impairment variable is one that has a higher Average (Mean = 4.23): 1 = None arrangement; 5 = strongly agree.

In contrast the performance variable (future), it is one that has a lower average (mean = 2.69) in a Likert scale of 1 to 5 where 1 = very bad and 5 = very good.

Discussion of Data

¹ However, as noted Hair et al. (2006), the limitation of this measure lies in the fact that there is a distortion related to the number of indicators of an aggregate scale. Scales aggregated with the largest number of indicators tend to report higher alphas.

To achieve the proposed objectives in this work, it is important to analyze how the different concepts of trust, commitment, cooperation, performance (past) and performance (future) correlate with each other (Table 1).

Table 1- Matrix Correlations

	Alfa	1	2	3	4	
1. Trust	0.84	1				
2. Commitment	0.77	0.81**	1			
3. Cooperation	0.65	0.37	0.486*	1		
4. Performance (<i>last</i>)	0.84	0.072	0.23	0.58**	1	
5. Performance (<i>future</i>) ^b	0.91	-0.23	-0.20	-0.52 *	-0.31 ^a	1

Note: ** $p < 0.01$ (2-tailed); * $p < 0.05$ (2-tailed); ^b was used 7 point scale (*Likert-scale*)

Based on the Pearson correlations the data reveal that, despite the fact that we are in the presence of a small sample size, there is a fairly strong positive correlation between variables as proposed in our model.

With regard to the events set forth in the study, one could say that:

The first hypothesis holds that: the greater the trust between the exporter and agent / distributor the greater the commitment tends to be. You can see that there is indeed a strong positive and significant correlation between these two variables ($r = 0.81$; $p < 0.01$) suggesting that there is a high quality in the correlation between exporters and their local intermediaries. In this sense, we can say that Hypothesis 1 is supported by the data.

This result can be supported by the following interview which states that:

"It's a tough little structured market where trust is critical, crucial." (...) "Shared values are the values of culture, mentalities. Understanding is easier between the Portuguese and the Angolans than among Angolans and the Irish. (...) Usually companies that use letter of credit have the guarantee that the customer will pay but if they do not pay, the bank pays all the same. I already know the company for X years then I no longer need a letter of credit value upon order. Letter of credit; advance; payment on delivery depends from company to company. "

However, as we can see from the interviews, there is great suspicion as regards the financial relationship, so it is necessary to strengthen the social dimension of the correlation to minimize the negative impacts resulting from the failure to collect. As regards social relations, there are shared values that are the culture of values, mentalities. In short, although there is trust in the affective / social does not mean that there are no bank guarantees for the fulfillment of financial operations.

With regard to the second hypothesis, it argues that the greater the trust between the exporter and agent / distributor the higher cooperation tends to be.

Data for this association have a non-significant positive correlation to the level of significance of 5% ($r = 0.37$, $p < 0.09$).

Based on this assumption, we have decided to partially confirm this hypothesis. This result can, however, be supported by the following interview:

As regards the shared values, this is highly variable. Still, "the difficulties encountered in Angola arouse a survival spirit that tends to devalue Branding values that should be important factors of brand differentiation."

As for the commitment, it is also variable. Some importers "show a greater ability to meet targets and maintain regularity in the market. Still, external stressors (port difficulties, logistics, customs and foreign exchange) often provide adequate justification for failing commitments."

Finally, with regard to cooperation, it "also varies widely and directly resulting from the two previous."

This is confirmed by the interview that follows:

"Cooperation towards the Portuguese company that comes here (Angola): Portuguese companies sell (mobile phones) to an Angolan company. The Angolan company says "I want exclusivity." The Portuguese company says "I will not give you exclusivity, I will sell it to you, but if a company wants to buy in Lobito or Luanda, we will sell it to them too".

This initiative can be from Angolan companies or Portuguese companies. "I want exclusivity."

Usually Portuguese companies prefer to sell as much as possible here and there. Especially because there is a lot competition between importers and which is good, because they want to sell more of their product."

We can thus deduce from this statement that the cooperation is due to the commitment as well as shared values.

As for Hypothesis 3, this is based on the assumption that the higher the compromise between the exporter and the largest player the higher the cooperation tends to be. The data for this combination show a significant positive correlation considering a significance level of 0.05 ($r = 0.48$; $p < 0.05$).

The confirmation of the hypothesis can also be verified through the interview when the respondent states that "cop (cooperation) - It is also very variable and directly resulting from the two previous (Co (commitment); S (shared values))."

As for Hypothesis 4, this is based on the assumption that the higher the cooperation between the exporter and the largest agent the higher the export performance (last 3 years) tends to be.

The data for this combination show a significant positive correlation considering a significance level of 0.05 ($r = 0.58$; $p < 0.05$).

Finally, Hypothesis 5 is also based on the assumption that the higher the cooperation between the exporter and the largest agent the higher the export performance (last 3 years) tends to be. Interestingly, the data for this association have a significant negative correlation considering a significance level of 0.05 ($r = -0.52$; $p < 0.05$). This result is particularly interesting in that future expectations of Portuguese entrepreneurs are relatively low in relation to the performance of their companies. Table 2 systematizes the results obtained in this study.

Tabela 2- Validation of Hypotheses

Hypotheses	Validation
H1: The greater the trust between the exporter and agent / distributor the greater the commitment tends to be.	Supported by the data
H2: The greater the trust between the exporter and agent / distributor the higher the cooperation tends to be.	Partially supported by the data
H3: The greater the commitment between the exporter and agent / distributor the higher the cooperation tends to be.	Supported by the data
H4: The greater the cooperation between the exporter and agent / distributor the more likely the export performance (last three years) tends to be.	Supported by the data
H5: The greater the cooperation between the exporter and agent / distributor the more likely the export performance (last three years) tends to be.	Supported by the data

The analysis and discussion of the data, the analysis of the findings and implications of the study were presented.

CONCLUSIONS AND STUDY IMPLICATIONS

As it is with this research, the purpose of this article is to analyze how the different concepts are correlated with each other, ie the trust, commitment, cooperation and export performance (last and next three years).

The purpose of this study is to contribute to a better understanding of relationship quality through trust and commitment which in turn influence the cooperation and therefore the export performance (last and next three years) of Portuguese companies operating in Angola.

That is, how trust influences the commitment and how to influence the trust cooperation. In turn, how they influence commitment to cooperation was analyzed. Finally, how cooperation influences the performance Export was examined.

This study had revealed that there is a strong positive and significant correlation between trust and commitment suggesting that there is a high quality in the relationship between exporters and their local intermediaries.

The data also confirms that there is a strong positive and significant correlation between commitment and cooperation.

This is particularly interesting in the Angolan market owing to special factors resulting from social relations between exporters and local intermediaries. As it can be seen in some interviews carried out, the "bonus system" is a constant in Angola.

On the other hand, the data also confirms that there is no significant positive correlation between trust and cooperation. That is, the hypothesis 2 is partially confirmed.

The study data also reveals that there is a strong positive and significant correlation between the cooperation and export performance (last 3 years).

On the other hand, the data also confirms that there is a strong negative correlation between the cooperation and export performance (next 3 years). This result is interesting in that it indicates a certain distrust / uncertainty about the future.

In short, the analysis of the data allows us to conclude that only the hypothesis 2 is partially confirmed, that is, it maintains that the greater the trust between the exporter and agent / distributor the higher the cooperation tends to be. The remaining hypotheses are validated in its entirety by the data obtained.

Regarding suggestions for future researches, this work can suggest the necessity to improve the relationship between the exporters and the local intermediaries in a longitudinal perspective. This research would make a dynamic analysis of the behavior of the Portuguese companies operating in Angola.

The use of a wide and longitudinal sample is certainly one of the assets of the study.

A business relationship involves two parties, and the current research only used data collected from a single side, from Portuguese exporters. So, suggestion for future research is analysis of matched pairs, that is, the Portuguese exporting companies and their distributors in Angola.

Therefore we can suggest an analysis aiming to assess both sides and extend it geographically to other countries. So, other export countries that might be relevant for further investigations are Mozambique and Brazil.

The presented conceptual method will only win and will be enriched if new values are added to it.

APPENDICES

APPENDICES 1

Measuring instrument development

As mentioned, the quantitative study design was based on a survey questionnaire. It is a cheaper method to quantify and collect a plurality of variables, has low cost; achieves a large geographically dispersed population, confers a greater degree of freedom and time to the respondent, the possibility of happen distortion is smaller, allows to obtain often surface data and more detailed data can be obtained with open questions (Barañano 2008; Lakatos, 1991).

However, it is important to note that the use of the questionnaire also has some drawbacks of which the most important is the low response rate. The questionnaire development was not only based on the contribution of exploratory interviews, but also on the relevant literature.

In order to evaluate the questionnaire issues, a pre test / pilot test by three academic and two businessmen / general managers who suggested some adjustments or adaptations making it more noticeable and adapted to the reality of the Portuguese companies and agents / distributors located in the Angolan market was conducted.

The structure of the questionnaire and your organization is a task of the utmost relevance since it must contain the appropriate questions for collecting the information that will be needed to solve a particular problem under study. Similarly, the issues should be linked consistently by different topics under review.

Operationalization of concepts adopted in this study

Most of the concepts used in this study were based on the work of Morgan & Hunt (1994). These variables were measured on a scale of 5-point Likert (1 = Nothing agreement; 5 = strongly agree).

Trust

Items:

- It's A relationship in which there is not always existing trust;
- It's A perfectly honest and truthful relationship;
- It's A relationship based on loyalty;
- It's A relationship based on what is actually correct;
- It's A relationship based on sincerity;
- It's A relationship based on high trust;
- It's A relationship based on high integrity;

- Our Main agent does not take advantage (or advantage) of our company if they have the opportunity;
- Our Main agent scrupulously keeps the established promises

Commitment

Items:

- This Relationship involves a high involvement / commitment on our part;
- This Relationship is very important to us;
- This Relationship is negligible;
- It's Something the company intends to maintain indefinitely;
- This Relationship is almost like belonging to a family;
- It's Something with which the company really cares about;
- It looks like the company devotes its maximum effort.

Cooperation

Items:

- Advertising / Joint promotion on a base / regional;
 - Politics Return of defective products;
 - Politics Inventory;
 - Politics Discounts;
 - Information Strategic marketing (e.g. new products, market trends;. Supply sources);
- Company -Collaborators are sent from the country to support the main agents and / or distributors.

As regards the variable **export performance** was based on input from Sousa & Lopez-Martinez & rabbit (2008).

Items:

- Volume Exports;
- Growth In export sales;
- Profits Arising from export activity;
- Market share;
- Growth Market share through exports;
- Success of New products.

A scale of 5-point Likert (1 = Nothing agreement; 5 = strongly agree) was used to measure the variable export performance in the last three years. In what refers to the export performance for the next three years, a range of 3-point Likert (1 = Worsen; 2 = Maintain and 3 = Improve) was used.

In terms of data collection, the questionnaire was supplemented with interviews in order to allow a better response to the study questions.

APPENDICES 2

Interview guide (exporters vs. agents / distributors)

1) Generally where is the main form of access to the Angolan market by Portuguese companies?

2) In the case of opting for export, is it often the use of agents / local distributors?

2.1) How do you establish the choice of these agents / local distributors?

3) Is the identification of the most appropriate agents / local distributors for the distribution of products in the target market done through the AICEP?

4) How would you characterize the relationship between agents / local distributors and Portuguese companies in the following dimensions: trust (t), shared values (sv), commitment (co) and cooperation (cop), communication (com) (..)

5) What are the main problems that occur when there is a break in the contractual relationship between export companies and agents / local distributors?

A NEW PUBLIC MANAGEMENT APPROACH TO PPP NORMS

ABSTRACT

This paper aims at highlighting the concrete legal and managerial relationship between New Public Management (NPM) and the Public-Private Partnership (PPP). The prevailed School of Thought in the capitalist world, the last decades, consists in the NPM approach to the public sector. Institutional PPP has to do with companies created by public and private investors or with public enterprises partially privatized. A more recent innovation has to do with the PPP contract model, included in the framework of the contracting out phenomenon, whose main alternative forms are concession contracts and the PPP ones. PPP contract is a type of long-term formal contract between the public sector and the private one, based on an important risk allocation for various scopes, consisting either in technical works or in provision of services or in both. PPP not only exemplifies NPM but it is strongly related to the notion of ethics within the state system of values, let alone the fact that it is used almost exclusively for non reciprocal scopes. However, even this innovation is not exempted from various problems.

INTRODUCTION: PPP ALTERNATIVES IN THE NPM CONTEXT

This paper aims at highlighting the concrete legal and managerial relationship between New Public Management (NPM) and the Public-Private Partnership (PPP). The prevailed School of Thought in the capitalist world, the last decades, consists in the NPM approach to the public sector. One of its tools is the PPP, whose forms are at least the following:

- the “institutional PPP”, which has to do with the organizational aspect of entrepreneurship of the public carriers: it is about companies created by public and private investors or public enterprises partially privatized.
- the PPP model of public contracts, regulated by national legislative norms.

It would be interesting to analyze the relationship between the PPP contract norms, for the state and the wider public sector, and NPM.

THE NPM SCHOOL OF THOUGHT

Theoreticians periodically expressed the need for the public sector to focus on the principles of productivity, efficiency and control (G.A Hodge, C. Greve, & A.E Boardman, 2011). The development of new theoretical power, known as the New Public Management NPM, emerged in the 1980s and 1990. This power seems to redefine the role of market forces (input-oriented management styles by market). (Walzer & Jacobs, 1998, Bult-Spiering & Dewulf, 2006).

The theory of the New Public Management (NPM) was born in the UK in the early 1980s (although the theoretical origins are earlier). The Conservative government of Margaret Hilda Thatcher became the first to engage actions of private individuals in public projects, by reducing the state budget expenditures. Oliver and Drewry (1996) support that the years *“when Margaret Thatcher became the prime minister have been particularly associated with radical programmes to reform public services – both substantively, in terms of the nature and range of services provided by the state, and institutionally, in terms of the way in which service provision is organized and funded”*.

From this reform resulted the development of an innovative for its time tool of cooperation between the private sector and the public one, known as Private Finance Initiative (PFI). Specifically, the Government of Prime Minister John Major introduced PFI in November 1992 to cope with economic crisis. Realizing that the State had lost the ability to solve economic problems by its own, Major decided *“to put into the game”* private partners, ruled by commercial concepts and not necessarily by the public values that the state is supposed to ensure (Bakali & Maniatis, 2013).

Primarily the adoption of NPM is due to the influence of three factors: the pressure in the economic level, the high-level political commitment to change and a set of ideas relevant to the design of change (Borins, 2002).

NPM is based on two tenets: a) limiting the differences between private and public sector, and b) changing the mode of operation of public organizations on the commitment to the rules to their orientation to results (Hood, 1995).

The OECD also supports the trend of international convergence in a "reformer Joint Program" and promotes the adoption of the principles of NPM in all European Union members (OECD, 1995).

In contemporary international reality, the public sector modernization and the NPM are common issues in public administration and characterized by elements, such as inter alia that each unit must have a manager and ensure unity of command whilst, competition should exist between the state and the private sector public (Osborne & Gaebler, 1992).

These principles are connected with the provision of services in a universe dominated by the tendency to limit funding and reduce costs through internal economies, in the context of the urgent need for a more effective response to political and social changes.

Nowadays, public organizations that implement NPM are judged on their results. The main features that distinguish NPM from the traditional management consist in extroverted stance towards the citizens – customers, to improve the quality of services. The focus is on:

- *the effectiveness*
- *the efficiency* (associated with funding and the results obtained) and
- *the economics of administrative actions*: here NPM emphasizes economics, expressing its evaluation of economic costs relative to the benefits and the estimated cost in terms of efficacy (Michalopoulos, 2003 & Bourandas 2002 & Karkatsoulis, 2001).

NPM in the case of PPP examines the trend relevant to the authorities and the private sector values, including the privatization of public bodies, the award - through contracts and agreements – of public service to private organizations, therefore through contracting out (Broadbent & Laughlin, 2003). Furthermore, it focuses on the orientation of the public sector to a "business" type cost management, based on a more efficient and economical public service system.

The Greek experience on current NPM applications is not different from the one of other European Union states whilst NPM in Greece, to date, has been successful for various reasons (Tsakalakis, 2013).

CONCESSIONS

Concessions are long-terms agreements having to do with reciprocal scopes, namely either with the construction of public works and their economic exploitation or the delivery of services, outside the traditional legal framework. In the Greek legal order each contract is submitted to ratification by the Parliament, as there is no legal framework on the matter.

In Greece, the first introduction of an informal and not explicit PPP model was held in 1993, in form of concession, in virtue of P.D 23/1993. At that time, public works concessions were considered as a rather "legal paradox" (Trova & Koutras, 2001).

Although the absence of a material law on PPPs, in the 1990s, the Central Administration of Greece used the method of synergies (informal PPPs) mainly to attract private funds to carry out large construction projects. Such important works were the big international airport "Eleftherios Venizelos" in Athens, "Attiki Odos" and the bridge Rio-Antirrio "Charilaos Trikoupis", which was co-financed by the European Investment Bank.

Many had highlighted the need for the development of a legal framework that would allow a wider implementation of partnerships, particularly for non reciprocal scopes relevant to social fundamental rights (schools, hospitals etc.) (Anonymous, 2014).

As long as reciprocal scopes are concerned, through the use or operation of the infrastructure and the reciprocal charges, the Special Purpose Vehicle (SPV) of the private partner involved receives no availability payments. These projects, due to the high risk taken by the private sector for the repayment of capital (since there are no payments from the government), require special preparation and arrangement of a series of issues related to their bankability.

PPP CONTRACTS LAW

The Greek Parliament voted in September 2005 the Law 3389/2005, a legal framework for PPPs, in accordance with European directives 2004/17 and 2004/18. This text established the following two administrative competent bodies:

- a) the Joint Ministers' PPPs Committee, which is the decision-making governmental organ, and
- b) the Special Secretariat for PPPs, within the Ministry of Economy and Finance.

It encourages ad hoc solutions tailored to the specific needs of each project given its uniqueness and particularity. It adopts the jurisprudence of the Greek Council of State law on the domains of public activity being incompatible with any public contract, the PPP one included, such as:

- national defence,
- policing,
- delivery of justice and
- execution of penalties imposed by the courts.

Partnerships may be subject to the provisions of this law if they meet the following conditions:

- a) they have as their scope either the execution of technical works or the delivery of services (or both), for which the public sector is competent,
- b) they include risk allocation whilst an important part of the risks relevant to the financing, construction, availability and demand of the scope and the associated risks, such as the administrative and technical ones, are in charge of the private partner,
- c) they are based on financing, in whole or in part, of the construction of the works or of delivery of services through funds and resources ensured by the private sectors and
- d) the total estimated cost is not superior to 500 million euros (at first the limit provided was 200 million euros) without taking account of the corresponding Value Added Tax. However, one or more of the last three requirements may be ignored in exceptional cases, through a unanimous decision of the competent governmental organ (Maniatis, 2010).

ARE PPPS VALUE FOR MONEY?

International experience has proved that PPPs are able to provide high quality services and goods that satisfy citizens' demands in an effective way. According to an opinion, the successful application of this method leads to a reduction in total financial costs by 15-20% against the traditional procurement (Venieris, 2007). The success of a PPP in practice largely depends on the thoroughness of the contractual framework to be agreed as well as on the accuracy and clarity of the terms that will rule its implementation. However, no clear and definite data have been produced to date, as long as PPPs are compared with traditional public procurement on international scale, let alone the fact that PPPs are reserved for big infrastructure.

Greece put into use late the formal mechanism of PPP and has limited experience even as for concessions, for various reasons (Getimis & Marava, 2002). Nowadays, Greece has strongly recovered, for instance in 2014 7 PPP contracts were signed with a total value of 465 millions euros. Those contracts represented 0.26% of Greek GNP, whilst the first position is occupied by Ireland (0.47% of GNP) and the second one by the UK (0.36% of GNP).

On one hand, the fundamental advantage resulting from the PPP contract model against traditional public procurement consists in the good involvement of the private carrier, for a long period, during the execution of the contract. This value for money is supposed to be achieved through a better risk allocation and the commitment of both partners whilst the private partner should be entitled to consider how projects will be exactly implemented (Mourmouris, 2006). Some of the potential advantages of PPPs are the following:

1. Effective use of infrastructure, with the possibility of commercial exploitation by the private company.
2. Releasing resources for other projects.
3. Possibility to finance public works and services by private capital.
4. Qualitative infrastructure with greater functionality throughout its life.
5. Flexibility of the legal framework (Kitsoglou, 2008).

On the other hand, the main disadvantage of PPPs consists in the increase in the cost, as the public sector participates in financing the project. Some of the potential disadvantages are the following:

1. Limitation of the state control on the project by the State, since the management and the operation are done by the private partner,
2. They do not serve the Public Interest.
3. Monopolistic behaviours.

4. Deterioration in the provided quality, due to efforts to reduce the operating costs of a project.
5. Political risk.
6. Diffusion of responsibility, ability to evade democratic control.
7. Inefficient management contract (Gkafaridou, 2008).

PPP AND NPM

The objective of PPP is the logical management to achieve a higher return on investment and to capitalize on the expertise and sometimes financial resources from the private sector. (Roehrich, Lewis & George et al., 2014). PPP is considered as a result of NPM, a modern tool of the alternative contracting out phenomenon, being conducive to innovation and efficiency (Evangelatou et al, 2013). The approach to PPP from the implementation phase up to the production and delivery of the "goods" are consistent with the principles of NPM (Karaiskou, 2013).

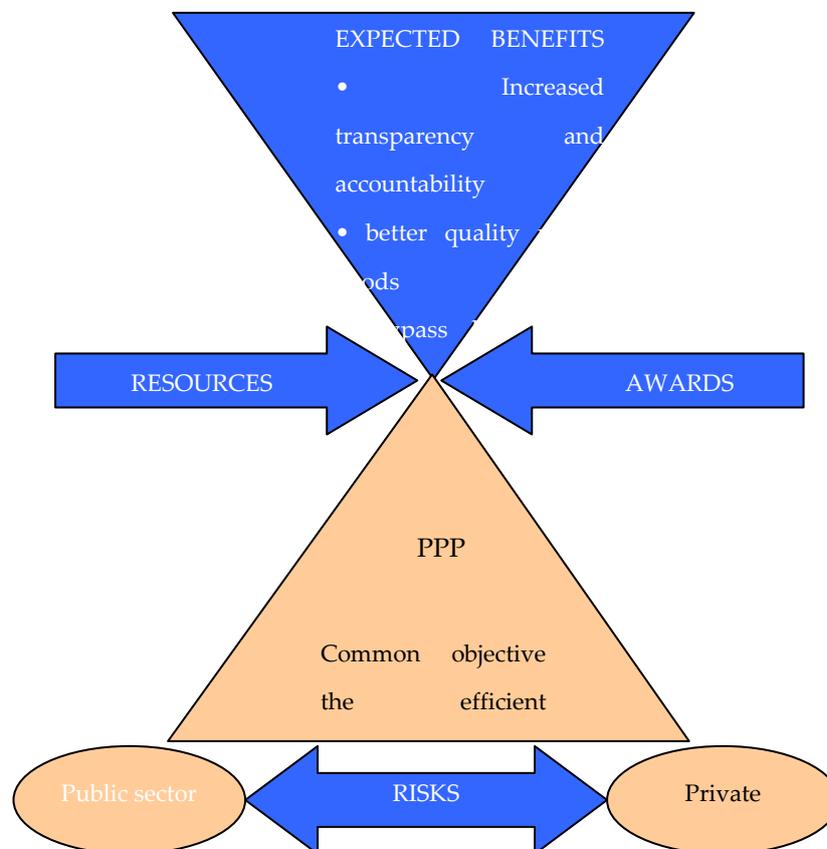

Figure 1: Value PPP and NPM

In conclusion, in harmony with the NPM, the "entrepreneurial governance" encourages private sector participation in the public sector activities, through PPP (Markantonatou, 2011).

Financial crisis, public budgetary cuts and liquidity restrictions force governments to develop new, more flexible tools and deontological rules for the provision of public services. The UK used institutional PPPs as a legal and managerial tool, based on the School of Thought of NPM. Speaking for British schools, experience has demonstrated that following the principles of NPM, UK Government first tried to give competencies to Local Authorities, but after the failure of the program, Government decided to follow a more centralized approach to procurement, like Greece. It seemed that liberal framework didn't work as expected, in this case.

While the UK PPP model is implemented in a rather liberal framework, following the common law system, in France PPP operates in the strict frameworks of the administrative law, following the jurisdiction of the French administrative courts. This contrast depicts the different administrative approaches of the two states; UK's liberal governance ("*Laissez-faire*") versus the French intervention policy ("*Dirigisme*").

CONCLUSION: PPP, GOOD NORMS AND AMBIVALENT PRACTICE

The world experience leads to the conclusion that PPP is an emblematic tool of the alternative version of the contracting out phenomenon, which is one of the main methods of NPM policy in the UK and the other developed countries.

It is to point out the contribution of PPP both in the fiscal consolidation and in the promotion of policies relevant to economic development. The potential disadvantages of partnerships have to do mainly with various dysfunctions such as bureaucracy and corruption in the public sector. However, the allocation of risks helps normalize all previous phenomena and increase the impact of this institution on the broader process of development.

The legal framework of PPP contracts does not raise criticism, as a general principle, although contracted out prisons are regarded in most legal orders as unconstitutional. Besides, PPP projects have proved to be conducive to positive results, such as inter alia job creation, expertise, innovation and competition for infrastructure development. However, various problems, such as delays in execution of the contracts and breach of deadlines of delivery of the infrastructures etc, are not unknown in practice, let alone the fact that PPPs could be more geared at the promotion of pioneer initiatives relevant to "green energy", public health (particularly R&D against diseases), ecological transports, tourism etc. Their ambivalent practice should be considered as a challenge for a new policy promoting social rule of law...

RIGHTS AND REASONS TO LEISURE AND TOURISM

Maniatis, Antonios¹; Vasilopoulou, Panagiota²

¹Technological Educational Institute of the Ionian Islands, Greece

²Technological Educational Institute of Western Greece & Technological Educational Institute of the Ionian Islands, Greece

ABSTRACT

The right to leisure and particularly to weekend fits in well with the modern right to open and distance learning but it is not fully recognized within the school system of Italy for both alumni and teachers. In a similar way, in the framework of fundamental rights of third generation (solidarity ones, against the first generation of civil and political rights as well as the second generation of social rights), the right to tourism activities is marginal right, still implicit in the vast majority of formal constitutions. The motivation for leisure and particularly tourism is an important factor of enhancing the demand of these volunteer activities and reveals the intrinsic relationship between tourism and hospitality, mainly in its form of free services like accommodation. Last but not least, destination brands, in order to be effective, need to establish a brand personality which creates a link to the tourists' self-image through their needs and motives. States are highly recommended to have a joint policy on culture and tourism, produced by a unified Culture and Tourism-Hospitality Ministry, endowed with a sponsored public organization competent for the promotion not only of the tourism product but also of the entire state involved, on international scale.

INTRODUCTION: NEW NORMS ON THE ENJOYMENT OF THE ENVIRONMENT

Literature has been recently enhanced by the PhD thesis "The normativity in law" (Brunet, 2011). As far as this monograph is concerned, it is to point out that till World War II, the term in use was, almost always, "the rule of law" (namely the legislative rule). Only later, because of the formulation adopted by Kelsen in his essays translated in French, the use of words "norme - normative - normativité" emerged, instead of the phrase "rules of law" (Pierrat, 2007). The newer expression was used mainly to imply that the law includes abstract and coercive rules of juridical nature. It is to

signalize that the French Constitutional Council in its judgement of 21.04.2005 made use of the following phrase: *'the law aims to provide rules, and must subsequently be coated with a normative significance'*. The doctrine has currently the tendency to admit the existence of a few 3G rights against the state, consisting in solidarity within the society, in the field of internal public law, such as the rights to the environment and to the sustainable development in the Greek constitution (Chrysogonos, 2006). One of the environment-centered rights is the right to tourism, incorporated into the branch of tourism law (Atherton, 2003). It deserves to be analyzed (in spite of its rather marginal normative recognition), particularly to its mass impact (Davidson, 1993).

On account of these data, the current paper aims to take an approach to the fundamental right and reasons to leisure. This analysis focuses on the enjoyment of the weekend and on tourism.

THE RIGHT TO WEEKEND IN COMBINATION WITH LEARNING

The earliest recorded use of the word "weekend" occurred in 1879 in an English magazine, under the title "Notes and Queries", while it was about Saturday afternoon as the end of the week's work and Sunday. However the "week-end", according to the form used for this neologism, had to do with spending the available non-working time. So, it was connected with privacy, another expression that would be promoted through the legislation on the protection of privacy and particularly of the "personal data". The term "week-end" was exported to French, while from French to English was imported the term "bricolage", having to do with the most favorite leisure activity of the French people.

However, the lack of consistency is obvious, not only in the underdeveloped countries, as for the right to the enjoyment of weekends. For instance, in the Italian legal order, the right to the weekend has not been fully consecrated, yet. Just the opposite, the five-day employment was a policy of the fascist rule of Italy, so the so-called "Fascist Saturday" was a labor law right of the working people. Indeed, the program of the fascist party had to do with the enhancement of the condition of the labor class (reduce in working hours, collective management, augmented taxation on the capital etc.) (Chrysogonos, 2015).

Pupils in the primary and secondary stages of the educational system are taught six days per week, so they have only a one-day period of rest. This phenomenon is rather problematic in pedagogical terms and, anyway, it constitutes a serious obstacle not only for tourism but also for other leisure activities, such as excursions and hobbies. Even if their parents spend six days working per week, children could benefit from the weekend to develop tourism activities, for instance if one of their parents does not work.

As long as teachers are concerned, they do not have exactly the right to the enjoyment of weekend but of one day off duty, besides Sunday. Given that pupils have no free Saturdays, some teachers should work in Saturday. This restriction implicates the possibility for teachers to get rest a couple of consecutive days, namely Saturday or Monday along with Sunday, or a remote day, in relevance with the common day off duty (Sunday). The second alternative, existent in practice, is not merely an alteration of the institution of weekend but also a serious obstacle of leisure activities.

As far as Greece is concerned, school education and the higher one are, as a general principle, exempted from the six-day duties but the five-day week for the working people is in danger. Indeed, the five-day schedule, in vigor to date within the majority of enterprises, has not been imposed by law but it was simply consecrated in practice, through the obligatory application of relevant conditions of Labor Collective Contracts. However, in accordance to L. 4046/2012 enterprises are enabled to adopt either the six- day model or the five-day alternative, per each employee, upon their special needs. However, this change could not be imposed unilaterally but it should be accompanied by the consensus of the already hired people.

Last but not least, on international scale weekends have been combined with the open and distance learning studies of adults, particularly with the facultative consultative meetings of students with their University tutors.

AN INTRODUCTION TO THE RIGHT TO TOURISM

Tourism has been institutionalized as a right, in deontological and juridical terms. As far as not legally binding consecration is concerned, article 7, under the title "Right to Tourism", of the Global Code of Ethics for Tourism, adopted by the General Assembly of the World Tourism Organization in 1999, has the following content:

"1. The prospect of direct and personal access to the discovery and enjoyment of the planet's resources constitutes a right equally open to all the world's inhabitants; the increasingly extensive participation in national and international tourism should be regarded as one of the best possible expressions of the sustained growth of free time, and obstacles should not be placed in its way;

2. The universal right to tourism must be regarded as the corollary of the right to rest and leisure, including reasonable limitation of working hours and periodic holidays with pay, guaranteed by Article 24 of the Universal Declaration of Human Rights and Article 7.d of the International Covenant on Economic, Social and Cultural Rights;

3. *Social tourism, and in particular associative tourism, which facilitates widespread access to leisure, travel and holidays, should be developed with the support of the public authorities;*

4. *Family, youth, student and senior tourism and tourism for people with disabilities, should be encouraged and facilitated''.*

Besides, this right is a version of the (first generation) civil right to movement from one place to another (Jégouzo, 2012). Tourism has also a dimension of (second generation) social right, particularly in favor of poor people.

THE 3G RIGHT TO TOURISM

The right to tourism could be incorporated into the 3G fundamental rights, which have some features in common, such as mainly the following ones:

- a. The universal character,
- b. The solidarity character,
- c. The environment-centered character (nature and culture, heritage included) (Bramwell, 1993).

First of all, as far as universality is concerned, tourism is a wide - range right, not geared exclusively for certain groups. Just the opposite, mainly after World War II tourism has been democratized as it benefited well from the new trend of social constitutional rights, particularly the employees' right to days off duty. In this way, working men and women could leave along with the rest members of their families for vacation, mainly in summer.

As for the solidarity character, it is to point out that literature was rather apprehensive towards international tourism in underdeveloped countries before the development of the 3G rights theory (Cromton, 1993). Tourism was considered as a factor of a new form of colonialism, based on the foreign dependency (Doxey, 1975). So, governments were supposed to find a means of managing, if not completely eradicating, the problems relevant to the cultural identity of the host countries. This was particularly the case in which tourism-related problems impacted on the sociocultural values of the society or on the environment (Budowski, 1976). Anyway, literature suggests that indigenous culture should be preserved through specific tourism legislation (Atherton, 1998).

Nowadays, it is obvious that tourism may develop a form of non-professional support of the host societies, particularly against poverty (Sarrasin et al., 2012). Tourists benefit from peace and the eventual friendship between the involved countries and may enhance the standards of life of local people, not merely in financial terms. For instance, the aforementioned Code is a fundamental point of reference for responsible and sustainable tourism. Tourists should pay respect for heritage and not

commit crimes, particularly relevant to cultural legislation, such as antiquities looting, and be encouraged to promote heritage. On international scale, in 1997 tourism adopted the objective of sustainable development, after the Special Assembly of the United Nations, known as 'RioPlusFive' (Aiello, Ferri, 2015). So, it is about an ecological approach to tourism within various international organizations and European Union (Dionysopoulou, 2012). This approach is quite different from the use of nuclear energy, although tourism development and atomic energy are officially studied by OECD (Rollina, 2011). Besides, specific forms of tourism, exemplified by cultural tourism, are also popular (Hunt, 1991).

Furthermore, alternative tourism constitutes a very dynamic version against the sovereign version of mass tourism (Apostolopoulos, Sdrali, 2009). It has been suggested that it could become '*the tourism in the promotion of a new order*' (Lanfant and Graburn, 1992). Justice tourism is regarded as a best example, building solidarity between visitors and those visited and supporting self-efficiency and self-determination of local communities (Scheyens, 2002). While the agendas of justice tourism and larger social justice may sound utopian, in fact relevant transformations can be seen underway. For instance, Argentina saw market relations disintegrate as a result of the 2001 economic crisis and Argentinians turned to worker – run cooperatives, barter arrangements and community solidarity networks to survive (Higgins – Desbiolles, 2008).

Tourism law exemplifies the phenomenon of law relevant to estates (in Spanish "estamental") (Parada, 1994). Indeed, it has been created mainly to protect the entire society enjoying the right to tourism, although it refers particularly to the entrepreneurs involved in the tourism industry market and to their employees (Logothetis, 2001).

THE "PUSH AND PULL" FACTORS THEORY ON TOURISM MOTIVATION

One of the least researched areas in tourism, both conceptually and empirically, is motivation (Fodness, 1994); Goossens, 2000).

The analysis of motivations based on the two dimensions of "*push and pull*" factors has been generally accepted, as a review of the past literature on tourist motivation indicates (Yuan & McDonald, 1990; Uysal & Jurowski, 1993).

People travel because they are pushed by their own internal forces and pulled by the external forces of destination attributes. That is the concept that lies behind the "*push and pull*" dimensions theory. On the one hand, most of the push factors, which are origin-related, are intangible or intrinsic desires of the individual travelers. Pull factors, on the other hand, are the ones that emerge as a result of the appeal of a destination, as it is perceived by travelers. They include both tangible resources and

travelers' perception and expectation, such as novelty, benefit expectation and marketed image of the destination (Baloglu & Uysal, 1996).

Crompton (1979) was the first to attempt to draw seven socio-psychological (or push) motives (escape, self-exploratory, relaxation, prestige, regression, kinship-enhancement, and social interaction) and two cultural (or pull) motives (novelty and education). The conceptual framework, which he developed, would influence the selection of a destination, and this theory demonstrates that the destination can have a degree of influence on vacation behavior in meeting an aroused need.

Since Crompton's initial empirical effort, a number of studies tried to identify "push and pull" motivational factors in various settings, such as nationalities, destinations and events (Jang & Wu, 2006). Among others, a study held in Australia examined the nature and usefulness of the relationship between push factors and pull ones by utilizing canonical correlation analysis (Oh *et al.*, 1995).

It is important to recognize the fact that knowing the importance of both categories of factors can help destinations (and consequently all stakeholders involved in the tourism sector of an area) meet the desired needs of individual travelers coming from different markets. As one can easily understand, knowledge of traveler's motivation is critical to predict future travel patterns.

DESTINATION BRANDING AND ITS ROLE RELEVANT TO TOURISM MOTIVATION

One of the most compelling tools, being available to destination marketers who are seeking a competitive advantage, appears to be the emerging destination branding. According to Morgan, Pritchard, and Piggott (2003) brands create a perceived distinctiveness, are evoking emotions and triggering behaviors because they have social, emotional and identity value to the users. In this sense, it has been argued that destination brands, in order to be effective, need to establish a *brand personality which creates a link to the tourists' self-image through their needs and motives* (Ekinci, 2003). This approach based on destination branding is very different from the traditional promotion of destinations, which normally use mostly physical attributes and activity opportunities. In this way, the tourist motives are directly targeted by marketers in their attempt to create more of a personal experience rather than a mere tourism package.

The development of destination branding research resembles many other areas of tourism research because it borrows and adapts concepts developed for consumer goods rather than services. So, an interdisciplinary approach is proved to be more fruitful. Hankinson (2001) argues that creating brands, as defined and discussed in the traditional marketing literature, is a more difficult and complex process when brands have to do with destinations and locations. As it happens in other areas of tourism research, questions emerge on the extent to which the assumptions of the traditional

branding are applicable in case of tourist destinations. Nonetheless, destination branding should be the result of a well-organized market research in order to implement the best marketing policies.

FIGURE 1. Conceptual Framework of the Destination Branding and Choice Process

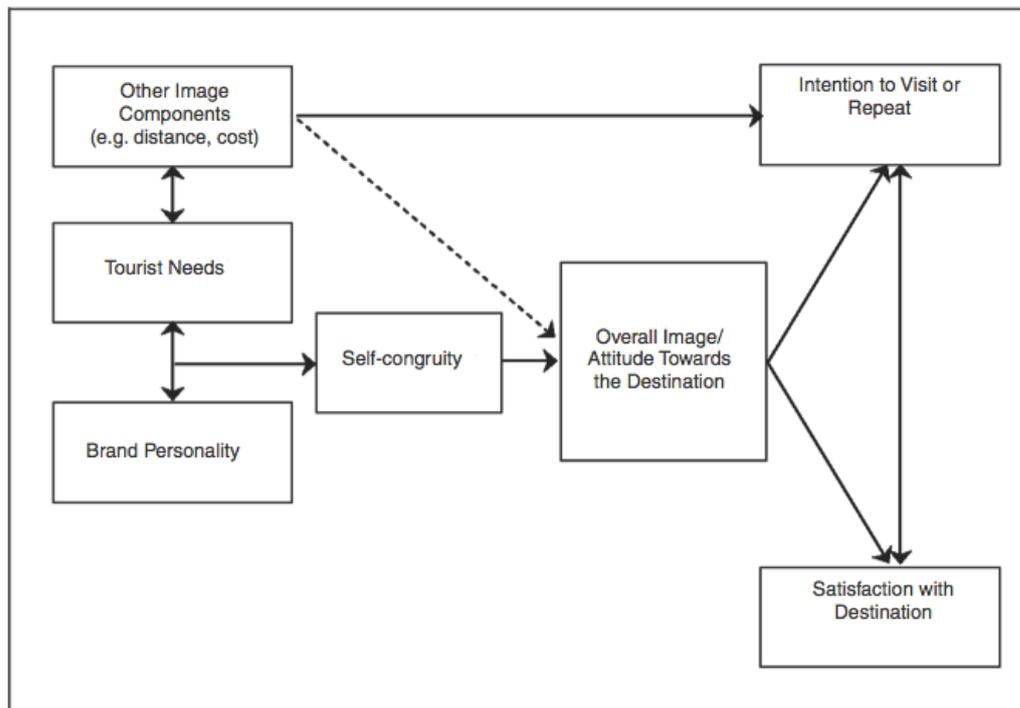

Figure 1. Conceptual Framework of the Destination Branding and choice process

MOTIVATIONAL MEASURES FOR THE RIGHTS TO LEISURE AND TOURISM

Leisure practices and tourism movement are in need of the suitable motivation, for benefit of both interested factors (for instance, tourists as well as tour operators, travel agencies and other tourism enterprises). Indeed, to realize a journey for the enjoyment of a relatively remote environment, people should feel a real challenge to leave the comfort of their own home and the certainty of their own universe, to discover something else. First of all, they must have enough time to travel and to get rest, otherwise travelling could have a boomerang result. So, state authorities are supposed to ensure enough time for vacation and consecrate legally the right to the enjoyment of the entire weekend for both working people and students. Even for the employees' categories, for which the weekend could not be institutionalized, partly or totally, as free time due to the nature of their duties, all people should be enabled to have an off duty period of two consecutive days per week.

As already implied, schools of the inferior education and universities, the open ones included, should teach and inspire tourism and the fundamental right to tourism. The social stereotype that "tourists" are not decent people against respectful "travelers" has been in vigor, so far (Vainopoulos,

Mercier, 2009). For instance, people have the tendency to say for a man who has not worked enough and is presented in a rather unconventional way that he is a ... "tourist". Actually, it is about the era of democratization of tourism, so tourists are supposed to be regarded as common people benefiting from the universal right to tourism, not as picturesque people with a rather deviant behavior.

Besides, the motivation strategy could be developed through institutional tools, coming from either the public management field or the marketing one, such as inter alia:

A.1 A joint policy of a unified Ministry on Culture and Tourism-Hospitality, not an autonomous policy of a separate Ministry on Tourism

Italy has been recently endowed with a unified Ministry on Cultural Goods and Tourism. This was also the case of Greece, from 2009 and on, for a short period of time. It is about a crucial political choice, highly recommended not only for the so-called archeological countries, such as these Mediterranean states. Anyway, the Ministry competent for Tourism deserves being called "Tourism - Hospitality Ministry", as hospitality is a symmetric (and also much wider) notion of the tourism movement. The couple "tourism - hospitality" is comparable with the modern notion of sustainable development. Anyway, the motivation for tourism movement becomes stronger as long as it is produced by carriers or private individuals offering hospitality. Indeed, if anyone offers free accommodation, let alone with discount tickets of transport or with other extras like free sightseeing tour, for instance within the program of an international scientific Conference, a challenge emerges for potential tourists. Of course, public carriers are expected to adopt this practice themselves (for instance as long their own conferences are concerned), setting a good example to private companies.

A.2 Advertisement mainly by an "ambassador" promoting the interested state, not only the national tourism!

Advertisement is not in use only by private companies but also by states, to promote international tourism, through Internet and traditional mass media. For instance, in virtue of L. 4276/2014, the Greek Organization on Tourism, a state legal person, has acquired the role to promote no more merely the tourism product of Greece worldwide but the Greek country itself, as its informal "ambassador"! So, it has to focus not only on tourism product but also on leisure activities and challenges and the whole identity of the Greek state, the cultural identity (such as political history, culture etc.) included. So this "diplomacy" innovation fits in with the aforementioned motivational measure of the existence of a unified Ministry on Culture and Tourism, although no combination is available in Greece.

A.3 Tax-discount sponsorship, exemplified by the support towards the advertising "ambassador" of the interested state

Another highly recommended mechanism, close to advertisement, consists in various forms of sponsorship contracts, exemplified by cultural sponsorship contracting. It is also to signalize that by the aforementioned L. 4276/2014 a new type of tax-discount sponsorship has been introduced in the

Greek legal order. New legislative “rules” (namely not “norms” having a coercive nature but, just the opposite, “rules” as motivational tools) preview the sponsorship contract for the development, the highlighting and the promotion of Greece. Receivers can be either the Ministry of Tourism or other carriers submitted to its supervision, like the aforementioned Greek Organization on Tourism. So sponsorship is officially connected with the mission of this advertising “ambassador”.

B. Contract privileges (Special offers)

Special offers for clients, exemplified by discounts of less or major importance, constitute one of the marketing tools available. A recent development consists in the consecration of privileges, which enhance the institutional position of some clients, benefiting from this particular offer. It has to do with the policy of big air transport companies, such as Emirates, headquartered in the city of Dubai, and Etihad, headquartered in Abu Dhabi. These enterprises offer a number of discount tickets to their staff and each employer can delivery them to his relatives or friends. In this way, these people may be facilitated to go from abroad to the city, in which their familiar person lives. Eventually, they may be offered hospitality by these migrants, who make use of the free accommodation offered by their employer. In this way, international tourism (as far as the journeys are concerned) meets hospitality related to night stay, within a very successful motivational project of air transport company involved. The most interesting element of this drive has to do with the assimilation of privileged travelers with the crew of the flight, at least as for the dress code of the company. In other words, common people, which are likely to have no professional bonds with the market of tourism and air transports, have to wear a decent attire during the travel, according to the norms (in form of the so-called “dress code”) of the company, like the crew that is supposed to wear the official uniform. It is not merely about a question of appearance but a matter of culture relevant to responsible tourism, for privileged travelers! However, in 2016 Emirates seems to abstain from its own drive...

CONCLUSION: THE RIGHT TO WEEKEND MEANS THE RIGHT TO BE AN ANTHROPOS!

In conclusion, tourism is a very important activity, still marginalized in legal terms. It is totally absent, at least in terms of explicit recognition and institutional guarantee, in the vast majority of formal constitutions, worldwide.

It is highly recommended to adopt rules and norms on the recognition, particularly in the constitutional level, of the following rights:

a. To Tourism

This proposed development does not have the meaning of completing the puzzle of the fundamental rights through the introduction of another right, which has inter alia a 3G content. In other words, it is not about the “last” constitutional right to add, in correlation with the 3G rights to the environment and to the sustainable development, but rather a key to reconsider the whole system of rights, institutional guarantees and similar general principles consecrated in formal constitutions, in favor of human dignity and particularly public health.

b. To Hospitality

The right to tourism is completed by the symmetric right to hospitality, particularly in its strict form of free accommodation. Anyway, the fundamental right to hospitality should be explicitly institutionalized, as a 3G right, in systemic correlation with the complementary right to tourism. It is about a new challenge, as even the aforementioned Code of the World Tourism Organization did not take this recommended approach to the tourism phenomenon. Hospitality constitutes a very important, polyvalent “code” of values itself, strictly related to various fundamental rights, particularly to the 3G ones, such as the rights to peace, to international friendship, to sustainable development...

c. To 2-day vacation per week and to leisure

Pupils, students and working people should be enable with a vacation lasting a couple of consecutive days per week, coinciding as a general principle with the weekend. All people do deserve the right to leisure, with the special care, let alone the motivation, of the state and the symmetric development of 3G rights.

As far as business is concerned, companies have to realize that 3G rights constitute a great challenge for their entrepreneurship, as they, themselves, are the carriers of these rights. By making use of these rights, they offer a great motivation for their potential clients, through free offers or conventional ones, always in conformity with the principle of sustainability and the ideal of responsible and sustainable tourism.

The missing constitutional right to the enjoyment of the entire weekend means the right to be an Anthropos!

DISTANCE LEARNING WITH EMPHASIS ON TOURISM

Maniatis, Antonios¹; Vasilopoulou, Panagiota²

¹Technological Educational Institute of the Ionian Islands, Greece

²Technological Educational Institute of Western Greece & Technological Educational Institute of the Ionian Islands, Greece

ABSTRACT

Distance learning, the alternative modern method for higher education, is likely to need completion by incorporating the traditional educational practices, mainly apprenticeship and lecture. It fits in with the right to leisure, well exemplified by the enjoyment of the entire weekend. As to the digital education technology, Internet is the medium of online learning whereas it is also available for distance education, which can serve even the apprenticeship through web casting. Mobile phones have a rather marginal function among the tutor and his students while educational community is apprehensive of hi-tech gadgets because of their frequent technical disorders. Distance education should incorporate not only the intrinsic treasure of wisdom of any traditional pedagogical technique but also these techniques themselves, without altering its own identity. As far as tourism education is concerned, it has been recently combined with e-learning as well as open and distance learning. The new, separate branch of law, Tourism Law, is promoted through its incorporation in the programs of higher education, exemplified by a master degree program of the Hellenic Open University.

Keywords: *Apprenticeship, Open and distance learning, Educational methodology, e-learning, Internet, Lecture, Mobile phones, Right to leisure, Tourism, Tourism Law (I"justurismo"), Weekend*

INTRODUCTION: DISTANCE LEARNING, WHERE VARIOUS INNOVATIONS MEET...

Nowadays, the traditional-type knowledge delivery for upper studies has lost territory in favor of distance learning, exempted from the natural contact between the student and the professor in the same place. Distance education is conceived as the intrinsic suitable tool for the delivery of open education services. This alternative method is widely regarded as the pedagogy of the future along with e-learning, particularly on-line learning. Moreover, some experts appear in such a pitch optimistic that they have predicted that the demanding traditional model, called "residential", consisting of students attending classes at prearranged times and places, will disappear in the near future (Blustain, Goldstein, and Lozier 1999 and Drucker 1997). The present paper focuses on the distance learning

process via the hypothesis that this method should be completed by incorporating the preexistent educational practices, mainly apprenticeship and lecture.

This paper analyzes the traditional education methodology, the right to leisure particularly to the enjoyment of the entire weekends and the hi-tech appliances available for distance learning. It makes a special reference to the phenomenon of tourism movement, as a discipline to offer either through online learning or distance learning. Within this case study, the modern branch of Tourism Law deserves a special focus.

TRADITIONAL EDUCATION METHODOLOGY: APPRENTICESHIP

According to the established concept, the lecture tool for higher education is as old as the hills. So, it is amazing to localize alternative approaches regarding lecture as a relatively new phenomenon against apprenticeship (O'Malley, and McCraw 1999).

Apprenticeship is the form of education that demands the physical contact of both poles of instructional process and has an intensively dynamic and practical orientation. It is undeniable that for centuries knowledge was passed from a master to a pupil in a one-to-one or one-to-few arrangement. This method may be regarded as older than lecture but the point is that the educational system of reference should be defined. In other words, learning an art or a profession in the correspondent workshop or office is something natural, dictated by the dynamic of the market. However, this practice, reminding of the so-called "informal learning", is far away from the official institution of University. At least in current terms of education, old apprenticeship should be defined as a form of training instead of higher education.

It is to signalize that the approach to the apprenticeship archetype recognizes it in the actual academic level. Advocates of this theory localize this institutional survival in most Ph.D. programs, today. This remark may be inspired by the random scheme of the student and his research director but it is hard to admit such a survival.

Indeed, Universities give the opportunity to researchers to compose a doctorate work without attending a doctorate school. In other words, even if there is a circle of lectures especially given to the correspondent students, attendance is purely voluntary. So, there is no difference between the distance learning methodology and the traditional one, as for this degree. However, the contact between the candidate and the professor is not exactly the apprenticeship form of education, given that it is not about a synchronous kind of instruction in the same place. Furthermore, the student does not attend the typical practice of his mentor, consisting in teaching or composing his own scientific monographs.

The phase of the doctorate monograph or of the term paper in lower levels, such as the bachelor and the master degree, is not really the case of apprenticeship. Nevertheless, this kind of practice is present in the official system of higher education, let alone in the same phase to the aforementioned. It is institutionalized as a stage, available in public services or in enterprises particularly for students completing their studies program.

It is to draw the conclusion that apprenticeship is not only present in the current academic field but also it has a major importance, exemplified by various elements. First of all, it characterizes the supreme phase of the studies period for a diploma and has a great grade impact. Furthermore, it has a material significance because it gives to beginners the opportunity to have an initial experience in their future field of competence, offered through the correspondent mentors. So, praxis has an obvious value in the still theoretical background of the interested persons and therefore it is incorporated to the material to teach.

Distance learning methodology is clearly not incompatible with praxis as it may be used for either purely theoretical material or practical one but the question is whether it fits in with the apprenticeship mechanism. Typically, it is perceived as something by definition different from this kind of particular learning because apprenticeship is supposed to take place in the mentor's place. This aphorism dissociates fully distance education from apprenticeship and may implicate a reduced content of remote learning, becoming poor in the correspondent intrinsic treasure of knowledge, on the basis of the eventual misunderstanding that this treasure cannot be theoretically taught.

By the way, it is to make a special reference to the fact that forms of education do have a typical pedagogical orientation, thanks to which correspondent pieces of academic truth are revealed. This crucial remark is exemplified by apprenticeship inherently linked with training, especially the vocational one, and the affiliated wisdom, as it is the case of the particular tricks in practicing a certain profession. This does not rule out the possibility to teach or investigate this material by using other techniques, like remote learning that does not deserve to be doomed to have a merely theoretical and vague content. Moreover, distance instruction should fit in with apprenticeship process, even if the discipline to teach is difficult and needs exemplifying and permanent monitoring. To accomplish this project, facilities offered by the new technologies of information and communication are of major importance while the academic speech should become "radio-type". This development accentuates the intrinsic nature of distance education, which is interactive and personalized, so not far away from the physiognomy of the instruction on the matter. However, in the current level of the distance learning system, even knowledge of some working students, which has been already acquired through their profession, remains often dissociated from the similar units of the discipline to teach.

TRADITIONAL EDUCATION METHODOLOGY: ORAL PRESENTATION

The talk giving information about a subject to an audience is typically perceived as the oldest method to deliver higher education material. This is true for the academic environment as the professor is a skilled lecturer before his usually extended public. In this way Universities have been created, as it is the case of the Constantinople University of the Byzantine Empire, created in 1044. The diploma that the students of that University obtained is regarded as the first one in the European history (Maniatis, 2004). Apprenticeship historically has been proved to function as the necessary substitute or the supplement of the theoretical presentation of the correspondent discipline. Indeed, arranging a meeting at a given place and time with many students has become the traditional main delivery method while distance education methodology, initially as correspondence courses, has been a marginal one. It is to clarify that modern professor can take advantage of many other pedagogical techniques, among which the most important one is the seminar, having to do with study of some subjects by a group of a few students coordinated by their professor.

Lecture is the random way to teach particularly theoretical material while seminar is typical for upper studies and in-depth participatory research. Distance learning is phenomenally incompatible with the oral delivery as it is by definition a form of separated education in terms of place but it has essentially adopted the seminar method to an extent, through essays for the qualification for the final written examinations. Even lecture is not completely unknown as it may be informally present during the synchronous contact between student and tutor. In other words, there are some institutionalized opportunities for short oral presentations reminding of the traditional teaching. This is the case of the so-called "group consultative meetings" of the Hellenic Open University, during which the tutor has a contact with all his present students. Although the scope of these periodical meetings of voluntary attendance is not officially to teach the discipline, an oral presentation of the entire material with eventual emphasis in some difficult units constitutes common practice. This practice, many times required by the students themselves, should not cause embarrassment in terms of methodology but it is really conducive to learning success. Therefore, it produces a better settlement of relationships between the tutor and his public while distance learning is right not to dissociate itself from the academic spirit to serve, along with traditional methods.

As learning is something difficult, the distance one is also lonely and needs personalized relations, particularly feasible in the weekends.

THE RIGHT TO LEISURE IN COMBINATION WITH OPEN AND DISTANCE LEARNING

It seems self-understood that people do deserve enough free time to get rest and entertain themselves. For instance, the right to leisure has been seriously promoted by the institutionalization of the five-day employment per week. Working people, in both private and public sectors, have acquired since '80s the possibility to remain off duty for two days, as a general rule in the weekend.

This couple of days is not merely an occasion to get rest but also a challenge for leisure activities. Last but not least, it has been combined in practice with another institutional trend, distance learning. The Open University of the UK has been the pioneer organization to modernize the distance education methodology and to give the opportunity, particularly to young people, let alone the working ones, to benefit from their leisure and realize further studies, either of graduate level or of upper one. So, students of many countries can complete their set of knowledge in educational institutions, particularly the specialized on the matter Open Universities. These Universities offer the opportunity for consultative meetings of each tutor with his group of students, in some weekends per academic year. In this way, students can meet one another and be supported by their tutor, in a way quite similar to the methodology of natural education. This is a very valuable way to cope with the intrinsic controversies of distance learning, such as the loneliness of the student during his study, the fact that the educational textbook is regarded as the professor...

As far as the not human substitute of the authentic educator is concerned in distance training, *the focus of the learning process is trainee, who discovers the pathway to knowledge, studying in his own space - time and at his own pace (Gatsoulas and Manousou, 2015). So, weekend is an excellent period of time for distance training programs as well as for distance education ones.*

So, working people have the challenge to become more competitive in their careers, by acquiring academic titles in an open way, namely without participating in the traditional-type knowledge contests for entry. They are also exempted from the constraints of the system of natural education ("residential" model). Even the consultative group meetings, held in some weekends, are merely facultative. However, open and distance learning system includes an important role for the tutor, endowed with a new role and another dimension than the ones relevant to the traditional educational system, the status of "Professor – Consultant" (Tsitlakidou and Manousou, 2013). This title is the official one for tutors of the Hellenic Open University.

It is also to pay attention to the fact that in some Open Universities, like the Open University of Cyprus, headquartered in Nicosia, consultative group meetings are blended. The blended system consists in natural meetings available in the Internet, for an e-learning simultaneous participation of students that are not present in the venue of the University. This model is particularly useful for a

University like the Cypriot one, because 50% of its students live in Greece, they do not have their residence in Cyprus. Just the opposite, the fact that the vast majority of students of the Hellenic Open University, headquartered in Patras (Greece) live in Greece justifies the fact that the blended system is not in use.

Anyway, new socioeconomic and pedagogical data have led to an increasingly polymorphic style of the current open learning.

HI-TECH APPLIANCES: INTERNET

Educational technology has the upper hand in terms of modernization of the higher education. For instance, learning through the interactive multimedia appliances is a process and not simply a technology, offering new learning possibilities (Stemler, 1997). It would be interesting to examine some facets of the advanced technology on the matter, with a special reference to the needs of the distance process.

Internet constitutes the medium of a new instructional method, the so-called online learning, which belongs to the wider category of e-learning along with audiovisual education and off-line use of computers. Students have the tendency to consider that the online paradigm has certain advantages to traditional methodologies, such as saving time, fitting in better with their personal schedules and enabling them to take more courses (O'Malley and McCraw, 1999). *The concept of Open Education incorporates a simple but powerful idea: that knowledge society is a public good and that the open Internet technology offers an excellent opportunity for everyone to share the use and reuse of knowledge.* (Gkelameris, 2015).

However, it is to pay attention to the fact that online instruction has been proved to be no easy task (McKenzie *et al.*, 2000). Online classes, if not delivered effectively can have high drop out rate due to a wide variety of reasons, such as insufficient feedback from the instructor, technical difficulties, and/or poor course design (McKenzie *et al.*, 2006). It is to underline that online techniques are quite often combined in praxis with classic ones for the same courses.

Offering instruction in the cyberspace does not coincide with the synchronous distance learning because it is asynchronous, given that delivery of the course material precedes receipt of such material by the student. However, both techniques have a lot in common, as they do not implicate the coexistence of professor and students in the same place and take advantage of Internet facilities.

As distance learning takes advantage of both categories of education, via typed material and e-learning, it has an obviously wider content than online instruction. It is not principally Internet-based and is exempted from the impersonal use of the available material, thanks to the tutor's intrinsic mission. It is to signalize that even Internet is in use to foster the appropriate bonds between the two

poles of the instructional process, mainly through the e-mail communication. This kind of practical communication is conducive to success for the mission of the tutor-counselor. As a matter of fact, on the one hand the mentor can play out his main role of instructor in a fast and rather economical way, which implicates a comeback to the roots of the distance learning method, in form of traditional correspondence. On the other hand, he enjoys the precious faculty to accomplish his consultative duty by giving information and advice as well as by encouraging the members of his study group, either in an individual or in a collective form.

Besides, innovative techniques like web cast may help the student learn the material in a way similar to the attendance of a lecture in a real classroom. However, this video-based oral presentation, which familiarizes the distance-learning student with the traditional methodology, is not exempted from technical controversies. As a general rule, the educational community feels apprehensive of the application of distance-learning technological appliances.

Apprenticeship should not be omitted from this instructional simulation as it is possible to present a mentor teaching not only orally but also through real action his experience. This "how-to-do-it" delivery, supported by further instructions especially via phone and during the consultative meetings, and also accompanied by a regular assessment of the correspondent learning, may be proved to be almost as satisfactory as the traditional one for the development of the student's required skills. Moreover, even a feed-back should be ensured, in the sense that the beginner may function as the productive assistant of his mentor in the mission on the matter.

HI-TECH APPLIANCES: MOBILE TELEPHONY

Up to date, mobile telephones constitute a rather marginal medium for distance education, contrarily to the conventional ones constituting a regular means of communication between the student and the tutor, like e-mailing. On the one hand, it is doubtful whether instructors are legally obliged to maintain a mobile phone number at the service of their students. Anyway, they may take advantage of a deviation of calls from their known phone to their mobile one during the weekly timetable of students' phone communication with them. On the other hand, students often ask for this kind of contact because it facilitates significantly the access to their mentor, although they can communicate by other fast media. Mobile phones may serve the group of tutors of a Subject, particularly during the examinations, simultaneously held in various educational centers, although this form of communication is not institutionalized.

Last developments on international scale consist in attempting to make mobile phone a regular medium of distance instruction. Nowadays, mobile phones of advanced technology constitute a tiny form of multimedia, incorporating the possibility of e-mail communication. Receiving an e-mail in the

frame of the Short Messages System is a valuable facility while, up to date, mobile phones are almost exempted from the spamming phenomenon that dominates classic Internet. However, one more time it is not to overlook the doubtful value of the current technical status of hi-tech gadgets.

AN INTRODUCTION TO ONLINE LEARNING ON TOURISM

Online Learning Training (OLT) has recently entered the fields of Hospitality, Leisure, Sport and Tourism. Estimable pioneers, the first members of staff who have paved the way are followed by an increasing number of colleagues, although there is still much reluctance amongst academics. With existing programs not principally designed to be delivered and assessed online, embarking on the e-wagon means using IT and CMC to support rather than replace face-to-face interactions. It is by no means an easy task: the learning curve is a steep one, and one is bound to experience frustrating technological, pedagogical and practical problems, at least in the beginning. Yet it is undoubtedly worth it, not only because of personal reward (feelings of achievement and self-esteem, popularity amongst students and colleagues as a successful innovator), but also because of four key advantages, in terms of IT skills, innovation, flexibility and support. Interestingly, both students and tutors seem to benefit from OLT in those four directions, which may well be the ultimate sign, if necessary, that everyone can gain from developing online activities in higher education in the subjects of Hospitality, Leisure, Sport and Tourism (Lominé, 2002).

As far as e-learning is concerned, its advantages are widely mentioned, e.g. life-long learning opportunities, alleviating spatial and time constraints, catalyst for institutional transformation (Poehlein, 1996), while its applicability and benefits for tourism/hospitality education are now also starting to be recognized (Cho and Schmelzer, 2000; Sigala 2001b; Kasavana, 1999). However, although an increasing number of tourism and hospitality educators are adopting and incorporating Internet tools in their instruction, only very few of them are fully exploiting the Internet's capabilities to transform and extend their pedagogical models (Sigala and Christou, 2002). On the other hand, it is generally agreed that we are still in the experimental stage for creating Internet learning environments. This, coupled with the low completion and effectiveness rates of e-learning (Sigala, 2001a), makes it evident that more needs to be learned about designing successful online environments, technically, pedagogically and personally.

MASTER DEGREE DISTANCE LEARNING ON TOURISM: THE GREEK CASE

As far as distance learning is concerned, it does not have strong bonds with the tourism discipline, yet. Anyway, it is important to signalize that Greece leads a boom period relevant to international tourism, from 2012 and on. Due to this serious development, the state attempts to upgrade both Innovation, Entrepreneurship and Digital Ecosystems

tourism services particularly to foreign tourists and tourism studies, traditionally offered by the public institutes “technological educational institutes”, as far as higher education (equivalent to the Universities one) is concerned.

The Alexander Technological Educational Institute of Thessaloniki runs its own three-semester program, from February 2016 and on. This master has no entry examination but it is based on a “soft” selection procedure, including a personal interview of candidates and two letters written by referees and a level B2 certificate of command of English language. The first semester and the second one include teaching, in Greek, of various courses whilst the third semester comprises uniquely the thesis. Some of the courses are obligatory and the rest à la carte, with no Tourism law discipline! In a similar way, the University of Macedonia, headquartered in Thessaloniki, runs from October 2015 and on an officially recognized three-semester, master degree program relevant to the management of tourism companies and organizations, with no Tourism law course available, at least among the obligatory ones.

So far, the unique available master degree program in the Greek higher education had been offered by the School of Social Sciences of the Hellenic Open University. Although other Universities and Technological Educational Institutes in Greece have recently adopted the trend to offer master degree programs through distance learning, at least in combination with the natural education methodology particularly useful in weekends, they seem rather apprehensive to offer a program on the matter, with the exception of a few Institutes like the above-mentioned and the Technological Educational Institute of Athens.

It goes without saying that tourism studies have been rather marginal till recently, in the Greek higher education. For instance, Universities had no bachelor degree programs specialized in management of tourism companies, being a specialty unofficially reserved for programs offered by Technological Educational Institutes. This implicates that this discipline was likely to be slightly underestimated, due to the fact that Universities, having as a general rule a particular prestige against the educational institutes of the technological sector, avoided offering academic titles on the matter. Besides, another implication consists in the fact that few experts in tourism subjects are available to teach within upper studies programs, like master degree ones.

As far as the program “Tourism companies management” of the Hellenic Open University is concerned, it is about a two - year program with a very high demand of candidates, lawyers included. It comprises 4 obligatory Subjects of common type (namely each Subject is equivalent to natural education courses) and the thesis as a separate Subject. It is to pay attention to the fact that this master degree program is not only offered by an authentic University but also related to the valuable possibility to teach and be taught the discipline of Tourism law.

Indeed, all students have the privilege learn principles and elements of Tourism Law, against the ones of conventional education, the Law School included! The law education is held initially within a Subject of wider content and potentially through the composition of the thesis. In other words, it is about a really open program, for those who want acquire knowledge on the legislation on tourism companies and organizations. However, as recently tourism law has evolved into a separate specific branch of law, being no more a mere "legislation", it is highly recommended to adopt the brand name "Tourism Law"!

As far as the financial problem is concerned, it is to point out that even the new master degree programs on tourism require payment of fees by students.

CONCLUSION: DEMOCRATIZATION OF EDUCATION THROUGH DISTANCE LEARNING

Distance learning is the adequate substitute of traditional education in its whole but it should incorporate not only the intrinsic treasure of wisdom of classic techniques but also the techniques themselves, without altering its own identity. In other words, the apprenticeship may take place alternatively, through new technology appliances. Despite the fact that apprenticeship is strongly connected with the coexistence of the mentor and the apprentice in the same place, this obstacle should not be absolutely prohibitive. If the superior academic semesters of Medicine studies are fully reserved for hospital practice, other disciplines may be partly or totally offered through remote educational methods. Otherwise, not only does distance methodology undermine the correspondent open education philosophy but also it is doomed to have a rather restricted reputation as long as programs of "upper class" are not available.

Distance learning is also compatible with the prevailed forms of traditional learning, both lecture and seminar, although it has its own methodology.

In this frame of thought, it is obvious that higher education needs not only modernizing but also further democratization through the democratic tool of open and distance learning. Thanks to this avant-garde form of instruction, people can reach to the universal legal good of knowledge far away from social exclusion, in the constitutional framework of social rule of law, explicitly consecrated as a double general principle (constitutional guarantee) in par. 1 of article 25 of the Greek formal constitution. Even the instructor figure symbolizes this antiauthoritarian concept as it has no authority *ex cathedra* but it is officially assessed by the distance learners through its consultative mission, conceived as a counterbalance to their particular and augmented controversies.

Distance learning is the instruction of the future, with correspondence to any form of traditional education, without repeating its commitments, so it is not a distant process but an accessible and

individualized one. It has a revolutionary, open content, particularly friendly for rather marginal disciplines and new branches of law, like the worldwide trend of "Tourism Law", known in Spanish with the neologism "Justurismo".

However, it goes without saying that open and distance education has still a lot of problems to solve, as inter alia the following:

1. *Open access*

How open is the student access through the electronic draw system, particularly for high demand programs like the management of tourism companies? The Greek government aims to replace this system as all studies in the Hellenic Open Universities are paid.

2. *No fees for studies*

How open is the student access with the payment system, even for the bachelor degree programs, which are still gratis in the rest Greek public institutions of higher education?

3. *Full salaries for tutors*

Tutors do deserve a full salary, independently of the number of students to teach, a problem already solved by the UK Open University for its Senior Lecturers, not by other Open Universities...

Distance learning and tourism constitute highly recommended alternatives for the weekends of end-users!

ANALYSIS OF SPORTS FAN RELATIONSHIPS WITH SOCCER TEAMS

Marques, Tiago¹; Nobre, Helena²

¹University of Aveiro, Aveiro, Portugal

²GOVCOPP, DEGEIT, University of Aveiro, Aveiro, Portugal

ABSTRACT

This paper investigates relationships sports fans establish with teams. Specifically, it is studied the Sporting C.P. case. The purpose of this study is to analyze whether the efforts that Sporting managers are putting on marketing strategies and initiatives, grounded on new communication channels and services (for instance, social media presence) impact the bonds of Sporting's fans with the club. Important European soccer teams need to preserve a strong fan relationship base, both at domestic market and abroad. Results indicate, in general, correspondence between the expectations expressed by club leaders in semi-structured interviews and information collected through questionnaires on fans perceptions. Most of the marketing strategies and initiatives are well received by fans. It seems that Sporting brand still has space to grow. The establishment of strategic partnerships, and sport marketing innovative strategies, in line with innovative communication channels are recommended. Study also emphasizes the importance that social networks have achieved in sports management.

Keywords: *Sports Fan, Relationships with Teams, Sport Marketing, Team Sport Industry, Sports Club, European Soccer Teams.*

INTRODUCTION

In recent years, sports marketing has experienced a growing interest. Basically, sports marketing apply the principles and processes of traditional marketing with the purpose to create a sport product directed to fans, participants and spectators (Gray and McEvoy, 2005; cit. in Fullerton and Merz, 2008). According to Shank and Lyberger (2015, p. 5) "sports marketing is the specific application of marketing principles and processes to sport products and marketing of non-sport products through association with sports".

Sports marketing can be divided into two categories: the marketing of sports and marketing with sports. The marketing of sports involves the promotion of sport products and services such as: sport events and equipment for fans and participants. The marketing with sports refers to all marketing

activities that use sports, sports events or athletes to promote non-sport products and services (Ratten and Ratten, 2011).

Sports results are an essential factor for the financial success of a club, since they are determinant in sponsorship catchment, membership and audience in domestic market (Arigil and Penazzio, 2011), and participation in European events, for instance in the case of European soccer teams, among others. In this way, a team with low sport scores tend to show a lower brand equity, and vice-verse. However, to limit sports brand equity issue to athletic success does not offer all the picture about how sports fan relationships with teams are grounded. For instance, strong emotional, exclusive and unconditional relationships that a lot of soccer fans establish with their teams are one of main assets that a soccer club can hold, since they give guarantee of continuation in the relationship (see, Aaker, 1996; Fournier, 1998; Keller; 1998) even in face of low results. Thus, teams should work to strength relationships with fans in order to increase brand equity (Bauer et al., 2005). Given the considerable growth that nowadays sports industry is experiencing, sports marketing can be of main importance for sports managers (Shank and Lyberger, 2015).

This topic has gained relevance in Portugal due to the consolidation of the soccer business in the national economy, and its importance in the promotion of Portugal image abroad. In particular, Sporting Club de Portugal (Sporting CP) is one of more important soccer teams in Portugal that has been suffering a downturn in terms of sports scores that put it away from the more important European football competitions in the last years. Sporting CP was one of the first Portuguese and European football teams, holding a long tradition and international recognized image, represented by internationally well-known and valued players and performing important economic transactions every year. Besides, there is a lack of investigation about it comparing to the other two major teams in Portugal.

The purpose of this study is to analyze whether the efforts that Sporting managers are putting on marketing strategies and initiatives, grounded on new communication channels and services, impact the bonds of Sporting's fans with the team.

The paper includes six sections. The first addresses theoretical background, the second section describes a qualitative first study, the third offers the hypotheses of the study for the second study, and the fourth the methodology. Results and conclusion are presented in the fifth and sixth sections, respectively.

THEORETICAL BACKGROUND

Kapferer and Laurent (1992) state that brand performs some roles in consumer's decision making process: guiding (distinctive, contributes to improve the information available), facilitator (allows

consumer to store results of recent decision-making processes, seeking a repetitive buying process), guarantee (repetitive quality standard) and personalizing (the consumer choice expresses the will of differentiation). A brand becomes valuable when consumers react positively to the product from the moment that recognize and identify it. This effect is at cognitive, affective and behavioral level. Brand equity is inextricably linked to marketing activities and market performance, and can be, ultimately, measured by the awareness and associations that brand achieve in the market (Keller, 1998). Keller also notes that the emotional factor, attached to the brand, results from the interaction between consumer and service.

Sport consumption is highly symbolic and experiential (Bauer et al., 2005) and, therefore, offers a ground to the development of highly emotional brand relationships. A consumer-brand relationship normally contains both functional and emotional components and the importance of each one can vary according to the offer, customer, etc. A brand-customer relationship is directly linked to customer satisfaction. This satisfaction varies depending on the perceived quality as a result of their individual expectations and perceptions (O'Shaughnessy and O'Shaughnessy, 2003). Thus, customer satisfaction is an important element of the emotional component. Common to all activities is necessary to measure, manage and improve brand value. Sport teams are no exception to this. A brand is the most valuable asset for the team sport industry (Bauer et al., 2005) because a team brand assumes the role of a partner in the relationships between clubs and their fans, sponsors, partners, investors and even shareholders.

One of the main interests of business today is to create conditions so that customers remain loyal and create strong ties with brands, generating satisfaction and confidence (Demo, 2010). Sports clubs are now seen as major brands that have their fans as special consumers, detaining advantages over other brands because a fan will never change his club by a rival (Rein et al., 2008). Kim et al. (2011) have created a scale that measures the quality of the relationship between a sports fan and his team, named SCTRQS – Sports-Consumer-Team Relationship Quality Scale, which will be adapted and used in this study.

Online marketing is an important vehicle to promote teams, considered an essential tool for sport marketing. In particular, social networks have been featured as one of the preferred communication channels in sport marketing (Ratten and Ratten, 2011). Most of the sports clubs have an official site and presence on various social networks (Ioakimidis, 2010). Moreover, sports marketing is one of the many business areas that today are engaging in the new media trying to competitively deliver their products and services to consumers (Askool and Nakata, 2011; Mangold and Faulds, 2009).

FIRST STUDY

In order to get a precise comprehension of the Sporting CP's context and to support hypothesis formulation, a preliminary exploratory study was developed, based on semi-structured interviews to three leaders of Sporting CP and three managers of others Portuguese soccer teams. This study has as specific objectives to understand Sporting's brand image, compare the perspectives of managers and fans, understand sport managers expectations, and understand the impact of the new strategies and marketing initiatives, such as the use of social networks, on relationships with fans. As research questions, this study inquires about the new sport marketing communication strategies, new services recently launched, and how these strategies and initiatives generate customer satisfaction; as well as how social networks improve relationships with fans, and, finally, if Sporting CP brand has space to grow. Data collection was carried out using different forms of communication: physical presence, video calls, phone calls and email.

The Sporting's leaders considered that relationships with fans are a key issue for the success of team's image. Marketing strategies, products and services and, even, communication channels follow the objective to satisfy fans and to get close to them, whose suggestions are useful and essential to the team. To achieve strong relationships with fans and attract new fans are the priorities of team managers who are working on several benefits to offer team community, either through the club (e.g., events, tickets, services) or through partners and sponsors (e.g., merchandising, discounts). Close relationships are catapulted by the use of new technologies, which are considered essential for the club. The creation of daily use communication channels as the official site, Facebook or Twitter, were considered very important because fans can follow the team's news with live updates, use services or communicate with the community, and offer suggestions to the team. Although Sporting innovates with this channels, it still promotes traditional communication channels such as the official newspaper or Sporting TV. Club also gives importance to the traditional media so that team can reach each type of fan, even if geographically distant from its area.

The managers of rival teams corroborated most of the information and opinions of Sporting managers. The divergent issues were related to the fact that rival managers sustained that better sports results from direct competitors may affect the growth of Sporting's brand. Regarding to communication channels, sport marketing strategies and relationships between fans and team, rival managers sustained Sporting's decisions.

In sum, all managers consider that new sports marketing strategies and initiatives (e.g., etickets, Apps, merchandizing, promotion of non-sports events, website, or Sporting TV) generate satisfaction, and the investment in social networks improves and strengthens relationships with fans. Is was also considered that Sporting brand still has space to grow nationally and presents potential to grow at an international level.

HYPOTHESES OF STUDY

The focus of this investigation is to check whether the expectations of Sporting managers match the perception of fans regarding products and services offered, in particular some new services recently launched, marketing communication strategies and initiatives followed, and respective benefits. In particular, study intends to inquire if website and social networks have impact on the relationships that fans establish with the team.

Based on the literature review and on the first study, four hypothesis of study were formulated:

H1: The continuous usage of the team's new services positively influences relationship strength with fans.

H2: The presence of team in social networks positively influences relationship strength with fans.

H3: The fans living outside team's geographic area show lower scores of relationship strength than fans living in the team's geographic area.

H4: Team's communication channels have a lower effect on the relationship strength with fans living outside team's geographic area comparing to fans living in the team's geographic area.

METHODOLOGY

Participants

A sample of 787 Sporting fans was obtained. The sample was divided in 2 groups: Group A consisting of participants living in Lisbon area (n = 307), and Group B consisting of participants living outside Lisbon area (n = 480). Different ages, genders and "fan condition" (1 = "I sympathize with Sporting"; 2 = "I am a Sporting fan, but not an associate"; 3 = "I am a Sporting associate"). It is worth to note that associates, under a payment fee, benefit from several services (e.g., special places to assist to games, participation in sports) and advantages (e.g., ticket discounts).

Measures

To measure the quality of team relationship it was used an adapted version of SCTRQS scale. This scale seeks to assess the relationship strength of a fan with his team (Kim et al, 2011). SCTRQS scale is multi-factorial, composed by five dimensions: Trust, Commitment, Intimacy, Self-Connection and Reciprocity.

Procedures

Questionnaires were developed in Google documents tool and collected on-line. The first part of questionnaire inquires about personal data of participants such as gender, age, occupation, fan condition and geographic location. Then a group of 18 dichotomous questions were placed (0 = "No"; 1 = "Yes") in order to assess fans' opinions on several marketing initiatives and services of the club and referred in the interviews in the first study. The objective was to ascertain if fans attributes importance and relevance to these issues as sports managers expected. The last part of questions was related to SCTRQS scale, in a total of 14 interval scales, anchored using a Likert type measurement approach of 5 points, between (1) "strongly disagree" and (5) "strongly agree".

RESULTS

Parametric Tests (T-TEST), Univariate Tests (ANOVA, ANCOVA) and Multivariate Tests (MANOVAS, MANCOVAS) were used to test hypotheses. The hypotheses were considered acceptable at a statistical level of p equal to or less than 0.05.

Reliability and normality

Reliabilities were calculated, through Cronbach's alphas coefficients, based on SCTRQS scale items (Kim et al, 2011). Acceptable internal consistency was achieved for the Trust, Intimacy, Self-Connection and Reciprocity dimensions, where Cronbach's alphas ranged from .76 to .87. Commitment dimension had a Cronbach alpha of .68, very close to the minimum of .70 recommended by DeVellis (2003).

The five dimensions on the SCTRQS scale did not follow a normal distribution; $p < 0,001$, which constrains the use of parametrical tests. But, since $n = 787$ (more than 30) parametric tests like T-TEST is acceptable (Pestana and Gageiro, 2003).

Hypothesis tests

H1 tests whether the latest services available to fans (e.g., etickets, team's Apps, team merchandizing, promotion of non-sports events) had the expected adherence and success as Sporting leaders reported, and if those services have a positive impact on the relationship of fans with the team. According to the four T-TESTS performed, the differences between groups are statistically significant at the level of relationship strength (SCTRQS scale) score. Data indicates higher relationship scores for the fans that use the service, in all cases, confirming **H1**.

H2 tests the influence of social networks in the relationship of fans with the team. Two MANOVAs tests were performed, assuming as dependents variables the five SCTRQS dimensions and as factor

the dichotomous variable SocialNetworkPage (0 = "I do not have the Sporting page of Facebook/Twitter added to my account"; 1 = "I have the Sporting page of Facebook/Twitter added to my account"). Statistically significant tests were obtained for both social networks. While Facebook team's page has a statistical significant impact on all dimensions of SCTRQS scale, Twitter team's page impacts all dimensions except Self-Connection. Moreover, fans that have Sporting's Facebook/Twitter page added score higher on relationship dimensions, confirming **H2**. Two more factorial MANOVA were performed, for the same dependent variables, assuming as independent variables SocialNetworkPage and Geographic Location. No statistically significant results were obtaining, indicating that no differences were found between Group A and Group B, relating to the impact of the use of team's Facebook/Twitter page on the relationship strength dimensions.

H3 tests whether the Geographic Location of fans influences relationship with the team. MANOVA tests, using SCTRQS scale dimensions as dependents and Geographic Location as factor, indicated statistically significant differences between groups for Trust and Reciprocity dimensions. For these variables, the average of Group B is superior to the Group A. Thus, fans living outside Lisbon area evaluate more favorably their relationships with Sporting, rejecting **H3**. These results are in line with the information gathered with Sporting managers, that revealed that huge marketing efforts have been invested on reaching audience and reinforce attachments with Sporting fans living in different parts of Portugal and abroad.

H4 tests the impact of club's communication initiatives (i.e., Sporting TV and team's website) on the different groups of fans. Two factorial MANOVA were performed, assuming the five SCTRQS dimensions as dependent variables, and as factors the Geographic Location and the dichotomous variable CommunicationChannel (0 = "I do not assist to/visit the Sporting TV/Website"; 1 = "I assist to/visit the Sporting TV/Website"). Both models showed statistical significance. Of the variables tested, only statistically significant differences were obtained for Commitment dimension, in the case of website; and for Trust dimension, in the case of Sporting TV. In both cases, Group B scored higher for Commitment and Trust, in contrast with **H4** statement. Thus, **H4** was rejected. Again, this result was in line with Sporting managers efforts to reach more distant fans.

The effect of other variables (as covariates) in the models above described shows that, for instance, gender influences relationships with team, except for social networks. The high number of men compared to women, in the sample under study (a sample mostly collected on online Sporting communities) might indicate that it is still necessary to explore initiatives adapted to female preferences, as different merchandising alternatives, creating new events or new content on the official website and Sporting TV. Age affects fans' relationships with team, except on the Facebook social network. In this case, there is the need to adapt the club initiatives, products and services to different

ages. Fan condition also influences relationship with the team in all the variables, where associates showed the higher relationship scores, followed by other team fans.

CONCLUSION

There is some correspondence between the expectations of club leaders and information collected through questionnaires about fans satisfaction. Most of the marketing strategies and initiatives are well received by fans, which may indicate well succeed marketing decision have been taken. However, they still have to develop the less successful marketing decisions (for instance, to capture female audience) and be updated with the different needs that constantly come up with fans. Social networks won their space in sport marketing, which is clear in Sporting case. Sporting looks to be an innovative club with presence in the most visited social networks. At the same time, the club developed their official newspaper and TV, as they give importance to the traditional media, important to build brand awareness, with impact on the team's brand value.

To establish strong relationships with fans is one of the team priorities. Based on the managers' interviews and on the questionnaires given to the fans, it's possible to understand that the majority of marketing strategies and services and communication channels seems to positively impact fans' relationships with team. Sporting is not just a Lisbon team, it's a Portuguese team with international representation. This reality forces club managers to improve strategies and initiatives to reach fans who live away from Lisbon.

From this investigation, it appears that Sporting brand still has space to grow, domestically and internationally, through the establishment of strategic partnerships with different entities, the sale of official merchandising and product licensing or through sports marketing innovative strategies, in line with innovative communication channels, besides sports results, especially of the professional soccer.

This study becomes relevant to the management of soccer clubs since, first, addresses an issue that is essential for the management of a sports club: the relationship with their fans. Without fans a club does not make sense, they are its greatest strength, they are always present in good and bad times, have an emotional attachment to the club that expands loyalty to levels that few brands are able to match. Second, it portrays the importance that social networks have gained in the management of a club. This study refers specifically to Facebook and Twitter, where every major international clubs already have official pages, but it should be noted that the characteristics of these networks mean that today you can find clubs exploring different networks, such as Instagram, Google+ or Snapchat. Social networks create a direct link to other online platforms increasingly developed by the clubs, as the case of Youtube, Spotify, blogs and official forums. There is a whole new world associated to new technologies that football clubs should explore as a way to expand their brand, advertise their

products and services, and reach fans. It should also be noted that social networks and online communities allow enhancing business and partnerships, it is quite easy and intuitive to the association of two or more brands to certain campaigns. However, it should be noted that the importance of these communication channels should be combined with the maintenance and updating of other channels such as the website, television or the club's official newspaper and, if possible, to independent media that are daily published information about the club, available nationally and internationally.

In sum, this study reveals the importance that club's strategies and marketing initiatives have on their relationship with fans. All events, services, merchandising, campaigns, etc. must be studied in detail in order to achieve targeting fans, such as fans that are geographically distant from the club, different genders, different ages, etc. The trust, commitment, familiarity, connection and reciprocity of fans should be a priority in sports management, particularly in large clubs that have to adapt their strategies, initiatives, communication channels and benefits to different groups of fans.

PROSPECTS OF REGULATING CAR USE IN RUSSIA BY MEANS OF TAXATION

Mayburov, Igor¹; Leontyeva, Yulia²

²dept.Graduated School of Economics and Management, Ural Federal University, UrFU, Ekaterinburg, Russian Federation

ABSTRACT

The paper analyzes changes in car use in Russia that have occurred over the past 25 years due to accelerated vehicle ownership expansion. A conclusion is drawn that the state needs to create fiscal instruments to regulate people's interest in owning and using cars.

Substantiation is provided for an idea that it might be useful to introduce a classification that divides transport taxes into fixed and variable ones with regard to the intensity of car use. The basic assumptions and methodological provisions for calculating the cost of owning a car are given. The structure of the costs of owning a car in Russia is presented. A conclusion is substantiated that two types of costs are prevalent in the structure: depreciation and insurance (mandatory and voluntary). At the same time, taxes do not exceed 13 percent of total ownership costs regardless of the vehicle class. The structure of taxes in car ownership costs is presented.

A conclusion is substantiated that fixed taxes dominate among transport taxes, and their share grows for pricier cars. The share of variable taxes in Russia is insignificant and tends to go down for pricier cars. Arguments are provided in favor of increasing the variety and fiscal impact of variable transport taxes that should have a bigger share than fixed taxes, in order to increase their power to regulate car owners' behavior. It is advisable to increase the fiscal impact of variable taxes by introducing various distance-based tolls.

Keywords: *transport taxation, cost of owning a car, fixed transport taxes, variable transport taxes.*

INTRODUCTION

People in the Soviet Union viewed cars not as a means of transport, as was the case in Europe, but as a luxury. Only members of elite groups had their own cars. Things have changed drastically over the past 25 years. Three main trends have emerged in Russia as regards car use.

The first one is that cars are now affordable to a wider population. As a result, Russia was swept under by an accelerated and uncontrolled growth of the car fleet. The number of cars has grown almost five-fold over this time, mostly due to an explosive increase in the number of privately owned vehicles. Ninety-five percent of cars are owned by individuals.

The second trend is an accelerated growth in residential and commercial building construction in cities that is not accompanied by the appropriate expansion of parking spaces and urban road networks.

The third trend is a significant transformation of the structure of passenger traffic. Over the past 25 years, passenger traffic on railroads, buses and trams have gone down by more than 50 percent. Public transport modes have been replaced with cars.

Along with positive externalities, the explosive development of auto transport has brought about new public expenditures on correcting negative externalities caused by the increase in car use. The non-reimbursable expenses that the government has to bear stem from the allocation of a substantial portion of land in cities for the purposes of road construction; the need to build and maintain road infrastructure; high road accident rates and environmental pollution; road wear, and congestion. The expenditures are paid for with local taxes, including those levied on people who do not own a car. The expenditures tend to grow year-by-year.

The state needs to create instruments that would regulate people's interest in owning and using a car. Fiscal instruments are internationally recognized as the most effective ones. They provide the strongest motivation to motorists, encouraging them to evaluate the costs and benefits of owning and using a car. The article aims to analyze the structure of taxes in the cost of car ownership and to propose recommendations for changing the structure in order to intensify tax regulation of car use in Russia.

RESEARCH METHODS

Analysis of foreign works on the matter shows that an optimum comprehensive system of transport taxes should incorporate two groups of mandatory levies (European, 2003).

1. Fixed taxes. The tax rates are not pegged to the intensity of car use, which means they do not directly involve the car owner in compensating for negative externalities. Yet their size is a determining factor in the affordability of a car; it influences the level of car ownership in society and the desire (of individuals in the first place) to own a vehicle. High fixed taxes could be used as an instrument of shutting out some people (usually those with low income) from owning a car and, consequently, from driving one. Theory-wise, fixed taxes are essentially Ramsey taxes and ensure certain tax revenues for the government from car owners (De Borger & Mayeres, 2007).

The application and scientific foundation of fixed transport taxes have long been of interest to researchers. Quantitative substantiation of the size of the taxes can be found in the works by J. Dupuit,

who was a member of the Ecole Nationale des Ponts et Chaussee. According to him, transport taxes are the price of using public services that is determined in terms of the surplus method. The taxes are an instrument of collecting consumer surplus that contributes to the funding of public infrastructure, while demand for trips is a function of fares and tolls and other transport taxes (Coevering & Schwanen, 2006), (Derycke, 1998).

2. Variable taxes the amount of which is determined by the intensity of car use. In this case, the size of transport taxes should reflect the tax price of negative externalities, while each car owner should pay an amount that is equivalent to the total of negative externalities caused by the operation of his/her car. A sophisticated system of variable taxes makes it possible to effectively administer the process of recovering marginal external costs while precisely factoring in all kinds of impact. Foreign studies show that in the case of the absence of fixed transport taxes, the amount of variable taxes is higher than marginal external costs. This makes it possible to also ensure a positive Ramsey component in taxes. From the theoretical perspective, this group of taxes are Pigouvian taxes (Clarke & Prentice, 2009), (Litman, 2009).

British scholars led by A. Pigou believed that the size of variable transport taxes is determined by the size of external social costs of using transport, and that taxes are a way of internalizing the externalities. A more comprehensive approach to defining the quantitative characteristics of the system of transport taxes was proposed by W. Vickrey. He considered transport taxes to be a universally applied charge for the use of the road network that depends on the time of day and is calculated using a system of electronic tolling. Vickrey was the first one to substantiate the idea of controlling the demand for car travel by imposing variable transport taxes. Vickrey suggested that toll rates should vary with when and where the road network is used. Vickrey explained that such charges (later referred to as Vickrey's Toll) would suppress the demand for roads because many drivers would instead use public transport. Those who are ready to use the road network without congestion will have to pay a fair price for it (Vickrey,1963), (Vickrey,1963).

We shall look at how these groups of taxes are represented in vehicle taxation in Russia. For this purpose, we shall analyze the cost of owning a car and examine the structure of tax costs incurred by car owners. We have selected three car classes for the analysis (compact cars represented by the Hyundai Solaris; business segment represented by the Mercedes E20, and compact crossovers such as the Toyota RAV4) in their basic configurations with automatic transmissions.

When analyzing the cost of owning a car we make the following assumptions. The car is in use for three years (before the warranty expires) in a large city in Russian for non-business activities. After that, the car is sold, thus enabling us to put the annual depreciation, which is the difference between the price of a new car and the price of an identical three-year-old vehicle, into calculations.

Data on the selling prices of three-year-old cars are borrowed from a PwC report. Other expenses include the cost of buying winter tires and other consumables for the day-to-day operation of the vehicle. Parking fees are not factored in (we assume that free parking options are available in Russia at the moment).

The following taxes paid by car owners in Russia were included in the calculations: VAT and excises duties that are paid on a one-off basis when a new car is purchased; the car recycling fee and the registration fee that is paid on a one-off basis when the car is registered with the traffic police; annually paid vehicle tax; fuel tax that is included in the price of fuel. We suggest ignoring the VAT on goods, works and services purchased in connection with the running of the car (Mayburov & Leontyeva, 2015).

To determine the annual amount of taxes paid at the moment of purchasing a car, we suggest performing the calculations in proportion to the depreciation of the car, assuming that the remaining part of taxes will be refunded to the owner once he/she sells the car. At the same time, writing off expenses in annual proportions is a conventionality.

Indicator	Compact car (Hunday Solaris)	Compact crossover (RAV 4)	Business class (Mercedes E20)
Car depreciation	23,0	35,0	51,1
including recycling fee	1,8	1,3	1,0
VAT	3,2	4,9	7,4
registration fee (annual mean)	0,5	0,4	0,2
sales tax	0,2	1,7	1,6
Fuel	29,5	21,1	8,9
including fuel tax	3,8	2,5	1,1
Mandatory and voluntary insurance	35,7	33,0	32,2
Taxes, fees and other mandatory charges	0,7	1,4	1,7
including vehicle tax	0,7	1,4	1,7
Maintenance	6,5	4,1	3,2
Other expenses	4,6	5,5	2,9
TOTAL	100	100	100

Table 1. Structure of car ownership costs in Russia, %

ANALYSIS OF THE RESULTS

The results of the calculations are presented in Table 1.

At present, two types of costs prevail in the structure of car ownership costs- depreciation and insurance (mandatory and voluntary). The share of these expenses for a compact car is 58.7 percent, for a premium car it may be up to 83.3 percent. At the same time, for the most expensive premium and business cars the share of value depreciation in total ownership costs considerably exceeds insurance

expenses. The total amount of taxes averages 10 to 13 per cent of car ownership costs regardless of the vehicle class.

We shall now analyze taxes and other duties, dividing them into fixed and variable ones (Table 2).

Indicator	Compact car (Hunday Solaris)	Compact crossover (RAV 4)	Business class (Mercedes E20)
Fixed taxes, including	6,4	9,7	11,9
VAT on cars	3,2	4,9	7,4
recycling fee	1,8	1,3	1,0
registration fee	0,5	0,4	0,2
yearly paid excise duties on automobiles	0,2	1,7	1,6
vehicle tax	0,7	1,4	1,7
Variable taxes (fuel taxes)	3,8	2,5	1,0
TOTAL taxes and mandatory charges in the cost of car ownership	10,2	12,2	12,9

Table 2. *Structure of taxes in the costs of owning a car, and their classification, %*

The analysis enables us to conclude that fixed transport taxes prevail in Russia and that their share grows in the case of pricier cars. At the same time, the share of variable taxes is insignificant and tends to decrease for pricier cars.

In order to increase the power of taxes to regulate car owners' behavior it is necessary to increase the variety and fiscal impact of variable transport taxes. They should have a bigger share in costs than fixed taxes. This can be done by introducing various distance-based tolls.

Such modern tolls, for example a federal road toll imposed on heavy trucks exceeding 12 tons of gross vehicle weight, are already being introduced in Russia. It is necessary to gradually expand the application of such fees to cover other types of vehicles.

Russian Federation must develop new fiscal instruments that would meet the following fundamental requirements:

- (1) toll revenues must be spent strictly on the objectives of transport policy in the urban agglomeration where the road system was used;
 - (2) tolls must be levied according to the distance travelled and be related to the type of the road (federal, regional or municipal);
 - (3) the charge should vary depending on the day of the week and the time of the day (the highest during peak hours and a minimal charge during the rest of the day);
 - (4) the minimal charge should match the marginal costs of road use, while the maximum rate should also include a surcharge. The surcharge would balance demand for the road network and its capacity.
- Such an approach to toll setting is outlined in the 2003 recommendations of the Council of the European Union and has already been successfully tried and tested (European conference of Ministers of transport, 2003).

It is critical to make sure that as a result of the introduction of road tolls the collected money is spent on improving road networks and is subject to public control. Increasing the fiscal impact of variable transport taxes will make public transport more appealing as an alternative to automobiles, thus spurring its development.

STRATEGIC RENEWAL, ACQUISITIONS AND AMBIDEXTERITY

Meglio, Olimpia

DEMM, University of Sannio, Benevento (IT)

ABSTRACT

Mergers and acquisitions literature is replete with integration models that depict the integration choices and associated solutions by simplifying the relationship between the merging companies into the two overarching concepts of strategic and organizational fit. The resulting integration models have proven to be too coarse-grained to capture the full spectrum of integration demands and related choices. There is an emerging awareness among M&A scholars that effective integrative solutions are far from these idealtypes and require hybrid approaches. This is even more evident when one analyzes acquisitions as a means to reconfigure strategic resources and capabilities. Seen in this light, the enduring classification of acquisitions as related or high technology loses its explanatory power and meaningfulness. In this paper, I have distinguished between high tech acquisitions as motivated by technological component or standalone product. In the former case, the need for interdependence is higher than in the latter case and this implies the importance of finding more balance solution between autonomy and integration. In this context, contextual ambidexterity may represent a key capability to solve these competing demands and pursue a more effective integration between the merging companies. Integration leader and integration mechanisms help finding proper answers to single integrative demands within the overarching integration model.

Keywords: *mergers and acquisitions, M&As, integration models, high technology acquisitions, related acquisitions, ambidexterity, contextual ambidexterity, strategic renewal*

INTRODUCTION

Mergers and acquisitions (hereafter M&As or acquisitions) have demonstrably served as mechanisms for multiple strategic goals, from pursuing growth to enabling innovation, from achieving synergies to entering new markets. Despite ambiguous evidence about their success rate (King *et al.*, 2004; Risberg and Meglio, 2012), acquisitions remain a maneuver of choice for top managers around the world. One reason for their popularity may be that they are recognized as an important tool for incremental strategic renewal (Agarwal and Helfat, 2009). By associating acquisitions to strategic renewal, strategic management scholars outline the role acquisitions play in accessing, refreshing or replacing resources

and capabilities, or technologies (Capron and Mitchell, 2009; Puranam *et al.*, 2009). Seeing acquisitions as a means to pursue strategic renewal implies to analyze the integrative demands in the light of the relationship between the resources and capabilities of the merging companies. The resulting classification is, we contend here, more meaningful than the traditional acquisition typologies based on the degree of relatedness between the merging companies. Instead of classifying acquisitions as related or unrelated, we focus on the relationship between the resources and capabilities that may be categorized as overlapping or complementary. Such classification enables a more nuanced understanding of integrative demands and effective solutions. In case of overlapping assets the integrative demands involve eliminating redundancies, which may in turn create organizational turmoil. In presence of complementary assets between the merging companies, the integrative demand is lower as complementarity reduces the need of eliminating duplications or overlapping functions and decreases the risk of organizational turmoil. This circumstance nonetheless requires a particular care to concurrently exploit the existing resource endowment and explore the new and augmented resources and capabilities base.

Whatever the level of integration effort required to the acquiring company's top management, the need to achieve balance between exploitation and exploration might be effectively handled by relying on ambidexterity, which may provide an integrated solution to these competing demands. In this paper, I build upon and extend previous work on ambidexterity in acquisitions (Meglio *et al.*, 2015) to examine how ambidexterity may shape the integration process at multiple levels of analysis, the organizational, the group and the individual levels. I achieve this aim by integrating two different research streams: post-acquisition integration and ambidexterity literature. In doing so I contribute to a more nuanced understanding of integrative demands and associated solutions in post-acquisition integration process and to examine the ambidexterity construct at multiple levels of analysis in an acquisition setting.

The paper is structured as follows. Next I review relevant research streams. Then I develop a typology of integrative demands and ambidexterity solutions at different levels of analysis. Limitations and implications for research and practice are discussed in the concluding section.

THEORETICAL BACKGROUND

In this section I briefly analyze acquisitions as a means for strategic resources and capabilities reconfiguration and discuss its effects in terms of integrative demands. Next, I introduce the concept of ambidexterity as a tool to achieve resources and capabilities reconfiguration during the integration process.

Acquisitions, resources and capabilities reconfiguration and integrative demands

Acquisitions have long been investigated by strategic management scholars. The recognized inherent complexities of acquisitions has led scholars to develop typologies of acquisitions primarily for research purposes but also to draw more effective managerial implications and help practitioners to integrate the merging companies. One of the most enduring classifications is the one that distinguishes between related and unrelated mergers and acquisitions (see Larsson, 1990 for a critical reflection on the Federal Trade Commission classification). The degree of relatedness is a longstanding construct in M&A research and has been extensively employed to study the relationship between the merging companies and post-acquisition performance (e.g., Datta, 1991). A high degree of relatedness means high potential synergies (Carow *et al.*, 2004) that demand longer execution especially in presence of organizational turmoil, which is very likely if achieving cost synergies requires elimination of redundancies and personnel layoffs. For cost savings, the considerations are likely similar for either unrelated or related acquisitions. For example, a combined firm will only need one Chief of Financial Officer. Meanwhile, there is a difference in how revenue improvement will be achieved. Unrelated targets have less interdependence that allows lower levels of integration and simplified planning (Coff, 2002). In contrast, related acquisitions derive value from coordinating interdependencies, integrating target resources, and divesting excess capacity (Barkema and Schijven, 2008).

Over time, parallel to the blurring boundaries among industries, the concept of relatedness has lost its meaningfulness and has been progressively replaced by the notion of fit (strategic, organizational and cultural). This concept is more nuanced than relatedness as it enables taking into account benefits arising from complementary resources. In this regard, more recent research suggests that combining firms that are dissimilar or balance strengths and weaknesses are most likely to create value (Harrison *et al.*, 2001; King *et al.*, 2004; Slotegraaf and Kesner, 2008). Strategic acquisitions that combine complementary resources may probably experience less troubles in the integration phase than acquisitions that build on overlapping resources that are expected to require a more complex integration process.

Akin to this portrait is the view of acquisitions as tools for reconfiguring resources and capabilities (Capron, 1999; Capron and Mitchell, 2009). Proponents of this view contend that the gap in resources and capabilities represents a main driver for sourcing decisions. Specifically, Capron and Mitchell (2009) offer an integrative framework that builds upon the resource gap attributes. They identify in the resource gap, such as that emerging from a rapid technological change, along with severe social frictions, the two conditions that make acquisitions a suitable and effective tool to renew company's capabilities and avoid the time-consuming and uncertain process of internally accumulating them (Dierickx and Cool, 1989). Such a view enables the acknowledgment of the dual components of task

and human task and human integrations in a post-acquisition context (Birkinshaw *et al.*, 2000), which often experience tensions between time and method of integration.

In case of complementarity assets (resources and capabilities), the integrative needs shift from the elimination of duplications, typical of purely related deals, to finding an optimal balance between different, although interdependent resources and capabilities. In such circumstances, Meglio *et al.* (2015) contend that the traditionally preservation–integration dilemma is ill suited to capture the spectrum of integrative solutions to apply, which often result into a hybrid approach (Schweizer, 2005). In his examination of acquisitions involving pharmaceutical and biotechnology companies, Schweizer (2005) finds that it is necessary to combine integration typologies into a hybrid approach. This reinforces the belief that the integration process requires ambidexterity to resolve conflicts from integrating what is old and new, to preserve tacit knowledge embedded in talented people, or to foster innovation while achieving efficiency through cost reduction. Meglio and colleagues (2015) suggest to analyze the integration process through the lens of contextual ambidexterity as it renders justice to alternate paths through conflicting goals and time frames for task and human integration.

The need for ambidexterity is particularly salient in high technology acquisitions that face choices between exploitation and exploration or incremental and discontinuous innovation. (e.g., Benson and Ziedonis, 2009; Graebner, 2004; Kang and Snell, 2009; Ranft and Lord, 2002; Phene *et al.*, 2012). In these contexts, the pressure for innovating pushes companies to access external flows of knowledge and to accelerate the internal transfer of knowledge across multiple hierarchical levels of combining organizations. Acquired external knowledge is intended to accelerate an acquirer's innovativeness by exploiting internal knowledge (DeCarolis and Deed, 1999; Kogut and Zander, 1992) and by exploring a greater magnitude of resource combinations from a shared knowledge base (Phene *et al.*, 2012). These acquisitions require, on the one hand, to be granted a certain degree of autonomy and, on the other hand, a certain degree of structural integration, depending on whether they are motivated for component technologies or for standalone products. I borrow the concept of structural integration (distinct from post-merger integration in general) from Puranam *et al.* (2009). These scholars contend that structural integration refers to the combination of formerly distinct organizational units into the same organizational unit and involves a formal design choice concerning the “grouping” of organizational units. The structural integration is a discrete decision about grouping units together within common organizational boundaries and precedes non-discrete decisions about the use of “linking” mechanisms between organizational units (such as the alignment and standardization of processes and systems, common hierarchical control, cross-unit teams, and integrating managers). This concept is consistent with the idea of distinguishing the integration choices and associated

solutions at different levels of analysis and ensures a more fine-grained representation of the integration process.

Whatever the motive behind a high tech acquisition (acquiring component technologies or standalone products), both types may create value for the acquirer, yet the extent of interdependence (and therefore coordination necessary) between the acquiring and target firms is higher in the former than in the latter. Thus, even if different acquisitions are alike according to existing typologies, namely high tech acquisitions, these typologies are too coarse grained and tend to lump together situations that may vary a great deal.

Below, I propose that contextual ambidexterity may provide an integrated solution to effectively handling structural interdependence between merging companies while concurrently solving competing demands of exploitation and exploration.

Ambidexterity in acquisitions

Since Duncan's article in 1976, the metaphor of organizations being equally dexterous at using both hands—referred to as organizational ambidexterity—has been employed to reconcile multiple, competing organizational demands (Simsek *et al.*, 2009; Lavie *et al.*, 2010) due to its versatility (Birkinshaw and Gupta, 2013). Over time, ambidexterity has been employed to address tensions between exploitation and exploration (March, 1991); tensions between incremental and discontinuous innovation (Tushman and O'Reilly, 1996); tensions between the capacity to achieve alignment and adaptability simultaneously (Gibson and Birkinshaw, 2004); tensions between market and political capabilities (Li *et al.*, 2013). Recently, Meglio and colleagues (2015), following this tradition, apply ambidexterity to trade-offs between task and human integration in acquisitions.

In the ambidexterity literature, solutions for balancing competing demands may take the form of structural, temporal, or contextual ambidexterity (O'Reilly and Tushman, 2013). *Structural* ambidexterity requires physically separating units with different orientations to different locations (Benner and Tushman, 2003). *Temporal* ambidexterity suggests that conflicting goals can take place within the same business unit, but only in a cyclical or sequential manner (Siggelkow and Levinthal, 2003). If competing demands are seen as orthogonal, or capable of co-existing, tensions can be best addressed by *contextual* ambidexterity that involves simultaneously pursuing conflicting demands using organizational processes and managerial intervention to achieve the needed balance (Gibson and Birkinshaw, 2004). Contextual ambidexterity refers to the routines and processes used by organizations to mobilize, coordinate, and integrate dispersed exploratory and exploitative efforts and to allocate, reallocate, combine and recombine resources and assets (Jansen *et al.*, 2009).

In the acquisition integration context, this is primarily achieved through integration leadership and integration mechanisms that help to concurrently achieve task and human integration (Meglio *et al.*,

2015). As such it involves the organizational, the group and the individual levels of analysis. In the next section I analyze the contribution of contextual ambidexterity for high tech acquisitions at different levels of analysis.

CONTEXTUAL AMBIDEXTERITY: A PANACEA FOR HIGH TECH ACQUISITIONS?

As discussed above, high tech acquisitions may be considered as an umbrella label under which one can find acquisitions varying a great deal. Motives are among key factors explaining such variety, but also several contextual conditions, for example the nature of interdependence between resource and capabilities, or the existence of a common ground between the merging companies that have been found to profoundly affect these deals (Puranam *et al.*, 2009). Puranam and colleagues (2009) have outlined that the nature of interdependence influences the integrative demands and in turn the mechanisms to rely upon to minimize disruption while achieving the desired level of structural integration. Meanwhile, the common ground determines the contextual conditions in which the integration process takes place and, in turn, influences the easiness of the integration itself. As discussed above, acquisition scholars tend to describe the integration solutions focusing on the organizational level of analysis. At the organizational level of analysis they identify integration models such as autonomy or absorption. These models, as discussed above, are too coarse-grained and do not capture hybrid solutions that could work at lower levels of analysis such as the group or the individual. Therefore I suggest that within integrative models, integration leadership and integration mechanisms may help achieve hybrid solutions. Integration leadership and mechanisms represent the building blocks of contextual ambidexterity in a post-acquisition context (Meglio *et al.*, 2015).

Integration leaders, as described by existing literature, lead and coordinate the integration process. An integration leader plays multiple shifting roles beginning with organizational maverick to promote a cooperative atmosphere; a shift to transformational leader can help to sustain commitment; a later move to serve as an organizational buffer alleviates pressures on integration teams; and a final role of network facilitator bonds previously separate personnel and divisions (Dagnino and Pisano, 2008). Seen in this light, an integration manager's roles contribute to contextual ambidexterity between merging units to facilitate structural integration. This can prove an effective solution if the degree of integration between the merging companies is low as in the case of an acquisition motivated by a stand-alone product. Autonomy can also be used as an intermediate step towards a deeper structural integration. In such a case, temporal ambidexterity may be seen along a sort of continuum, from autonomy to absorption.

If the technological component need to be integrated into the acquiring company, then integration aims to create a common set of goals and procedures to pool resources and capabilities together. By doing this, structural integration increases the predictability of actions of merging parties employees (at all levels, from the shop floor to the R&D laboratories), yet it may also bring about disruptive effects.

Along with the introduction of unifying formal systems and procedures in the merging companies, informal organizational processes also shape the integration process. These informal processes aid knowledge transfer through the creation of a common ground, informal communication channels, and group identity (Puranam *et al.*, 2009).

An integration leader may help achieve balance formal and informal integration by contextual ambidexterity if she relies on a proper set of integration mechanisms that help to address competing demands at multiple levels of analysis, the individual, the group (imagine a team of scientists into a R&D lab) or the organizational level. Integration mechanisms represent the micro-mechanisms through which tensions between exploitation and exploration in post-merge integration are balanced. The idea of investigating the integration process as a coordination problem dates back to Larsson (1990) and has been more recently revamped by Puranam and colleagues (2009) who outline that the integration process involves choosing from a repertoire of integration mechanisms depending on the kind of interdependence the integration manager has to deal with (sequential, pooled or reciprocal, according to Thompson's classification, Thompson, 1967).

In case of acquisitions motivated by a technological component the interdependence is expected to take the form of pooled or reciprocal and this means balancing between structural integration and the creation of a common ground. This balance requires an integration leader to act as a change agent and as a network broker, following Dagnino and Pisano's (2008) classification. In terms of integration mechanisms, while formal planning and the standardization of procedures and information systems improve the coordination, socialization, mutual consideration and human resource systems are more suitable to create a common ground. Socialization can be conceived as "the creation of a shared identity, the establishment of trusting relationships, and the absence of divisive conflicts between the members of the combining organizations" (Björkman *et al.*, 2007: 5) and is eminently aimed at avoiding employee dis-identification that is counterproductive to coordination in organizations (Smith *et al.*, 2013). Cultural seminars, as documented by Vaara (2003), are one possible way to achieve socialization. Another option is training that can foster organizational learning and knowledge transfer (Kase *et al.*, 2009; Prieto and Perez-Santana, 2012). Alternative social integration mechanisms are personnel rotation, short-term visits, participation in joint meetings, and membership in cross-unit teams, task forces, and committees (Björkman *et al.*, 2007). Socialization is facilitated by mutual

consideration to decrease conflict by focusing employees on tasks and not politics by using cultural seminars (Vaara, 2003) and communication to minimize employee resistance (Risberg, 1999). HR management generally emphasizes reducing conflict and relationship formation that can hinder (at least initially) post-merger integration. These mechanisms work particularly well in transition teams, ad hoc group that deal with specific integrative tasks while also favoring cultural socialization (Sarala *et al.*, 2015).

HR management covers a comprehensive set of tools to deal with personnel issues, such as career planning, keeping talented people, and instilling new competences through training programs (see Weber and Tarba, 2010). Acquisitions can have multiple impacts on an individual's career including the temporal sequence of work positions and activities over the course of an individual's life (Larsson *et al.*, 2001), and the feelings of ambiguity of how an employee's work efforts are to be rewarded in the new entity need to be mitigated (e.g., Risberg, 1999; 2003). For example, Patel *et al.* (2013) find that competing demands framed as alignment and adaptability can be addressed by HR management through fostering support and trust.

The preceding considerations highlight that within integration models different roles of the integration leaders along with the repertoire of integration mechanisms may play an important part in ensuring the attainment of integrative priorities at different organizational levels and within different organizational units, such as the R&D laboratories that are central in high tech acquisitions.

DISCUSSION

Mergers and acquisitions literature is replete with integration models that depict the integration choices and associated solutions by simplifying the relationship between the merging companies into two overarching concepts such as strategic and organizational fit. These models, although simple and elegant, have proven to be too coarse-grained to capture the full spectrum of integration demands and choices. There is an emerging awareness among M&A scholars that effective integrative solutions are far from these ideal types and require hybrid approaches. This is even more evident when one analyzes acquisitions as a means to reconfigure strategic resources and capabilities. Seen in this light, the enduring classification of acquisitions as related or high technology loses its explanatory power and meaningfulness. In this paper, I have distinguished between high tech acquisitions as motivated by technological component or standalone product. In the former case, the need for interdependence is higher than in the latter case and this increases the importance of finding more balance solution between autonomy and integration. In this context, contextual ambidexterity may represent a key capability to solve these competing demands and pursue a more effective integration between the

merging companies. Integration leader and integration mechanisms help finding the proper answers to single integrative demands within the overarching integration model.

The application of ambidexterity in the acquisition context is still in its infancy yet it holds promises of further developments at theoretical level. The considerations developed in this paper should and could be further developed into a conceptual model and a set of propositions. In doing so, particular attention should be devoted to the measurement of key constructs, such as acquisition success or the relationship between resources and capabilities. A further conceptual development could also arise from enlarging the domain of application of ambidexterity to acquisitions in mature industries, such as the automotive or the steel industries, both heavily involved by huge consolidation processes. This analysis has also important managerial implications signalling the importance of appointing an integration managers or a team of integration managers early in the integration process. This research provides also important indications of the skills needed for the person recruited as integration manager and the tasks this manager needs to perform.

In closing, contextual ambidexterity is applied to acquisition integration to recognize increased nuances in integration decisions. Contextual ambidexterity enables managing conflicts between task and human integration during acquisition integration in high tech acquisitions to better recognize inherent complexities.

ADVANCES ON HOW CROSS-CULTURAL VALUES SPRING THROUGH TRADITIONAL FOOD ETHICS DEVELOPMENT

Mihoreanu, Larisa ; Vasile, Adrian; Saracin, Valentin Cosmin

Bucharest University of Economic Studies, Romania,

ABSTRACT

The purpose of the present research is to analyse the impact of the global crisis consequences over the Romanian market and consumption of traditional food, linked to some aspects of consumers' health and the ethics of those businesses. Romanian consumer is sensible to the traditionally and culturally aspect linked to food and the variety of internationally processed food available on the Romanian market grow substantially in recent decades. On one hand, technology made this possible, but on the other made the local consumer more cautious in preferring the highly processed food mainly due to health concerns, the toxicity of highly processed products used in the modern approaches of consumption, the lack of control and inadequate traceability of food products quality. When the public authorities ensure the optimal standard of quality and safety of food products, customers will feel reassured by this guarantee of the food they buy and the local food *underground* economy would substantially drop.

Keywords: *traditional products, model of consumption, economic crises, semi-subsistence farms, underground economy*

THE EFFECTS OF ECONOMIC CRISES UPON THE QUALITY AND TRACEABILITY OF LOCAL TRADITIONAL PRODUCTS

There are many reasons for which a deep analysis of what people eat is necessary. Healthy and unhealthy diets are found everywhere in the world, no matter the policy or the development level of the country. The same happens in Romania where the health of the population is affected on a daily basis, due to the openness to a larger, highly technical market where the lack of experience and knowledge could not satisfy entirely the expectations.

General habits are not changing at the same rhythm as the versatility of the market and the ever increasing quantities of food brought to the local market either from or from national suppliers. With over 60% arable of its territory, Romania doesn't use its full local potential given by the land and imports large amounts of fruit and vegetables from countries with intensive agriculture: Turkey,

Holland, Spain, and Israel. The total imports of food increase significantly every year, amounting over three billion Euros in the last years.

The share of chemical fertilizers used in agriculture grew gradually, to the detriment of natural fertilizers.

Due to the incorrect management and abusive use of modern technologies, plants accumulate large amounts of nitrogen, which are converted to nitrogen and then in nitrosamines - substances extremely cancerous.

Disequilibria are present at economic and social level too. Under the temptation of a *fake* feeling: the modernism of western societies, people adopt different techniques, diets, experiences or style of living and make mistakes in the use of chemical fertilizers, insecticides and herbicides, additives in finished products, genetically modified organisms, the consumption of sugar and refined foods, meat and fat abuse or unnatural methods of preservation. The consequences are inevitable: dramatic changes of health indicators and a general pathology among all inhabitants.

Fruits and vegetables, as the most important sources of minerals keep the researchers, technologists and producers' permanent attention. The cultivation technologies, upgraded in order to produce record crops, have damaged many foods making them dangerous for health. Following the trends, our country imports fruits and vegetables especially from those countries where the agriculture technical are highly technologized: Netherlands, Turkey, Spain, and Israel. The explanation relies on the exporters' better technology and their use of chemical treatments to streamline production.

The fact that Romania possesses better soils for growing vegetables doesn't help anybody today: Romania manages to get up to 300 tons of tomatoes per hectare, while the Western countries productions double that. The same happens for apple, potatoes and celery.

With imported products in their daily basket, people tend to change the consumption behaviour too. The increase in prices of traditional products generated increase in the purchasers' choice for imported fruits and vegetables found in supermarkets, at lower prices. Consumers prefer price to the quality and that happens on their own health risk.

People working in agriculture in the past were using chemical fertilizers too until the December revolution came and agriculture took a slower speed. Unfortunately this process is not enough standardised and controlled, and leaves place to a chaotic application depending on producers' knowledge and interest. Therefore the levels of pesticide and residues found in food exceed the admissible limits set by the Administration for Environmental Protection. Apples are one category containing high pesticide quantities making their consumption very dangerous.

For marketing policy reasons, the food manufacturers use the idea of colour and size for a better sale of their products: huge peppers, brightly coloured and giant strawberries, tasteless apples and forever

fresh grapes crowd the stalls at cost very high. These vegetables, of which many are genetically modified, are exposed to ionizing radiation in order to maintain their freshness for longer time. In Romania, according to official statistics, 99% of imported fruits are irradiated. In 2001, the Government issued a legal decision governing allowed productions under ionizing radiation of production, import and food marketing and treated ingredients. The document requires the Ministry of Health to issue and keep permanently updated, the list of foodstuffs that can be irradiated together with the irradiation dose used in accordance with the European Community requirements and standards. Romanian producers follow specific chemical treatment instead of European norms for preserving food and many manufacturers in their race for profit prefer to ignore these norms by not taking into account the time delay needed for the fruits or vegetables treatment chemicals to become harmless. Food should be offered for sale only after 18-21 days since it was chemically treated, but no one control exactly if, indeed, producers meet this requirement. From this point of view, experts say that food irradiation is more appropriate than chemical treatment done inadequately.

The traditional baked products are also important due to their diversity, relish, taste and flavours (Valnet, 1981). Romanian traditional products especially the cooked ones, have a well-defined traceability, which leads to quality improvement, and consumers' security.

FOOD SAFETY AND TRACEABILITY

Following the ISO standards for products and services and the traceability definition, the Romanian specialists consider the application of traceability of local food to identify origin, history or location. (Golan, Krissoff, Kuchler, Calvin, Nelson, 2004). Traceability is an important chain in the production, storage and commercialization processes of food in general and traditional ones in particular. The management of traceability along the alimentary chain implies the association of an informational flux together with the physical flux of detectable products. To obtain traditional products, the farmers use only natural ingredients, with no additives or chemicals" (Ioan, 2009). The home-made know-who of producing traditional foods has been transmitted from generation to another and historical documents and ethnological sources are proving it. . The traceability builds and demonstrates the real state of connectedness of any product, from the natural resources until the marketed product from the shop shelves. Specialists state that the local food principle of sustainability is relying on using and consuming those food products specifically based on locally grown resources (Ipate, 2010). Here, the traditional food is made from natural products, fresh ones obtained in recognized farms or processed by recognized recipes. To sustain this idea, we have analysed the traceability of hotchpotch of fresh vegetables – which is a traditional cooked dish, a sort of vegetarian stew, a mixture various vegetables cut into different shapes and tomato sauce, with red decor and finely chopped with green parsley

leaves. (A. Stroia, et al, 2011). The most used culinary preparation is the "*hotchpotch of fresh vegetables*" spread throughout the country. Vegetables are used in all possible combinations aiming to achieve a specific, subtle and appetizing flavour.

The secret to achieve a great culinary dish consists in respecting the right time and conditions for thermal treatment (blanching, tempering, stifling, cooking, and baking in the oven) for each processed vegetable; flavour with "*greenery*" and indigenous herbs. The vegetables, spices plants and processed food obtained from vegetable raw materials used to obtain the traditional culinary preparation of "*hotchpotch of fresh vegetables*" (A. Stroia, et al, 2011) are the following: green pepper, potato, yellow onion, cauliflower, pumpkin, bean peas, peas, carrot, parsnip, roots of parsley, tomato, celery, white cabbage, eggplant, green leaves of parsley and dill. The „*dish*" is prepared based on a "*synopsis of green vegetables*" grown and cultivated on the Romanian territory from thousands of years. Another observation refers to the fact that all ingredients found in the personal or local garden or at the farmers' market. With other words, Romanians always prefer the bargained and low price products, sometimes purchased from places where the fiscal economy is not at all present. Therefore such approach connects the traditional food to some ethical aspects too.

UNDERGROUND ECONOMY CASES IN ROMANIAN FRUITS AND VEGETABLES TRADE SECTOR

The high level of social contributions paid by both the employer and the employee, the existence of illegal employment market, the high degree of poverty, the low level of subsistence in agriculture make people to look for low priced products, bought often at the street corner, in perishable, unhygienic and unhealthy conditions. The evolution of this phenomenon is an alarming issue brought to the attention of specialists working on fiscal and budget policy and to national development policy makers, economic forecast analysts, and of legal advisers, equally to prevent and reduce this scourge. The underground economy is still highly developed in the fruit and vegetables sector, mostly taking informal forms. The reduction of VAT and the new fiscal programs (national lottery) brought some improvements; however, the current economic climate due to lack of appropriate regulation still encourages illegal acts such as abusive behaviour, corruption, fraud or tax evasion.

The black market attracts, every year, billions of euros by smuggling of fruits and vegetables. In order to defrauding the state budget, large quantities of vegetables and fruits are introduced in the country illegally; they are transported, stored and sold at wholesale warehouses from the country without supporting documentation and by using fictitious companies managed by third parties, bringing huge damages to the state.

Methods of fraud are diverse: from fake recordings of transactions in accounting documents, to develop commercial activity through ghost companies ruled on behalf of homeless people whose identity was stolen, and VAT frauds or illegal incomes got from tax evasion. We retain here, the dominance of importations of both vegetables and fruits under some groups' interest, with the support of local authorities who organised the tax evasion, and the disregard of anti-competitive practices, all of their own profit increase. There is another technique of the small producers' fraud consisting in the undervaluation of goods, but also in the declaration of a smaller quantity than the real one.

Although a small group of economic agents operate business of billions in the grey and black markets of fruits and vegetables sector, bringing substantial losses to the public budget, the authorities representatives act and sanction only the very few traders, mainly found in the street, not the 'big players' those in the big shops and markets. The sellers of fruits and vegetables are always punished for various contraventions of conducting illegal commercial activities, but as the penalties are small they prefer to pay and not change their behaviour making these correctives measures to be ineffective. Another pressing issue is the one of the producers because the "mafia of the markets" of agricultural products doesn't allow producers to market their production, and find themselves being forced to sell their products at extremely low prices. Most of the food markets are managed/ owned by speculators, and in many cities of the country there are controlling groups that condition the access of producers to the market and perceive illegal 'access fees'. Another phenomenon happening is a repeated and an over control against only small and medium sized producers who try with difficulty to access the big supermarkets. This type of measure is only a strategy used to eliminate what the big sellers call as dangerous competitors.

HOW THE LOCAL MARKET OF FRUITS AND VEGETABLES CAN RETRIEVE THEIR REAL VALUE AND RECOGNITION

As a European market member, Romania has to apply the EU regulations and market requirements in agriculture, even in the absence of effective mechanisms and technologies needed for this. In order to be a proactive part of a common market whose aims is to stabilize markets to ensure a fair level of income to farmers, and to develop the quality of products to meet consumers demands, Romania has to adapt and update European modern mechanisms of processing and delivery the agricultural products.

The reorganization of the production-exploitation of fruits and vegetables- products with a primary role in public health and nutrition due to their sensory qualities and of valuable nutrients they contain as glucides, vitamins, organic acids, mineral salts, etc. To efficiently valorise the pedo-climatic

conditions available in Romania, while improving the socio-economic level of rural areas, is the main objective of a strategy in the field. The policy must meet the requirements of this market sector by reducing price fluctuations and the imbalance between supply and demand and by encouraging consumption of fruits and vegetables, while ensuring the competitiveness of products. Although, initially, Romanian consumer has being obvious price sensitive and less sensitive when it comes to quality, lately most of the Romanians are becoming more attentive to place of origin of goods, paying more attention to quality products for healthier lives, even if the marketplace is not sufficiently developed to cover this need.

Local organic producers do not have however the capital to form their own network of shops and supermarkets and selling on the market is impractical considering that are huge shelf fees and prices charged are lower than market display costs, leading to idea that the exploitation of agricultural potential of Romania to be directed towards the Romanian organic products so demanded abroad

The official data issued by National Commission of Statistics and the Ministry of Agriculture and Rural Development shows, given the lack of care for the agriculture during the last decades, the Romanian land creates great opportunities for organic crops. For the moment, figures show the organic agricultural productions occupy less than 1% (0.94%) of farmland in Romania, of 14.82 million hectares, while at the level of the European Union, the dedicated to organic farming area is 6.11 million hectares, which is 3.7% of the 162.3 million of cultivated hectares.

Latest data published by the European Commission on European macroeconomic indicators of the agricultural sector highlight the Romanian position towards the other 26 Member States. Although it occupies an honourable sixth place regarding the utilized agricultural area, representing 7.7% of total EU utilized agricultural area, Romania has the largest number of farms (3,931,000), placing it on the last position. The same situation is found in the number of people working in agriculture, where Romania, with 28.8 per cent far exceeds the European average of 5.4%, being overtaken by all other Member States.

In this case, it is essential to find the right balance between consumers' expectations to consume more natural products and technological constraints related to their production chain up to the market. Therefore, we consider - as highly necessary - the creation of a legal framework allowing the Romanian manufacturers to develop the sector of fruits and vegetables and sell local products, making them known abroad, as European products. The present legislation lacks in coherence and stability and together with the poor management and low remuneration of the public service's jobs facilitate: •the deficiency in monitoring and in professional control over such businesses and •the lack of transparency in the decision-making process and in the relationship with citizens. All this are part of the corruption process, too deeply rooted in this region. In these circumstances, the activities linked

to the market competitiveness, boarder operations, sanitary police and consumers' protection should be modernised and intensified. Additionally, authorities should exercise more their attributions based on a developed professional plan of quality control and assessments of agricultural products markets, and should analyse the level of pesticides, nitrates and nitrites in vegetables and fruits and monitor their limitations as stated in the law. The informal exchanges on the fruits and vegetables market cannot be countered only by perseverance or desire to bring order in this sector. Laws and appropriate norms of application are expected to come into force and lead to Romanian agriculture development.

QUALITY AND SAFETY OF THE ROMANIAN TRADITIONAL FOODS

Nowadays, under globalisation influence, it is quite difficult to recognise the brands and identity of all products. Their certification has to become a must, for the consumer safety and security, a non-negotiable condition (Arvanitoyannis et. al., 2005). Under this process, a special attention should be given to the traditional products that are forming a special category as classified according to the origin, technology, content and recipes.

Nowadays, there are more and more official initiatives to create the necessary context, both legal and methodological, in order that opens a larger access to the market for organic agricultural productions. It is also important to apply the norms of certification referring to the traditional products recognition at national and European level. For a product to be certified with 'traditional' designation it should fulfil a series of conditions: any good should be made from traditional raw material, using traditional ingredients ways of processing and local recipes. Applying these rules, an identification system called *tracking* was developed, to monitor and evaluate both quality and safety d. In this way, local-specific and traditional products could be recognised for the value of theirs components, for the original recipe used, the ways in which they were processed and for their health attributes and preservation together with cultural vestiges promotion by becoming certified internationally Some of the advantages of products certification would be

At international level the big farms are more common in developed countries such the Netherlands, France, Spain and Turkey. Often, farmers and processors make abusive use of chemical fertilisers to get bigger crops. (Larsen, 2006). Following the farmers requests for profits, the European legislation, dynamic, has brought a lot of improvements for preserving also the consumers' safety. Unfortunately, some of those crops, once arrived in the emerging countries' shops, face the local conditions not harmonised either with the farmers' requests for public sustain of agriculture nor with the socio-economic conditions of living of the local population. A good example is the firm request of implementation of the *Codex Alimentarius* principles and standards as the main safety reference for food products traded internationally.

Another aspect to consider refers to the processed products in rural areas, sold mainly in improvised markets or by the main road in uncertain hygienic conditions without much knowledge of the norms stated by the authorities.

In the countryside, people continue to practice basic agriculture, to make their own dairy or meat products following the knowledge inherited from their elders, ignoring the pollution, or the new physical and atmospheric condition of our times. The intensive industrialization, the increase in pollution, the tendency to short the crops maturation, the pressure to increase the goods consumption generated big differences/gaps in living standards, crops qualities, and people's health. Therefore, more contaminants enter the food composition: polycyclic aromatic hydrocarbons, polychlorinated dibenzop-dioxins and dibenzofurans, polychlorinated biphenyls, a number of other persistent halogenated organic compounds, and toxic trace metals such as cadmium, lead and mercury (Larsen, 2006). New contaminants have been discovered associated with the way of producing traditional food. In order to prevent the contamination of traditional food, its production has been regulated successfully on the basis of acceptable daily intake (ADI) – the use of additives, pesticides, and veterinary drugs; tolerable daily intake (TDI) – for contaminants that might appear in the production process (Larsen, 2006).

Before reaching the markets, products are labelled and some categories of additives appear on the label. The label is the first “contact” of the customer with the product. European authorities regard labelling as an important issue. It refers not only to consumption date, but to percentage ingredients, potential allergens, adulteration etc. (Arvanitoyannis et al., 2005). The particularities of the place of origin or provenance, if not present might mislead the consumer to a material degree as to the true origin or provenience of the food. This aspect plays a greater role in the area of traditional foods, because these contain specific elements according to the traditional production ways.

Even if legally speaking, for authorized producers there have been imposed norms in order to protect the consumers, they have to be aware when they decide to consume a traditional product. The different consumer attitudes that are rather linked to consumers' demographic and socio-economic status, culture, personal preferences and experience, do not necessarily lead to behaviours that increase the safety of the food consumed (Wilcock et al., 2004). This means that consumers can put pressure on the producer, but only if they are completely aware of the phenomenon. Here appears the major role of the media. But is the media always willing to objectively inform the wide public by using reported statistics and risks within their context? Or its intentions are to sell food scare stories? Carslow (2008) points out in his review that the media's role in communicating the risks linked to food is to inform the audience correctly using as primary source the knowledge of scientists and

authorized persons. Only in this manner consumers can have access to relevant and objective information that could help them to make informed decisions.

So far we consider here only authorized producers of traditional Romanian products. But the fact that many of the traditional products that are out on the local market come from individual producers shouldn't be neglected. There are 11 million subsistence farms in Romania according to a former ministry of agriculture's declarations (2010) with low resources and high motivation of selling their products on the market. When considering the traditional food, the Romanian consumer actually retains the idea of home-made products and ignores any connection between them and the authorized products. Since the subsistence agriculture is practiced at such a scale the access to these products is easy. We can ask ourselves, thus, how could we ensure the optimal quality of these products in order to eliminate all possibility of infections after consuming them?

Even if on short term this kind of practices can't be eliminated, prevention measures could be taken in order to act on the environment where these traditional foods are made in, but also on the way they are delivered. Last but not least, the consumer should be informed about the consequences he is facing when buying traditional products from inadequate places that don't respect the requested standards in terms of hygiene and not only.

In what the producer is concerned, the hygiene measures regarding the procurement of raw materials and the process of production have to become more restrictive. Here, the local authorities need to consciously monitor in order to verify the health of the household animals (the local vet), but also the substances used like pesticides when producing fruits, vegetables, cereals etc. These measures are vital taking into account that the environment is suffering major changes because of increased pollution and affect not only the health of people but of all creatures.

Distribution means should also comply with more restrictive verifications. If we talk about the markets where local producers sell different products then the way the products are preserved and also whether the information about the origin of food and its freshness were made available to the consumer, should be verified and in case of noncompliance those found responsible should be punished

Selling traditional products in unauthorized places like on the side of the road etc. should be forbidden and the authorities should get more involved in the elimination of this phenomenon. At this point, the role of the consumer also interferes because he should not encourage this "commerce" through buying products up for sale in inadequate conditions that lead to the alteration of the products and finally to side effects after consuming them.

Some of the EU initiatives have as at their core the regulation of semi-subsistence farms that would facilitate the producers and control consumer's safety. Those can be regulated only in a wider legal

frame, at a European level, allowing in this way, each member state to adapt it to national conditions. Semi-subsistence farms are important for the Europe's rural economy because they keep traditions and the ethic-cultural specificity of various regions of Romania alive, and could be developed as cultural patrimony elements to be included in the European landscape and contribute to the development of biodiversity.

CONCLUSIONS

Romanians are lucky enough in the sense of applying the rules of a 'bio' type of agriculture dating from before the 'bio'-term was even invented, and managing to keep themselves still safe from the harm brought by wrong application of technological innovation, from so many toxic products that made their appearance lately in so many people's diet. Even though between 2000 and 2011, the share of agriculture in GDP fell by approximately 5%, standing at the end of 2011 slightly below 10% (9.), mainly Romanians consume products from domestic production - of a higher quality and much healthier than the imported ones. In terms of traditional products cooked in Romania, their traceability is one characteristic that defines their quality. Most Romanian traditional recipes are older than few hundreds of years, being best kept in rural areas, and transmitted from generation to generation. The ingredients of such products have been grown in peasants' gardens, fertilized with natural fertilizers and produced in conditions that keep their flavour, taste and quality at their best.

The quality and safety of Romanian traditional foods can yet not be guaranteed. On one hand we have created an institute that is meant to authorize the Romanian traditional products based on recent legislation and quality standards. However, there is an aspect that cannot be neglected, namely that most Romanian foods come from "producers" who are not sufficiently controlled and tracked which of course puts into question the products quality.

The idea of creating a legal pattern for local producers practicing subsistence agriculture is welcomed. Creating a framework for semi-subsistence farms enables parties concerned to benefit from "safety chain". On one hand farmers can produce and sell their products through a legal market network, on the other the public authorities ensure and impose the optimal standard of quality offering safety. Nonetheless the customers that get a guarantee of the quality of the Romanian foods will buy more. Once such measures will be taken, great results are expected from the reduction of the Romanian underground economy which of course will lead to higher national economic growth and prosperity.

ABSTRACT

The development of creative cities is a phenomenon of last decades in the regional development and also in the regional policy of European Union. It belongs to the modern “smart” concepts based on innovation, creativity and excellent ideas strengthened by involving various local stakeholders. The paper aims to analyze the creative potential at the local level - districts and to identify the potential pathways of its future development regarding the theoretical framework and experience in the European cities. As an object of our study we selected the cities with surrounding (districts) in the Slovak Republic.

The paper is divided into three chapters. The first chapter is devoted to definition of the theoretical framework, the interconnection between the city – creative potential – its role in the local development. In the second chapter the methodology and research results are presented. To map the creative potential we use the criterial matrix defined for the Slovak district's conditions in 2014. Moreover, to rank and order the potential in creative development we use the multi criterial analysis by TOPSIS. In the last part of the paper, based on the research results we identify the most suitable areas and the suitable pathways for the future development regarding the strategies of creative cities.

Keywords: *Creative potential. Strategy. Cities. Creative industries. Development.*

INTRODUCTION

Due to changes in society caused by the global economic crisis, integration and interdependence between regions, demographic changes, changes in values and threats to the competitiveness of the territories, cities and their development have become an important part of the regional policy of the European Union. Achievement of integrated urban development is a part of the main goals of the Territorial Agenda of the European Union in 2020, which follows the Europe 2020 strategy (Territorial Agenda of the European Union 2020, 2011). The role of cities in the EU program documents is crucial in Innovation, Entrepreneurship and Digital Ecosystems

achieving the smart growth because cities are characterized by high degree of innovation activity, achieving the green growth oriented on building green, compact and energy-efficient cities, as well as achieving the inclusive growth with an emphasis on addressing the consequences of population aging, social exclusion and segregation (Cities of Tomorrow, 2011). The cities are considered engines of economic growth whose base lies in creation, dissemination and sharing creativity, knowledge and innovation. The uniqueness of new ideas is stimulated by proactive innovation policy and education, targeted application of sophisticated information and communication technologies in education, employment, social services, health and safety. Cities are also the centers of development of the regions in which they are located. This is a result of strongly manifested role of creativity, especially human creativity during 21st century that is a fundamental source of new ideas, innovations and knowledge (Landry & Bianchini, 1995; Kozina, 2011). The creative and innovative potential and its gradual targeted use in cities and regions is becoming a key criterion for deciding on the establishment of new businesses producing higher value added, the formation of clusters and industrial parks, attracting tourists, locating foreign investment.

The paper deals with the “hot” topic of identifying the role of creative potential in the local development, its analyzing in the districts of the Slovak Republic and defining the pathways of its future development regarding the theoretical framework and experience in the European cities. The paper includes three main chapters. In the first chapter the role of creative potential in the local development is defined by the theories of regional and local development and theory of creative city. The second chapter is devoted to the analysis of creative potential based on the defined criteria and the use of mathematical and statistical apparatus (multi criterial analysis, TOPSIS, etc). In the last chapter, based on the research results we recommend the possible strategies in the Slovak districts for further local development based on the creative potential.

ROLE OF CREATIVE POTENTIAL IN THE URBAN DEVELOPMENT

The concept of use and development of creativity is examined for a several decades in terms of different territorial units that mean districts, cities, regions. Particularly the term creative city appears for the first time in the literature in the 80-ties of the last century (Landry, 1990; Hall, 1998; Bradford, 2004; etc.). Creativity and knowledge concentrated in cities and regions have led to perception of cities as economic development focal points of regions in which are cities located. Cities are becoming laboratories that provide genuine technological, organizational, legal and social solutions for their further growth (Hall, 2010).

The local - endogenous – potential (or city and district potential) is a very important component of each territory progress and is usually divided into the following categories: economic and technical (e.g. hard and soft infrastructure, industry and sector structure of the local economy); socio-demographic and cultural (e.g. demographic indicators, social structure, culture); natural and geographical (e.g. environmental quality, water, soil, minerals); urban. The traditional composition of local potential is recently complemented by new categories of innovative and creative potential, mainly consisting of intangible elements, which are becoming increasingly important localization factors, as well as a source of socio-economic development (Čapková, et al., 2011; Vaňová, 2006).

The perception of creativity as a new, essentially unlimited, production factor which can be found basically everywhere has changed during the past decades. Number of authors and organizations (Landry, Bianchini, 1995; Howkins, 2001; Florida, 2004; KEA, 2006; Luknič, 2008; Kloudová, 2010; Mikuláščík, 2010; UNCTAD, 2010; Franková, 2011) consider creativity the factor complementary to the traditional labor, land and capital. Furthermore, since 1990's the creativity is considered as the new source of territorial development.

The creative economy at the local and regional level follows from the fact that cities and urban areas have always been places where human creativity flourished. Here not just the world's great art and fundamental advances in human thought originated, but also the great technological breakthroughs that created new industries and even entire new models of production. Ever since cities became large and complex enough to present problems of urban management, they also became urban laboratories, the places that developed the solutions – technological, organisational, legal and social – to their own problems of growth (Hall, 2009).

Camilleri (2010) has summarized the role of creativity in spatial development as follows:

- creativity is considered a source of economic success since the talented, creative and educated people are demanded production factor and are increasingly replacing hard infrastructure components in the process of deciding on the businesses localization;
- creativity has a positive impact on the present and future situation in the territories - it is well known that currently over half the world's population live in the cities, and according to the World Health Organization (WHO, 2014) this trend will continue with the assumption that in 2030 every sixth person out of ten will live in the city. It is associated primarily with the transition from traditional (agrarian economic structure) to a modern society (service economy, the knowledge economy, creative economy) or by changing the preferences and opportunities of the population. Landry (2007) argues that creativity is now one of the possible answers for cities and regions (as

well as individuals) confronted with problems accompanying these processes. Such a creative approach to solving problems should lead to a better quality of life and promoting socio-economic development.

An interesting view of creativity as a driver of spatial development brings Pratt (2011), who claims that any attempt to define creativity in this context unambiguously is useless. According to the author, we should understand creative territories relatively, which means to define their creativity individually, for a specific territory, under its specificities and potential in its. We add that the relative definition of creativity also applies to the implemented activities aimed at promoting the development of the territory.

Based on the knowledge of the new role of creativity we conclude that the territory can express creativity through relationships and the extent of cooperation between the local stakeholders, the level of commitment of the local community (or communities), willingness to address current local problems and their search for new, creative solutions. We also consider necessary to underline the fact that creativity should not be seen as a new production factor, replacing the traditional ones but as a factor that has always been present in the process of any kind development including the development of human society, and has always been a source of economic growth (Moroni, 2011).

Generally, the territory with creative potential we understand as a creative economy in the defined territory represented by creative class, public, private and community organizations and activities that foster creative industries and innovations. Economic, social, cultural and political networks which generate appropriate conditions for stimulation of various forms of creativity are a basis of creative territory. At the same time concentrated creativity in enterprises increases productivity of the territory, it becomes a source of competitiveness based on specialized products and through new ideas and know-how enhances creativity and innovation (Scott, Agnew, Soja, Storper, 2001). Several authors (inter alia Landry, 2000; Kalandides & Lange, 2007; Clifton, Cooke, 2009; Suciu, 2009) stress within the territory the importance of creative people, cultural institutions, creative and cultural activities. Another group of authors (Bradford, 2004; UNCTAD, 2008; Smith & Warfield, 2008; Kagan, Hahn, 2011) see the role of creative cities especially in development of creative and innovative thinking and emphasize the equal status of all stakeholders in the territory, support inclusion of segregated groups and drop on preferring only the creative class as a key driver of economy.

Romein and Trip (2009) perceived creative city considering the agreed development goals, either in support of the production milieu (support of creative industries in the territory, its integration in the

local economy, networking and clusters of enterprises) or consumption milieu (focused on activities increasing attractiveness of the territory and the quality of life in the city - often related to the attraction of so-called creative class). In general, the creative city can be considered to be a tool of local development promotion using available local potential and so called creative infrastructure which mostly includes intangible elements, such as atmosphere, authenticity, diversity of the city and its ability to produce symbolic values. The obvious advantage of this concept is that it encourages local actors from all sectors (public, private community, voluntary) to use the available potential of the territory, its specific features – it is not conducive to the realization of high-cost projects. To main characteristics of the creative territory belong uniqueness and authenticity, dynamic links and partnerships (new models in organizations, transformation of social relationships and values), sharing knowledge and experience, openness and diversity, high-quality workforce, infrastructure (Landry, 2000; Wu, 2005; Creative Economy Report, 2008; Hamilton, Arbib, Baeke, 2009; Baycan, 2011; Romein, Trip, 2012).

INDICATORS OF CREATIVE POTENTIAL IN THE CITIES

The role of creative potential in cities and regions has been examined by several experts. Mostly it is a description of the economic structure of businesses and creative activities in the territories (e.g. Documents and analyzes of Urban Community Development; Inspired by Culture: The Potential of Creative Cities in East Asia, 2008; Creative Metropolises, 2011; Potentials of Creative Urban Regeneration - Ljubljana Urban Region, 2011; Creative cities: The Potential of Portuguese Cities, 2011; Lisbon Creative city, 2013). In the Central and Eastern European countries an analysis of mapping the creative potential in townships has not been done yet. Nonetheless, mapping creative potential based on expert judgment allows further decisions about the use of other conceptual creative potential as part of an integrated and balanced smart local and regional development. So by the analysis in the paper we cover this gap in the knowledge.

First of all, we need to define the main indicators with some variables that cover the wide scale of the creative potential. As the key approaches we selected – the approach of Romein' and Trip's (based on their extensive research in the field of creative city and their classification of production and consumption milieus, 2009); consulting group INTELI's approach (results of their qualitative research in small and medium-sized cities around the world in the field of soft development factors making the city creative, 2011) and Landry' and Hyams' approach (they examined level of creativity in ten groups which indicators are very similar to those of quality of life, 2012). These approaches have been selected based on originality of exploring creative potential of the territory. They are not modifications of existing approaches; identified indicators of creative city are results of original empirical researches.

Innovation, Entrepreneurship and Digital Ecosystems ISBN: 978-9963-711-43-7

Approach	Area	Indicators
Traditional Development Factors	Endogenous	Potential of a city; Competitiveness; Innovation strategies; Clusters; Institutions; Public entities; Soft infrastructure; Way of communication and its channels; Image; Leisure time infrastructure; Green spaces
	Exogenous	Development degree of the whole country; Openness of the economy in relation to foreign countries; Economic and social policy; Direct foreign investments; Political system; Legal framework
Quality of Life	Political and Social Environment	Relationship with other countries; Internal stability; Crime; Law enforcement; The presence and integration of foreigners; Safety and trust; Limitations of personal freedom; Media and censorship; Voter turnout; Consultation of rulemaking
	Economic Environment	Job security; Personal earnings; Long-term unemployment rate; Employment rate; Currency exchange regulations; Banking services; Employment opportunities; Financial situation of household
	Education	Educational attainment; Student skills; Years in education; Number and availability of schools
	Health	Hospital services; Medical supplies; Life expectancy; Health care services
	Environment	Air quality; Noise level; Cleanliness; Green spaces; Fight against climate change; Water quality
	Public Services and Transport	Electricity; Water availability; Telephone; Mail; Public transport; Traffic congestion; Airport; Sports and cultural facilities; Streets and buildings; Public spaces; Availability of retail shops; City administrative services; Quality of support network
	Leisure Time	Variety of restaurants; Theatrical and musical performances; Cinemas; Sport and leisure activities
	Housing	Housing; Household appliances and furniture; Household maintenance and repair; Housing expenditure; Dwellings with basic facilities; Rooms per person
Creative City	Political and Public Framework	Political and public representatives with sense of purpose and ethics; Transparent and accessible political and public representatives to inhabitants; Light, lean, responsible, adaptable bureaucracy; Ability of citizens to interact with local bureaucracy; Level of decentralization of power, decision making or responsibilities; Support of voluntary and community sector; Quality work force in public institutions; Creating conditions rather than detail planning; Cooperation between local authorities, firms and interest groups; Strong sense of vision for the place; Inspiring leaders are present in the city; Formulated strategies are looking at the future in the broadest terms and see the planning process as continuous and intrinsic; The city works well, goals are achieved and things there happen; High standards of services; Benchmarking; Attributes such as reliability, punctuality, efficiency or accuracy are highly respected; Partnership; Ability to delegate authority
	Social Climate	Prevailing values and attitudes; Social tolerance; Openness towards diversity (e.g. gay and foreign-born population, subcultures); Openness of public, private and voluntary/community sectors; Understanding the differences; Community engagement; Trust relationships; Culture of participation; Neighborliness' and sociability; Social capital; Presence of civic associations; The city values learning and knowledge; Diversity of learning options; The city is fostering local talents
	Representation of a City	Image; Symbolic value of cultural heritage; Clear identity of a city; Citizens are self-confident in their attitudes, values, local production, cultural and other public facilities; A city offers a variety of experiences,

		choices and opportunities for people to express themselves; Variety of cultural spaces and access to them; Openness to cultural variety of a city; Environment rich on science, gastronomy, cultural life, attractions, parks, events, festivals, etc.
	Entrepreneurship, Exploration and Innovation	The city is business-friendly; Social recognition of entrepreneurs; Extensive support system for old and new entrepreneurs; Innovations and R&D opportunities; Significant role of creative industries is evident; Diverse pool of talented workers; Vocational training
	Communication, Connectivity and Networking	The city is well connected internally and externally; It is easy to get in the city; Walkability through the city; High quality public transport system; Good and quality traffic infrastructure; Knowledge of foreign languages; Presence of clusters, hubs, focal points and knowledge exchanges; Affordable spaces; Old industrial buildings; Authenticity; Face-to-face networks
	Built Environment	Diversity and size of buildings; Diverse, pedestrian-friendly public spaces; Authentic neighborhoods; Condition and quality of hard and soft infrastructure; Ecological-friendly infrastructure; Health and social services; Quality schools
	Amenities	Cultural festivals; Outdoor sporting facilities; Parks; Education facilities; Specialist libraries; Specialist shops; Diversity of cafes and restaurants; Architectonic and archaeological heritage; intangible heritage; Accommodation facilities; Vibrant street life
	Liveability and Well-being	Quality of life factors; GDP; Offered services' standard; Crime; Safety; People like to live and work in the city

Table 1 Comparison of territorial development indicators

Source: own processing according to Miškovičová, A., Vaňová A. (2015)

The table 1 shows that the quality of life and creative city approaches focus on both quantitative and qualitative indicators. We think that creative city indicators are significantly affected by quality of life indicators. The creative city indicators, however, take into account the important role of culture, creativity and cultural infrastructure, as well as various intangible and abstract elements of the territory - mutual relations, attitudes, history, traditions, values and symbolic value. Creative city indicators we consider the creative potential of a territory. The indicators in the table encompass the traditional potential (economic, technological, infrastructural, etc.) as well as the intangible one. These indicators are fundamental for the realized research which results are presented in the next chapter.

ANALYSIS OF THE CREATIVE POTENTIAL IN THE DISTRICTS OF THE SLOVAK REPUBLIC

The second chapter of the paper consists of 2 subchapters. The first one explains the methodological framework of the realized research and the second one has already presented the research results. In our investigation, we were strongly influenced by the availability of the research data, so we decided to realize the research on the level of districts, not cities in the Slovak Republic. The districts could be considered spatially as cities with surroundings, and by the Slovak statistical availability it is the lowest level of data regarding the socioeconomic situation, quality of life and etc. Currently, the number of districts in the Slovak Republic is 79. They are divided into 8 regions – region of Prešov (13 districts),

region of Banská Bystrica (13 districts), region of Košice (11 districts), region of Žilina (11 districts), region of Trenčín (9 districts), region of Bratislava (8 districts), region of Nitra (7 districts), region of Trnava (7 districts). The graphical presentation of districts by region is illustrated in the Figure 1

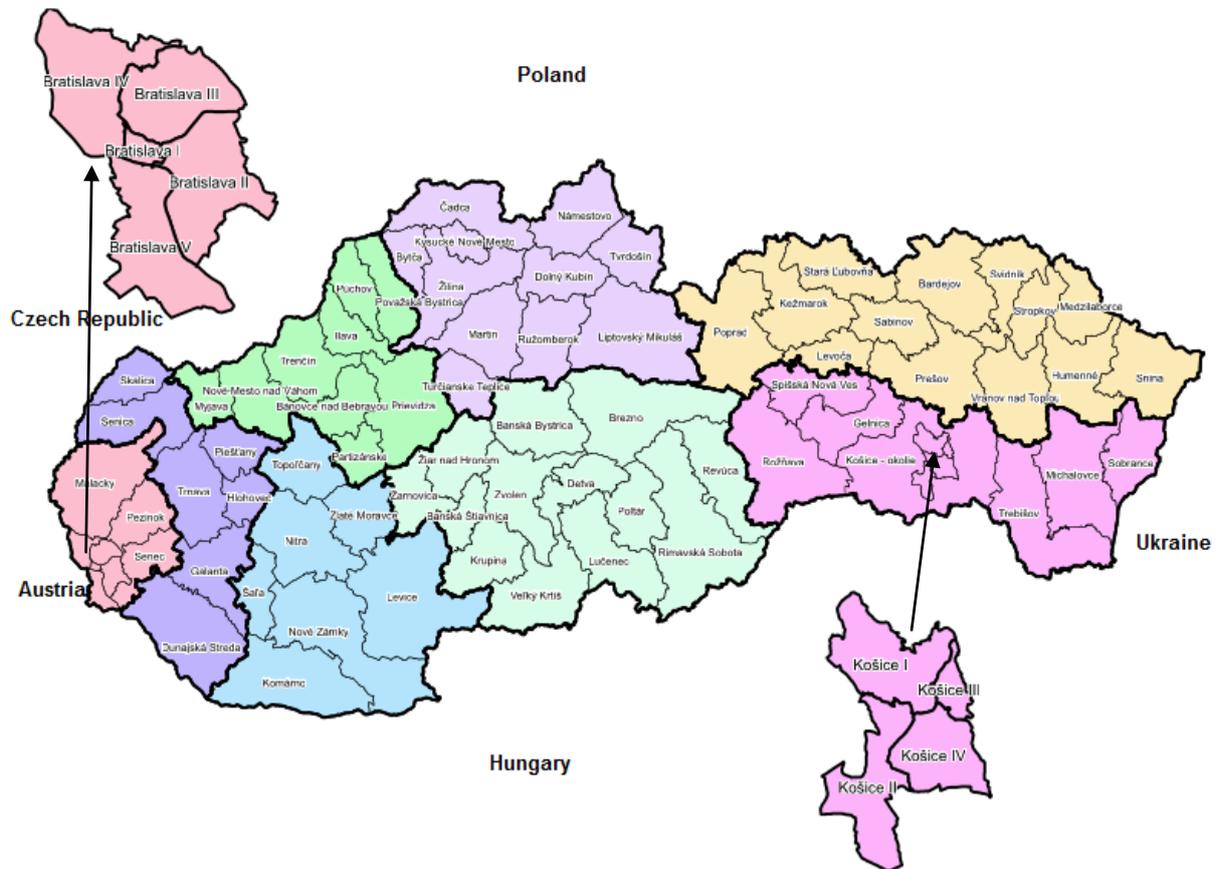

Figure 1 Districts of the Slovak Republic by the regions

Source: https://upload.wikimedia.org/wikipedia/commons/c/cf/Okresy97_Slovakia.svg.

METHODOLOGY OF THE RESEARCH

Regarding the theoretical framework and approaches summarized in table 1 we had to define the main indicators to map and measure the creative potential in the districts. We use the method of criterial matrix defined for the Slovak district's conditions. It is divided into three main areas of indicators – creative city, economic conditions and social conditions. All indicators were defined with regards to the data availability in 2014.

Area of indicators	No.	Indicator	Short.	Description	Unit
Creative city	1	Foreign nationality inhabitants	OCN	Share of foreign nationality inhabitants in district on the total number of district inhabitants	%
	2	Cultural and creative industry*	KKP	Share of businesses employees by SKNACE belonging to the CCP and persons employed as liberal professions on the total number of businesses employees by SK NACE and the number of individuals under different legal forms in the district.	%
	3	Non-profit organizations	NS	Share of non-profit entities (legal entities serving to financial and non-financial corporations, government and households, e.g. budget organizations, subsidized organizations, civil society organizations, associations, clubs, political parties, churches, etc.) in the district on the total number of legal entities (both profitable and non-profitable) in the district.	%
	4	Pollution emission**	EZL	Emissions of major pollutants – solid emission, sulfur dioxide, nitrogen oxides, carbon monoxide in the district	t/km ²
	5	Cultural infrastructure**	KI	The number of museums, libraries, galleries, theaters, cinemas, cultural and educational facilities, research libraries, leisure facilities for children and youth, the number of accommodation facilities.	natur.
	6	Tourism activity* **	TAktiv	Share of the number of visitor overnights in the accommodation facilities in the district and the number of district population	%
	7	Tourism attractiveness* **	TAttrakt	Share of the number of visitor overnights in accommodation facilities in the district and by the district area (in square kilometers)	%
	8	Scientific and research infrastructure	VVI	Number of colleges and universities (public, state, private), departments of Slovak Academy of Sciences and research institutes in the district	natur.
Economic area	9	Foreign businesses	ZP	Share of businesses in foreign ownership, which are established and controlled by a foreign legal entity or physical entity - businessman on the total number of enterprises in the district.	%
	10	International businesses	MP	Share of businesses in international ownership in district, which are established and controlled by a foreign legal entity or physical entity - businessman on the total number of enterprises in the district.	%
	11	Direct foreign investments* **	PZI	State of foreign direct investments (the equity, reinvested earnings and other capital) in the district.	thous. EUR
Social area	12	Population migration	M	Migration balance - the difference between the number of immigrants and emigrants (from Slovakia and beyond SR) to / from the district.	natur.
	13	Aging index	IS	Number of persons in postproductive (65+) age to people in preproductive (0-14) age in the district.	%
	14	Criminality	K	Identified violent crimes, vice crimes and thefts in the district.	Natur.
	15	Safety	B	Percentage of solve crimes in the total crime identified in the district.	%

Table 2 Criterial matrix of creative potential research in the districts of the Slovak Republic

Source: Miškovičová (2016)

* Some data are not available for their confidence, what reduces the resulting value criteria..

** Figures for 2013 and/or 2014 were not available at the time of the survey, the completeness of data are estimated by using regression analysis.

The main sources of data for the multicriterial analysis were the Statistical Office of the Slovak Republic, the National Portal for the technology transfer, Centre of Science and Technology Information, Universities Portal, Slovak National Bank and the Police Presidium of the Slovak Ministry of Interior Affairs. However, during the data mining we found out that there is a problem to collect data about the criminality and safety. The unavailability of the data caused the reduction of the research sample to 38 districts - region of Prešov (7 districts), region of Banská Bystrica (6 districts), region of Košice (6 districts), region of Žilina (6 districts), region of Trenčín (3 districts), region of Bratislava (1 district), region of Nitra (5 districts), region of Trnava (4 districts). If the data were not available, we used the regress analysis and forecast the development of statistics regarding the previous 11 years by the mathematical and statistical methods. To analyze the creative potential the normalization of the original values was done in the criterial matrix. The output of the analysis is to identify the strengths and weaknesses of the creative potential in the Slovak districts.

In the second step of analysis, we transformed the criteria to maximize their value, settled the weight of criteria (method of gradual scale setting) to normalize the data. Following, we implemented the method of TOPSIS (Technique for Order Preference by Similarity to Ideal Solution), which compares the real values of each district criteria with the optimal (highest) value of criteria. The most powerful district is the one with the highest values in all researched criteria. All these research results will be used as a main input to strategies of creative potential development in the Slovak districts.

RESEARCH RESULTS AND DISCUSSION

The analysis of the creative potential in the Slovak districts is realized by the 15 identified indicators (Table 2), which are an inevitable part of the creative city concept. Based on these criteria we were able to evaluate the potential of districts with the available data and to identify their strengths and weaknesses. We divided them by the Slovak region to make the outputs more transparent and illustrated the values of defined criteria in 8 radar graphs (see next page). As closer is a value of criteria to 1 point, as strong is a part of potential. In presentation of the analysis we did not include the indicator 4 and indicator 14 because of their transformation to maximize the values (by this methodological step both indicators were evaluated as the best in all districts). However, we will use them in method of gradual scale setting and TOPSIS.

By the comparison of the graphs presented data in 2014 it is confirmed a significant strong position of the Bratislava district as a part of capital city and a city with a great location on the crossroad to all Innovation, Entrepreneurship and Digital Ecosystems

neighbor states. The district has reached the value 1 in criteria: tourism attractiveness, scientific and research infrastructure, international businesses and direct foreign investment and population migration. The high evaluation (close to 1) is also in criteria – cultural infrastructure and creative and cultural industry. These criteria can be seen as strengths of the district. The weaknesses are the share of non-profit organizations and safety. The Bratislava district has the best evaluation in the selected aspects of creative city. Five indicators were evaluated as 1, and nowhere in the Slovak districts the indicators have reached this point of evaluation.

From the districts – Dunajská Streda, Galanta, Senica, Trnava (Trnava region) the district of Dunajská Streda is characterized by the multiculturalism because of the high share of foreign nationality inhabitants. It is probably caused also by its location on the border with the Hungary. The high evaluation was marked also in indicator – population migration. However, in the district absents the scientific and research infrastructure, as same as in Senica district. The district of Trnava does not include some specific strong part of researched potential, as well as in Galanta district.

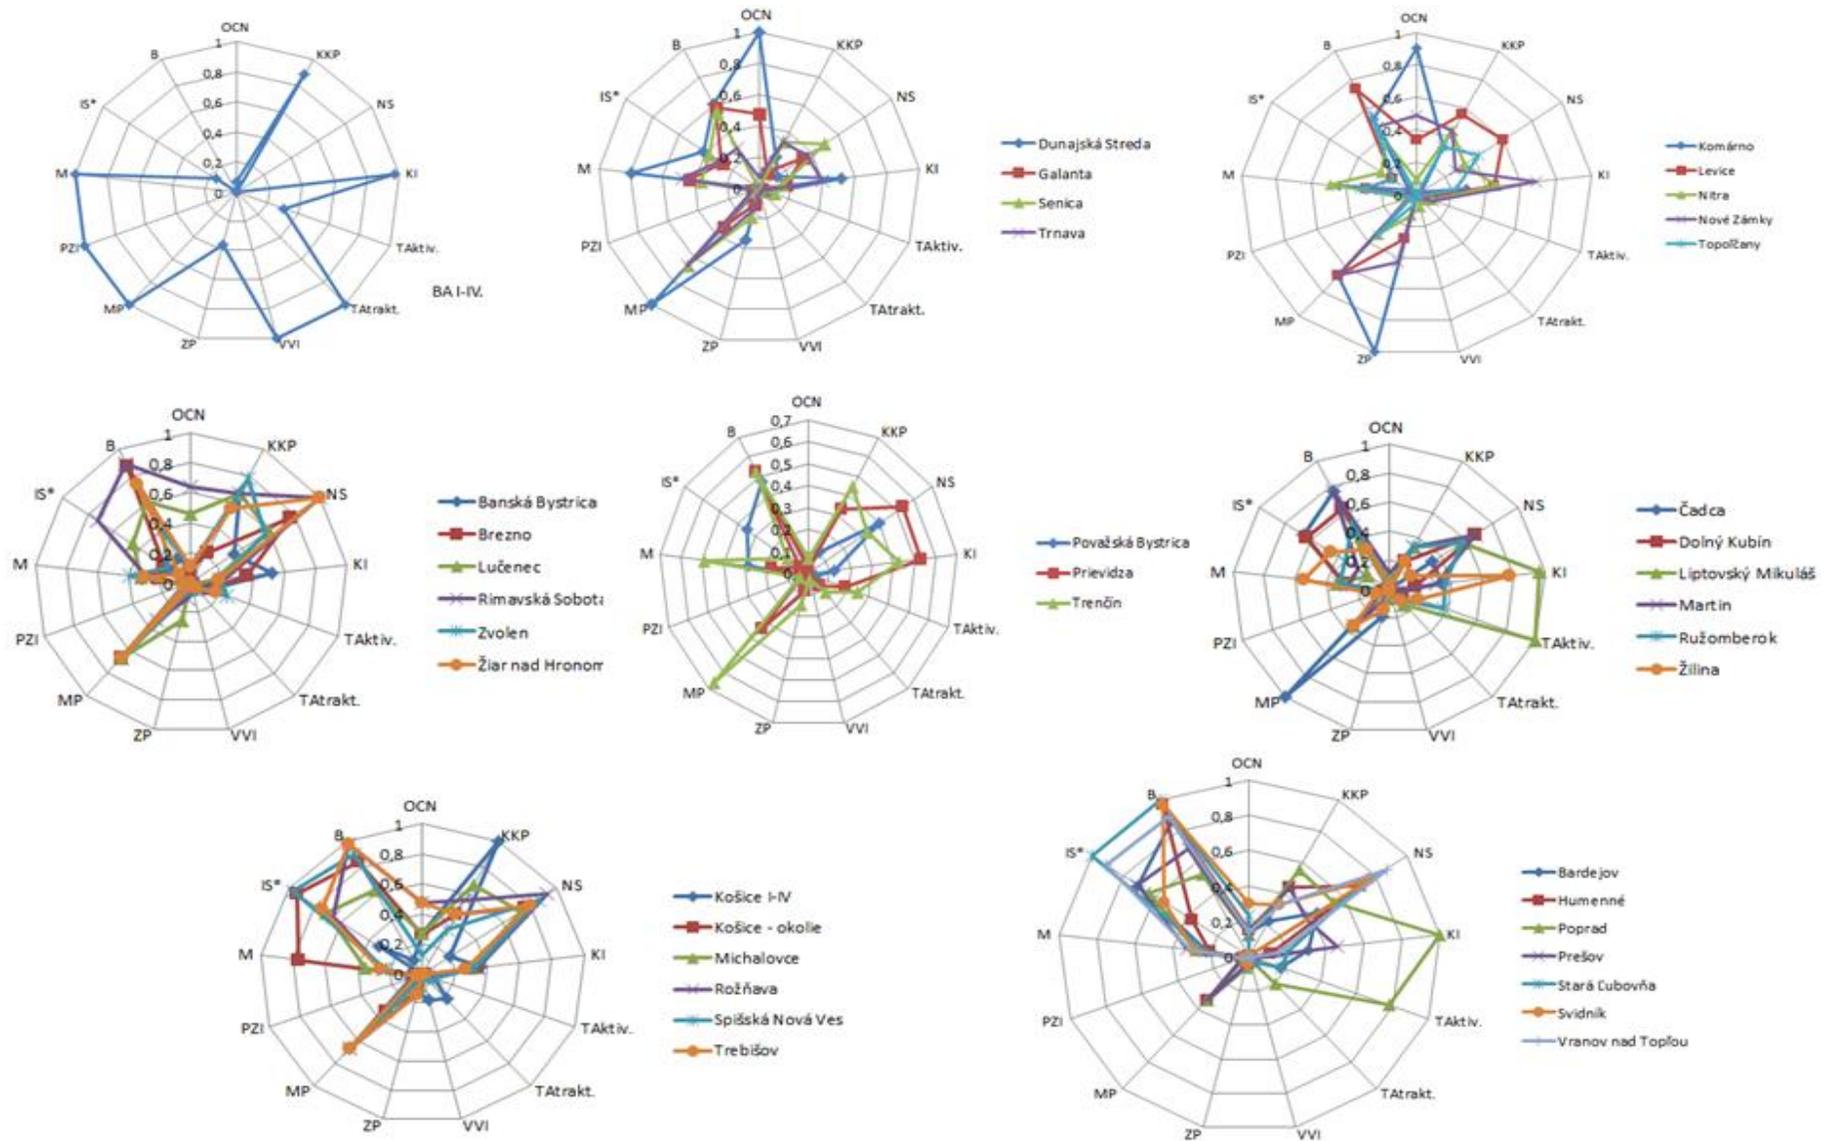

Figure 2: Mapping the creative potential in the Slovak districts by the selected criteria. Source: own workmanship

In Nitra region (Komárno, Levice, Nitra, Nové Zámky, Topoľčany) has Komárno district a strong position in share of businesses in foreign ownership and also in share of foreign nationality inhabitants. In other researched districts is not a significant strength or weakness.

In all districts of Banská Bystrica region, i. e. Banská Bystrica, Brezno, Lučenec, Rimavská Sobota, Zvolena and Žiar nad Hronom, has stronger position by the evaluation of the indicators – creative and cultural infrastructure and population migration. In all districts belong to the weak aspects of potential tourism attractiveness, and research and scientific infrastructure. The district of Rimavská Sobota and Žiar nad Hronom reached the highest possible value in indicator – nonprofit organization, what indicates active non-profit sector in these districts.

In region of Trenčín were evaluated three districts – Považská Bystrica, Prievidza and Trenčín. In all of them, the best evaluated indicators are safety, non-profit organizations and population migration. The weak position has the research and innovation infrastructure, share of foreign nationality inhabitants and tourism attractiveness.

The region of Žilina includes district of Čadca, Dolný Kubín, Liptovský Mikuláš, Martin, Ružomberok and Žilina. The level of scientific and research infrastructure is the lowest in comparison with other districts. The district of Čadca reached 0 point in three indicators – share of foreign nationality inhabitants, cultural and creative industry and research and scientific infrastructure. District of Dolný Kubín has the lowest evaluation (0 point) also in 3 indicators - share of foreign nationality inhabitants, research and scientific infrastructure and population migration. The strengths are in Čadca district population migration and safety, in Liptovský Mikuláš tourism activity and cultural infrastructure, in Dolný Kubín nonprofit sector and aging index, in Martin nonprofit sector and safety, in Ružomberok nonprofit sector, in Žilina cultural infrastructure and population migration.

The east part of Slovakia includes two regions – Košice and Poprad. In region of Košice we evaluated districts – Košice I-IV, Košice and surroundings, Michalovce, Rožňava, Spišská Nová Ves. The best evaluated potential is in two districts - Košice I-IV, Košice and surroundings. In Košice I-IV is the highest score for the cultural and creative industry in comparison with all evaluated regions. To the other strengths belongs also population migration. The district of Košice and surroundings reached the highest evolution in indicators of aging index, population migration, nonprofit organizations and safety. To the weaknesses in these districts belong the scientific and research infrastructure. In the rest of evaluated district to the best evaluated indicators belong nonprofit organizations, safety and aging index and to the worst evaluated indicators tourism attractiveness and activity and direct foreign investments.

The last group of districts includes districts of Bardejov, Humenné, Poprad, Prešov, Stará Ľubovňa, Svidník and Vranovu nad Topľou. Generally, this part of Slovakia is less developed and also the analysis of creative potential confirmed the weaker preconditions for development. In two districts – Stará Ľubovňa and Svidník were the greatest share of indicators with 0 points, in Stará Ľubovňa – cultural and creative potential, research and scientific infrastructure, foreign businesses and population migration, in Svidník cultural infrastructure, tourism attractiveness and activity, scientific and research infrastructure and population migration. The best evaluated indicator is safety in Bardejov, Humenné, Stará Ľubovňa, Svidník. In Vranov nad Topľou, Prešov and Poprad it is aging age.

To summarize the outputs of the criterial analysis we divided the values of indicators into 4 groups – 0-0,25 – very significant weakness; 0,26 – 0,5 – weakness; 0,51 – 0,75 – strength, 0,76 – 1 – very significant strength and illustrated them with colors by districts and indicators in the table 3.

Table 3 Criterial matrix of creative potential research in the districts of the Slovak Republic by the character of evaluated indicators

Source: own workmanship

In the next step, we give the weight to each criterion to rank the districts. The weight of criteria is based on the expert opinion of authors.

Group of criteria	I.								II.			III.			
Weight of criteria group	0,5								0,17			0,33			
Criteria	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Weight of criteria group	0,14	0,22	0,11	0,06	0,17	0,08	0,03	0,19	0,17	0,33	0,5	0,3	0,4	0,1	0,2
Standardized criteria weight	0,07	0,11	0,06	0,03	0,09	0,04	0,02	0,10	0,03	0,06	0,09	0,10	0,13	0,03	0,07

Table 4 Weight of researched criteria by the method of gradual scale setting to evaluate the creative potential

Source: own workmanship

By quantification of the criteria in the Slovak districts we identified the ranking of the districts as follow:

Districts			
Region of Bratislava		Region of Žilina	
Bratislava I-V	1	Čadca	30
Region of Trnava		Dolný Kubín	
Dunajská Streda	2	Liptovský Mikuláš	8
Galanta	11	Martin	32
Senica	18	Ružomberok	19
Trnava	9	Žilina	4
Region of Trenčín		Region of Banská Bystrica	
Považská Bystrica	33	Banská Bystrica	16
Prievidza	37	Brezno	35
Trenčín	7	Lučenec	15
Region of Nitra		Rimavská Sobota	
Komárno	5	Zvolen	12
Levice	22	Žiar nad Hronom	27
Nitra	6	Region of Prešov	
Nové Zámky	20	Bardejov	34
Topoľčany	26	Humenné	36

Region of Košice		Poprad	10
Košice I-IV	38	Prešov	17
Košice and surrounding	3	Stará Ľubovňa	29
Michalovce	13	Svidník	25
Rožňava	21	Vranov nad Topľou	24
Spišská Nová Ves	31		
Trebišov	23		

Table 5 Ranking of districts in 2014

Source: own workmanship

The ranking confirmed the dominant position of Bratislava District. The second best preposition to the creative development has a district of Dunajská Streda, the third is district of Košice and surrounding. Based on the research results, in the next chapter we identify the possibilities how to develop the creative potential in these cities more systematic with perspective of positive results.

RECOMMENDATIONS TO THE CREATIVE POTENTIAL DEVELOPMENT AT THE LOCAL LEVEL

The outputs of detail analysis of creative potential are the starting point for the future creative development in the territory. The core of the creative potential development should be a development strategy based on the local specific potential, strengths, weaknesses, need of market and defined problems. In our research, currently, the highest level of creative and cultural industries and cultural infrastructure is in districts of Bratislava, Košice I –IV, Liptovský Mikuláš and Banská Bystrica. However, to develop the creative city, the territory has to include more aspects of potential, including the suitable economic and social conditions for life.

In the literature, we can identify three main approaches to the development strategies based on creativity. The first approach by Hansen (2001 in Costa, Magalhaes, et al., 2006) defines the creative city as a territorial marketing strategy – it is based on demand analysis with the main goal to attract investments, tourists, entrepreneurs or new residents by improvement of attractiveness, competitive advantage or image of a territory. The second approach (Joffe, 2009) prefers the creative city as a tourism strategy – even though tourism has a positive impact on infrastructure, economic situation and residents' self-esteem of a certain territory it is not recommended to focus primarily and only on tourists' segment. They usually have different requirements and needs than local residents which could become neglected. Another problem could be the monotonous type of attractions such as spa or wellness. Landry (2006) suggests territories should focus on a specific, experimental or unique tourist attraction based on local potential, advantages as well as disadvantages. We would add, that this type of a creative city strategy is strongly connected with the marketing one.

By the research results we can recommend to follow these combined strategies to districts of Bratislava, Košice (both I-IV and Košice surrounding), Liptovský Mikuláš and Poprad. All these districts belong to more tourism active and also to the attractive districts for tourists. The districts of Bratislava and Košice should be more oriented at sophisticated areas of creative cities as new IT technologies, production of higher added value, cooperation with the scientific and research institutions, in other words to create “modern creative city” that satisfied the inhabitant’s needs, businesses interests and tourist’s wishes. The districts of Liptovský Mikuláš and Poprad are very tourism attractive because of its location in Low and High Tatras. The level of cultural infrastructure is average in comparison with other Slovak districts as well as the development of creative and cultural industries. The strategies of these cities should be more on tourism oriented that use the cultural and creative infrastructure to enrich the experiences of tourists in the territory. They should be supplemented by other partial activities as sport, relaxing or shopping activities, etc.

The third approach to the creative city is a creative city as a strategy for production or consumption milieu improvement. This approach is suitable for territories where the creative and cultural industries is at higher level developed, it is closely connected with the cooperation with universities and research institutions, businesses and especially with creative people. These features again indicate as the most suitable district – the district of Bratislava. That is why it is necessary to understand the above mentioned strategies as complementary. To succeed in the implementation of agreed development goals it is important to combine creative city strategies. As a kind of support for the Bratislava districts in production, providing services and also the human resources have served already a few districts – district of Dunajská Streda, Galanta or Trnava. This function is given by their localisation in the west part of Slovakia, close to Bratislava.

In the region of Banská Bystrica (central and south Slovakia) is in comparison with other districts cumulatively the highest share of creative and cultural industries. There is also very active non-profit sector, but the problem to develop the strategy based on creativity can be in partnership, communication among relevant stakeholders and orientation of the regional and local policies, that do not support enough this type of development. So we can conclude that there is a potential for development based on creativity but the “external” factors create the barriers to it.

Specific positions have the districts in the east part of Slovakia. Their evaluation by almost all criteria is quite low beside Košice and Poprad. As a first step in development of this area of Slovakia should be some external impulse given by the national government to support the development of these districts, e. g. construction of good highway interconnection between west and east; attracting more investments but not only to Košice as a metropolis of this Slovak part.

In north and northwest districts of Slovakia I, regarding the research results there is no specific strengths or weaknesses except the district of Liptovský Mikuláš. There can be developed a creative and cultural potential as a partial source of future local development, but not with the dominant function, just to enrich the offer for the inhabitants, tourists or businessmen. However, in the close future the position of Žilina district can be changed where during last two years a lot of new activities in IT in cooperation with the universities have been developed, which have been not mirrored in the published results yet.

CONCLUSIONS

The paper discussed very actual topic of spatial development based on the creativity. With regards to the theoretical issues defined in the first chapter, the paper analyzed the creative potential at the local level - in the Slovak districts in 2014. In the collection of data we identified significant problems with the data availability. We identified 15 main indicators by which we evaluated the level of specific parts of district potential, the strengths and weaknesses of the districts and the order of the districts by the preconditions to develop a strategy based on creativity. Based on the discussion of the research results, we recommend the main pathways in the development of the Slovak districts regarding their potential to be a creative place.

ACKNOWLEDGEMENTS

The paper presents the results of the project VEGA V-14-101-04 Creative industries delivering the crucial intangibles to public sector in context of innovation and smart growth and the project KEGA 007UMB – 4/2015 Marketing in regional and local development.

THE BUSINESS MODEL CONCEPT AND DISCLOSURE: A PRELIMINARY ANALYSIS OF INTEGRATED REPORTS

Moggi, Sara; Cantele, Silvia; Vernizzi, Silvia; Beretta Zanoni, Andrea

Department of Business Administration, University of Verona, Italy

ABSTRACT

This paper sought to explore how the definition of business model (BM) suggested by the Integrated Reporting Framework (IRF) applies to firms that explicitly refer to the framework. This study adopted a content analysis methodology that focused on the most recent integrated reports available on the website of the International Integrated Reporting Council (IIRC). Specifically, this study compared the level of disclosure presented in the BM section of these reports to the contents suggested by the IIRC. This study also used a four-level scale (i.e., absence of information, qualitative information, quantitative information, both qualitative and quantitative information) to evaluate the 'quality' of the disclosures. Given the preliminary nature of this study, the evaluation model was only applied to 'input' items. The results showed that not all the aspects suggested by the IIRC are being considered by the organizations adopting the framework; however, a prevalence of qualitative disclosure was found in relation to the 'input' items. Thus, it appears that firms prefer to disclose information by providing qualitative descriptions rather than by using quantitative indicators. This paper contributed to the existing literature by providing insights into how the BM model disclosures work in practice.

Keywords: *Business model, integrated reporting, content analysis, value creation*

INTRODUCTION

Despite being a widespread concept, no clear and univocal definition of the term business model (BM) exists. One branch of the literature has used this term extensively; however, several meanings and applications have been applied depending on the context, the organisation and the management approach. Further, while several scholars have tried to explain the meaning of the concept, no common or shared idea has been reached as to what comprises a BM (Magretta 2002; Schweizer 2005). Depending on the context, the term BM has assumed different meanings in relation to different items of research such as strategy (Richardson 2008; Venkatram & Henderson 1998) or value creation (Teece 2010). The origins of the concept of BMs are rooted in numerous disciplines; thus, reaching a unique general definition of the term remains a challenge (Teece 2010). Further, practitioners have failed to

reach an agreement on a common model and few organisations have attempted to resolve this issue. However, the International Integrated Reporting Council (IIRC) presented a formal description of the BM concept and its constitutive elements in its Integrated Reporting Framework (IRF) (2013).

A large number of studies have focused on the theoretical definition of the BM concept (Chesbrough 2010; Lecocq, Demil & Ventura 2010; Teece, 2010; Zott & Amit 2008); however, only a limited number of studies have focused on single case studies (Beretta Zanoni, Vernizzi, Pauletta D'Anna 2014; Chen et al. 2004; Sabatier, Mangematin & Rousselle 2010). Further, to date, no comparative analysis of the practical implications of the BM concept has been undertaken (Klang, Wallnöfer & Haclink 2014). Consequently, the study sought to address the following research question: *How do firms that explicitly refer to the IRF apply the BM definition?*

This paper sets out that the preliminary results of a content analysis of recent integrated reports (available on the IIRC website) that explicitly identified the IIRC's BM section. The analysis considered the level of disclosure presented in these reports compared to the contents suggested in the IIRC's background paper on the BM concept (IIRC 2013).

The remainder of the paper is structured as follows. First, the main issues that arose in relation to BM definitions in previous studies are discussed. Second, the content analysis methodology employed to analyse the integrated reports is described. Third, the results of the analysis are set out. Finally, conclusions are drawn and recommendations made for future studies to ensure a comprehensive analysis of the BM disclosure.

THE THEORETICAL BACKGROUND TO THE BUSINESS MODEL CONCEPT

The term BM has been used in many articles; however, understandings of the building blocks of the BM concept differ widely. Practitioners and academics (Lecocq et al. 2010; Zott, Amit & Massa 2011) appear to share sort of 'tacit knowledge' about the meaning of the term BM (Baden-Fuller & Morgan 2010; Chesbrough, 2010; Ghaziani & Ventresca 2005; Lambert & Davidson 2013; Lecocq et al. 2010; Magretta 2002; Schweizer 2005; Zott & Amit 2008). However, despite significant efforts, scholars remain far away from achieving from their goal of reaching a widely recognised definition.

Some authors have defined BM by referring to the networked nature of firms, emphasising cooperation, partnership and joint value creation (Chesbrough 2010, Mansfield & Fourie 2004). In this context, Zott et al (2011) defined a BM as the way in which a firm chooses to transact with its customers, partners and vendors. Conversely, other scholars (Teece 2010) taken a wider perspective and, by referring to value creation and the value capture topic, defined BM as the value proposition for customers and the structure of revenues and costs that the firm uses to deliver that value. Other authors have tried to define the term by emphasising its strict relationship with firms' strategies.

Venkatram and Henderson (1998) defined BMs as coordinated plans used to design strategies along three vectors: customer interactions, asset configurations and knowledge leverage. According to Richardson (2008) BMs explain how the activities of firms work together to execute strategies and thus bridge the gap between strategy formulation and implementation. Similarly, Shafer, Smith and Linder (2005) and Casadeus-Masanel and Ricart (2010) both defined BMs as reflecting firms' realised strategies.

Despite the efforts of various scholars and the growing presence of the concept in strategic literature, no one univocal definition of BMs exists and the concept is often used without a clear idea of its theoretical boundaries. There are numerous reasons for the lack of a clear definition of the term, including the interdisciplinary nature of the concept (it is a concept that straddles a number of domains such as economics, strategy and organisational studies). Thus, any attempt to identify a single theoretical framework is both complex and ambiguous (Teece 2010). This lack of convergence is also reflected and highlighted in practice, where finding a univocal definition of BMs is very difficult.

The Financial Reporting Council (FRC) has adopted one of the most interesting positions in the practice-side of the BM debate. Under the United Kingdom (UK) Corporate Governance Code, the FRC (2014b) states that: 'The directors should include in the annual report an explanation of the basis on which the company generates or preserves value over the longer term (the BM)' (p. 16). Further, in the FRC's (2014a) document entitled 'Guidance on the strategic report', states that: 'The description of the entity's BM should set out how it generates or preserves value over the longer term, and how it captures that value. It should describe what the entity does and why it does it. It should also make clear what makes it different from, or the basis on which it competes with, its peers' (p. 21). The FRC (2014 a) also makes explicit references to other relevant parts of the BM description such as the structure of the firm, the markets in which the firm operates and the nature of the relationships, resources and other inputs that are necessary for the success of the business. Thus, the FRC provides a consistent definition of BMs in the area of corporate governance; however, in relation to financial reporting its definition continues to be subject of debate.

In its 2013 bulletin entitled 'Getting a Better Framework' the European Financial Reporting Advisory Group (EFRAG) considered the role of BMs in financial reporting' to emphasise the need for an explicit description of the BM concept. The International Accounting Standard Board (IASB) financial standards only provide one explicit reference to BMs in IFRS 9 in relation to very tight aspect of firms' investment portfolios. Thus, the IRF (2013) provides the only formal description of BMs in a standard reporting document. This document defines a firm's BM as 'its system of transforming inputs, through its business activities, into outputs and outcomes that aims to fulfil the organisation's strategic purposes and create value over the short, medium and long term' (p. 25). In 2013, the IIRC also

published a background paper setting out the results of an exploratory study on the main practices that have developed in the BM field. This paper presented the specific aspects and features that a BM should incorporate (IIRC, 2013). The IIRC (2013) proposed a BM based on a review of literature and a review of current BM reporting practices.

Categories	Aspects
Business Model definition	Definition
Inputs	Financial capital Manufactured capital Intellectual capital Human capital Natural capital Social and relationship capital
Business Activities	Research and development Planning Design Production/conversion Product differentiation Market segmentation Distribution Service provision Quality control Operational improvement Relationship management After-sales services Customer satisfaction Profit/loss Shareholder returns Asset consumption Contribution to local economy through taxes Job creation Employee development and engagement Improved standards of living Environmental impact
Outputs	Products/services Waste Other by-products
Outcomes	Customer satisfaction Profit/loss Shareholder returns Asset consumption Contribution to local economy through taxes Job creation Employee development and engagement Improved standards of living Environmental impact Licenses to operate Others

Table 8. *Coding categories*

METHODOLOGY

Content analyses are widely employed as research methods to measure the level of disclosure in annual reports and are applied using two main approaches (Guthrie & Abeysekera 2006). The first approach aims to codify the text into categories based on criteria (Weber 1988) that have preferably been defined by previous studies (Guthrie et al. 2004). The second approach considers the use of disclosure indices to evaluate and compare the completeness of disclosure in annual reports (Beck, Campbell & Shrivs 2010; Guthrie & Abeysekera 2006).

To understand how BMs have been developed by organisations that embrace the IIRC framework, a content analysis was undertaken on 19 reports selected from the IIRC's database. The data analysed comprised the more recent integrated reports available on the IIRC website that explicitly identified a BM section. The sample included 11 organisations from Europe, three from Asia and Africa and one from Australasia and South America (see Appendix A). In relation to the main industries represented in the sample, five of the 19 reports were from the financial services sector and four from firms that produced basic materials, while the remainder came from economic sectors such as professional services, consumer goods, industrial, utilities, oil and gas and technology.

The research adopted Krippendorff's (2013) approach to content analysis. The context of the analysis was the BM section included in each report. The content analysis was carried out by considering the main aspects indicated in the disclosure map of the background paper on BM (IIRC 2013). A form of sentenced-based coding was used (Milne & Adler 1999). Table 1 sets out the categories based on the disclosure map in the BM background paper and includes an additional category for BM definitions.

No previous study had determined what disclosure quality means in the context of the reporting narrative. However, Lang and Lundholm (1993) did state that a 'quality' disclosure contains both narrative and numerical information. Adopting their approach, the following scale was applied to evaluate levels of disclosure:

- 0 indicated an absence of information;
- 1 indicated qualitative disclosure;
- 2 indicated quantitative disclosure; and
- 3 indicated quantitative and qualitative disclosures.

The analysis adopted an interpretative content analysis approach to capture meanings. More specifically, it first considered the narrative contents disaggregated throughout the disclosure parts of the report and then analysed the analytic components of each of these parts (Milne, Tregidga & Walton 2003; Raar 2002). By distinguishing between four levels of disclosure, the content analysis was

able to provide an enhanced understanding of how the organisations following the IIRC framework interpreted their BMs. Each sentence was first classified into one of five categories (see Table 1). Its specific aspects were then considered and evaluated depending on the disclosure level. The sentences were evaluated in respect of content and discourse; thus, information was gathered on the detailed disclosure quality level (Beretta & Bozzolan 2004). Disclosure level was based on the input sections of BMs. The scores in Table 3 show the extent of disclosure in relation to each presented aspect. The total maximum score for each score was 57 (i.e., 19 firms by three points) while the lowest possible score was zero (Arshad et al. 2013).

PRELIMINARY INSIGHTS FROM THE ANALYSIS OF BUSINESS MODEL NARRATIVES IN INTEGRATED REPORTS

Before examining the reports' specific disclosures, a number of preliminary analyses were run on the context in which the BM narratives were included. The parts of annual or integrated reports dedicated to BMs are usually included at the beginning of reports in sections dedicated to a company's presentation or strategic report or before the report index (e.g., CIMA). Usually BMs were represented using images similar to the image suggested by the IIRC framework. BMs were symbolised as a process of connecting inputs (e.g., capital or other resources), activities, outputs and outcomes. Some reports had more creative representations (e.g., ENI, Itochu, Generali and FMO) of 'circular' BMs or showed more complex connections among different components (e.g., Showa Denki).

The titles of the chapters dedicated to BM representation were sometimes simply entitled 'Business Model' (i.e., in six of 19 cases), or 'How we Create Value' (i.e., in four of 19 cases). However, in other cases the titles expressed a link between the two concepts, indicating that the BM was peculiar to the firm's creation of value (e.g., Aggreko's 'How we create value through our Business Model'). Only one case used a title that did not mention the BM or value creation (e.g., Iberdrola's 'Our assets'). Two pages were frequently dedicated to BMs (i.e., in nine of 19 cases); however, in a large majority of cases (i.e., in 15 of 19 cases), no more than four pages were dedicated to BMs. The mean incidence of BM pages on total report's pages was 5.7%.

In addition to synthetic graphic representations of BMs, firms sometimes expressed their own concepts of BMs in a manner that was similar to a 'slogan' that announced firms' ideas of their businesses. Some of these slogans referred to the activities being conducted by the firms (e.g., Sanford's 'Our Business Model reflects the activities we perform and how they shape our outputs and impacts' or Strate's 'The Business Model represents the process flow of Strate's core services'). Conversely, other slogans focused on firms' strategies (e.g., CIMA's 'Our Business Model describes how we will deliver our strategy. It identifies the resources and relationships that are the basis of our

organisation (...)’ or Rosatom’s ‘a system that (...) is aimed at the achievement of strategic goals’). In other cases, firms defined BMs by the process of value creation, not only for the firm, but also for its stakeholders (e.g., ENI’s ‘Eni’s Business Model targets long-term value creation for its stakeholders’ or Natura’s ‘Guided by our essence, we strive to develop products and concepts that add value for all stakeholders throughout our chain’). The thought of value creation as a process that includes different subjects, interests and perspectives was reflected by some firms that highlighted the idea of sustainable BMs (e.g., Anglo American’s ‘Together we create sustainable value that makes a real difference’ or AngloGold Ashanti’s ‘Creating value and maximising sustainable free cash flow’ or DBS’s ‘Our activities generate sustainable returns, in a responsible manner and we seek to positively benefit the communities we operate in end deliver value to our stakeholder’).

Of the specific categories and aspects presented in the IIRC’s BM, the inputs usually comprised financial capital and manufactured, intellectual, human, natural, social and relationship capitals. These categories correspond to the first column of the disclosure map in the BM paper that includes funding models, infrastructure, intellectual property, people, raw materials, ecosystems services and relationships, respectively. This study found that some types of capital were less represented than others, particularly, natural capital and manufactured capital.

In relation to business activities, similar to the disclosure map, a very large representation of ‘operational improvement’ (i.e., 18 cases) and of ‘research and development’ (i.e., 16 cases), followed by service provision (i.e., 10 cases) and quality control (i.e., 8 cases) was found, indicating that firms view innovation, quality and service as the activities that add the most value. The output section of the model showed that less consideration was given to environmental and natural capital. Notably, descriptions of waste and other by-products were absent in 15 of 19 cases and only two cases included both qualitative and quantitative disclosures.

Inputs Aspects	No disclosure	Qualitative	Quantitative	Qualitative and Quantitative	No. of Reports
Financial capital	3	10	1	5	19
Manufactured capital	6	10	0	3	19
Intellectual capital	3	14	0	2	19
Human capital	2	9	3	5	19
Natural capital	10	6	0	3	19
Social and relationship capital	3	12	0	4	19

Table 9. *Disclosure on inputs*

Finally, the outcomes usually referred to financial results (e.g., profit and loss was referred to in 15 cases and shareholder returns in 13 cases); however, two other categories of stakeholders were also referred to (i.e., employee development and engagement were referred to in 11 cases and customer satisfaction in eight cases). The environment was given greater consideration in this part of the model (environmental impacts were presented in 10 cases).

In relation to the content presented in each aspect of the IIRC's BM, Table 2 and Figure 1 present an example of the first results for the category of inputs and their level of disclosure.

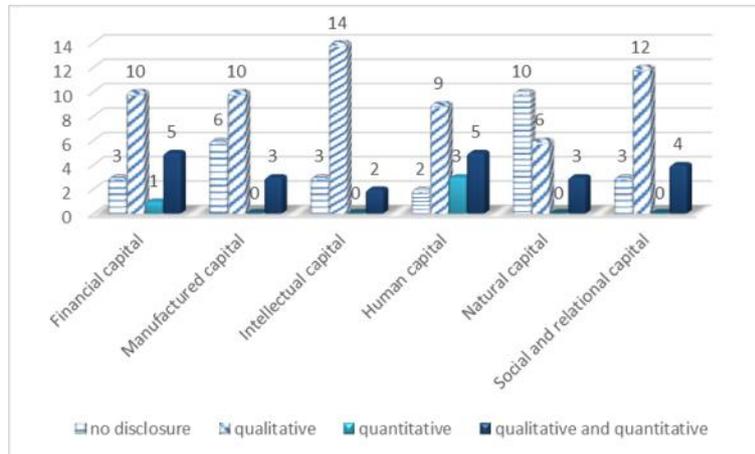

Figure 1 Disclosure on inputs

Inputs Aspects	No disclosure	Qualitative	Quantitative	Qualitative and quantitative	Disclosure level score	Maximum score
Human capital	0	9	6	15	30	57
Financial capital	0	10	2	15	27	57
Social and relationship capital	0	12	0	12	24	57
Intellectual capital	0	14	0	6	20	57
Manufactured capital	0	10	0	9	19	57
Natural capital	0	6	0	9	15	57

Table 10. Disclosure score on inputs

These preliminary insights on disclosure scores show that natural capital and manufactured capital are less represented than the other capitals (see Table 3) and that qualitative disclosure prevails over other forms of input. Except for natural capital, which was not present in the majority of cases, qualitative representation was used in the majority of inputs (i.e., in at least nine reports on human capital), followed by combined qualitative and quantitative disclosures. Pure quantitative disclosure was only used in relation to financial and human capital. The prevailing use of qualitative disclosure

Innovation, Entrepreneurship and Digital Ecosystems

was questionable given that BMs are intended to be representations of the value creation process of organisations' operational activities.

CONCLUSION, IMPLICATIONS AND FURTHER ANALYSIS

Scholars have spent decades considering how to define the BM and its implications, but have failed to reach any agreement on the concept. Consequently, both academics and practitioners should be involved in any attempts to understand what BMs are and the main implications related to implementing BMs. The majority of studies on this issue have focused on theoretical discourses (Beattie & Smith 2013) and case studies of best practices; however, to date, little is known on how BMs work in practice. Notably, the majority of studies have undertaken descriptive analyses of IR content and its determinants; however, only a few studies have undertaken content analyses of BMs using integrated reports (Wild & van Staden 2013). Consequently, the present study sought to undertake an in-depth analysis of the content elements of BMs and used the IIRC's standard as the starting point to analyse how organisations that embrace this framework disclose their business models.

A content analysis was undertaken to collect preliminary data on the disclosure of BMs in integrated reports. The results showed that BMs were depicted using images similar to the image provided by the IIRC. However, in relation to these BMs, not all the aspects proposed by the IIRC were used for each dimension and, in some cases, these aspects were completely omitted. The inputs usually represented financial capital while natural capital and manufacturing capital were rarely or only briefly described. The business activities analysis suggested that more focus was placed on 'operational involvement' and 'research and development' issues and thus, revealed the importance of innovation to the firms. The outcomes mainly referred to financial results and shareholder returns. Finally, in relation to the input disclosure examples presented, there were more qualitative disclosures than quantitative disclosures or mixed forms of disclosure. Thus, it appears that firms prefer to disclose their information using descriptions rather than quantitative indicators or figures.

The preliminary findings showed that Integrated Reporting (IR) disclosure practices could be significantly improved, particularly in relation to BM sections. Further, managers should adopt better IR practices to gain competitive advantages in terms of reputation and legitimacy. However, it should also be noted that firms could use any attempts to describe their BMs to improve perceptions of their firms' present and future visions and align these perceptions with the perceptions of relevant stakeholders. In this context, the role of set standards could be discussed, in order to gain a better convergence of empirical practices (and firms' disclosure needs) with standards framework and theoretical overviews.

This research had a number of limitations; however, these limitations provide a starting point for further development and analysis. Future studies should consider a wider sample of reports from the IIRC's database, including documents from previous years and reports that do not have a specific BM section. Further, future studies could have two coders undertake the content analysis to increase the reliability of the analysis and provide an agreement coefficient such as Cronbach's alpha (Dumay & Cai 2015; Krippendorff 2004). Despite these limitations, the results of this preliminary study should be viewed as representing the first step in a wider area of research that aims to ascertain the level of disclosure presented under the IIRC framework.

TOWARD LUXURY BRANDS AND THEIR ONLINE COMMUNICATION: A STUDY OVER PLAYERS EFFORTS AND THEIR SOCIAL ENGAGEMENT

Mosca, Fabrizio; Casalegno, Cecilia

Dept. of Management, University of Turin, Turin, Italy

ABSTRACT

The transformation of consumer and audience media attitude and buying behavior can be described as such a output of the evolution of the technology and the fall of communication barriers between firms and their target. Marketers and Communication managers are facing new challenges: nowadays people ask for a more transparent and close relationship with organizations they buy product from. This research project assumes that luxury companies are changing their strategic action, in order to communicate with their changing target. Through a research have started three years ago, the intent of this present paper is to empirically and qualitatively examine how luxury brands communication strategies have been evolving during the latest years towards a stronger relationship with a huge variety of different audiences at the same time. The interaction has to follow a continuous way and the will of contents sharing must be the center of every communication effort in order to enhance the experience of consumers and to establish a strong relationship with the audience, since people – today more than 10 year ago – aim to share, aim to feel like they are a part of a certain community. The present research on 100 cases shows that, even in the luxury markets, players who have the most authority and esteem are the ones using social media tools and counting a higher number of impressions on social networks and a higher frequency of video views and shares content online.

INTRODUCTION

Mature markets consumers and audiences are affected, nowadays, by media continuous evolution. This leads to a consequent different approach between business and target audience even in those markets where, traditionally, the business- consumer has always been top-down (Schultz, 1992). In which way

the technological progress is lived and declined in communication from luxury companies in mature markets? Is to consider that the greater the stratification of a society is, the more languages will be spoken and will be much more complex to analyze consumption dynamics (Mosca et al., 2013). This is especially true for luxury goods (Chevalier & Mazzalovo, 2012), in a context where the use of communication is experiencing a transition from "linear to multi device" (Mattiacci, 2012). The "future" of the luxury communication will be the result of what is appropriate to share and communicate with the target audience manifesting a growing interaction propensity (Tuten, Solomon, 2014) and the present research is investigating how this can happen nowadays. Since many authors have talked about "multichannel marketing" (Venkatesan, Kumar, 2007; Konus et al., 2008; Arikan, 2008; Zhang et al., 2009) and this is no longer a brand new topic, the present research wants to analyze and test some starting points. First of all, worldwide firms, nowadays, look ahead to the integrated communication tools as the most strategic way to improve their assets and business, especially over discontinuities (Casalegno et al., 2012). Secondly, managers have to consider that building a strong brand communication structure could be valid for all the stakeholders as extended audience (Kliatchko, 2008), since communication is not a two-way factor (Grunig, 2001) anymore and it is possible to talk about social media marketing (Tuten & Solomon, 2014).

Since, according to our knowledge, little has been written about the impact of social media strategies on luxury players audiences, the present research wants to investigate how luxury brand communication has been evolved in the latest years, it focuses the attention on the analysis of social and viral marketing trends, it wants to give managers new suggestions in order to better manage new communication tools starting from the data collected through the case analysis.

LUXURY GOODS SOCIAL AND VIRAL COMMUNICATION FOR A WIDER AWARENESS

While the power of mass media is undergoing a decline, due above all to generation Y media attitudes, there is a growing interest in new media generated by the consumers themselves, or the so-called user-generated content (UGC): blogging, podcasting, online video (eg : Youtube, Vimeo), social networking (Facebook, Twitter, Printerest, Google plus). Internet is getting the real "backbone of the media system" (CENSIS, 2012); Tapscott and Williams (2006) define social networks as a "mass collaboration"; according to the authors, audience participation and globalization are changing markets and organizations which are giving to social networks a special place in their strategy. The trend sees all organizations dealing with the programming of a communication plan that integrates all the tools with which they intend to interface with their stakeholders (Schultz et al., 1993; Romano, 1988; Krugman et al., 1994; Collesei, 2002; Duncan, Mulhern, 2004; Aiello, Donvito, 2005; Collesei, Innovation, Entrepreneurship and Digital Ecosystems

Ravà, 2008; Belch, Belch, 1998, 2009). Companies need to augment their process of information and experience creation and exchange, providing to users and brand followers content and additional services, together with dedicated spaces. The concept of integrated marketing communication - strictly related to the integrated firm communication (Romoli Venturi et al., 2014) - becomes inseparable from the one concerning common values sharing with stakeholders: this "sharing attitudes" is taking worldwide firms to stress their efforts in order to reach a major audience engagement, able to take to a higher degree of brand attractiveness (Gensler et al., 2013). In this context, consumers in mature markets have been characterized by a series of changes that led to contradictions and to the concept of polarization (Mosca et al. 2013). It is thus possible to consider three macro trends that will contribute to a substantial change in consumption related to competitive environments considered (Corbellini & Saviolo, 2007): the search of experience and personal gratification is the first trend to consider. The decade in which we live (2010-2020) is characterized by the centrality of the experience (Mosca et al., 2013). The focus is no longer on "what", but on "how" people buy things. Therefore, Kotler (2006, 2009) third "P" - distribution - is becoming increasingly important in major luxury markets strategies and the point of sale becomes the final touch point in the integrated communication process. Here the consumer can impart, through tangible and intangible elements, the image of the brand itself (Mosca, 2011). The second is the technology pervasiveness. Nowadays, it is evident the overwhelming role technology has had on the purchase and use of goods scenario. In fact, thanks to advances in innovation, final consumers have changed their behaviour and role in the purchase, from passive to active users, expressing the desire to produce content and participate to products and services development of what they are "invited" to consume (Mosca et al., 2013). The information technology increasing development (Rifkin, 2000) and the continuous compression of products life cycle reinforce new consumption mechanisms will be focused not in the possession of the product, but in wealth and consumption experiences sharing. Eventually, the third is named iper-mediation (Corbellini & Saviolo, 2007). The social stratification, in fact, has always been the basis of the luxury and fashion goods consumption in a ostentatious logic, this logic has always been related to show the others. To these motivation, that could be defined "historical", in recent years it is to add others consider luxury consumptions to satisfy personal needs, well defined as "self realization" needs (Mosca, 2011).

The contemporary presence of these two different consumption logics have taken to the birth of some bubbles demand (Brondoni, 2007), they are paradoxes, new buying behaviours. In recent years researchers and managers can find that various consumption forms are living together: from the more traditional buying behaviours (well described in the Conspicuous Consumptions Veblen Model), to the birth of the connoisseurs, ecc (Corbellini & Saviolo, 2007). This is due to the on-going changes related to purchasing schemes used by a customer defined (Okonkwo, 2010) as smart, well informed, Innovation, Entrepreneurship and Digital Ecosystems

always looking for brand new experiences and relationships. He/she is powerful, influent, individualist, but at the same time he/she looks for constant connections with the community.

RESEARCH QUESTIONS

In order to better define development trends in luxury markets communication strategy, the case analysis method has been considered to underline, when possible, different and similar firms' media attitudes. The analysis has been based on ways through which global luxury goods firms integrate their communication tools each other, by focusing the attention on social media communication strategies. Going deeper, the social analysis has been based on data coming from the daily view (in three different periods) of major online platforms' generated traffic.

Questions the present research wanted to answer to were the following:

(q1) How luxury companies uses online and social tools normally used in mass markets and which is the most social active luxury market?

(q2) Which kind of content is the most published? With which engagement?

(q3) Which correlation exists between number of fan/followers and frequency of content publication?

RESEARCH METHODOLOGY

In order to test the most suitable methodology to use and whether it made a sense to investigate over luxury players and online social communication platforms, a first attempt (it was more like an exploratory study, actually) over the use of those platforms by luxury players had been carried out in 2013, having considered 30 international cases. Cases had been chosen to represent in an equal way different luxury brands markets and the aim of that research was to estimate not just the on line presence, but even the contents different players posted in order to get in touch with the online audience (Mosca et al., 2014). The surveys of the online presence of the analyzed firms have brought us to identify Facebook, Twitter and YouTube as our field of research in order to have complete data for every considered case. Moreover the analysis has been carried out at three different times. A first analysis was carried out on a daily basis from April 14th 2013 to May 14th 2013, while a second one was carried out after 10 months (March 14th 2014). This kind of analysis has been chosen in order to test, in a first time, how good the used method would have been. This first analysis took to authors to the consideration that luxury players aim at utilizing web 2.0 strategies in order to attract the attention of customers and potential ones enhancing their brand engagement. Thus, in a second time, the analysis has been enlarged and enhanced including other luxury brands to reach the number of 75. The

observation of the social traffic around every brand has been carried from the 14th of April until the end of June 2014. In the third step, we have considered to enlarge the sample up to a number of 100 cases and this time the collection of data period considered the last three months of the 2014. It is to underline that the results analysis of this paper concerns this last part of the research and it refers to the 100 cases sample.

Considering the final analyzed sample, it is to underline that this research can cover the majority of known luxury brands, chosen and investigated in order to represent in a balanced way every luxury product market. Although we tried to build a balanced sample, considering the various luxury markets, its composition is the following and as it is easy to see, the apparel and fashion market is the most populated.

- Perfumery and cosmetics: 10,67%
- Wines and spirits: 9,33%
- Jewellery and watchmaking: 12%
- Automotive: 12%
- Apparel and fashion: 52%

In every case the intent was to understand how luxury markets players want to use online tools, which are generally used in the field of wide consume and, more importantly, what kind of reaction from the audience these media strategies generate in a long while. Thus, the calculation of the social engagement has been carried out with the aim of understanding the way through which luxury players impact to their audience.

RESULTS ANALYSIS AND FINDINGS

The analysis allowed estimating the "social media activity" of the analyzed firms operating in luxury markets, not only in quantity (number of like, followers and share), but also in terms of quality on the basis of the published on line content.

Comparing the social activity of the analyzed firms in the three steps, at the beginning of our research the 100% of the cases had a Facebook page (but at that time we just considered 30 cases), while only the 73% a Twitter account. At the end of the study (December 2014) these data could have been confirmed with a difference: the 98% of the considered sample had a Facebook page (we talk about the 100 considered cases), while 90% had a Twitter account. It means that Twitter has been increasing its

importance among luxury firms. Considering the (q1), the case analysis has helped the research to underline the social media use. After a first glance, we haven't considered the use of LinkedIn due to its scares use by luxury firms (Mosca et al., 2013). We also have not considered Instagram due to the fact that almost the 12% of the sample doesn't utilize it. Moreover, results highlight firms use "pop" platforms as Youtube to disseminate short films can give the chance to build the idea of "dream" and the dreamlike landscape typical of the communication of the luxury brand.

Table 1. Sample social media presence

Considering the social presence, Facebook is the most preferred platform by the analyzed cases, even if YouTube is able to generate a major online traffic, calculated through the cunt of the raise of fan and follower during the last analyzed period. To reach this result it has been calculated the sum of every analyzed case fan/follower social rise. Wine and spirits sector is the one investing less in social communication.

Table 2 Fan/follower rise

Quarterly rise (Oct-Dec 2014)	Facebook	Twitter	Youtube
Fan /follower rise	8,35%	11,72%	12,03%

Jewelry & Watches					
TOOLS	CONTENT				
	% Link	% Pictures	% Video	% promotion	% entertainment
Facebook	4,36%	88,45%	7,19%	71,42%	28,58%
Twitter	26,69%	70,49%	2,82%	60,83%	39,17%
Wine & Spirits					
TOOLS	CONTENT				
	% Link	% Pictures	% Video	% promotion	% entertainment
Facebook	5,87%	83,03%	11,10%	48,84%	51,16%
Twitter	33,61%	64,39%	2,00%	59,33%	40,67%

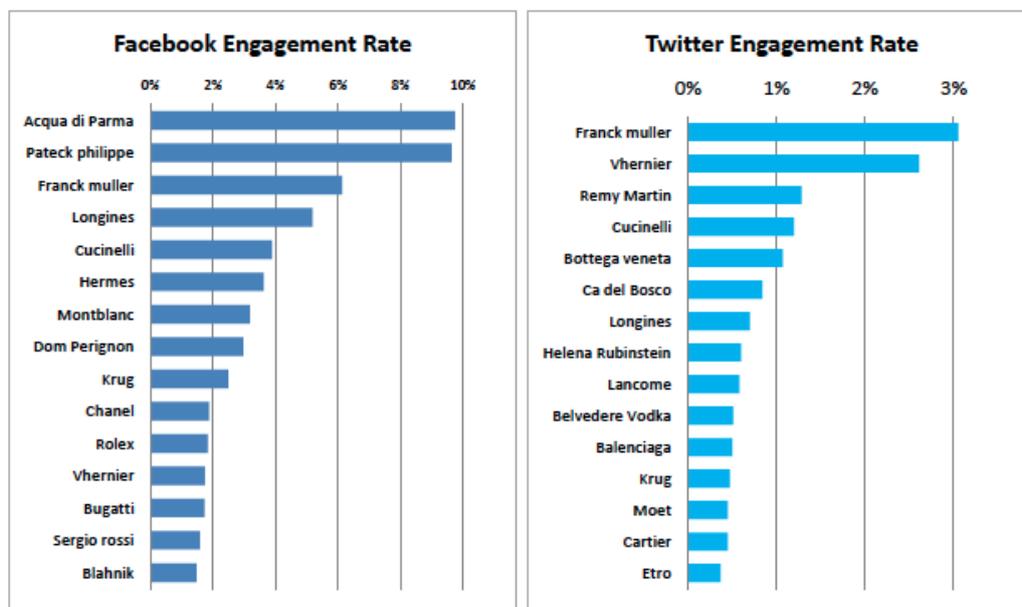

Most published contents by companies (q2) have a promotional intent (heritage, storytelling, events and celebrities). Shared contents recount heritage, so this refers to the tradition, the experience and the work behind prestigious products. This has a huge impact above all on consumption aimed to satisfy the "self realization" (Mosca, 2011). Considering that YouTube is largely utilized for the storytelling and for building that dreamlike sense, which characterizes the high symbolic value brands, the analysis towards contents shared by using social networks has been conducted considering Facebook and Twitter. Results are the following and the table 4 presents the way through which various brands want to communicate (Tools are: links, pictures, videos) and the kind of communication they want to spread (if promotion or entertainment).

Concerning the engagement of the two social networks above, a valid indicator could be represented by the so called *Average Engagement Rate* coming from Socialbakers. In order to consider, as stated by Peters, Chen, Kalpan, Ognibeni e Pauwels (2013), the different weight of every social action and every peculiarity of it, this KPI has to be weighted as follows: Facebook engagement rate = $\{[(Likes + Shares*3)/n. \text{ of daily post}]/fan\} * 100$

Twitter engagement rate = $\{[(Retweet*2)/n. \text{ of daily tweet}]/follower\} * 100$

Results are the following.

Figure 1 Top 35 Facebook and Twitter social engagement – The TOP 15

Concerning the kind of relation among the three social we have chosen to analyse (q3), considering the different increases of visibility, the research has focused the attention on the possible correlation between the Facebook and Twitter engagement, the one concerning Facebook YouTube official channel engagement and visualisations, the one concerning the increase of Twitter and YouTube engagement. In which: $C(x;y)$ is the correlation to test; x is the augment of Twitter and YouTube engagement; y is how much can augment the engagement of Facebook. Results can be interesting because empirically show what is possible to reach by simply using the qualitative knowledge of social media use. Correlations are weak between the Facebook and YouTube engagement (0,18) and between Twitter and YouTube engagement (0,29), but there is a strong correlation between Facebook and Twitter engagement (0,72). Considering other correlations, there is a strong correlation between the number of twittes published and the rising of Facebook fan/follower (0,65), but there is a weak correlation between the number of tweets and the YouTube increasing of videos visualizations. By

summarizing, Facebook and Twitter are linked together, while the other social networks are not so much. Considering this, when a player wants to implement a social strategy, it has to consider that Facebook and Twitter mutually augment their engagement.

MANAGERIAL IMPLICATIONS

Whereas, therefore, the web experience is based on the exchange, sharing and collaboration, consumers of luxury in mature markets are certainly not been immune to this revolution.

In particular, among the luxury markets the apparel and fashion market is the most populated, and the most published contents by luxury brands are promotional (heritage, storytelling, events and celebrities). The most relevant contents are focused on heritage, the tradition, the experience and the work behind prestigious products, and this factors of the brand and product concept are communicated with the most used social media that are Facebook, the most preferred platform by luxury brands and YouTube that is able to generate a major online traffic. Instead, they need to share their passion for luxury brands with other users on the network and trust you more and more of the opinions of the latter "acquaintances unknown" within the forum or blog. This is what literature sustains (Okonkwo, 2009): since the luxury is an identity, a concept – rather than a good or a service – luxury firms have to face the internet challenge if they want to lever on the emotion and they want to share their philosophy and their emotional values (Okonkwo, 2009) strictly tied to the brand.

The existing literature (Campbell *et al.*, 2011) has already understood that even in these particular markets it is possible to use democratic tools like internet and social medias, in order to improve values sharing and audience commitment, but little has been written concerning how to develop a stable long-term relationship with the luxury target. The results of this research can serve as a framework for all organizations wishing to compete in the luxury good markets. It considers that, especially in this particular competitive environment, consumers are looking for a deep and intimate relationship with brands that emphasize recognition, respect, dialogue and collaboration. On the contrary, they tend to reject those brands that do not damage their involvement and attention they require. In addition, they tend to abandon those brands that are not able to convey experiences, values, and, above all, excellent product concepts consistent between the real world and the online environment. In this perspective, the integration between communication and distribution its increasing importance in the management of luxury brands.

It is also confirmed that, from the integrated marketing communication perspective, luxury markets players have to apply the same approach, but not with the same contents, of the consumer goods ones in the use of media tools. The integration between traditional communication, new media and

distribution is strategic to renovate a luxury brand and transfer to the consumer the sense of modernity and innovation of the brand.

It is crucial for luxury players to build long lasting and strong relationships based on trust, able to provide customer loyalty in a second time.

Adopting a managerial perspective, multichannel marketing thus endeavors to understand, design, coordinate and exploit different channels with the aim of increasing in time the value generated by the customer base (customer equity) through targeted actions of acquisition, retention and development. Taking advantage of the potential provided by such an approach to multichannel marketing, firms are able to manage the increasing variety of demand using the potential flexibility of communication offered by digital technologies.

In this perspective, multichannel management policies can provide a decisive contribution to the acquisition of new market segments and therefore to growth in size. At the same time, customer relationship management can benefit from careful channel management, collecting new and uncommon information on consumer habits, being able to use digital environments as a privileged laboratory for behavioral observations. Finally, the customer base can be incentivized to continue the relationship thanks to the incremental value generated by supply in terms of greater availability and systematic adaptation of the channels of contact with the company on the basis of consumption opportunities but also of the evolution of the relationship's life cycle.

The virtual channel substantially changes the processes and activities of the distribution chain because products purchased online are often the same products purchased offline, but with different service and information content. It is essential that the different sales channels – physical and digital – be integrated in order to have a complete view of customer behavior (customer journey). A consumer may decide to purchase online from a physical point of sale, or vice versa may buy offline from the point of sale only after visiting the online site, and in the physical point of sale can access multimedia content that helps give value to the purchase. The increased penetration of digital environments, in their different forms, feeds the growth of consumers who associate new activities with the traditional rituals of consumption; searching for information about products and brands, comparing the prices offered by different selling points, choosing the nearest point of sale, are activities now largely carried out with digital tools. The spread of multichannel marketing encourages customer interaction and helps the company to capture market changes in a timely manner. The use of multiple platforms to reach the public offers firms the opportunity to achieve a number of business advantages: it increases the ability to receive comprehensive feedback on what the customer wants and what the company can improve. Brands can achieve significant benefits in terms of customer loyalty. It increases sales. Multichannel retailing, by offering a variety of points of contact, both physical and digital, with the

customer, increases the convenience and ease of purchase, thus increasing profit. It increases productivity: employees can benefit from the use of new technologies to achieve greater efficiency in customer service.

To manage multichannel marketing in the best possible way, attention must be focused on the customer rather than on the channel, because today the customer is considered an integral part of the production process. Moreover, when we talk about social networks, as virtual communities and showcases, the consistent and strategic presence of luxury brands on them can augment the potential of generating profit, engagement and awareness, by transforming the traditional communication from firm to customers in a relationship we can describe as transparent and closer. Consumers too can reap benefits from a multi-channel approach: easy access to information, savings in time, opportunities for interaction, shorter delivery times. Virtual and digital points of sale characterized by the immediate availability of the product are often preferred by consumers.

CONCLUSION AND RESEARCH LIMITS

To conclude, luxury firms managers can benefit from a larger consideration of online communication strategies, since their audience is everyday more used to social platforms. The literature can help them by analysing case studies and defining trends and best practices to follow. Of course, this present research presents some limits that can be turned in further steps. The biggest limit is that it is necessary to enlarge the period of observation, because the trend is in rapid and constant development. Secondly, it would be advisable to test, from a consumer side, luxury global users perception of the contents developed in the social media, not only in mature markets but also in the emerging ones.

THE IMPACT OF CEO CHARACTERISTICS IN INFLUENCING THE ORGANIZATIONAL CULTURE AND ITS ABILITY TO ESTABLISH AND DEVELOP NETWORKS

Mouta, Cristina¹; Abrantes, José Luis²; Meneses, Raquel¹

¹Faculdade de Economia do Porto. Universidade do Porto, FEP-UP, Porto, Portugal

²Escola Superior de Tecnologia e Gestão. Instituto Politécnico de Viseu, ESTGV-IPV, Viseu, Portugal

ABSTRACT

This paper presents a brief literature review on CEO characteristics, organizational culture and cooperation networks, dealing in particular with the influence of both observable and psychological characteristics, and of social capital, in the culture of the organization, and on its ability to create and develop cooperation networks.

The purpose of this paper is to present a conceptual model that by integrating the constructs referred enables to explore the potential existing relationships among them.

Based on a combination of grounded findings and literature in each field, as the Upper Echelons theory (Hambrick & Mason, 1984), to assess the observable characteristics; the Big Five framework to study the psychological characteristics (Costa and McCrae, 1992); and of the Competing Values Framework (Kalliath, et al., 1999) to explore the organizational culture, a new conceptual model emerges.

A conceptual framework is developed whereby the CEO observable and psychological characteristics, and social capital; organizational culture are due to influencing the ability of the firm to establish and manage cooperation networks.

Keywords: *CEO, Big Five Personality Dimensions, Culture, Competing Values Framework, Network.*

INTRODUCTION

The shifting patterns of international trade, the new forms of competition and the rapid technological changes have forced many firms to rethink their market approaches, and consequently their strategies, structures and management processes (Miles & Snow, 1986).

As a result, there is a change in the focus of organizational theory, including not only the internal processes of organizations, but also in the organization–environment interface (Håkansson & Snehota, 2006). Firms are more and more aware that are members of a network, in which they not only act and react, but above all, they interact (Ford, Gadde, Hakansson, & Snehota, 2002). Therefore, the options and actions of each firm depend on other firms' options and actions, which reflect their executives.

Executive actions substantially shape the fate of enterprises (Hambrick & Quigley, 2014), but already the Upper Echelons Theory had mentioned the influence of Top Management Teams (TMT) in the outcomes of an organization (Hambrick & Mason, 1984). Executive attributes shape not only organizational performance but also business, corporate, and international strategic profiles (Carpenter, Geletkanycz, & Sanders, 2004).

Therefore the aim of this research is to find out whether the personal characteristics of the managers may influence the organization in terms of culture, and consequently in their ability to establish and develop cooperation networks.

This paper begins with a brief literature review on the CEO, his psychological and observable characteristics and his social capital; on the organization and its culture; and on networks with complementors, competitors and universities. Then, research hypothesis emerge and a conceptual model is developed. At last, some limitations of the work and orientations for further research are presented.

THEORETICAL FRAMEWORK

The actions and decisions of a small number of people within the organizations are largely reflected on how the organization perform the way they do, therefore the importance of comprehending top executives experiences, values, social capital, aspirations, abilities and other features (Finkelstein, Hambrick, & Cannella, 2009).

THE CHIEF EXECUTIVE OFFICER (CEO)

Organizational outcomes depend on values and cognitive bases of the most powerful actors in the organization (Hambrick & Mason, 1984). There is a connection between the performance of the organization and the top managers who manage it (Hambrick & Mason, 1984), the so called Chief Executive Officers (CEOs). Later, Papadakis and Barwise (2002) found that the characteristics of the CEO and of other top team members had an impact on strategic decision-making processes.

Furthermore, CEO's enjoy a dominant position within TMT so it is interesting to discover how they influence organizational strategies, culture, structures, outcomes and performance (Finkelstein, 1992). The CEO is probably the most powerful member of the top management team (Crossland & Hambrick, 2007).

When the influence of CEO characteristics are studied most of the research focuses in the impact of the observable variables, and less in psychological features. Nevertheless, it is recognized the importance of these in the way organizations work. In fact, Van Gils (2005) studied the characteristics of the entrepreneur/manager, of the TMT and of the board of directors in Dutch SMEs and found that two

thirds of the CEOs created their TMT. And, that both combine their industry and functional knowledge to create the firm know-how, and concluded that entrepreneurs/managers should be aware of the strategic knowledge and networking advantages that a TMT can offer.

Psychological characteristics

The Upper Echelons (Hambrick & Mason, 1984) defend the idea that organizational outcomes reflect TMT characteristics, values and cognitive bases. However, Hambrick (1984) focused the research only on some observable variables like age, education, financial position, functional background, group heterogeneity, socioeconomic roots and other career experiences, once he found that top executives tend to be reluctant to participate in psychological tests. Therefore, to assess the CEO personality it will be used the Big Five framework (Digman, 1989).

The big five personality dimensions

The Big Five framework has been widely used as a research model of personality, mainly by psychologists, however it has been used by management researchers as Barrick and Mount (1991). Over the past few years some authors have studied the influence of personality dimensions on job performance (Barrick & Mount, 1991), others studied the implications of the Big Five for research and practice in human resources management (Mount & Barrick, 1995), others focused on the decisions to become and stay self-employed (Caliendo *et al.*, 2014).

More recently the Big Five Personality 'traits' have been used to study the influence of the five dimensions on the entrepreneurial personality (Zhao, 2006; Antoncic, et al., 2015).

This framework is a hierarchical model of personality with five factors or 'traits', suggesting that most individual characteristics can be grouped into five personality dimensions: Extraversion, Emotional Stability, Agreeableness, Conscientiousness, and Openness to Experience (Digman, 1989). These five 'traits' and their impact in human personality were proficiently explained by Costa and McCrae (1992).

The first factor – Extraversion – suggests the individual is talkative, assertive, with energy and enthusiasm when presents a high score, if not he is seen as cautious, introverted and quiet.

Agreeableness – the second 'trait' – reveals the tendency of a person to easily agree with others. A person with high score is seen as altruistic and trustworthy.

The third dimension – Conscientiousness – shows the individual is reliable, responsible, organized, if classified with a high score. This is often considered a good indicator of a person job performance.

Emotional Stability - the fourth factor – suggests that a person tends to react with impulsiveness and anxiety when the score is low, or tends to show some self-confidence, if the score is high.

At last, Openness to Experience puts into evidence how a person is open to new ideas and experiences. An individual with low score is seen as narrow-minded, while one with high score is regarded as being creative and reflective.

Observable characteristics

There are some observable characteristics whose effects in firm performance are important to analyze, as demographic elements, managerial tenure and functional background (Song, 1982; Bantel & Jackson, 1989; Finkelstein & Hambrick, 1990).

Age

Decision maker's age is negatively related to firm global strategic position, the younger the manager the more likely he is to engage in collaboration networks and follow internationalization strategies (Carpenter & Fredrickson, 2001). So, age matters.

Education

The education background of the executives reveals their knowledge, their values and their skills, which may have an impact in organizational performance, as defended by the Echelons theory (Hambrick & Mason, 1984). So, formal education matters.

Functional background

The effect of the executives' functional background and experience of the CEO are significantly related to the diversification strategy of a firm (Song, 1982).

Functional heterogeneity also influences a firm global strategy. In low uncertainty environments, the more functional heterogeneous are the executives, the more likely is the firm to adopt a global strategic posture (Carpenter & Fredrickson, 2001). So, functional background matters.

Managerial tenure

Managerial tenure has an impact on a firms' global strategic posture, in both high and low uncertainty contexts. Managerial tenure is positively related to a firm global strategy, in low uncertainty environments, but negative in highly uncertainty contexts. The more diverse is the management team in terms of tenure, the more global is the firm in a context of low uncertainty (Carpenter & Fredrickson, 2001). So, managerial tenure matters.

Social capital

Organizations are largely affected by social relations, since "economic action is embedded in structures of social relations" (Granovetter, 1985, p. 481).

Firms may enjoy a strategic advantage when individuals are members of multiple and separated networks, as they gain access to different sources of information and resources (Burt, 2000).

Social capital may explain the success achieved by different individuals and companies in the competition they face every day. The actions of individuals and groups can be really facilitated by their direct and indirect connections to other actors in social networks. The main aspect of social capital is not about what you know, but about whom you know (Woolcock & Narayan, 2000).

Also, it is more and more frequent, a person being considered by what he is, but also by who he knows, and by who does he relate to, this is by his network. If a manager used his personal social relationships to create business for the company he worked for, it means that organizational social capital was created on the basis of an individual social capital (Inkpen & Tsang, 2005).

The benefits of social capital can be noticed in the influence, information and solidarity exchange among actors of a network, the so-called "bonding" social capital, and in the relations of one members to others, the named "bridging" social capital. The characteristics of social relations that contribute for the development of social capital are based on the opportunities born within the relations' network (Kwon & Adler, 2014).

THE ORGANIZATION

Organizations are open systems once they depend on the continuous exchanges with the environment (Katz & Kahn, 1966), and they must adapt to the environment if they want to survive and prosper (Hambrick D. C., 1982).

Culture

There are many definitions of organizational culture, and many kinds of organizational cultures, nearly every firm has its culture (Melé, 2003).

However, it usually refers to the values and beliefs that provide norms about expected behavioral patterns that employees might follow (Schein, 1992). Those shared values work most of the times as guidelines to members' behavior. Schein (1984) presents culture as a set of assumptions one makes about a group they belong to, and those assumptions can be grouped into three levels: artifacts, espoused beliefs and values, and basic underlying assumptions differentiating the levels at which organizational culture manifests.

So, as to assess if a given culture "is an effective and efficient coordination instrument" (Buschgens *et al.*, 2013, p. 763), Quinn and Rohrbaugh (1983) developed the Competing Values Framework (CVF) which is one of the most widely used model in organizational culture research. It was originally developed to assess organizational effectiveness, however it became quickly an important tool to explore the organization value system (Kalliath *et al.*, 1999).

The CVF (Figure 1) considers that two dimensions of competing values can feature most organizations (Kalliath *et al.*, 1999). The first one, flexibility/decentralization-control/centralization show the Innovation, Entrepreneurship and Digital Ecosystems

importance given to control within the organization. The second dimension, show the internal-external focus, revealing how concerned the organization is with what happens within its limits or in its environment and relationships with stakeholders.

Each axis represents a dimension, by cross-classifying them it results in four quadrants, each one associated to a type of culture. However, an organization can rarely fit in one quadrant, in fact it will show values from different quadrants, with more emphasis on one or two quadrants (Buschgens *et al.*, 2013).

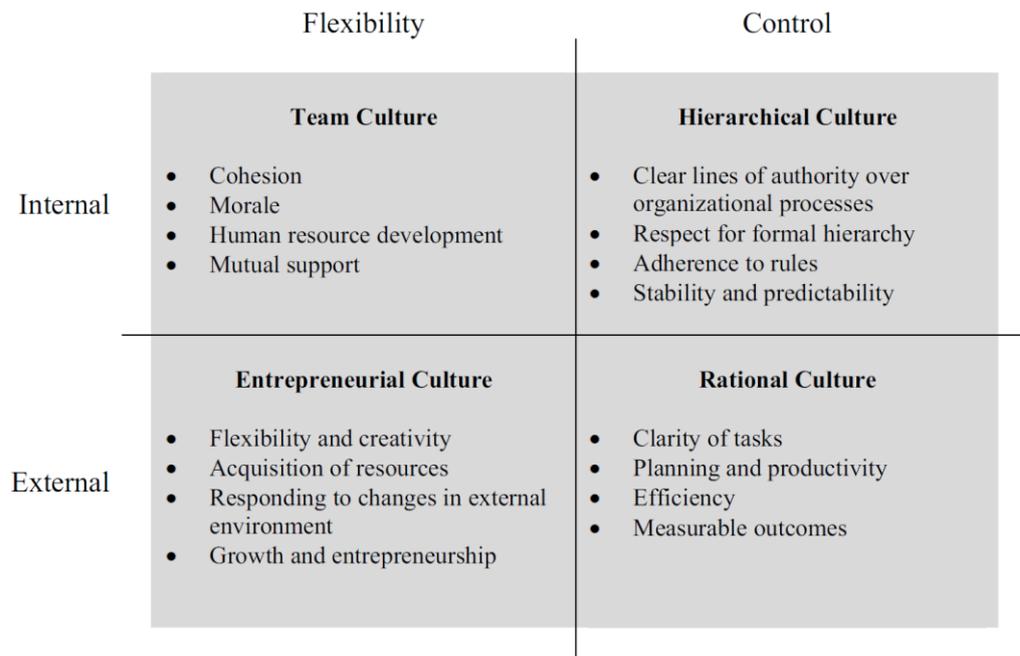

Figure 1. The Competing Values Framework of Organizational Effectiveness.

Adapted from Kalliath, Bluedorn, & Strube (1999). "A confirmatory factor analysis of the competing values instrument." Educational and Psychological Measurement, 59 (1) in Helfrich, C.D. et al. (2007) "Assessing an organizational culture instrument based on the Competing Values Framework: Exploratory and confirmatory factor analyses."

Organizations with values reflecting an internal focus and emphasis on flexibility - "Team Cultures" - encourage decentralization, autonomy, mutual help, empowerment and teamwork (Helfrich *et al.*, 2007).

In the opposite side of the axis, there are organizations with values showing an internal focus and emphasis on control, reflecting "Hierarchical Cultures", which tend to show centralized authority, formal rules and procedures, good definition of the employees' responsibilities, as stability is a goal (Helfrich *et al.*, 2007).

Organizations with values revealing an external focus and emphasis on flexibility - "Entrepreneurial Cultures" - are usually considered open systems, favorable to creativity, innovation, and risk takers (Kalliath, *et al.*, 1999).

Finally, organizations with an emphasis on control and external focus - "Rational Cultures" - are known for pursuing efficiency and measurable outcomes (Kalliath *et al.*, 1999).

In any case, whatever the type of culture, the most important is to understand the impact of organizational culture in the way organizations work (Schein, 1996).

THE NETWORK

The business context is now seen as a web of relationships, a network, replacing the old view of independent suppliers and customers (Johanson & Vahlne, 2009).

Networks may help a firm to enhance their competitive advantage once a network provides external access to tangible and intangible resources of other network members (Davies *et al.*, 1995). A network usually enables the firm to have access to information, resources, technologies, markets, and knowledge, being their relationship building ability a source of sustainable competitive advantage (Batt & Purchase, 2004).

A network can be defined as a set of companies and the relationships among them, being the boundaries of a firm network difficult to define, because if it is considered only the group of companies with which the firm cooperates then the view of the organization context becomes very limited (Ford *et al.*, 2003).

The management of a network is a result of the interactions that occur among the individuals in the network, so no individual alone controls the network (Batt & Purchase, 2004).

Firms do not depend only on their individual efforts to survive, they also depend on the activities and performance of other firms, and on the relationships, they maintain with their partners (Wilkinson & Young, 2002). In fact, "a firm is embedded in a network of ongoing business and nonbusiness relationships" which may work as enablers or inhibitors of firm performance, therefore firms should be looked as part of "business systems" (Ritter *et al.*, 2004, p. 175).

Complementors

A firm has a complementor when customers consider the product to be more valuable when they also have the other firm's product rather than when customers experience the firm's product alone (Brandenburger & Nalebuff, 2011).

For Ritter *et al.* (2004) a complementor firm develops relationships with different types of firms whose products or services increase the value of their own outputs.

The existence of complementary products increase the value offered to the customer and consequently the size of the market increases. The key to solve eventual disagreements abides on the relationship management, by deep understanding their capabilities, strategies, goals and their incentives to cooperation, without neglecting any potential areas of conflict, and thus benefit from the opportunities a cooperation relationship may offer (Yoffie & Kwak, 2006).

Coopetition

Cooperation may exist among apparent rivals, and sometimes there are cooperation and competition activities between business companies, or sometimes actors compete in some attributes of their interactions and cooperate in other aspects with other members (Ford & Håkansson, 2013).

Firms compete with each other in order to create competitive advantages and deliver value to the customer, shaping the network of relationships among firms (Wilkinson & Young, 2002).

Two competitors can both compete and cooperate with each other, simultaneously this shows the meaning of the term "coopetition" (Bengtsson & Kock, 2000).

The two activities: cooperation and competition can be analyzed separately depending on the proximity to the customer and on the competitor's access to some resources. A company may cooperate with one competitor and compete with another, and thus taking part in different relationships with different members. These relationships are rather complex, as members are involved in a hostile relationship (competition) on one hand, and on the other, in a friendly relationship with the member with whom they share the same interests. These two logics must be properly managed so that a coopetitive relationship emerges (Bengtsson & Kock, 2000).

One side of a coopetitive relationship assumes that individuals behave according to their own interests, pursuing their own aims, ambitioning that their products differentiate and perform better than their competitor, so the existence of different self-interests will lead to conflicts with each other. The other side of the coopetitive relationship assumes that individuals behave in order to achieve common goals, seek to profit from their partner's competences, seek to reduce lead times and reduce costs of new product development. The reason why individuals pursue a win-win relationship abides in the social structure and not in the individuals' motives and interests. In this relationship, what really matters is the well-being of the competitors and of the relationship. It is the industry structure that force firms to compete with each other, but it is the social structure that explain why they cooperate with each other (Bengtsson & Kock, 2000).

Coopetition has been more frequent due to the increase of interdependence between global actors and the need for collective action, risk and knowledge sharing and strategic flexibility (Luo Y. , 2007).

University-Industry Collaboration (UIC)

Cooperation between universities and industry has seen its importance growing in the literature since 1990, first more related to medical research and now more used in social sciences and in the management field (Ankrah & Al-Tabbaa, 2015).

Universities and other higher education institutions are a relevant source of scientific knowledge; therefore, industry can have access to this knowledge by developing formal and informal relationships with those entities, and thus encourage innovation and production. Those relationships may be due to the founders' educational qualifications and to their links to those organizations (Westhead & Storey, 1995).

UIC has been generally considered an important source of innovation capacity for firms, as they use external networks to develop innovation and knowledge, to complement the traditional internal R&D department (Dess & Shaw, 2001). Although factors as capacity and resources, legal issues, and contractual mechanisms, management and organization issues, and others related to technology, politics, and others facilitate or inhibit the collaboration between universities and industries (Bruneel *et al.*, 2010), it is the managerial and organizational issues the success critical factors of the University-Industry relationship (Ankrah & Al-Tabbaa, 2015).

The motivations of both universities and industries to establish a collaborative relationship are necessity, reciprocity, efficiency, stability, legitimacy and asymmetry. This last motivation was found only in the side of the industry, once industry enjoys having the power to control its resources (Ankrah & Al-Tabbaa, 2015).

A CONCEPTUAL FRAMEWORK

The conceptual model comprehends the organization as the object of study, with three elements of observation. The first focuses on the CEO as an individual, like any other executive of a TMT, with different psychological characteristics, different age, education, functional background, and managerial tenure, and network of contacts. The second studies the organization with its culture, values, norms and artifacts. The third is dedicated to cooperation networks with firms providing complementary products or services – complementors, with firms offering similar products/services – competitors, and university-industry collaboration viewed as a mean of reducing R&D costs and of enhancing industry capacity of innovation.

By combining different theoretical approaches, some hypotheses of research emerge.

An organization is a result of people's behaviors, as people define the way an organization looks, feels, and behaves. Therefore, the characteristics of people "are the fundamental determinants of organizational behavior" (Schneider, 1987, p. 437).

Executives of an organization can have an impact within the organization by emphasizing certain values and creating norms for expected behaviors (Mumford, et al., 2002). In fact, by emphasizing certain values and by creating norms for expected behaviors, managers can build an organizational culture with a powerful influence on employee behavior. Values and norms can in turn manifest itself in artifacts (e.g., organizational rituals, language and stories, and physical configurations) and lead to desired or accepted behaviors.

H1 – The Individual characteristics have an impact in the Organization Culture

The Upper Echelons Theory (Hambrick & Mason, 1984) argue that both CEO's and TMT observable characteristics have an impact on the interactions of CEO's and TMT's with others within and external to the firm, producing effects on organization performance (Bromiley & Rau, 2016). So, it can be said that

H1a) The CEO observable characteristics have an impact in the Organization

Zhao and Seibert (2006) used the Big Five framework to assess to what extent entrepreneurs are different from managers in those personality 'traits'. Moreover, found that managers score higher on agreeableness and significantly lower than entrepreneurs on conscientiousness, openness to experience, and emotional stability. So, it can be said that

H1b) The CEO psychological characteristics have an impact in the Organization

The actions of individuals and groups can be facilitated by their direct and indirect connections to other actors in social networks. The main aspect of social capital is not about what you know, but about whom you know (Woolcock & Narayan, 2000).

Social networks influence the flow and the quality of the information, as people prefer to trust people they know instead of relying on impersonal sources, so social networks helps trust to emerge (Granovetter, 2005). In fact, it is through social relations that social capital provides information to facilitate the action (Coleman, 1988). Many business relationships are a result of the personal sociability of business managers, and this happens not only at the top of the firm but at all levels, business occurs (Granovetter, 1985). So, it can be said that

H1c) The CEO social capital has an impact in the Organization

Organizations are connected by networks of personal relations (Granovetter, 1985), so firms with top executives with a given set of characteristics and greater social capital will be preferred by partners to establish business relationships, and therefore cooperation networks. Still, if many business relationships are a result of the managers social capital (Granovetter, 2005) then it is expected that cooperation networks, are also a result of the executives' social capital. So, it can be said that

H2) The CEO characteristics have an impact on the establishment and development of Cooperation Networks

The reason why individuals pursue a win-win relationship abides in the social structure and not in the individuals motives and interests. It is the industry structure that forces firms to compete, but it is the social structure that explains why they cooperate with each other, even if they are competitors (Bengtsson & Kock, 2000). So, it can be said that

H2a) The CEO social capital has an impact on the establishment and development of Cooperation Networks

CEOs with a low score in Extraversion, being a cautious, introverted and quiet person, will have more difficulty in developing their social capital, and therefore business relationships, meaning cooperation networks. In the same way, an executive with low score in Agreeableness will be seen as not to be trusted, and will hardly be able to connect with other managers, as these may be reluctant to develop any kind of personal or business relationship. This may happen, because most of firms prefer to negotiate with individuals of known reputation to avoid risks, instead of relying on institutional arrangements (Granovetter, 1985). So, it can be said that

H2b) The CEO psychological characteristics have an impact on the establishment and development of Cooperation Networks

CEO heterogeneity in demographic features reveals a tendency to pursue alliance formation and therefore establish cooperation networks (Carpenter, et al., 2004). The more heterogeneous are the executives the more prepared they are to deal with the greater complex relationships, cooperation networks bring (Ferrier, 2001).

Education may also be crucial in establishing strong inter-organizational ties, as it implies membership in a given socioeconomic group (Hambrick & Mason, 1984). And, therefore access to a network of contacts, so it is probably, that educational background with what it implies is also important in the development of business networks, as the main issue of social capital, is not about what you know, but about whom you know (Woolcock & Narayan, 2000).

Decision maker's age is negatively related to firm global strategic position, the younger the manager the more likely he is to engage in collaboration networks and follow internationalization strategies (Carpenter & Fredrickson, 2001).

The effect of the executives' functional background and experience of the CEO is significantly related to the diversification strategy of a firm (Song, 1982). So, it can be said that

H2c) The CEO observable characteristics have an impact on the establishment and development of Cooperation Networks

Although organizational culture is a largely invisible social force, it is very powerful within organizations. For this reason, Hogan and Coote (2014, p. 1609) stated, "organizational culture is a powerful means to elicit desired organizational outcomes".

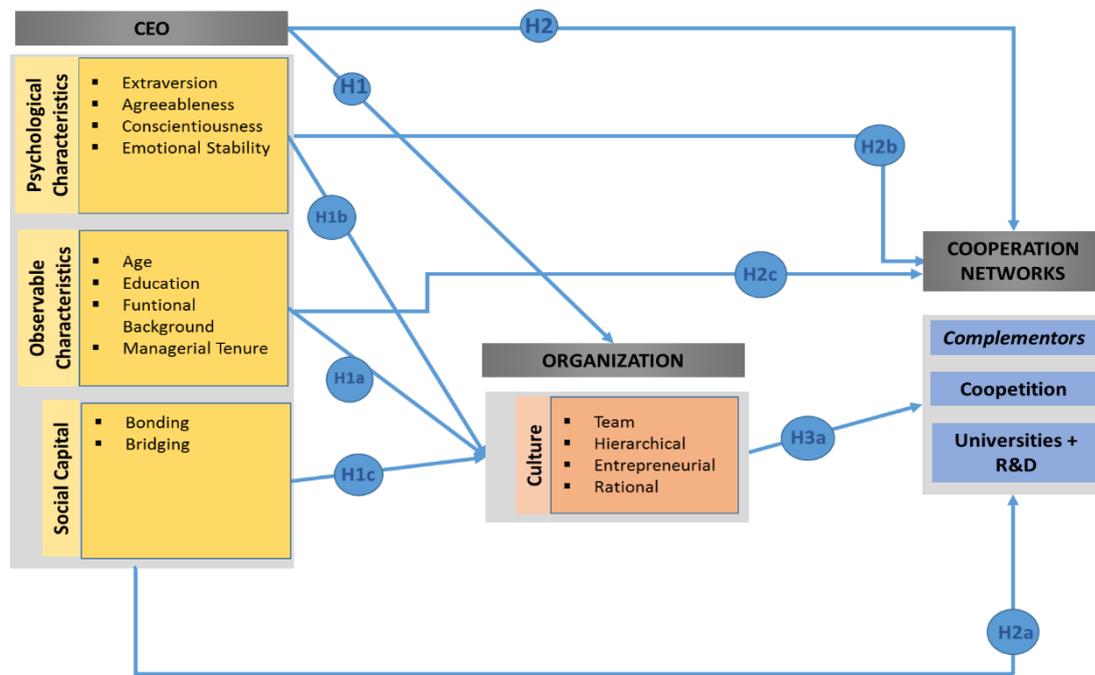

Figure 2. Conceptual framework – The Impact of CEO characteristics on organizational culture and in establishing and developing cooperation networks

Organizations with values revealing an external focus and emphasis on flexibility, called “Entrepreneurial Cultures” are usually considered open systems, favorable to creativity and innovation and risk takers (Kalliath, et al., 1999). So, it can be said that

H3a – The Organizational culture has an impact in how the organization establishes and develops cooperation networks

Organizational culture also influences the way employees relate to each other, and also how they look after new members, so it has been pointed out as an important barrier to the flow of new knowledge and innovations (Helfrich, et al., 2007).

By neglecting the connections to the stakeholders (employees included), the organization may be missing business opportunities related to innovation, creativity or efficiency and incur in additional costs (Fenwick, et al., 2009).

CONTRIBUTIONS, LIMITATIONS AND ORIENTATIONS OF THE RESEARCH

Little research has been conducted on the study of psychological characteristics of top executives (Barsade *et al.*, 2000), so a contribution to knowledge of this research would be the collection of data regarding the influence of CEO psychological characteristics on organizational culture and firm behavior.

Major limitations of this work abide on the absence of empirical work, and of firm performance measures, to assess the financial impact of the CEO personality in the organization culture and on its ability to establish and develop cooperation networks. Other variables, like the size of the firm and the industry should also be taken into account, once they might influence the results, and its interpretation. Therefore, for future research the conceptual model presented should have an empirical testing, and also the relationships between the constructs and the research propositions should be discussed and tested. Different contexts (e.g. different industries, regions, countries), might also be used as a basis to discuss potential relationships.

EFFECTIVENESS OF WEBSITE LOCALIZATION: PRACTICES FROM DIFFERENT CULTURES IN READY-TO-WEAR SECTOR

Mutlu Turan, Pınar¹; Bayraktaroğlu, A. Gül²

¹Aydın, Turkey

²Department of Business Administration, Dokuz Eylül University, Izmir, Turkey

ABSTRACT

Despite the fact that recently the world has become a global village, localization still keeps its importance when it comes to creating websites. It is important to have an effective localization, in order to have an effective website. Cultural distance might also have a role in the localization level of websites from different cultures. One of the most important indicators of an effective website would be the satisfaction consumers get from that website. Therefore; the present study aims to explain the effectiveness of websites through localization with satisfaction elements taking into consideration the effect of cultural distance in ready-to-wear sector. The study is composed of three phases: conducting a cluster analysis to find out cultural differences and to select website brands; evaluation of localization levels by a jury of academicians using KJ method and conducting an online survey to determine the effectiveness of the selected websites.

Keywords: *Localization, Cultural distance, Satisfaction, Websites, Ready-to-wear sector, Hofstede, Effectiveness*

INTRODUCTION

The Internet has changed the way millions communicate, conduct business and manage their daily lives. Websites are the new communication medium for companies to reach out their consumers not only nationally but also internationally. However, this requires companies to consider cultural differences while they are designing their websites and reaching their international customers (Sun, 2001; Reinecke and Bernstein, 2013).

It is assumed that companies from different cultures would behave differently when creating a website for a country from a different culture (Zhang, 2015). Global websites are the gateways of the companies of future to reach out consumers with different cultural backgrounds where the right strategy to design a website is crucial especially in the ready-to-wear sector, where online shopping started gaining an important percentage of the total sales. Trust, site quality and positive affect (i.e. satisfaction) were found to be more significant for selling high-touch goods such as clothing (Lynch et al., 2001). Shopping Innovation, Entrepreneurship and Digital Ecosystems

sites were included under hybrid website category implying that these websites could be providing informational content as well as offering some hedonic benefits such as satisfaction for their consumers (Valacich et al., 2007). There is no more either standardization or localization alternative in every aspect of a website design. There are many parts of a marketing strategy where standardization would be beneficial for a company to employ while there are some aspects of the strategy that would lead to failure if "local" tastes of the consumers are not taken into consideration (Quelch and Hoff, 1986:59).

The aim of this study is to analyze whether different levels of localization versus standardization would create a difference in the satisfaction the consumers get from the website. Since, cultural distances between the headquarter of the firm and the targeted country can have an impact on this relationship, the cultural distances are also considered. Turkey is chosen as the country of reference since she is an emerging country with a high population where the young people have a larger percentage. This brings a more dynamic market with a growing interest in technology thus online shopping. According to the information of an analysis by eMarketer (2016:9), Turkey is expected to see a rapid growth in the number of internet users as the percentage of residents who go online will jump from 54.2% in 2015 to 65.2% in 2019. The results are expected to shed a light on the differences of the effectiveness of global ready-to-wear brand websites in Turkey.

LITERATURE REVIEW

Localization

Standardization strategy can be stated as "marketing activities coordinated and integrated across multiple country markets" (Johansson, 2009:14) whereas localization can be defined as "the process of adapting a product and service to a particular language, culture, and desired local look-and-feel" (Cyr and Trevor-Smith, 2004:3).

Even though websites might be reached globally, their content is still expected to vary from culture to culture. Luna et al (2002) aimed to provide a cognitive framework to investigate the effect of the manifestations of culture, including language, on website effectiveness. They carried out three experiments with two Spanish and one U.S. sample, all of which included Spanish-English bilingual participants. The results suggested that the congruity of a site with a visitor's culture is a key site content characteristic that affects a visitor's likelihood of an optimal navigation experience or flow in a cross-cultural context. Even people with an advanced knowledge of English as a second language feel more comfortable searching in their first language.

Designing websites that are appropriate for audiences with different cultural backgrounds has never been an easy task. The designers need to take into consideration various aspects such as pictures, graphics, currency and measurement units while forming a website for a different country. Website localization is more than the mere translation of words into a different language. It is the adaptation of the contents of a website linguistically as well as functionally and culturally to be acceptable for a certain target audience (Cyr and Trevor-Smith, 2004).

Effectiveness and Satisfaction

Satisfaction is an important factor when evaluating the effectiveness of websites (López and Ruiz, 2011). Consumers visit websites for various purposes. They do not only wish to gather information but also to have fun while surfing the internet. When designing websites, companies must take into account the expectations of their consumers. Effectiveness of websites is closely related to the satisfaction the consumers would attain from a website. More satisfaction leads to more customer loyalty resulting in effective websites (Van Dolen et al., 2007). This study aims to depict the differences of effective localization practices; therefore satisfaction evaluations are taken into consideration to explore its relation with localization levels of websites. It is assumed that as the localization level increases, satisfaction of customers from the website would increase; therefore it is hypothesized that:

H₁: Satisfaction from the websites will differ with respect to localization levels of websites.

Satisfaction evaluations are evaluated with three dimensions (Steenkamp and Geysken, 2006); therefore the following sub-hypotheses are tested:

H_{1a}: Pleasure acquired from the websites will differ with respect to localization level of websites.

H_{1b}: Arousal acquired from the websites will differ with respect to localization level of websites.

H_{1c}: Accessibility to the websites will differ with respect to localization level of websites.

Cultural Distance, Level of Localization and Effectiveness

Cultural distance of the country of the global company to Turkey is also taken into consideration. Closer cultures would be expected to have similar tastes (Drogendijk and Slangen, 2006), therefore when a global brand enters a market from a closer culture, not much localization should be required for

successful results in that market. Lower level of localization would be sufficient, therefore it is hypothesized that:

H₂: The closer the cultural distance of the ready-to-wear brand, the lower the level of localization will be necessary.

It is assumed that a ready-to-wear brand from a closer culture would have similar tastes, therefore it would cover the expectations of consumers from a similar culture in designing websites implying for a higher effectiveness, therefore it is hypothesized that:

H₃: The closer the cultural distance of the company to the country where its website operates, the higher the effectiveness of websites.

It is assumed that localization of the websites influences the effectiveness of websites, however cultural distance would as well have an effect on the results. Therefore, it is hypothesized that:

H₄: Localization level of websites influences the satisfaction acquired from websites regarding cultural distance.

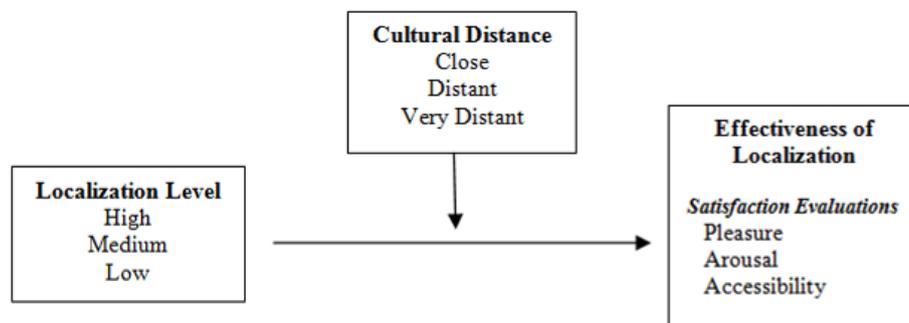

Figure 1. *Research model.*

RESEARCH DESIGN

The study was designed in three phases. In the first phase, the aim was to determine the companies whose websites were to be evaluated. For this purpose, since cultural distances were believed to affect the need for localization; the countries were categorized as distant, very distant and close to Turkey in terms of culture. The cultural differences of the countries were specified by using Hofstede's cultural dimensions since this is the most widely used and accepted scale in various social science studies (Soares et al., 2007; Rinuastuti et al., 2014). Various studies were done using Hofstede dimensions. However, none of the previous studies included all six dimensions at the same time. Only some dimensions of Hofstede (1980) were included in most of the studies in the marketing literature (Han

and Shavitt, 1994; Cutler, Erdem and Javalgi, 1997; Zandpour et al., 1994). Some studies (Zandpour et al., 1994; Yalcin et al., 2011; Tigre Moura et al., 2015) used dimensions from Hofstede (1980, 1991) together with dimensions from Hall (1976, 1983).

In the cluster analysis, the country scores of Hofstede (Hofstede et al., 2010) dimensions were used as clustering variables using the dimension data matrix downloaded from Geert Hofstede's website (<http://www.geerthofstede.com/dimension-data-matrix>). Fifteen clusters were obtained (Table 1) and named following the evaluation of the proximity matrix and the dendrogram (the details are not included due to page limitations).

Cluster Number	Suggested Name*	Countries Included in the Cluster
1	Anglo	Australia, USA, Canada, New Zealand, Ireland, Great Britain
2	Nordic	Denmark, Sweden, Finland, Norway, Netherlands
3	Latin African	Mexico, Venezuela, Colombia, Africa West, Trinidad and Tobago
4	Baltic	Estonia, Lithuania, Latvia
5	Germanic	Germany, Switzerland, Luxembourg, Austria
6	East European and Mediterranean	Belgium, France, Hungary, Italy, Czech Republic, Poland
7	Far Eastern	Malaysia, Philippines, Indonesia, Vietnam, Hong Kong, India, China, Singapore
8	African Arabic	Africa East, Thailand, Arab countries, Morocco, Iran
9	Latin Undeveloped	Chile, El Salvador
10	Latin Europe	Portugal, Uruguay, Peru, Slovenia
11	Latin American and Mediterranean	Brazil, Turkey, Spain, Malta, Greece, Argentina,
12	Far Eastern Developed	South Korea, Taiwan
13	East Europe Far East	Romania, Serbia, Bulgaria, Croatia, Russia, Bangladesh, Pakistan
14	Japan	Japan
15	Slovak Republic	Slovak Republic

*The names of the clusters are inspired and adapted from Hofstede (1980, 2001) and Ronen and Shenkar (1985, 2013).

Table 1. *DETAILS OF FIFTEEN CLUSTERS FORMED ACCORDING TO HOFSTEDÉ'S SIX CULTURAL DIMENSIONS*

In the second phase, companies having websites for Turkey from different cultural clusters were chosen. Following extensive research on the internet looking for websites in ready-to-wear sector for global brands that are active in Turkey, it was determined that the examples of global ready-to-wear brand websites were limited to countries from five different clusters. Therefore; website examples from

these clusters were considered for evaluation. A jury of academicians evaluated the websites in terms of their localization level according to those web design elements including language, symbols, navigation, multimedia, layout, color, content and structure, pictures and graphics as proposed by Cyr and Trevor-Smith (2004) using KJ (Kawakita-Jiro) method, a popular method to group items according to similarity. The cultural distances were also considered while selecting the websites. Mango was from a culture closest to Turkish culture while Gap was from a very distant culture. C&A brand was from a distant culture. The proximity matrix and the dendrogram obtained with the cluster analysis proved the distances. The aim of this phase was to eliminate the companies having similar level of localization. The number of websites was decreased to three regarding the evaluation of the jury of academicians and it was decided to include the websites of C&A (low-level localization), Mango (medium-level localization) and Gap (high-level localization).

The third and the final phase consisted of the evaluation of the effectiveness of the selected websites with different localization levels with respect to web design satisfaction. Steenkamp and Geysken's (2006) satisfaction measurement items (pleasure, arousal and accessibility) were used.

Data Collection and Sampling

The Internet provides numerous advantages and opportunities to conduct survey research more efficiently. Internet-based surveys have many advantages such as low research costs, taking shorter time to collect data and reaching potential respondents in wider areas (Zhang, 1999). In this study, it was preferred to distribute the survey via internet to reach the targeted sample that is sufficiently capable of using the Internet for various purposes. Therefore the questionnaire was distributed via Facebook, e-mail and other internet platforms using snowball method of convenience sampling which is a non-probabilistic sampling method. The questionnaire was sent to friends, acquaintances, classmates, and relatives via e-mail or Facebook who distributed the questionnaire further via Facebook or e-mail, the link of the questionnaire was posted in Facebook and LinkedIn accounts. Survey monkey was used to collect the data. The questionnaire was open for access from 18th of June until 18th of August, 2014. 498 people viewed the questionnaire, however 293 completed questionnaires were obtained that are found appropriate for analysis.

The sample composed of rather highly educated people (54,9% with an undergraduate degree) most of which were from the cities Istanbul, Aydın and Izmir and knew English (89,4%) in advanced level (64,1%). Nearly three fourths was between 20-39 years of age. More than half of the sample (62,1%) was female and nearly half (45,4%) was married with children and private sector employees (45,7%) Most of the respondents have been using the internet for 9 years or more (70%) mostly with a frequency

of 1-4 hours per day (55%). Therefore, the sample is experienced with internet usage but the time they spend on the internet is rather low. The respondents stated that they were using the internet mostly for communication (90%). Shopping was indicated as a reason by more than half of the respondents (52,9%).

Data Analysis

Cluster analysis was used in the first phase of the study to categorize and find out similar country groups with respect to the country scores of Hofstede's cultural dimensions. KJ method is used in the second phase. In the third phase, reliability tests, frequency distribution and one-way Anova tests are used. To conduct all these analyses, SPSS Statistics 17.0 Software program is used.

Reliability Analyses

The reliability scores were quite high ranging from 0.88 to 0.91 for each of the three websites for the first two dimensions of satisfaction, i.e. for pleasure and arousal dimensions, and acceptable for the third dimension, i.e. accessibility dimension, with scores ranging from 0.64 to 0.77 for each of the websites. Therefore; the satisfaction measurement items adapted from Steenkamp and Geysken (2006) (pleasure, arousal and accessibility) were used in the study.

FINDINGS

Effectiveness of Websites with Different Levels of Localization Regarding Satisfaction Evaluations

The mean scores of the medium-localized website are the highest for all three dimensions of satisfaction, followed by high-localized and low-localized websites, respectively. The Anova test shows that there is a statistically significant difference in at least one of the three ready-to-wear brand websites in terms of all three dimensions of satisfaction with respect to localization levels. Therefore, H1_a, H1_b, H1_c and H₁ are supported (Table 2).

Bonferroni and Tukey tests showed significant differences between the pleasure acquired from all three websites at different localization levels (Tukey^{low-high, low-medium:} 0,000, Bf^{low-high, low-medium:} 0,000; Tukey^{high-medium:} 0,039, Bf^{high-medium:} 0,044).

In the post-hoc test, Tamhane was applied for arousal dimension. All websites differ significantly with respect to the arousal they create. The most significant difference is created between low-medium localized websites ($p=0,000$) followed by low-high localized ($p=0,017$) websites. But there is no significant difference between medium-high localized websites ($p=0,096$) with respect to arousal. So, low localized website is the one that creates significant difference regarding arousal.

		Mean scores s.d.	\pm F	Sig.
S1_PLEASURE	high-localized	3.4505	28,408	,000
	medium-localized	3.6451		
	low-localized	3.0563		
S1_AROUSAL	high-localized	3.0546	11,899	,000
	medium-localized	3.2355		
	low-localized	2.8328		
S1_ACCESSIBILITY	high-localized	3.5205	11,152	,000
	medium-localized	3.5614		
	low-localized	3.2611		
OVERALL SATISFACTION	high-localized	3.3417	25,327	,000
	medium-localized	3.4807		
	low-localized	3.0500		

Table 2. ANOVA FOR SATISFACTION DIMENSIONS REGARDING DIFFERENT LOCALIZATION LEVEL OF WEBSITES

In the post-hoc test, Bonferroni and Tukey tests were applied for accessibility dimension. In terms of accessibility, the most significant difference is observed between low-medium localized websites (Tuk: 0,000, Bf: 0,000) followed by low-high localized website (Tuk: 0,001, Bf: 0,001). However, no significant difference is found between medium-high localized websites (Tuk: 0,823, Bf: 1,000) with respect to accessibility. So, low localized website is the one that creates significant difference regarding accessibility.

In the post-hoc test, Bonferroni, Tukey and Tamhane tests were applied for overall satisfaction score. In terms of satisfaction, low-localized website is significantly

different from both medium-localized website and high-localized website (Tukey: 0,000, Bf: 0,000 and Tamhane: 0,000). Medium-localized and high-localized websites also differ (Tukey: 0,064, Bf: 0,074 and Tamhane: 0,070), however the significance level is lower than that of low-medium and low-high localized websites.

As a conclusion, medium-localized and high-localized websites do not have a huge difference in terms of satisfaction, whereas low-localized website is very different from both medium and high-localized websites. Hence, satisfaction score for low-localized website creates the difference.

Relationship between the Level of Localization and Cultural Distance

Closer cultures would be expected to have similar tastes, therefore when a global brand enters a market from a closer culture, not much localization should be required for successful results in that market. Lower level of localization would be sufficient, therefore it is hypothesized that:

H₂: The closer the cultural distance of the ready-to-wear brand, the lower the level of localization will be necessary.

		Cultural Distance	Localization Level of Ready-to-Wear Brand Website
Cultural Distance	Pearson Correlation	1	-,500**
	Sig. (2-tailed)		,000
	N	879	879
Localization Level of Ready-to-Wear Brand Website	Pearson Correlation	-,500**	1
	Sig. (2-tailed)	,000	
	N	879	879

** . Correlation is significant at the 0.01 level (2-tailed).

Table 3. *Partial Correlations between Localization Level and Cultural Distance*

Relationship between localization and cultural distance was tested. Meaningful rather significant relationships were found between the localization level of websites and cultural distance (Table 3). There is a negative relation between cultural distance and localization. H₂ was only partly supported. The website from very distant culture was assessed to be highly-localized which would be anticipated. The website from close culture was assessed to be medium-localized. The website from distant culture was assessed to be low-localized which would be expected to be medium-localized.

The unexpected results of this analysis could be explained as follows. The website from very distant culture (Gap) had a highly-localized website whereas the website from a close culture (Mango) had a medium localization level instead of low localization level. Their aim could be to use the advantage of having a close culture and further enhance their website by localizing more than expected. In contrary to these, the website from distant culture (C&A) had a low localization instead of a medium-localization level. This could imply that C&A does not take the virtual market in Turkey very seriously; therefore they do not have online sales. Maybe because of this, their website is evaluated as not having any localization at all.

Effectiveness of Websites with Different Cultural Distance Regarding Satisfaction Evaluations

It is assumed that a ready-to-wear brand from a closer culture would have similar tastes, therefore it would cover the expectations of consumers from a similar culture in designing websites implying for a higher satisfaction, therefore it is hypothesized that:

H₃: The closer the cultural distance of the company to the country where its website operates, the higher the effectiveness of websites.

The influence of cultural distance variables on the satisfaction dimensions was tested. First of all, Anova test was carried out individually. Significant differences existed for satisfaction evaluations (Table 4). H₃ is supported.

	Sum of Squares	Df	Mean Square	F	Sig.
Satisfaction Mean					
Between Groups	28,318	2	14,159	25,327	,000
Within Groups	489,727	876	,559		
Total	518,045	878			

Table 4. *Anova for Satisfaction dimensions*

In the post-hoc test, Bonferroni, Tukey and Tamhane tests were applied for cultural distance versus satisfaction evaluations. In terms of satisfaction, the website from distant culture is significantly different from both websites (Tukey: 0,000, Bf: 0,000 and Tamhane: 0,000). whereas the websites from very distant and close cultures do not have a huge difference (Satisfaction evaluations: Tukey: 0,064, Bf: 0,074 and Tamhane: 0,070). Hence, the website from distant culture creates the difference.

Relationship between Satisfaction and Localization with Cultural Distance as Control Variable

It is assumed that localization influences the effectiveness of websites, however cultural distance would as well have an effect on the results. Therefore, it was hypothesized that:

H₄: Localization level of websites influences the satisfaction acquired from websites regarding cultural distance.

		Satisfaction Mean	Zscore: Localization Level of Ready-to-Wear Brand Website
Satisfaction Mean	Pearson Correlation	1	,155**
	Sig. (2-tailed)		,000
	N	879	879
Zscore: Localization Level of Ready-to-Wear Brand Website	Pearson Correlation	,155**	1
	Sig. (2-tailed)	,000	
	N	879	879

** . Correlation is significant at the 0.01 level (2-tailed).

Table 5. *Partial Correlations between Satisfaction and Localization*

Relationship between satisfaction and localization was tested using cultural distance as the control variable. Weak but significant relationships were found (Table 5). There is a weak positive relation between satisfaction and localization. When cultural distance is added as a control variable, the relationship is again weak and positive; however, the correlation increases from 0,155 to 0,222 (Table 6). This means that when the cultural distance is less (closer distance), the influence of localization level on satisfaction evaluations increases. It can be confirmed that the localization level of websites influences the satisfaction acquired from websites regarding cultural distance. Therefore, H₄ is supported.

Control Variables			Satisfaction Mean	Localization Level of Ready-to-Wear Brand Website
Cultural Distance	Satisfaction Mean	Correlation	1,000	,222
		Significance (2-tailed)	.	,000
		df	0	876
Localization Level of Ready-to-Wear Brand Website		Correlation	,222	1,000
		Significance (2-tailed)	,000	.
		df	876	0

Table 6. *Partial Correlations between Satisfaction and Localization with Cultural Distance as the Control Variable*

CONCLUSION AND RECOMMENDATIONS

Despite the fact that recently the world has become a global village, localization still keeps its importance when it comes to creating websites. It is important to have an effective localization, in order to have an effective website.

The websites of those global brands that operate in Turkey according to localization level (high – medium – low) were analyzed in terms of satisfaction to depict whether localization creates any difference in the satisfaction the consumers get from the website. The study was designed to evaluate the effectiveness of the selected websites with different localization levels with respect to web design satisfaction taking into consideration the cultural distances as control variable. The assumption that localization level would affect the satisfaction evaluations of ready-to-wear websites was supported in all dimensions of satisfaction. It seems the low-localized (C&A) website creates the difference for satisfaction evaluations. The medium-localized (Mango) website has the highest mean scores for satisfaction evaluations.

The differences between satisfaction evaluations for websites with different localization levels were depicted clearly in the dimensions of satisfaction. The differences in pleasure acquired from the websites existed not only between the low-localized website and the others but among each website, which has strong implications that localization level has a significant effect for the pleasure acquired from websites. In terms of arousal and accessibility, significant differences existed between all three websites; however it was interesting to find results supporting even more significant differences between the low-localized and medium-localized websites. It might be concluded that localization level creates differences in the satisfaction evaluations in the websites from ready-to-wear sector, however further examples need to be evaluated to explain and strengthen this assumption.

Furthermore the effect of cultural distance was considered. Countries from different clusters were considered being more distant to each other therefore requiring more localization to have higher satisfaction levels. The selected websites were classified as close, distant and very distant taking into consideration the gap between cultures of the brands. It was expected that the brand from a closer culture would not be required to realize a high level of localization to be successful in satisfaction evaluations. However the brand from the closest culture (i.e. Mango) had a medium level of localization instead of a low level as expected. The brand from very distant culture (i.e. Gap) had the highest level of localization, which was expected. The brand from distant culture (i.e. C&A) had the lowest level of localization while it was expected that it would require at least a medium level of localization to have better results. The results implied that the website from a closer culture would have the highest results even with a medium level of localization which showed the influence of cultural

distance as well. The website from the very distant culture also had high results as they did a high level of localization, however, the results stayed as second best level due to the huge cultural gap. The website from the distant culture had the lowest results with the lowest level of localization, which implies that the amount of localization created the effectiveness of website which was measured through satisfaction evaluations.

Only those companies that think global but act local in the necessary parts of their strategies will become the companies of the future. It is important to know what changes are necessary to create a website that would suit the website for each culture. A company's website is basically the image of itself; therefore, presenting a poorly constructed website would not only hurt profits but also ruin the image of a company for years to come. Hence, international and global companies should keep this fact in mind while creating their websites.

One of the most important contributions of this study is to take into consideration all six dimensions of Hofstede while evaluating the localization level of websites. The evaluations of localization in the literature mostly included content analyses of websites from different countries and different sectors (Han and Shavitt, 1994; Cutler et al., 1997; Yalcin et al., 2011; Tigre Moula et al., 2015; Mele et al., 2016). Yeygel Çakır and Temel Eğinli (2010) analyzed the localization level of websites operating in Turkey from different sectors using the existing framework of Singh et al. (2005:144-146) and emphasized that cultural differences are important for the design of websites. However, the websites they considered were randomly selected from various sectors. Different design elements could be more important for different sectors. This issue may make it harder to compare localization levels of these websites. The contribution of this study is to focus on only one sector, therefore eliminate the influence of product and sectoral differences and make the effect of localization level to be observed more clearly.

The effectiveness of localization is measured via satisfaction evaluations in this study trying to come to a conclusion how the effectiveness could be created. It was important to find out the cultural distance has some effect; however, it was also clear that the level of localization is a powerful tool to reach out to the consumers in the most appropriate way.

It would be interesting to apply this study using an experimental design through creating non-existing brands. This would provide a more objective evaluation possibility, as the consumers would not have any subjectivity created by familiarity to a certain brand. The best features of different ready-to-wear brands could be taken into consideration to create a high-localized website and tested in different countries analyzing the eyeballs of consumers while evaluating the websites for online shopping in a

laboratory environment. This would offer the chance to compare and contrast results for different markets in different countries.

The ready-to-wear sector was considered for analyses, as this sector was one of the most quickly expanding sectors for online commerce. Different sectors might be considered in future studies and comparisons could be made for different sectors as well. The level of localization and cultural distance relation might be affected by the fact that one of the websites (C&A) did not have online sales while the other two websites did. Therefore, in future studies examples with online sales could be selected to test further results.

The respondents in this study were mostly highly-educated and knew at least one foreign language. This would mean they are also familiar with different cultures. This fact could have an influence in the results. The study could be applied to respondents from different backgrounds to compare and contrast the results. The respondents stated that they are experienced internet users most of which have shopped online at least once. It was not in the questionnaire, however whether they have shopped from the websites in the analysis or whether they were familiar with the tested brands. It would be interesting to analyze the results of the questionnaire if the questionnaire was applied to the consumers of the website after they have shopped online in that website. A mixture of methods was used in this study including cluster analysis, KJ method and Anova tests. It would be interesting to analyze using qualitative methods analyzing the same websites with experts in a longer time span in more detail and reaching results.

ABSTRACT

This paper provides vital insights into the challenges facing youth in terms of employment opportunities in India (Mitra and Verick, 2013). The main objective of this paper is to encourage discussion and further research for the promotion of decent work with respect to youth employment in Asia and the Pacific.

According to ILO's Global Trends Report 2012 on Youth, almost 75 million young people are unemployed across the globe, which represents an increase of more than 4 million since 2007 (ILO, 2012). These challenges are noticeable in India, which has the largest youth population in the world with around 66 per cent of the total population under the age of 35 (United Nations, 2003). In this environment, much is often said about a 'demographic dividend' (Ghosh et al.2010). However, not being able to provide right match of employment opportunities for this lot of young people as they penetrate the labour market risks a 'demographic disaster' (Verick, 2009).

With this regard, governments are precisely concerned about increasing levels of youth unemployment and underemployment because of not only the direct economic costs, but also due to the social impact of joblessness as manifested by increased mental health problems ,violence, drug taking and other social outcomes (Bell and Blanchflower, 2009).

Against these conditions, this paper addresses the nature of employment profile of youth in India with focus on the suggestions for challenges with respect to youth unemployment in India. The research methodology used is qualitative with major focus on secondary data.

Keywords: *Youth, Employment, Unemployment, Underemployment, Social impact, Challenges, Demographic Dividend, Demographic disaster, Population, India.*

INTRODUCTION

The youth population in any country is dynamic and vital for its long run development. The hidden power and demographic shift of the Indian youth population can improve our economy. In 2014, the

Government of India devised a National Youth Policy covering eleven priority areas—Education, Employment and Skill Development, Entrepreneurship, Health and Healthy Lifestyle, Sports, Promotion of Social Values, Community Engagement, Participation in Politics and Governance, Youth Engagement, Inclusion, and Social Justice—which provides youth a strong road map for realizing the projected goals throughout the consecutive 5 years with an appropriate framework. National Youth Policy (2014) aims to empower Indian youth to utilize their full potential. In accordance to this policy, youth in the age group, 15–29 years includes 27.5 per cent of the population. This important section of population can increase its labour participation and productivity for betterment of the economy. It is predicted to contribute about 34 per cent of the Gross National Income (National Youth Policy 2014).

The Census of India (2011) has unconfined a number of indicators on youth including other age groups, literacy, work status, total population and age wise population. Some vital socioeconomic and demographic indicators are to be released by the Census, which will facilitate researchers and academicians to explore youth development in detail for designing national plans and policies. Over consecutive five to six years the average age in China and the US would be 37, Western Europe—45, and in Japan it would be 48. In this scenario of demographic profile, India's average age would reflect a young 29 years. This demographic dividend could even facilitate the GDP of the country add two per cent each year.

Moreover, a considerable total (25 %) of the worldwide increase of the working age population of 15-64 years until 2040 is estimated to be witnessed in India. At present, more than half of India's population is under the age of 25, with 66 percent of the population under 35.

However it's vital to grasp that there will not be any dividend without investment, either in cash or kind. So time has come to think "What India has invested in youth? It doesn't follow that simply because India has large lot of young population there will be an automatic dividend. There is already so much unemployment; the young become a part of illegal activities as they cannot get jobs. They will become more violent. The main objective of this paper is to stimulate discussion and further research with reference to a crucial question "Whether greater percentage of young population in India would lead to encashing on demographic dividend or prove to be a demographic disaster?"

Against these conditions, this paper addresses the nature of development and employment profile of youth in India with focus on the suggestions for challenges with relevance to youth unemployment in India. The research methodology used is qualitative with major focus on secondary data.

BACKGROUND OF THE STUDY

Global Scenario with respect to youth employment

Worldwide, the ILO predicts that the amount of jobless youth is on the increase once more since 2011, after declining somewhat from the peak it reached at the height of the worldwide monetary crisis. It is predicted to reach 73.4 million young people by 2013 (International Labor Organization 2012). The worldwide youth unemployment rate has also been increasing since 2011; it is currently predicted at 12.6 percent and is projected to rise to 12.8 percent by 2018. In contrast, the worldwide adult unemployment rate, while also increasing slightly, is much lower at 4.6 percent in 2013 (ILO 2012). Whereas we attempt to take a worldwide viewpoint on youth employment challenges, our focus in this paper is on the developing country India. This is the country where the great majority of youth in the globe currently reside and where youth employment challenges are presumably to be related with the demographic challenges posed by growing youth populations in upcoming decades.

Indian scenario with respect to youth employment

India has one of the highest adolescent (253 million) and youth populations in the globe. The Census of India (2011) has highlighted the profile and status of the adolescent and youth population, which comprises a vital segment of the total population of India. Socio-political, economic and demographic developments rely on them. The transition from education and training to economic activity marks a crucial phase in the lives of youth, who are the operative workforce of the country. The high level of unemployment among youth due to lack of skills and poverty is a long term challenge for India.

In 2010, it was projected that the population of the world was 6.91 billion and that adolescent population (10–19 years) constituted 1.19 billion and youth (15–24 years) 1.22 billion, which together accounted for 26.3 per cent of the total population of the world (World Population Prospects: the 2012 Revision, June 2013). In India, the adolescent population is 253 million and the youth population is 231.9 million, which comprise 20.9 per cent and 19.2 per cent of the total population respectively and both adolescent and youth population comprise 40.1 per cent of the total population of India (Census of India 2011). The youth population of India is so large that it is equivalent to the total population of eighteen countries in western Asia in line with United Nations estimates (World Population Prospects: The 2012 Revision 2013).

Youth is defined as those persons in the age group 15–24 years by the United Nations, though the age range for youth may vary in different countries due to different environments and needs of youth. During this transitional phase, physical, educational, psychological, social and economic changes occur in their lives. The India National Youth Policy (NYP) covers all youth in the age group 13–35 years, which is divided into two groups, that is, 13–19 years and 20–35 years (National Youth Policy 2003). The recent National Youth Policy has defined youth as those in the age group 15–29 years, who

comprise 27.5 per cent of the population. Youth is a more dynamic segment than a fixed age-group. 'Youth' is commonly indicated as a person between the age where she/he departs from compulsory education, and the age at which she/he finds her/his first employment (National Youth Policy 2014) and this paper will consider this definition to define youth.

Every year, the Government of India assigned Rs. 2710/-per youth per annum for development in terms of employment, appropriate education, skill development and awareness about health (Union Budget, 2011–2012). State governments, institutions, other stakeholders and Non-Governmental Organizations (NGOs) additionally assisted the development of youth, towards making them a productive workforce.

Various analyses have shown how socioeconomic factors determine the youth development pattern within the Indian context. There is proof that the young (16–24 years) are particularly more prone towards the negative effects of recession, which create a spell of unemployment (Bell and Blanchflower 2010). Global recession creates a hefty volume of temporary employment among them (O'Higgins and Niall' 2012). Low literacy rate, poverty and health problems among youth are obstacles for the development of youth in India (Dreze et al. 2011).

RESEARCH METHODOLOGY

Research Objectives and Methodology

The broad objective of this research paper is to answer an important question "Whether the increasing population of youth in India will lead to be a demographic dividend or demographic disaster?" The specific objectives are:

1. To examine the nature of youth development and employment (appropriate education, skill development and awareness about health).
2. To suggest recommendations for challenges with respect to youth unemployment in India.

The research methodology used is qualitative with major focus on secondary data collected from various published and unpublished electronic and paper sources like international and national journals, government policies, reports, labor laws, acts, reforms, discussion and working papers, newspaper, etc.

FINDINGS AND DISCUSSIONS

Nature of youth employment

Current Population of India as of 2013 was 1.27 billion, according to, the world population statistics. India had a population of 1.12 billion (as per census estimates in 2010). In 1995 - the population was 0.95 billion, which is expected to reach 1.8 billion by 2050, overtaking the Chinese population.

Incidentally nearly 50% of these, are below 25 years of age, and less than 10% are above 65 (Ministry of Finance 2007-8). Consequently India has the world's second largest working class and a dynamic labour force comprising 509.3 million people, 60% of whom are employed in agriculture and related industries, 28% in services and related industries and 12% in manufacturing. These are the ones who contribute to the growing GDP and the economy prospers due to the contribution of this labour force. This concept was coined as "demographic dividend" by Rao and Verghese (2009), who believe that HRM in India can exploit the demographic dividend. Population projections also indicate that India will continue to have a larger share of working population for a sustained two to three decades, further boosting the growth of the economy (Manorama Yearbook 2008). In addition, with more people shifting from agriculture to the manufacturing and services sectors, and migration from villages to towns continuing to rise, more and more workers are expected to join the growing service sector and contribute to the growth spiral (Rao and Verghese, 2009).

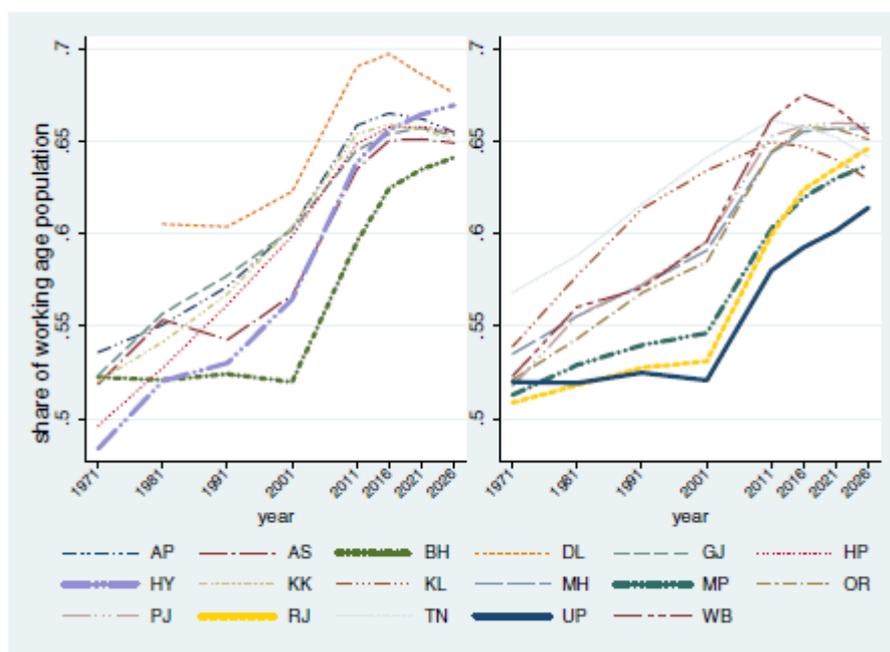

Figure 1: STATE WISE SHARE OF WORKING POPULATION IN INDIA

Source : Registrar General of India

Figure 1 shows the share of the working-age population in total population for 17 major Indian states. A few things stand out in relation to the differences in the evolution of the age structure across states. First, the share of the working-age population, varies across states. It was 64 per cent in Kerala and Tamil Nadu in 2001, and only 52 per cent in Bihar and Uttar Pradesh in 2001.

Second, over the 30-year period from 1971, to 2001, the four southern states of Andhra Pradesh, Karnataka, Kerala, and Tamil Nadu saw an increase in the share of the working age population by 6.7, 8.4, 9.5, and 7.3 percentage points, respectively. This is a reflection of the decline in the share of the dependent age groups (0–14 and 59-plus). Though not shown here, this change is accompanied by a decline in fertility rates, birth and growth rates, and an increase in life expectancy in these states. The other states that saw an increase in the share of the working-age population are Gujarat, Haryana, Himachal Pradesh, Maharashtra, Orissa, Punjab, and West Bengal. At the same time, the above mentioned states saw a smaller increase in the share of the working-age population states, which together account for 40 per cent of India's population, are projected to contribute 52.5 per cent of the increase in India's total population, and 58 per cent of the increase in India's working-age population. These four states are the slowest in their pace of transition to low birth rates and low death rates. Using data for 1971–2001, we have shown that the states with a higher growth in the share of the working-age population tend to grow faster.

In order to reap the “demographic dividend”, state policies with respect to education, public health and skill development is a matter of regional state government. Thus, regional state governments mentioned above, perform better on various indicators of infrastructure, health, education, and investment climate seem to be the ones that not only fully exploited the demographic dividend but also generated additional growth on top of it. Kochhar et al. (2006) argue that policy reforms implemented since the 1980s have given way to ‘multiple Indias’. They argue that in the post-1980s period, the performance across states has varied with state characteristics such as institutional quality, investment climate, labour laws, and product market regulations.

As further noted by Rao and Verghese (2009), there is a difference in the concept of HRD. In India there is a HRD ministry at the centre, and the state takes care of the public sector undertakings and also defines policy measures. On the other hand there are HR departments in various organisations. Their main contribution is in sourcing, training and retaining the knowledge workers for the sector. Rao and Verghese (2009) further argue that India has strict laws regarding employee protection.

Demographic dividend

There is a concept of demographic dividend which is elaborated by Rao and Verghese (2009). In many countries, demographic shift is reached after the huge segment of adolescent and youth population

joins the total population. This occurrence happens only when there is a conversion of its population from a high to a low situation for both mortality and fertility over a particular period, which is also known as the demographic window of opportunity. Demographic dividend can be accomplished when economic growth accelerates. This occurs when the working age group population, having acquired technical and vocational skills, is productive by getting involved in economic activities. The timely implementation of national policies chains the process. This significant shifting of age structure in the Indian population, can increase economic participation and cut back dependency, which will in turn support economic growth. Many demographers and economists have predicted that India will reap the demographic dividend through its operating population, that features large hidden potential and productivity (Chandrasekhar et al.2006). Literacy rate among youth increased from 36 per cent in 1962 to 86.1 per cent in 2011. There is some distinction between male literacy (90 %) and female literacy (81.8 %), and that of rural youth (83.7 %) and urban youth (91.4 %) youth according to Census, 2011. Many countries within the globe now a days are grappling with an aging population. Over the following five to six years the average age in China and the US would be 37, Western Europe –45, and in Japan it would be 48. In this scenario of demographic profile, India's average age would comprise of young 29 years. This demographic dividend could even assist the GDP of the country add two per cent each year. Moreover, a considerable total (25 %) of the world wide increase of the working age population of 15-64 years till 2040 is projected to occur in India.

Demographic disaster

Till date however, India's ability to reap the rewards of its large demographic advantage is uncertain. In line with a survey released on the occasion of World Men's Health Week, lifestyle diseases, such as diabetes and high cholesterol, are currently striking more young Indian men in metropolitan cities. In line with a large-scale government study over 40 million people from across the country screened under the Government's National Programme for Prevention and Control of Cancer, Diabetes, cardiovascular Diseases and stroke (NPCDCS) has discovered that 6.34 per cent of the population is suspected to be suffering from diabetes and over 6 per cent are hypertensive. Health being one of the factor there are other challenges like employment rights, poverty, education and training which raise the question whether the increasing youth population will lead to be demographic dividend or demographic disaster.

Challenges for youth employment

Employment rights

In a context of ever-increasing costs of living and non-existent social protection, a young worker is destined to earn for him- or herself and also to provide for dependents. In extreme anxiety, they accept any job with any conditions that are offered to them. Most of these jobs are without any rights. Sometimes they are made to work for longer hours, paid much less and can be fired from their job without any notice. As a consequence, India is faced with increasing numbers of working poor.

The other challenge that young people are confronting is insecurity at the workplace. Regular and continuous forms of employment have been replaced with non-permanent job contracts that involve a specific project or activity for a defined period of time. In this scenario, employees not only lack employment-related benefits but also the capacity to plan their own life.

Education and training

The majority of youngsters have either limited or no skills. In addition to this the present education system does not prepare them for employment as it is far from meeting market demands. The avenues of good education and training are not many and extremely costly.

Technical institutions in the private sector have been drawing undue benefits from the imbalance by exploiting youngsters and their folks. Also the flow of data on the supply of training and/or job opportunities is delayed. There is also inadequacy in the operating of employment exchange, primarily due to the insignificant attention paid to trends in market and sharing knowledge. The working of Industrial Training Institutes has also been repeatedly questioned as they have been delivering training that has no market value (Dev S. et al. 2011, 2012).

As a result, young people in India confront situation that is not rendering the desired support. The current scenario provides neither reasonably priced opportunities to acquire and/or upgrade skills nor sufficient knowledge on apt employment opportunities. In the absence of such support and any sort of social security, young people, in desperation, settle for exploitative employment conditions (World Bank, 2010).

IMPLICATIONS

Organizational implications

The BJP-led government came to power in 2014 with a directive to repair a wavering Indian economy. Though bold campaigns like 'Make in India' and 'Digital India' have been initiated, the final yardstick with which the success of these initiatives will be assessed is the level of employment they generate. And, if statistics are a signal, it's a difficult task. Consistent with experts, only 10 percent of the Indian Innovation, Entrepreneurship and Digital Ecosystems

workforce is in the organized sector; just 2.5 percent of the country's operating population has any professional training, compared to the average of 60 to 70 percent in developed countries (O' Higgins and Niall, 2010). Of the 11 million students graduating from different faculties each year, only 20 percent get jobs in line with their skill sets. And though women include 49 percent of India's population, they form solely 21 percent of the workforce.

Dichotomous situation

A dichotomous situation exists in India with respect to youth employment. On one hand, not enough people are getting jobs and on the other, there isn't enough skilled labour in the country. From perspective of the technology industry, a huge portion of the population has been excluded from employment due to lack of availability of skilled employees. Unlike in manufacturing, where a number of low-skilled jobs exist, the technology industry has completely stayed away from generating such jobs. Over a period of time, this has to change. Some organizations have started de-skilling certain functions to a precise level of automation to assist usher in more inclusive growth when it comes to employment generation and faucet the lower end of the skill-set spectrum. India is usually seen as a labour surplus economy with a majority of workers having restricted or negligible marketable skills. Furthermore, on investigating the situation more closely one finds that India has a asymmetrical skills stock. On one hand, a huge section of the workforce are not able to get even minimum wages, as made compulsory by the government; on the other hand, there are a few people with marketable skills who are able to demand higher rewards. Recently, there has been inflated activity in the area of acquiring and updating of skills. Young people are attending various technical institutes in large numbers. This can be seen in the information and communication technology sector, which has experienced a large influx of IT-skilled workers. Additionally it has caused issues due to the unregulated growth of technical institutions in the private sector and a lack of guidance for youth in selecting career paths. As a consequence, an imbalance within the Indian labour market has created a surplus in some skills and shortages in others.

Education, training and development

With reference to skills front, in India, as in other OECD [Organisation for Economic Cooperation and Development] countries, the lack of essential skills among the youth and the resultant lack of employability is an outcome of the education system. From organization's point of view, they are trying to see how they can interact more with the universities and devise training programmes for students, so that the essential skills can be imparted at an early stage, as opposed to industries running an expensive training programme at the customer's expense at the later stage.

The corporate is in the process of hiring. But if employment in the formal sector is considered, it is only 10 percent of the total working population of the country. In case of professional training, only

2.5 percent of the people in the country are vocationally trained. In any other developed country, 60 to 70 percent of the working population has received professional training. The common section of the Indian population which can be counted as being the poorest of poor, from the backward classes and with low levels of attainment, is around 306 million people. So, the problem is less to do with whether a company is hiring or not. There is a larger responsibility on India as a nation to ensure that the under-utilized potential across the country gets tapped. If immediate action is not taken in this direction reaping benefits out of demographic dividend would be difficult. Corporations can play a vital role in the process of creating employment, but it is largely a function of the way in which the economy is progressing and generating youth who are ready with required skills to get employed in India.

Societal implications

Poverty and health

Poverty index is a predominant indicator for youth development in India, which may be considered the first pillar of youth development. In every context, the poverty index clearly shows that the lower the economic condition of the household, the more disadvantaged the youth. Poverty definitely leaves its mark on youth development in India along with the negative impact on their health and nourishment affecting the productivity of the youth (Dreze et al.2011).

Women – security and social restrictions

The opening up of the Indian economy has created increased employment opportunities for female workers, particularly in technology, retail, travel and tourism. Their full engagement, however, remains constrained due to problems of personal security, biased attitudes of co-workers and social traditions and customs (Hudson,2005; Druskat & Wheeler 2003). Various studies have indicated marriage and child and elderly care as major causes of women workers withdrawing from the labour market.

Social Nuisance

With regards to social nuisance, governments are precisely concerned about increasing levels of youth unemployment and underemployment because of not only the direct economic costs, but also due to the social impact of joblessness as manifested by increased physical and mental health problems ,violence, drug taking and other social outcomes (Bell and Blanchflower, 2009; Urdal and Henrik,2006).

CONCLUSION

Despite its demographic dividend and increased literacy levels, India faces youth unemployment as a significant challenge for labour market policy. Young job seekers comprise 49 per cent of the total unemployed in India. With only 10 per cent of the accessible work provided by the formal sector, a significant number of well-educated youth in India are either unemployed, underemployed, seeking employment or between jobs, or addressing insecure work arrangements.

India's main challenge concerning youth unemployment is the lack of any form of social security system, as well as proper and adequate avenues for professional training. In an context of vast opportunities for economic growth, India requires more national as well as international cooperation among different labour market actors (trade unions, vocational training organisations, committees at the national level) to sustain it (Visara,1998). India should have a one-point agenda that is to educate the new generation and improve school curriculum.

The country is so focused on IIMs and IITs that it has no time for the concentration on basic school education. Financial aids have to be put into basic and further education, poverty eradication and health related initiatives.

In the Indian context, major emphasis has been placed on skills development. In this regard, the National Skills Development Policy (2009) sets a target of training 500 million skilled individuals by 2022, which will be reached by expanding public institutions in rural areas; using innovative delivery models; using skill development centres in rural areas to provide training information, guidance and delivery; involving panchayats and local government in skill delivery; improving entrance to apprenticeships and raising female participation in training (Ministry of Labour and Employment 2009). Moreover, the role of the Industrial Training Institutions (ITIs) is important in delivering technical skills to the youth and helping them access better sources of livelihood. Also, a quality education can counteract the social factors that hinder women's labour market participation.

"Besides education, health is key to nation-building" Dr. Terrence Hermon from Mumbai who spoke to The American Bazaar, said. The success mantra of transforming the demographic dividend into an economic growth lies not just in having more people, but generating large numbers of better trained, healthier and more productive people. India must connect the advantage of its youth to fulfill its economic potential, and in turn must generate growth in order to continue to support its growing population. India must act fast on health, education and unemployment to do so. Overall, the challenge is both in terms of job creation and the preparation of young people for the labour market to guarantee that India's demographic dividend does not become the often quoted 'demographic disaster'.

COMPANIES WITHOUT EQUITY: CONSIDERATIONS FROM ITALIAN RECENT EXPERIENCES

Napoli, Giuseppe; Migliaccio, Guido*

Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

ABSTRACT

To overcome the economic crisis and boost employment for young people, Italy has disclosed a new type of limited company, characterized by facilities administrative provisions and especially from a paltry initial capital (only 1 euro). The paper describes this innovative legislation, emphasizing the goals and above all the risk of funding activities undocumented economic risk capital. After about four years after the introduction of these companies set up by young entrepreneurs, we evaluate the results, considering the number of companies and sectors where they operate. Statistical quantitative analysis has solicited many reflections on functions of equity and the effective possibility that productive activities free from internal sources made by shareholders can still be economically and financially stable, which is a necessary condition for their durability.

Keywords: *Private Equity; Venture Capital; Society Without Equity; Financial Requirements.*

INTRODUCTORY PROPOSITIONS

A strong tradition of Italian and international economic literature considers that any business should be based on a reasonable, although not exclusively, owners' equity.

The size of this contribution of the entrepreneur is discussed and should be such that it does not affect the ordinary account making it complex to burdens and deadlines that characterize the external sources of finance.

The need for a startup capital represents, however, a barrier to entrepreneurship of young people who, of course, may not have sufficient means to ensure permanent financial autonomy at nasciture initiatives.

*The paper is the result of a collaborative work. However it is possible to attribute to Giuseppe Napoli: legislative profiles, initial discussions, assumption of data, their description and further discussions. The other sections are of Guido Migliaccio.

The economic crisis of the past few years has prompted the Italian Government to experiment with alternative social forms characterised by a considerable simplification in the Constitution and ordinary operations and above all by the absence of initial capital.

In doing so, you will want to boost the economy by encouraging the initiatives of young entrepreneurs.

The norm, however, has puzzled scholars and practitioners and therefore scientific research has a duty to evaluate its effectiveness, evaluating the results after a few years of existence.

AIMS AND STRUCTURE OF THE PAPER

This paper wants to answer some questions:

- A reasonable size of the initial capital is a necessary condition for the harmonious development of a business?
- What are the essential functions of venture capital?
- What are the correct quantitative and qualitative relationships between internal and external sources?
- The Italian rules which have spread simplified companies without venture capital have had the desired effect?
- How many companies have been set up with such innovative regulations, and, in a few years, what are the results obtained?
- In what circumstances a company with no equity are still unable to reach an adequate economic and financial balance?

Therefore this contribution would analyze the effects of the Italian rules on domestic production dynamics as a result of the promulgation of legal corpus enabling the commencement of companies substantially without share capital. In Particular, the objectives of this paper are:

- . see if one can actually run a company in the long run despite being constituted without capital;
- evaluate the success of an initiative aimed at the development of entrepreneurial logic among young people;
- identify productive sectors more suited to the spread of companies like that.

In the beginning part, the paper discusses Italian literature review, and some references about the most widespread international doctrine.

Subsequently, it describes, even briefly, the classic functions attributed to risk capital, a factor of production in a residual position.

So, the innovations of the law passed by Monti in particular Italia. In government, listing the major simplifications, one focusing on the minimum limit of only 1 euro which has essentially eliminated the requirement of an initial equity capital.

Following are some quantitative evidence on companies formed thanks to this rule a few years after its promulgation, in other words you want to evaluate the actual boost to productivity growth of such small companies. In conclusion we formulate some considerations and proposals outlining possible future research developments.

RESEARCH APPROACH

Recently were released some data relating to small limited liability company, without equity, constituted on the basis of a rule intended by the Italian government to Mario Monti.

Objectives of the paper will be achieved with some theoretical considerations based on those data that are still processed and linked to the finding of other statistical sources.

The paper, therefore, does not present the results of a specific quantitative survey. It, plays, enriching the effects on the national economy of a law aimed at the development of the economy. It has an interdisciplinary fair because it originates from the combination of general economic, managerial, juridical, ethical etc. aspects.

The proposed considerations are based, of course, also on the established tradition of the best scientific doctrine, especially Italian.

INTERNATIONAL LITERATURE REVIEW (NOTES)

The wide international literature refers importance of leverage that relates the size of their capital and the scale of investment and, consequently, the volume of third party sources. So already in the contribution of Miller (1991) and then, in those of Chaplinsky and Niehaus (1993), Wei et al. (1998), Johnson (2003), M.L. Lemmon et al. (2008), Korteweg (2010), and Denis McKeon (2012), etc. In each written text, the central role of leverage in different situations investigated is underlined, it is often supported by the necessary quantitative surveys. Besides, is necessary the study of the contributions that analyse the capital structure and its balance (Hodder and Senbet, 1990; Berens and Cuny, 1995; Myers, 2001; Rauh and Sufi, 2010), also considering its connections with the strategy (Barton and Gordon, 1988), the influence of costs (Bagwell and Zechner, 1993), the countervailing incentives (Spiegel and Spulber, 1997), the market timing (Baker and Wurgler, 2002), the stock returns (Welch, 2004), the credit ratings (Kisgen, 2006), the costly enforcement (Hvide and Leite, 2008), etc.

Although the considerations for the capital functions are numerous, there aren't specialized studies about companies in corporate form that can be set up without venture capital, because the existing laws often order an initial minimal equipment. Therefore it is important to investigate the Italian situations that is being tested after the inclusion of the rules.

ITALIAN LITERATURE REVIEW

It is very difficult to propose a comprehensive literature review in a few pages. The theme is interdisciplinary and can be approached in different perspectives.

As part of the vast Italian bibliography, almost all volumes of business administration, after outlining the main features of your capital and credit, reiterate the impossibility of setting optimal unique relationships between the different sources of funding. Merely to cite publications from the second half of the last century, it is definitely necessary to read Onida (1985) and his previous essay of 1951 dedicated exclusively to the optimal size of the business capital.

The monograph which has better focused the issue, being exclusively related to the relations between capital and credit in corporate financing, it is definitely written by Capaldo 1967.

Followed, in subsequent decades, reflections adapting previous insights to changing economy: Tagi (1991), Capodaglio (2005), Pavesi (2011), Patané (2012), Gervasoni and Sattin (2015).

Interesting considerations are also contained in the publications that relate to the financial needs of all characteristic businesses and most widespread in the credit sector strategies: Bonora Grassilli and Mondini (1989); Omarini (1993); Tagi (2000).

In the new millennium, however, the best Italian doctrine was focused primarily on financial market dynamics where to raise funds. With specific reference to private equity and venture capital, in addition to more diffuse manual corporate finance, see: Corigliano (Ed) (2001); Modena (2003); Blandini (2005); Kotler et al. (2007); Miglietta and Schiesari (2012); Cataldo (2014).

Interesting considerations also characterize monographs relating to some specific sectors such as banks (Flower, 1983; Remains and Maccarinelli, 1993) where venture capital has had, especially in the past, a relatively small size compared to the volumes traded funds, generating even recent insistence of pearl control authorities recapitalization of banks for maximum protection of depositors.

Italians have also significant studies related to small medium-sized businesses that characterize the Italian productive system and who often complain of difficulties their financial equilibrium. Among others: Ferri (2002); Rija (2006); Thistles and Ughetto (Eds) (2013).

Although for different reasons, many authors reaffirm the necessary functions on equity for the benefit of the durability of the companies that are to be briefly summarized before introducing the specific object of this paper.

THE TRADITIONAL FUNCTIONS OF EQUITY

The typical production process of each company is developed through constant relations with the outside world: it is therefore often claimed that the property assets was primarily necessary to protect third party creditors (Migliaccio, 1994). Recently the obvious observation that often the balance sheet entities is still insufficiently induced to introduce new and alternative subjects of other studies.

The capital functions that affect all management options vary according to different technical and legal categories of companies, the presence of any operational constraints, and possible problems or sectoral specializations established by the directions.

The first obvious feature, typical of all companies, would be to finance the initial start-up (pay structures and advertising launch campaigns), as well as the overcoming of barriers to entry.

In normal operations, then, equity capital plays an economic and financial functions that are reflected in the company policy. From an economic viewpoint, in fact, the capital could face possible losses if the financial reserves of the net profits were low wage earners. Moreover by comparing the magnitude of the net to the overall financing needs for and the impact of external financing charges it occurs that the lowest ratio between equity and debt does not necessarily mean a modest or marginal contribution to economic dynamics.

At the same time, compared to the financial dynamics, capital constitutes a supply immobilized with no time limit, for an ideal cover of the constant needs of fixed assets and other investments stagnated or very fluid.

Similarly, in the processes and retrieval of liquidity can provide a very useful contribution because it does not originate from cash requirements, rather typical of frequent debt maturities, and especially not involve procurement costs, and then further out, creating the premise for useful growing and net positive cash flows and growing, resulting in further developments of business. La considerable amount of equity capital, available shortly, stabilizes then the dynamics of the treasury is often conditioned by the needs of customers are not always easily predictable.

More benefits on the economic-financial may result from the release of resources from the constraint of the legal reserve subsequent to risk capital increases, with expansionary effects of loans especially long-term.

The increased availability of capital without repayment constraints also enables strategic investments linked to technological innovation and the diversification of services, otherwise much more expensive.

We must consider, in conclusion, that the new credit supervision rules favoring lending to needy companies characterized, however, by appropriate asset correlations, despite the inability to establish universally valid good terms.⁷

LEGISLATIVE PROFILES

Article. 3 of Decree Law 1/2012, the so-called liberalization decree introduced in the Civil Code art. 2463 bis entitled "Simplified Limited Company" - SRLS.

In our system we have introduced a new type of joint-stock companies, simplified especially in the deployment phase, the exclusion of members, in the transfer of investments and the dissolution.

When the first drafted the rule is that the company is on contract, or unilateral act drawn up in the form of private agreement, and with the adoption of a standard typed statute. They can be of members, only natural persons, who have not attained the age of thirty five years of age at the date of incorporation.

The minimum share capital is fully paid in cash in hand at the time of the constitution, it must be at least equal to a euro but less than € 10,000.

The registration of companies is practically without expenses.

The completion of 35 years of age of a member is a reason for exclusion with the right to reimbursement of the proportional participation of the equity. Company shares can be transferred by private deed to be filed with the Register of Companies.

The SRLS melts, as well as for other reasons provided by the corporation, for the completion of 35 years of age of all members if the Assembly does not act the transformation.

This rule (art. 2463 bis), already amended by Law 27/2012 Conversion of Decree 1/2012, little more than a year of enactment, was still subject to substantial amendments work of D.L. 76/2013 converted with amendments by Law 99/2013.

In particular, with this last intervention, the legislature states that the articles of association must be drawn up by a public act in accordance with a standard model, has eliminated the limit master of 35 years for members and has provided the ability to appoint directors who need not be shareholders. These innovations have created problems of coordination with the standard model statute adopted on the basis of previous legislation and is now in reset.

INITIAL DISCUSSIONS

The stated objective of the standard is to promote the launch of new business initiatives by young people. In fact, the law affects especially in the company formation stage, but not on the next management. The constitution is made easier especially for times and costs: adoption of the standard model of association without legal fees and subsequent registration in the Register of Companies with almost no cost .

In fact it is difficult to completely eliminate any constituent burden, as the norm would like, as it is always appropriate assistance from a company law expert to prevent subsequent disputes between

members of specialist expertise to assess the feasibility of administrative, technical, economic and financial initiative, not least in terms of a balance between funding sources and applications. These are precisely the evaluations, which are essential during the start-up of an economic activity, however, to be more expensive in terms of cost and time. In this respect, therefore, the standard is also morally harmful to the educational and business plan as it tends to strengthen the false idea that in young people is an economic initiative without financial resources can be started.

The most obvious innovation, in fact, is the reduction of the minimum share capital for a euro that would require operating income results always positive for the durability of the initiative. Otherwise, and in the absence of equity release, you should proceed with the liquidation of the company.

In the event of loss, in fact, and in the absence of reserves set aside in capital protection, although with the formula accelerated with and without the adoption of a special shareholders' resolution of coverage, the company is dissolved. In practice, in the presence of leaks albeit meager, members to prevent the dissolution of society are forced to make their new financial resources but with simplified procedures to those of ordinary SRL.

So, in the absence of profits, a situation most likely in the early years of operation, also for the lack of proper planning and verification of the feasibility of the initiative, members would find to make after the Constitution that do not have the financial means made on incorporation.

For small business could be useful the alternative of a sole proprietorship: it too can start on one day and "free of charge".

The SSRL would only benefit of limiting the liability of members. This advantage, however, is only fictitious as the company, in a banking system in which banks look more to the programs, will hardly be able to get credit lines being precisely without history and without capital; while suppliers, for the same reasons will demand payment in cash.

ASSUMPTION OF DATA, THEIR DESCRIPTION AND FURTHER DISCUSSIONS

AFTER FOUR YEARS OF VALIDITY OF THE LAW, HOWEVER, THE RESULTS IN TERMS OF COMPANIES INCORPORATED SEEM POSITIVE (GALIMBERTI, 2016): IN FACT, DESPITE NUMEROUS LEGISLATIVE CHANGES THE TREND OF REGISTERED SSRL IS GROWING (TABLE 1).

	2012	2013	2014
N. SSRL	3.472	16.000	28.000

Source: Galimberti, 2016.

At 30th of september 2015 the SRLS are around 5,4 % of the universal (Bauco, C. et al., 2016).

The dizzying growth of this type of company has partially offset the negative balance of enterprises in the period 2011/2015 and allowed to approach the business world especially for the young of south Central, mainly in the activities of construction, trade and catering and hospitality services, as is explained later.

Table 2 demonstrates the national distribution of SRLS: the 49,35% are located in the regions of the South Centre (Lazio, Campania, Puglia and Sicily).

Dettaglio territoriale srls	Iscritte in V.A.	Iscritte in %	Popolazione residente in V.A. al 01/01/2015

There is direct correlation between SRLS registered and resident population: the decrease of one diminishes the other, with the exception of the regions Lazio, Lombardia, Emilia Romagna, Veneto and particularly Piemonte. In Lazio has about 20% of company to receive a portion of approximately 10% to the population. Lombardy, however, has an inverse relationship: in a population of about 16% corresponds to a percentage of 10% SRLS. Even for the other regions mentioned the relationship is inverse. Other abnormal finding is in Campania which, together with Lazio, has a percentage of SRLS recorded higher than the percentage of the population. These two regions have used the new type of company in considerably greater extent than the other: have the 19,34% of the population with 33,18% of the registered companies.

It is interesting to understand why these two regions account for a third of SRLS, maybe even considering the local unemployment: some answers you might get in the first analysis of Table 3.

Table 3: Distribuzione territoriale SRLS al 30/09/2015 in relazione al numero di persone in cerca di occupazione di 15 anni e oltre

Dettaglio territoriale srls	Iscritte in V.A.	Iscritte in %	Persone in cerca di occupazione al IV trim 2015 V.A.

It can observe a direct relationship between SRLS registered people looking for employment, and over 15 years: the first magnitude decreases with decreasing the second. unaligned data are those of Lazio and Piedmont. Lazio, the fifth for persons seeking employment, has the highest number of SRLS; conversely Piedmont sixth for people looking for employment, it is only twelfth for SRLS members. To be investigated in the future, the motividell'anomalia.

Table 4 relates the territorial distribution of SRLS the unemployment rate.

Dettaglio territoriale srls	Iscritte in V.A.	Popolazione residente in V.A. al 01/01/2015	Iscritte per ogni mille abitanti
Lazio	15.861	5.892.425	2,7
Campania	10.661	5.861.529	1,8
Lombardia	8.410	10.002.615	0,84

Source: Unioncamere, Istat, Our calculations.

Even between these two variables there is a direct correlation. Bocking still Lazio.

In first conclusion it is clear that the SRLS phenomenon has manifested itself mainly in the south center, closely related to unemployment, less with the resident population.

Table 5 describes the SRS economic sectors.

Totale	48.234

Source: Unioncamere, Our calculations.

It is noted that about 54% of registered and active SRS were formed in the traditional sectors (primary, secondary and tertiary): between agriculture, manufacturing and trade, excluding services, there are about 540 each SRS 1000. The traditional services, however, they account for about 35%, for a total of traditional sectors accounting for 89%. The other 11% is distributed between communication and information services (6.5%) and other services (4.5%): the SRSnon contributed to the development of innovative sectors.

Table 6 allows youth about the commitment considerations.

Source: Unioncamere, Our calculations.

About a third of SRLS registered and active are young people under the age of 35 years. From Tables 5 and 6 shows that only 60% (48,234) of SRLS iscritte (79,974) said they had started the business, while only 33% of active consists of under 35. It then highlights the ineffectiveness of the standard insertion occupazionale dei youth: it would seem that allowed the establishment of several companies but not always the their actual launch!

Among active SRLS is then necessary to quantify and assess the financial results for estimating their durability. First, the determination of the turnover (Table 7).

Classi di ricavi	V.A.
Minore o uguale a € 10.000	10.808
da € 10.000 a € 100.000	11.620
da € 100.000 a € 1.000.000	6.741
Oltre € 1.000.000	294
Totale	29.463

Source: Calculations FNC su dati Bvd.

The sample is observed approximately 61% of active SRLS. Over a third of SRLS (37%) produces revenues below 10,000 Euros, a very modest threshold in the production of goods and trade should the companies, while second a contribution margin of 50% and a non-employee designated only (the partner), may not provide a cash flow. Positive results would be close to zero, however, possible in the innovative services sector, including General professionali. In one can observe that about 76% of SRLS the sample does not exceed 100,000 Euros in revenues.

To express more reliable judgments it is necessary to evaluate the profitability outcomes (Table 8).

Table 8: Distribuzione SRLS per classi di risultato netto di esercizio	
Classi di risultato netto	V.A.
Minore o uguale a zero	13.665
da zero a € 5.000	9.740
da € 5.000 a€ 10.000	2.655
da € 10.000 a€ 100.000	3.328
da € 100.000 a€ 1.000.000	86
Totale	29.474
<i>Source: Calculations FNC su dati Bvd.</i>	

46% of the observed SRLS is at a loss. Considerations also pessimistic for SRLS with profits up to € 5,000 (about 80% of the total), with profits up to € 10,000 (about 90%): many active SRLS not seem appropriate to continue the business without recapitalize. because certainly it is alarming that seems to confirm the initial concerns.

CLOSING REMARKS, LIMITATIONS AND FUTURE RESEARCH

In the past, it was widely shared opinion that an adequate equity base was an absolute necessity. It was discussed, exclusively, of the appropriate size of such means in respect to the risk to those of credit.

The law analyzed in this paper, however, seems to refute the same need to acquire an adequate amount of equity capital, by inverting, then, what is normally asserted, in the first instance it would appear that the guarantee for the benefit of creditors generally attributed to shareholders' is now to be only attributable to economic-financial balance of the company permanently operating in the markets. In the experiment concerning SRLS it should be just one symptom of this changed relationship between lenders and business ownership, maybe extendable, *mutatis mutandis*, to other types of companies.

However, a critical judgment on the exposed standards and data should consider two different perspectives.

In a political and economic vision of the rule that frees itself from an initial endowment certainly encourages young people and their entry into production realities. It avoids, as well, to influence the choices based social extraction and thus to family resources. The rule analyzed would therefore respond to a typical social need of the Italian reality, definitely be extended to other countries. It has definitely had an "educational" function towards the younger generation, encouraging their entry where aspiring actors in the productive reality which must establish itself as a viable alternative state and, more generally welfarism. Without significant constraints, the unemployed youth are surely been led to form the role of entrepreneur in the areas at their most congenial. In that sense data are really

encouraging and should emphasize the effectiveness in the first four years of introduced by Law experimentation.

In a more typical managerial dimension, however, must be reiterated several times concerns highlighted in the presentation of results: starting a business does not automatically mean being able to produce a stable, and thus to affirm the productive body as enduring star of the production company!

Although subsidized, goodwill remains complex, especially when lacking adequate management culture. In this sense, the rule could paradoxically have a negative educational effect, inducing subjects unprepared and incompetent to formalize an organism without necessary awareness of the difficulties to establish itself in the context of globalized competitive markets. These difficulties emerge significantly from the analysis of the dimensions of the results obtained and the high corporate mortality that occurs.

These considerations are based on the statistics offered by the analyzed study (Bauco, C. et al., 2016) that should, however, be further developed, especially by analyzing a larger sample of budgets and monitoring the performance of the main indicators of the time. It will, therefore, be necessary, in the future, to continue to assess the trend of the new constitutions, but also calculate the number of companies liquidated or bankrupt by investigating their most frequent causes, and especially the operating results of these production organisms. The profitability remains, even in these cases, the first and fundamental management of economy indicator that ensures the durability of the company. Where they might emerge modest these activities could hardly persist, negating the objectives of the legislature, and transforming the apparently positive results in unfortunate outcomes for the national economy, as well as the initiators that you would find again the unemployed, further demotivated by failure.

To prevent such unfortunate outcomes that unfortunately appear likely, the state should intervene not only in the start-up company, but also witnessing the process of growth and development of new companies established for the purpose of stabilizing them, of course, hoping to meet people willing to productive lifelong learning.

To this end, at technical and economics universities should play a paramount role.

RISK MANAGEMENT AND CORPORATE GOVERNANCE MODEL OF THE ITALIAN CREDIT COOPERATIVE BANKS

Ossola, Giovanni; Giovando, Guido; Crovini, Chiara

School of Management, University of Turin, Turin, Italy

ABSTRACT

Our research is a conceptual study in which we identify and discuss the Corporate Governance structure and the Risk Governance Framework of 364 Italian credit cooperative banks in 2015.

As sound corporate governance and internal controls have become the determinant elements for the stability of every single institution and of the overall financial system, we tried to draft a Corporate Governance and Risk Management model in order to evaluate its adequacy and compliance with the laws and the new regulatory requirements, imposed by the European Central Bank and the Basel Committee and transposed into the Italian legislative context by Banca d'Italia.

This adequacy can also be reflected on the capitalisation of these banks. In fact, at the end of our paper, we briefly analyse the impact of an effective Corporate Governance system on the internal capital, as required by Basel II.

Finally, we tried to consider the interaction between Corporate Governance and Risk Governance in order to strengthen the role of a robust communication among the different boards involved.

Keywords: *credit cooperative banks, Corporate Governance, Risk management, model*

INTRODUCTION

Over the past few years the global financial crisis has brought to the collapse of numerous businesses at the international level, illustrating that no industry or jurisdiction is immune from inadequate or inappropriate Corporate Governance and risk management structure.

All businesses should have the capacity to develop policy with a full appreciation of risk and the development of a suitable set of operating procedures in order to respond to changing circumstances in a timely manner and to use an appropriate risk governance framework.

This last element has become extremely critical for every company and even more so for the banking sector. In fact, in response to this situation, since 2010 the Basel Committee has witnessed banks strengthening their overall governance practices and supervisors enhancing their processes. The Basel Committee's *Principles for enhancing corporate governance* (October 2010) represented a consistent development in the long-standing efforts to promote sound corporate governance practices for banking organisations. In general, banks have improved effective board oversight, rigorous risk management, strong internal controls, compliance and other related areas. In addition, many banks have made progress in assessing collective board skills and qualifications. In February 2013, in order to assess the progress of national authorities and the banking industry in the area of risk governance since the global financial crisis, the Financial Stability Board (FSB) issued a *Thematic review on risk governance*. In addition, the new regulatory requirements introduced in 2014 consistently modified the banking activity. The new rules introduced by the enactment of EU Regulation n. 575/2013 (CRR) and the EU Directive n. 36/2013 (CRD IV) established new capital requirements, the so-called Basel III Regulation.

National authorities have taken measures to improve regulatory and supervisory oversight of corporate and risk governance at banks. These measures include developing or strengthening existing regulation or guidance, raising supervisory expectations for the risk management function, engaging more frequently with the board and management and assessing the accuracy and usefulness of the information provided to the board. In Italy, Banca d'Italia revised regulatory documents related to Corporate Governance and Internal controls (Circolare n. 263/2006- *Nuove disposizioni di vigilanza prudenziale per le banche*- and Circolare n.285/2013- *Disposizioni di vigilanza per le banche*).

Our research fits into this framework and, in particular, we concentrated on the case of the Italian credit cooperative banks, analysing the Corporate Governance structure and the Risk Governance Framework of 364 banks in 2015. Consequently we tried to draft a model in order to evaluate its adequacy and compliance with the laws and the new regulatory requirements. This adequacy can also be reflected on the capitalisation of these banks. In fact at the end of our paper we briefly analyse the impact of an effective Corporate Governance system on the internal capital, as required by Basel II. Finally, we tried to consider the interaction between Corporate Governance and Risk Governance in order to strengthen the role of a robust communication among the different boards involved.

The remainder of this study is organized as follows. In Paragraph 1, we provide the Literature Review. In Paragraph 2 we define the specific business that we analysed and we present the Corporate Governance and the Risk Management function of the Italian BCCs. In paragraph 3 the methodology

is described. The research analysis and Discussions are presented respectively in Paragraph 4 and 5. Conclusions are in the last part of the research.

1. LITERATURE REVIEW

Many authors concentrated on the topic of Corporate governance (Brown et.al., 2009; Cantino, 2007). Corporate Governance has a determinant role in every company because the primary objective should be safeguarding stakeholders' interest in conformity with public interest on a sustainable basis. Corporate Governance determines the allocation of authority and responsibilities by which the business and affairs of a company are carried out by its board and senior management, including how they:

- set strategies and objectives;
- select and oversee personnel;
- operate the company business on a day-to-day basis;
- protect the interests of all stakeholders and meet shareholders' obligations;
- align corporate culture, corporate activities and behaviour with the expectation that the company will operate in a safe and sound manner, with integrity and in compliance with applicable laws and regulations; and
- establish control functions.

Some researchers concentrated on the quality of Corporate Governance and the concept of accountability (Van Essen et.al., 2013; Masocha and Weetman, 2005). Other studies focused on the case of SMEs. In particular, some researchers studied the functioning of their internal control system (Jiang and Li, 2010) and others focused on the role of risk management (Marcelino-Sadaba et.al., 2013; Leopulos et.al., 2007; Blanc Alquier and Tignol, 2006).

As regards the topic of credit unions and credit cooperative banks, Labie and Perilleux (2008) studied the Corporate Governance in Microfinance, while Smith et.al. (1981) discussed about the economic theory of these businesses. With reference to the Italian context, several researchers concentrated on this kind of banks, in terms of characteristics and role within the Italian banking sector (Bonfante, 2010; Agostini, 2009; Costa, 2007; Capriglione 2005; Bonfante, 2004; Vella, 2004; Appio, 1996). Zago and Dongili (2014) examined in depth the impact of the financial crisis on the Italian credit cooperative banks and the technical efficiency of the Italian BCCs for the period 2003 to 2012. They also discussed and tested different specifications and objective functions for BCCs. The importance of local small banks, such as BCCs, was emphasized in few studies. For example, Ferri and Messori (2000) stressed that close and long lasting customer relationship between small banks and firms can promote a favourable allocation of credit for economic growth. Usai and Vannini (2005) distinguished among

various types of banks while studying the finance-growth nexus in Italian regions. Good capitalisation, stable funds availability and liquidity have given BCCs the ability to provide credit even during the recent financial crisis, when they have replaced other banks suffering more from the credit crunch. In 2009, for example, loans to firms by the Italian BCCs have grown by 4%, while loans overall have decreased by 3% (Tarantola, 2011).

In 2007-2008, the financial crisis illustrated how different types of risk may interact with each other and consequently it revealed significant new problems in risk assessment and management. As a consequence, some researchers tried to locate the perimeter within which identify the financial risk and study methods for good management, in accordance with the requirements of Basel (Álvarez and Rossignolo 2015; Angelini, et al. 2011; Draghi, 2009).

Our research fits into this framework. We decided to concentrate on the Italian credit cooperative banks and study their Corporate Governance structure in 2015 after the new laws and requirements established by the European Central Bank, the Basel Committee and Banca d'Italia. We chose this business because in 2015 Credit Cooperative Banks represented more than fifty percent of total number of Italian banks and because they, as financial institutions, operated with SMEs. In fact, loans granted by the Italian BCCs represent 22.4% of total loans to small businesses, 8.5% to the Consumer households, 17.8% of family businesses, 8.6% of non-financial companies, 15.4% of total loans to non-profit institutions (Third Sector). However, these banks also covered a market share of 9.6% (84.3 billion Euros) of loans granted to large companies. By analysing the Corporate Governance and Risk Governance Framework of 364 banks, we aimed at evaluating the adequacy and compliance with the laws and the new regulatory requirements of their governance model. This adequacy can also be reflected on the capitalisation of these banks. In fact at the end of our paper we briefly analyse the impact of an effective Corporate Governance system on the adequacy of the internal capital, as required by Basel II. We also tried to consider the interaction between Corporate Governance and Risk Governance in order to strengthen the role of a robust communication among the different boards involved. As our research is a conceptual work, we wanted to study in depth the governance and the risk management mechanisms of these banks, by delineating a generalised model, in order to create a solid background that will be used in further research about Corporate Governance, performance and efficiency of credit cooperative banks.

2. CORPORATE GOVERNANCE AND RISK MANAGEMENT IN THE ITALIAN CREDIT COOPERATIVE BANKS: THEORETICAL FRAMEWORK

2.1 Credit Cooperative banks

Before analysing the Corporate Governance and the Risk Management model, it is important to give some details and definitions.

A *credit cooperative bank* is a member-owned financial cooperative, democratically controlled by its members, and it operates for the purpose of promoting thrift, providing credit at competitive rates and providing other financial services to its members.

More than fifty percent of total Italian banks are Banche di Credito Cooperativo (BCCs). They usually are small banks (according to the classification of Banca d'Italia) and their total weight on the loan market is 8%. In addition, they are particularly relevant for Small and Medium Enterprises (SMEs). In the Italian context, credit cooperative banks base their organisation and mission on mutualism and localism (Zago and Dongili, 2014). In 2015 there were 364 credit cooperative banks, 4,414 bank counters, 1,248,724 shareholders and 36,500 employees.

The main characteristics of these banks are:

- widespread ownership: as being cooperatives, BCCs have a variable share capital and consequently there is the so-called "open-door policy". This policy give the directors significant powers related to the possibility of choosing and excluding new members, obviously by motivating their reasons adequately;
- those who have accounts in the credit cooperative bank are its members and owners and they elect their board of directors in a one-person-one-vote system, regardless of their amount invested;
- link with the territory: members must live and/or operate where their bank operates;
- mutualism: BCCs' activities must be prevalently towards members because they are "not-for-profit" oriented. In fact, their purpose is to serve their members rather than to maximize profits;
- very limited profit-seeking nature: credit cooperative banks must allocate most of their annual profits to legal reserves (at least 70%) and to specific funds for the development of cooperation (at least 3%).

As mentioned above, the mission of the BCCs, defined by statute and law, is to pursue the spirit of mutual benefit, to promote value for members and social cohesion and sustainable development of the territory where their members operate.

This mission can be carried out and represented in two phases:

- *Production phase*: it consists in providing services at favourable conditions to their members, in terms of low interest rates on loans and high interest rates on deposits. It also consists in choosing an efficient management style, capable of maintaining the BCC's intertemporal sustainability and competitiveness, and in expanding the access to credit to otherwise excluded groups of clients.
- *Distribution Phase*: it consists in distributing resources to the territory and the social context in which they operate, through support and sponsorship of meritorious initiatives.

2.2 Corporate Governance Structure of BCCs

Over the past few years there have been several developments in the Corporate Governance of banks. The Basel Committee's *Principles for enhancing corporate governance* (October 2010) represented a consistent development in the long-standing efforts to promote sound corporate governance practices for banking organisations. In February 2013, in order to assess the progress of national authorities and the banking industry in the area of risk governance since the global financial crisis, the Financial Stability Board (FSB) issued a *Thematic review on risk governance*. In addition, the new regulatory requirements introduced in 2014 consistently modified the banking activity. The new rules introduced by the enactment of EU Regulation n. 575/2013 (CRR) and the EU Directive n. 36/2013 (CRD IV) established new capital requirements, the so-called Basel III Regulation. Moreover, because of these new European modifications, Banca d'Italia revised regulatory documents related to Corporate Governance and Internal controls (Circolare n. 263/2006- *Nuove disposizioni di vigilanza prudenziale per le banche*- and Circolare n.285/2013- *Disposizioni di vigilanza per le banche*). In particular, starting from 1st July 2014, banks had to adopt a new corporate governance model, reshaping the role and functions of the internal control system, emphasising their importance because sound corporate governance and internal controls have become the determinant elements for the stability of every single institution and of the overall financial system.

2.3 The Risk Management Function in the Italian Credit Cooperative Banks

The Risk Management function is part of the overall framework of the Internal Control System and it covers an independent position from the internal audit function.

The independent risk management function is a key component of the bank's second line of defence. This function is responsible for overseeing risk-taking activities across the enterprise and should have authority within the organisation to do so.

Key activities of the risk management function should include:

- identifying material individual, aggregate and emerging risks;
- assessing these risks and measuring the bank's exposure to them;
- subject to the review and approval of the board, developing and implementing the enterprise-wide risk governance framework, which includes the bank's risk culture, risk appetite and risk limits;
- ongoing monitoring of the risk-taking activities and risk exposures in line with the board-approved risk appetite, risk limits and corresponding capital or liquidity needs (i.e. capital planning);
- establishing an early warning or trigger system for breaches of the bank's risk appetite or limits;
- influencing and challenging decisions that give rise to material risk;
- reporting to senior management and the board or risk committee on all these items, including but not limited to proposing appropriate risk-mitigating actions.

While it is common for risk managers to work closely with individual business units, the risk management function should be sufficiently independent of the business units and should not be involved in revenue generation.

Such independence is essential because it has the possibility to have access to all business lines and functions that have the potential to generate material risk to the bank as well as to relevant risk-bearing subsidiaries and affiliates. Therefore the Risk Management Function has unrestricted access to corporate and external data.

2.4 The Role of the Chief Risk Officer

Italian credit cooperative banks, like large, complex and internationally active banks, have a senior manager (CRO - Chief Risk Officer) with overall responsibility for the bank's risk management function. The Chief Risk Officer is appointed, after verification of the requirements of the Supervisory Board, and revoked (giving reasons) by the Board of Directors, after consulting the Statutory Auditors (collegio sindacale). The appointment is then communicated to Banca d'Italia and to the entire staff of the Bank, with a special communication. Any termination of the mandate or of the person shall be immediately reported to Banca d'Italia, with related motivations.

The CRO has primary responsibility for overseeing the development and implementation of the bank's risk management function. The Chief Risk Officer is responsible for supporting the board of

directors in its engagement with and oversight of the development of the bank's risk appetite and RAS (Risk Appetite Statement) and for translating the risk appetite into a risk limits structure. Therefore the CRO, together with management, should be actively engaged in monitoring performance relative to risk-taking and risk limit adherence. The Chief Risk Officer should have the organisational stature, authority, independence and necessary skills to oversee the bank's risk management activities.

3. METHODOLOGY

3.1 Research design

We chose the sample of the Italian credit cooperative banks and we analysed the Corporate Governance structure and the Risk Governance Framework of 364 banks in 2015.

Afterwards we tried to draft a model in order to evaluate its adequacy and compliance with the laws and the new regulatory requirements. Thanks to our study we also tried to demonstrate that this adequacy can also be reflected on the capitalisation of these banks. Finally, in the discussion we tried to consider the interaction between Corporate Governance and Risk Governance in order to strengthen the role of a robust communication among the different boards involved.

3.2 Research question

The following two research questions are discussed for the analysis in this study:

- RQ 1: By analysing the structure of the corporate governance of BCCs, is it possible to draft a common Corporate Governance Model? Does it comply with the laws and regulations?
- RQ 2: Does the model adequacy reflect on the capitalisation of those banks?

4. RESEARCH ANALYSIS

By analysing the structure of 364 BCCs, we tried to develop a common Corporate Governance structure (Figure 1).

In line with the foregoing provisions, the model adopted outlines the main responsibilities of the corporate bodies in order to ensure the overall effectiveness and efficiency of the internal control system.

The Board of Directors is responsible for the internal control and risk management system and the definition, approval and revision of the strategic and risk management guidelines, as well as the general rules for their implementation and supervision.

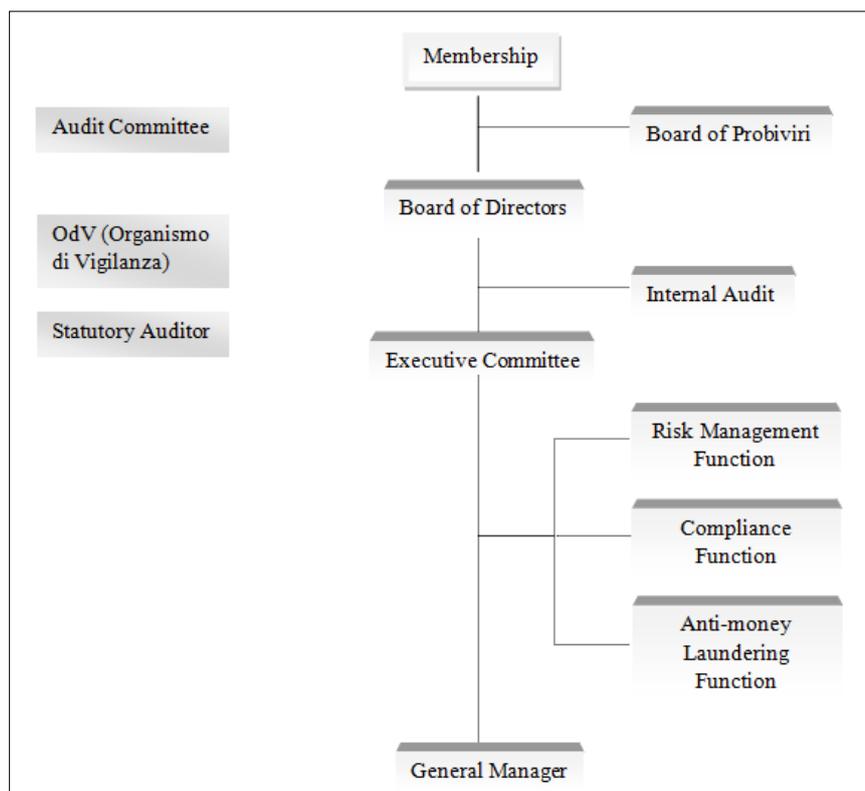

The Board of Directors designates the Executive Committee, which has an operative role in managing the bank.

The General Manager gives execution to the deliberations of the corporate bodies and they are a supervisor, assuring the right functioning of the bank and its internal procedures.

The bodies on the left of the figure (Audit Committee, Statutory Auditor and OdV) control the others. In particular, the Audit Committee is responsible for the vigilance of compliance with the law and the statute, vigilance of the respect of the correct principles of management, vigilance on the right functioning of the internal control system and on the overall organisation. In some banks, this body can carry out the statutory audit.

The Statutory Auditor is an external body, that controls that the financial statements are correct and they respect the accounting principles and policy.

The OdV (*Organismo di Vigilanza*) has to evaluate and manage an adequate internal organisation in order to avoid the bank to be criminally responsible for violations and crimes committed by employees or managers. Most of times, this body coincides with the Audit Committee.

Source: self-elaborated figure

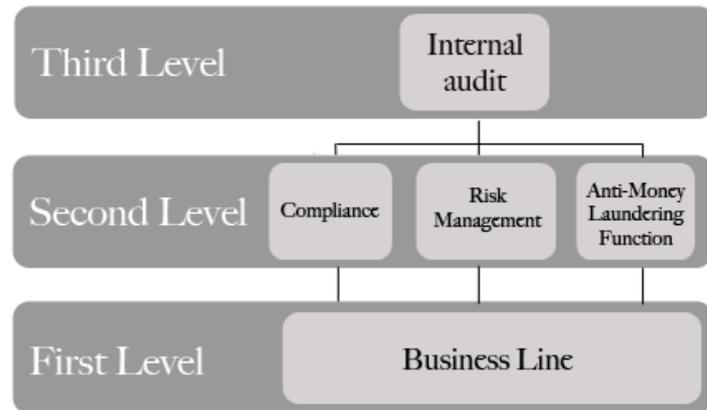

Figure 1. *The Corporate Governance structure of the Italian Credit cooperative banks*

Finally, because of the new regulatory requirements, the credit cooperative banks had to institute new bodies, in order to separate functions and guarantee the right functioning of the internal control system. These bodies are: the Internal auditor, the Risk manager, the Compliance manager and the Anti-money Laundering manager. They belong to the Risk Governance Framework. Their role is linked to the assessment, measurement and management of all the risks of a bank.

The Guidelines of the Basel Committee on Banking Supervision (Corporate Governance principles for banks - July 2015) state that *Banks should have an effective independent risk management function, under the direction of a chief risk officer (CRO), with sufficient stature, independence, resources and access to the board.* These principles also state that the risk governance framework, often referred to as the "three lines of defence", should identify the responsibilities of different parts of the organisation for addressing and managing risk.

The business line, which represents the first line of defence, has "ownership" of risk, in fact it acknowledges and manages the risk that incurs in conducting its activities. The risk management function, as explained before, is responsible for further identifying, measuring, monitoring and reporting risk on an enterprise-wide basis as part of the second line of defence, independently from the first line of defence. The compliance function monitors the compliance with laws, corporate governance rules, regulations, codes and policies to which the bank is subject. The board should approve compliance policies that are communicated to all levels. This function should assess the extent to which policies are observed and report to senior management and to the board on how the bank is managing its compliance risk. The function should also have sufficient authority, stature, independence, resources and access to the board. The other body, part of the second line of defence, is the Anti-money Laundering Function, which has the role to monitor that the bank with its activities do not break the laws against money laundering and funding of international terrorism. The internal audit function is charged with the third line of defence, conducting risk-based and general audits, by providing assurance to the board that the overall governance framework, including the risk governance framework, is effective and that policies and processes are in place and consistently applied.

Figure 2 shows the Risk Governance Framework of the Italian credit cooperative banks.

Source: self-elaborated figure

Figure 2. *The Risk Governance Framework of the Italian Credit Cooperative banks*

Consequently, by studying the structure of 364 credit cooperative banks, we can affirm that the Corporate Governance and Risk Management model is adequate and compliant with the laws and regulatory requirements. As regards RQ 2, the adequacy and compliance of the Corporate Governance and Risk Management model are reflected in the capitalisation of those banks. A proper risk assessment, measurement and management are a consequence of a sound corporate governance. Italian credit cooperative banks are well-capitalised. In fact the overall amount of equity in 2015 was on average about 20 billion Euros and their capitalization index (CET1) averaged out at 16.6% and the TCR (Total capital ratio) averaged out at 17% .

5. DISCUSSIONS

As we commented before, effective and sound corporate governance is a crucial element for the proper functioning of each bank and consequently for the financial stability as a whole. Banks have a significant role in the economy by intermediating funds from savers and depositors to activities that support enterprise and help drive the economic growth. The primary objective of corporate governance should be safeguarding stakeholders' interest in conformity with public interest on a sustainable basis. By analysing the Corporate Governance structure and the Risk Governance Framework, we can deduce that there is a strict link between them. Figure 3 helps us explain this relationship.

Source: self-elaborated figure

Figure 3. Corporate Governance and Risk Governance model in the Italian credit cooperative banks

The present model underlines the critical role of the corporate culture, which has to reinforce the responsible ethical behaviour.

Risk Governance Framework and Internal controls are inter-related. In fact, Internal controls are designed to ensure that each key risk has a policy and a specific process, which have to be controlled in order to monitor if they are well-applied and they work properly. Moreover, Internal controls assure that financial and management information is reliable, timely and complete and that the bank is in compliance with its various policies and applicable laws and regulations. Consequently, as the Basel Committee states, *An effective risk governance framework requires robust communication within the bank about risk, both across the organisation and through reporting to the board and senior management.*

By drafting the Corporate Governance and Risk management model, we could evaluate its adequacy and compliance with laws and European Regulation, but we could also evaluate this adequacy in terms of proper capitalisation of those banks.

Concluding, thanks to our study, we can highlight the importance for a financial institution, such as a credit cooperative bank, to have a proper organisation and an effective governance. Therefore it is essential, despite laws and regulations, to develop, spread and communicate the right culture at every level of the governance model because every company bases its own activity on people and their values.

6. CONCLUSION

Our research is a conceptual study in which we identify and discuss the Corporate Governance structure and the Risk Governance Framework of 364 Italian credit cooperative banks in 2015.

As sound corporate governance and internal controls have become the determinant elements for the stability of every single institution and of the overall financial system, we tried to draft a Corporate Governance and Risk Management model in order to evaluate its adequacy and compliance with the laws and the new regulatory requirements, imposed by the European Central Bank and the Basel Committee and transposed into the Italian legislative context by Banca d'Italia. This adequacy is also reflected on the capitalisation of these banks. In fact, at the end of our paper we briefly analyse the impact of an effective Corporate Governance system on the internal capital, underlining that credit cooperative banks are well-capitalised because their capital ratios are higher than those established by Basel II. Finally, we tried to consider the interaction between Corporate Governance and Risk Governance in order to strengthen the role of a robust communication among the different boards involved.

This last element can help us underline that this study represents the first step of a far deeper analysis regarding the Corporate Governance and the internal control system of the Italian credit cooperative banks. This a conceptual work that aims at creating a solid theoretical background for further studies. Therefore we have made an attempt to develop an agenda for discussing the interaction between the risk management function and other corporate boards and for the discussion on the impact of risk management on bank performance.

In the following analyses, after individuating the Corporate Governance and the Risk Management model, we would like to evaluate the impact of Corporate Governance on the overall performance and on the efficiency of these banks. Another element to evaluate is the impact of the remuneration system on the structure of Corporate Governance and on its performance. It could be interesting to monitor these items in the period between the beginning of the financial crisis and the new regulatory requirements, introduced by the European Central Bank and the Basel Committee in order to assess the progress of national authorities and the banking industry in the area of risk governance. Another future development could consist in comparing and contrasting credit cooperative banks with listed banks or groups, in order to evaluate if and how the governance affect performance and compliance with laws. Moreover, in order to move to an international level, the case of the Italian credit cooperative banks can be compared to that of the French *Crédit Agricole* or the credit union in Germany, USA, Canada and Netherlands.

PROFITABILITY OF THE ITALIAN CREDIT COOPERATIVE BANKS

Ossola, Giovanni; Giovando, Guido; Crovini, Chiara

School of Management, University of Turin, Turin, Italy

ABSTRACT

Our research explores the Italian banking sector. It's focus on the world of Credit Cooperative Banks (BCCs). The reality of the mutual banks in Italy is very important: they are 364 BCCs in 2015 for a total of over 4,400 branches throughout the Italian territory. The employees are over 37,000.

This study can help us understand the context and the main business in which banks operate. Data were extracted from Bankscope, which is a database containing comprehensive information on financial companies (banks and insurance companies) in Italy. Our sample represents 264 Italian BCCs.

In our research we want to show that the BCCs are relevant in the Italian banking sector and then the sample data are particularly significant also as an indicator of the Italian banking sector, then we have appropriately calculated the two indicators: the Profit Margin and ROE, and we put them in comparison to see how they have changed over the years.

At the end we calculate the Pearson correlation ratio between Profit/Loss and Net Banking Income of each year. Thanks to this relationship, we are able to analyze the possible correlation of Net Banking Income on the profitability of the banks, in order to assess the effects of a policy that is carried out by governance to face the difficulties that the banking world is going through.

Keywords: *credit cooperative banks, Profit/loss, Net banking Income, Roe*

INTRODUCTION

The banking system of the Credit Cooperative in Italy finds its origins in the last quarter of 1800. Since their inception these credit cooperative phenomena were closely linked to the local communities in which they were establish, in fact thanks to the deep knowledge and mutual members of the community, their family situation, their personal reputation were singled out to creditworthy people.

The earliest forms of cooperative credit in Italy were the rurals and artisans who, inspired by Christian values, played a key role in stimulating the humble groups of rural people, especially farmers and craftsmen to obtain loans on terms more favourable than those applied to traditional banks.

Since then, Rural and Artisan banks have maintained a very close relationship with the territory of reference, weaving their own story with that of the communities, as to be "local banks call".

The rural banks were also called upon to fulfil a social function, as well as financial income. In other words, the aim was not to maximize profits, but rather support the local economy. Their role was, in fact, to carry out lending activities against people belonging to certain occupational groups such as farmers and artisans, themselves members of the cooperative bank, within a given territory in order to promote social and economic development of community.

The rural banks were able to grow in number and spread over time, supporting the socio-economic development of their local areas.

In 1993, the Banking Act lays down a radical change since the naming ranging from "Rural and Artisan banks" to the current "mutual banks". By means of this decree are not operating limitations of BCCs that can offer so all the products and services of other banks.

The system of mutual banks in Italy today includes 364 banks for a total of over 4,400 branches throughout the Italian territory. The employees of the banks are over 37,000.

In total there are more than one million and two hundred thousand members of the mutual banks and mutual banks are more than 6 million customers.

The remainder of this study is organized as follows. In Paragraph 1, we provide the Literature Review. In Paragraph 2 we define the methodology. In Paragraph 3 we show the findings of our study. Discussions are presented in Paragraph 4 and conclusions in the last part of the research.

1. LITERATURE REVIEW

The structure and functioning of the banking company has been studied in its entirety by many scholars (Koch and MacDonald, 2007; Ossola, 2005; Giovando and Gianoglio, 1999; Giovando, 1996). Many scholars have studied the bank account (Bocchino et al., 2013; Ossola, 2005), its performance (Barros et al., 2007; Berger and Allen, 2005; Boubakri et al., 2005) and its financial analysis (Hartvigsen, 1992). Recent studies concentrated on the accounting policy of banks, focusing on the application of the International Accounting Standards (Dezzani et al., 2014) and other specific studies focused on the analysis of the assets and liabilities of the balance sheets (Ossola, 2000).

In addition other researchers have recently analysed the impact of the new capital requirements under Basel III on bank lending rates and loan growth (Khalert and Wagner, 2015). As a result higher capital requirements, raising the marginal cost of bank funding, have led to higher rates (Cosimano, et al., 2011; Elliott, 2009; Laeven and Valencia, 2008).

Some studies focused on the way some financial entities have addressed this moment of global crisis (Crowley, 2015; Costa and Thegeia, 2013; Avdjie et al. 2012; Caprio et al., 2011). Many researchers concentrated on this period of financial crisis (Kapan and Minoiu, 2015; Calvo, 2012), highlighting the crucial role played by the liquidity risk in the stability of a bank, and, more generally, in the financial system (Borio, 2008; Dell'Ariccia et al., 2008). Some have tried to locate the perimeter within which identify the financial risk and study methods for good management, in accordance with the requirements of Basel (Álvarez and Rossignolo 2015; Angelini, et al. 2011).

An important study analyses, by means of alternative techniques, both cost and profit efficiency in a sample of ten countries of the European Union for the period 1993–1996, again obtaining profit efficiency levels lower than cost efficiency levels (Maudos, 2002).

For many years, a comparison of accounting ratios in the banking sector has shown the existence of remarkable differences in average costs. Wide ranges of return on equity (ROE) are found, although these results are more difficult to evaluate due to their greater instability.

Other studies have focused on these issues in particular the effect of banks' capitalization on banks' Return on Equity (ROE) (Blaga, 2015). A debate has emerged on the costs for banks of the increase in capital requirements under Basel III (Camara, 2014) .

Some researchers analysed the performance of banks belonging to individual countries (Faisal et al., 2015; Raus and Fu, 2014; Iqbal and Raza, 2009; Ali and Ansari, 2007; Barros Ferreira and Williams, 2007).

Iannotta, Nocera and Sironi (2007) as well as Illueca, Norden and Udell (2008) documented that bank ownership is an important determinant of lending behaviour, risk taking and performance.

With reference to the Italian context the importance of local small banks, such as BCCs, was emphasized in few studies (Usai and Vannini, 2005; Ferri and Messori, 2000), several researchers concentrated on this kind of banks, in terms of characteristics and role within the Italian banking sector (Bonfante, 2010; Agostini, 2009; Costa, 2007; Capriglione 2005; Bonfante, 2004; Vella, 2004; Appio, 1996). Zago and Dongili (2014) examined in depth the impact of the financial crisis on the Italian credit

cooperative banks and the technical efficiency of the Italian BCCs for the period 2003 to 2012. They also discussed and tested different specifications and objective functions for BCCs.

The importance of local small banks, such as BCCs, was emphasized in few studies.

Our research fits into this theme by analyzing the banking world of Italian BCCs. We considered, a sample of 264 Italian BCCs banks, which represent more than 72% of the all Italian BCC. In addition, we covers the period between 2009 and 2014. Moreover, we did not implement a sophisticated statistical model in order to pursue the effectiveness of the results and to concentrate on the real relationship between the items considered. However, thanks to our analysis, we tried to find a relation between net assets and net banking income and profit/loss of the banks of the sample.

Our approach is balance-sheet and income statement based, consequently we started from the data extracted from Bankscope database and consequently from the financial statements of banks. However, despite the limits of the research, thanks to this analysis and the results obtained, we may consider the opportunities of growth and development of our analysis.

In conclusion, one of the aims of this research is to improve the existing literature by using an empirical approach.

2. METHODOLOGY

The following paragraphs describe the sample and the methodology followed to conduct our research.

2.1 The sample and the data

This analysis focuses on the Italian BCCs banks. Our sample represents 264 Italian BCCs total of 364 BCCs on the Italian territory, between period 2009- 2014. We decided to exclude the banks of which had not for all the years considered its financial statements. To homogenize the sample analyzed by the totality of the BCCs were excluded those that did not had the balance sheet data of a few years taken into consideration.

This study can help us understand the context and the main business in which banks operate. Data were extracted from Bankscope, which is a database containing comprehensive information on financial companies (banks and insurance companies) in Italy. In the first part of Phase 2, we focused on information about Net Assets, Net banking Income and Profit/Loss.

We want to specify that data provided in our figures all refer to the mean of the single element analysed.

In the second part, we concentrated on some ratios, such as Profit/Loss on Equity to total Assets and Net Banking Income on Profit/Loss on, provided by Bankscope.

2.2 Research questions and phases of analysis

The present research is based on the following hypotheses:

- *H1*: The BCCs represent a significant banking institution in the Italian territory;
- *H2*: The Net banking Income is the profitability linked to the core business of banking. In the sample of BCCs examined the Net banking Income is preponderant.

To reach the goals of this study, we need to formulate three research questions:

- *RQ1*: What is the trend during the period monitored between the Net banking Income and the Profit/loss?
- *RQ2*: What is the trend in the period between 2009 and 2014 between the Profit Margin and ROE ?
- *RQ3*: Is there a correlation between the Net banking Income and the Profit/loss ?

The research methodology follows three phases:

- a) *Phase 1*: Analysis of the BCCs world and its characteristic features.
- b) *Phase 2*: Empirical analysis and findings. It involves an analysis of the information derived from the sample. The research methodology only uses the information provided in the financial statements because it is sufficient to answer the research questions.

With reference to *RQ1*, we want to show that the BCCs are relevant in the Italian banking sector and then the sample data are particularly significant also as an indicator of the Italian banking sector.

Referring to *RQ2*, we have appropriately calculated the two indicators: the Profit Margin and ROE, and we put them in comparison to see how they have changed over the years.

We concentrated on the analysis of the Profit Margin Ratio and ROE because we based our research on the Dupont analysis. It also called the Dupont model and it is a financial ratio based on the return on equity ratio that is used to analyze a company's ability to increase its return on equity. In other words, this model breaks down the return on equity ratio to explain how companies can increase their return for investors.

The Dupont analysis looks at three main components of the ROE ratio:

- Profit Margin;
- Total Asset Turnover;
- Financial Leverage.

Based on these three performances measures the model concludes that a company can raise its ROE by maintaining a high profit margin, increasing asset turnover, or leveraging assets more effectively. The Dupont Corporation developed this analysis in the 1920s. The name has stuck with it ever since.

With reference to *RQ3*, we calculate the Pearson correlation ratio between Profit/Loss and Net Banking Income of each year. Thanks to this relationship, we are able to analyze the possible correlation of Net Banking Income on the profitability of the banks, in order to assess the effects of a policy that is carried out by governance to face the difficulties that the banking world is going through.

As mentioned above, the correlation ratio of Pearson (p) is used to identify a positive or negative correlation between the Profit / Loss and Net Banking Income. For this, it is necessary to emphasize the following conditions:

- if $p > 0$ there is a direct correlation;
- if $p = 0$ there is no correlation;
- if $p < 0$ there is an indirect correlation;
- if $0 < p < 0.3$ the correlation is weak;
- if $0.3 < p < 0.7$ the correlation is moderate;
- if $p > 0.7$ the correlation is strong.

c) *Phase 3*: Conclusions and limitations of the research.

3. FINDINGS

First of all, before analysing the data obtained, we want to give further details and definitions.

The Profit Margin Ratio is an index that is created as the ratio of Profit/loss and Net banking Income. This index shows the impact of different management from the Net banking Income on the operating result. ROE (Return on Equity) is calculated as the ratio between net income and shareholders' equity. It represents the net return for the shareholder.

Phase 1 concerns the stages of our research and the related comments.

Starting with *HP1*, BCC is a structured system on a network of approximately 364 Cooperative Banks. The main feature of the BCC is to be widely spread in our country, for over 130 years played their role of local banks, performing a specific function, to promote development and to address the economic and social needs of local communities. On Italian territory have 4,414 branches 14.8% of the Italian bank branches, with 1,248,724 members and 36,500 employees (including those of the Company's system). The total funding (deposits from banks + customer deposits + bonds) amounted to EUR 196.7 billion and a Customer deposits + bonds: 161.8 billion euro.

The market share of customer deposits including bonds is 7.7%. Economic Loans totaled 134 billion euro. The market share of lending for mutual banks is 7.2%.

Including loans granted by banks of the second level of the Cooperative Credit, loans amounted to 149 billion euro, for a 8% market share. On the basis of the data and the considerations it can be argued that *HP1* is confirmed and BCCs are important banking institutions in Italy. In order to proceed in our analysis we present in Table 1 the data collected referred to our sample in the period 2009-2014.

Table 1		Main items considered in the financial statement analysis

Table 1. *Main Items considered in the financial statement analysis*

With reference to RQ 1, Figure 1 shows the trend of Net Banking Income and Profit Loss in the period between 2009 and 2014. The data refer to the mean of the sample for each year.

By analysing Table 1, we can affirm that HP2 cannot be confirmed in all the years considered.

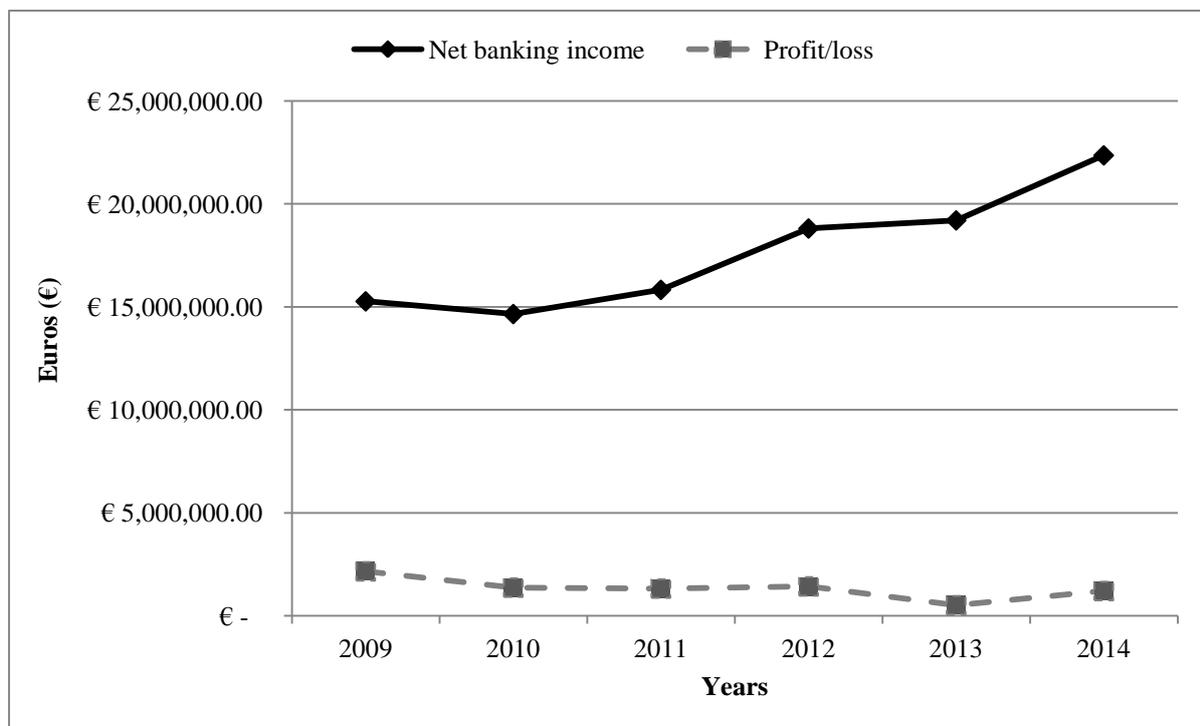

Figure 1. *The trend of Net Banking Income and Profit/Loss of BCCs in the period between 2009 and 2014*

The figure confirms our first hypothesis. Therefore, in the sample of banking firms considered, it can be noted that the Net Banking Income substantially in the years follow the Profit / Loss.

Continuing our analysis in order to answer RQ2, we analyze the second figure.

The Profit Margin Ratio is an index that is created as the ratio of Profit/loss and Net banking Income, instead, ROE (Return on Equity) is calculated as the ratio between net income and shareholders' equity.

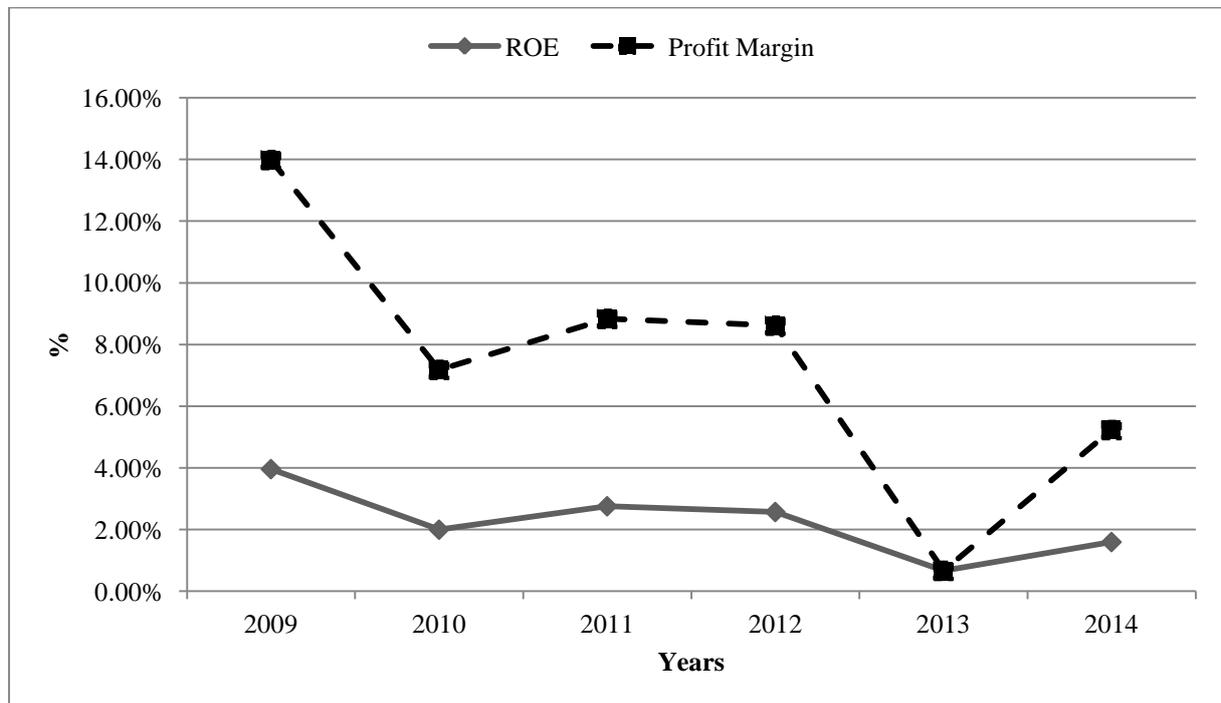

Figure 2. *The trend of ROE and the Profit Margin Ratio of BCCs in the period between 2009 and 2014*

In this figure it can be noted how the two indices do not comply with the same deviations. This shows that in the sample analyzed ROE is almost stable over the years analyzed but its composition is different.

The two figures demonstrate that the initial first hypothesis is true. In fact, as can be seen from 2009 to 2012 the Profit Margin is at higher levels of ROE while in 2013 the Profit Margin goes down is the same level of ROE and then climbs slightly up in 2014.

In order to answer RQ3, we calculated the Pearson correlation ratio between Profit/Loss and Net Banking Income of each year between 2009 to 2014.

Table 2 shows the results deriving from the Pearson correlation ratio calculated.

Table 2		The Pearson correlation ratio between Profit/loss and Net banking income					
Net Banking Income	Profit/Loss						
		2009	2010	2011	2012	2013	2014
	2009	0.87					
	2010		0.70				
	2011			0.56			
	2012				0.48		
	2013					0.29	
	2014						0.55

Table 2. *The Pearson correlation ratio between Profit/Loss and Net Banking income*

The current table confirms that there is a strong correlation between the Profit / Loss and the Net Banking Income in 2009 and 2010. Instead, the correlation started decreasing from 2011 to 2013. In fact in 2013, the Pearson ratio is 0.29. In 2014, the ratio recovered.

Therefore, we can affirm that RQ3 can't be confirmed for all the years considered. And especially in recent years it is not confirmed.

In more recent years the correlation is very low.

4. DISCUSSIONS

Our research and its results confirm what many previous studies stated before: the mutual banking system in Italy is important. In the world of Italian banking group BCCs are definitely relevant. Our HP1 was confirmed by the analysis of data and numbers of the whole Italian BCC system giving ample confirmation initial hypothesis.

As mentioned above, the system of mutual banks in Italy today includes 364 banks for a total of over 4,400 branches throughout the Italian territory, 14.8% of the Italian bank branches. The employees of the banks are over 37,000. Italian BCC system have 1,248,724 members and 36,500 employees (including those of the Company's system). The total funding (deposits from banks + customer deposits + bonds) amounted to EUR 196.7 billion and a Customer deposits + bonds: 161.8 billion euro.

The market share of customer deposits including bonds is 7.7%. Economic Loans totaled 134 billion euro. The market share of lending for mutual banks is 7.2%. Including loans granted by banks of the second level of the Cooperative Credit, loans amounted to 149 billion euro, for a 8% market share.

As regards HP2 and RQ1 we can affirm that the Net Banking Income trend was positive.

But the value of the Net Banking Income between 2009-2011 was not as significant, while the Profit Loss trend declined significantly between 2009 and 2010 and remained constant until 2012 and then, again, decrease in 2013. In 2014, instead the Profit, it returned to grow.

Surely the financial and economic crisis has had a negative effect both on the Net Banking Income is the profit. The decrease in 2013, the profit is linked to a negative impact of the extra-ordinary management.

As regards RQ2 the answer is less convincing. From the analysis we have carried on our sample indicates that if in the early years (2009 and 2010) there is a substantial correlation is not the case in recent years.

So we can argue that in the years 2009 and 2010, the Profit / Loss was influenced by the Net Banking Income. In the following years this correlation is lower, in fact, in 2013 the Pearson index is around 0.29.

This may mean that in the following years the crisis and the persistence of the banking crisis of the BCCs has diversified its activities. Those activities that affect our income statement therefore do not always represent the core business of banking.

So RQ2 is not verified and we can deduce that the banking business over the years has evolved in areas not always the bank's core. All this can also be explained by the crisis of the banking business and then accordingly also in bank intermediation which led the bank's governance to change their business objectives.

5. CONCLUSIONS

This study focused on the world of Italian BCCs. We could analyze their size with a very significant sample. From this study we were able to note the relevance of the BCCs in Italy.

Later we have tested the sample the possible relevance of Net Banking Income on Profit / Loss.

Afterwards we analyzed the Profit Margin Ratio (index that is created as the ratio of Profit/loss and Net banking Income) and ROE (Return on Equity) during the period 2009 to 2014.

Finally we concentrated on the relationship between Net Banking Income and the Profit /Loss of the data Italian BCCs banks between the period 2009 and 2014. We have noticed that the correlation in recent years appears weak.

We noted that such importance was low especially in recent years. The study thus points out that the banking business especially during the crisis years has moved away of the core to explore and develop other activities.

Data were extracted from a database, called Bankscope, which is a database containing comprehensive information on financial companies (banks and insurance companies) in Italy.

Our research raises important questions regarding the BCCs field of the resonance in Italy and the evolution of their business in recent years.

What we have also analyzed possible to introduce all the limitations of this research. First, this study represents the first step of a much deeper analysis that can take into account other variables, financial indicators and margins. We decided not to use an extremely complex model because we aimed to achieve effective results and focusing on the true relationship between the factors taken into account.

One of the future developments is to extend both the years under consideration in the same analysis to other banks that do not belong to the world BCCs in order to compare and contrast the situation between different realities.

ABSTRACT

Social entrepreneurship (SE) has been lately established as a potential strategy for the development of disadvantaged areas. However, in spite the fact that SE seems to be well suited to the crisis framework -especially the one in Greece nowadays- it is highly questionable if and how it can be implemented in rural mountainous areas where there is usually a low level of awareness and a number of weaknesses due to remoteness from the central governmental authorities. The present research purports to explore certain macro-level and contextual factors that stimulate or impede social entrepreneurship development and sustenance in the Municipality of Pyli, a mountainous area in Central Greece. It builds on a well-structured questionnaire using 1-5 Likert scale for the majority of the questions. The data were recorded, processed and analyzed via the statistical package SPSSWIN ver 20.0 and the appropriate tests needed. Such areas are quite common in Europe and constitute the most vulnerable entrepreneurial environments especially in times of recession. Results confirm the view that average people are not aware of the benefits of social entrepreneurship and indicate that women are more likely to be attracted. The role of local and central governmental authorities seems to be of core importance while education and training appears to be needed in order to stimulate and sustain SE. The study contributes mainly empirically to SE literature while it may add to the relevant theory regarding facilitators and constraints within the environmental context.

Keywords: *Social Entrepreneurship, Social Entrepreneur, Mountainous areas, constraints, facilitators, environmental connect. AITHIKOS project*

INTRODUCTION

Social entrepreneurship (SE) is a phenomenon that attracts the growing interest of practitioners, theorists and policy makers since it may offer solutions to socio-economic, environmental as well as cultural problems (e.g. Chell et al., 2016; Seelos, and Mair, 2005). Although it became popular due its non-profit and co-operative nature, today it is more known as the process of using market-based methods in order to address social problems (Grimes et al., 2013). Therefore, its principal focus seems to be its ability to address social needs, create social value and stimulate social change by generating jobs and permitting the creation or acquisition of goods and services (Borgaza et al., 2011). Theoretically, such models might be embraced by people to function and to be supported to work effectively. Especially when economies lie within recession, these types of entrepreneurship form a vehicle to “provide ready solutions to economic woes” (Chell, 2007).

A stream of SE literature focuses on the environmental context that may enhance or hinder the development of social entrepreneurship. This may regard political, social, economic, technological and cultural factors which, in turn, may be local, regional or national. Environmental factors constitute a quite extensive issue for general entrepreneurship research; however, relevant theoretical and empirical research appears to be rather scarce in the case of social entrepreneurship (Urbano et al., 2010).

The present research purports to shed light into this specific area of interest; i.e. to highlight factors that may stimulate social entrepreneurship and spot those that may put SE efforts in danger, in the very specific case of a mountainous area. Such areas are quite common in Europe and constitute the most vulnerable entrepreneurial environments especially in times of recession. The study contributes mainly empirically to SE literature while it may add to the relevant theory regarding facilitators and constraints within the environmental context.

The next section of this work attempts a short description of relevant theoretical considerations on social entrepreneurship; a brief reference in categories and criteria will establish the theoretical background of the research. The empirical part will outline the perceptions and views regarding constraints and facilitators of social entrepreneurship in a specific Greek mountainous area in Greece (Pyli, Region of Thessaly) within the current and long-lasting crisis framework. Statistical data will be discussed in order to produce useful insights about the evaluation of factors regarding the phenomenon under investigation. The concluding section includes implications for future research, limitations and some policy recommendations.

LITERATURE REVIEW

Social entrepreneurship appears to confuse people even after many decades. Trexler (2008) had stated that it is a “simple term with a complex range of meanings”; his saying is still very popular among both theorists and practitioners. So far, it appears that research has focused on defining the phenomenon, set it apart from regular entrepreneurship (e.g. Arend, 2013; Mair and Marti’ 2006, Zahra et al., 2009) or add criteria such as the role of innovation (e.g. Mair and Marti’ 2006). On the other hand, empirical efforts are still scarce (Yiu et al., 2014) with case studies to dominate the empirical research (a review in Short et al., 2009). Furthermore, the empirical efforts focus mainly on SE outcomes while it appears that there is scarce empirical analysis on the individual drivers, pros and contras of the antecedents of social entrepreneurship (Lepoutre et al., 2013).

Definitions of social entrepreneurship have evolved over the years. Back in 1998, Dees described the “ideal social entrepreneur” as the change agent in the social sector with a mission to create and sustain social value by engaging innovation in the pursuit of new opportunities. With this definition, the SE concept turned from nonprofit and volunteering organizations to the pursuit of entrepreneurial activities with social goals (e.g. Miller et al., 2012). After an extensive review of SE definitions, Zahra et al. (2009) defined SE as *the activities and processes undertaken to discover, define, and exploit opportunities in order to enhance social wealth by creating new ventures or managing existing organizations in an innovative manner*. The definition allows for a wide are of social entrepreneurial action. Actually, according to Lepoutre et al. (2013), there are three main social entrepreneurship categories: for profit, hybrid and NGOs. Hybrid enterprises combine both market-based and social logics and for-profit social enterprises exhibit high attention to social and environmental objectives. NGOs may be the traditional ones or a new type that combines their social mission with an innovative approach in achieving their goals.

In all cases, social entrepreneurs interact continuously with the context “in which they and their activities are embedded’ (Mair and Marti’ 2006, p. 40). Social entrepreneurship has not evolved in a vacuum, but rather within a complex framework of political, economic, and social changes occurring at the global and local levels (Harding 2006; Urban, 2013). Therefore, it appears that the environment plays a significant role both in the decision to start a social enterprise as well as its sustenance (Urban, 2013). Within the entrepreneurship literature in general, macro-environment analysis is considered mandatory for “understanding market growth or decline, business position, potential and direction for operations” (Kotler, 1998). The identification of the several political, socio-economic and technological factors (Porter’s PEST analysis) and their impact on the business can clarify opportunities and support the creation of strategic plans. In the same line, this analysis regards the institutional framework of a society which comprises the fundamental political, social, and legal

ground rules that establish the basis for strategic entrepreneurial choices (North, 1990). Accordingly, the investigation of the environmental context of specific areas may define, create or set limits to SE opportunities, affecting the scope, width and speed of the creation and development of social enterprises.

Within the SE literature and the role of the environment, Urbano et al (2010) have studied the impact of the institutional environment on SE in Catalonia, Spain using a case study methodology. Urban (2013) explored social entrepreneurship within the emerging economy in South Africa in relation to three types of context (following Busenitz, Gomez, and Spencer, 2000): the regulatory environment which refers to the formally codified, enacted, and enforced structure of laws in a community, society, or nation; the normative dimension which determines the degree to which agents embrace creative entrepreneurial activity; and the cognitive dimension that reflects the knowledge and skills of potential entrepreneurs. The author concluded that favorable perceptions of the regulatory and normative dimensions are essential to increase social business practices. Griffiths et al., (2013) investigate the macro-level influences and factors that can stimulate or impede the emergence of social entrepreneurship.

A small stream of research has also focused on the role of national contexts and formal institutions in SE (Estrin, Mickiewicz, & Stephan, 2013; Zahra, Gedajlovic, Neubaum, & Shulman, 2009). As used here, the institutional configuration perspective recognizes the significant role of formal and informal institutions; this view has been discussed in extant research but has rarely been empirically tested. Stephan et al. (2015) consider that institutions may influence individual behavior, both as stimulants of motivation.

THE RESEARCH OBJECTIVE

Hence, based on the underlying ideas of the role and impact of the environment in fostering social entrepreneurship, the present study tries to outline the perceptions and views regarding constraints and facilitators of social entrepreneurship in a specific Greek mountainous area in Greece (Pyli, Region of Thessaly) within the current and long-lasting crisis framework.

Despite the importance of social entrepreneurship, it is still questionable whether the phenomenon has reached individuals mainly in remote and problematic areas. Are the average people aware of social entrepreneurship? Are they attracted by the SE alternative? What are the worst barriers to overcome? What could facilitate the creation of a social enterprise? What do people in disadvantaged areas need to start a social business? What are the major initiatives the State or Regional authorities should implement to create a promising environment for the efficient development of social entrepreneurship?

The research purports to offer insight on the nature of some dimensions of the institutional environment and its potential influence on social entrepreneurship, in terms of Greece's current socio-economic milieu. SE constraints and facilitators may delineate the right canvas enhancing the 'can-do' of potential social entrepreneurs in disadvantaged areas like the mountainous area of the Municipality of Pyli in Greece and changing the common belief that governments or big multinationals are the only job creators in such areas while self-employment cannot support sustainable entrepreneurship in a small market heavily hit by long-lasting socio-economic crisis.

METHODOLOGY

The research followed the quantitative research approach under the positivistic research philosophy. Research was conducted in 2016 i.e. the seventh year of the severe socio-economic crisis. The area of investigation hosts around 300 enterprises as registered by the relevant authorities. The sample was chosen to include respondents of different background. In order to collect the necessary data, a structured questionnaire was prepared and random sampling was engaged. Questions are short, precise and easy to be understood by the majority of respondents. Likert scale was used for the majority of the questions.

At the beginning of the research, the researchers performed content validity of the questionnaire; this regarded an extensive literature review and several conversations with experts on the social entrepreneurship issue. A pilot research included a sample of 10 respondents. It actually led to gaps and needs for further specification of the questions. Thus, the final questionnaire was improved (Dillman, 2000).

The research was conducted by skilled researchers who addressed the entrepreneurs or executive members of the firms by personal face-to-face interviews. The questionnaire consisted by three groups and a total of 28 questions. The first group consisted of eight questions regarding the level of familiarization and information of respondents regarding the concepts of social economy and social entrepreneurship. The second group of seven questions investigated the factors that impact development and existence of social entrepreneurship in the mountainous area of Pyli. The third group of questions offered information about the respondents' profile such as age, sex, educational level, type of business and profession, income etc. This profile is presented in Table 1.

The data were recorded, processed and analyzed via the statistical package SPSSWIN ver 20.0 and the appropriate tests for frequency (Frequencies), descriptive statistics (Descriptives), variable comparison analysis (Crosstabs), Factor Analysis and Correlation analysis (Person correlation) were conducted, in order to derive critical conclusions in regard of the issue under investigation.

THE AREA UNDER INVESTIGATION

This paper reports a quantitative research in the Municipality of Pyli, at Trikala Prefecture in the Region of Thessaly, Greece. Municipality of Pyli lies on a "geographical zone" in the southwestern part of Trikala Prefecture. The area includes highlands and lowlands (dynamic) local districts, according to Directive 75/268/EEC. In total, the area includes 43 out of 146 local and community districts of Trikala Prefecture, while 33 of them are characterized as highlands and 10 are characterized as dynamic (lowlands).

According to the data of the 2001 and 2011 census of the Hellenic Statistical Service (EL.STAT), a depopulation of the area by 10.55% is observed over the last decade. The high dependency ratio (0.61) is considered to be evidence of unsatisfactory economic development perspective in the area. Furthermore, in regard of the ageing index in the area of 2001, the ratio is 1.65 (165 elderly for every 100 children) while the economically active population in 2001 is amounted to be 5.880 people, with 5.290 employed people (percentage 89.97%) and 590 unemployed people (percentage 10.03%). According to the data of EL.STAT., the percentage of the unemployed people by 18.17% and 34.17% in the last 10 and 20 years respectively.

Sex	Percentage	Studies	Percentage	Profession	Percentage
Male	69.7%	Postgraduate	4.7%	Civil Servant	37.5%
Female	30.3%	Bachelor	34.4%	Forest-worker	28.1%
Age	Percentage	IEK	Percentage	Freelancer	12.5%
21-40 years	35.4%	Secondary school	35.9%	Stock-breeded	7.8%
41-60 years	58.5%	Primary School	17.2%	Unemployed	6.3%
>60 years	6.2%			Farmer	3.1%
Income (€/year)	Percentage	Population of place of residence (persons)	Percentage	Private Employee	1.6%
<5,000 €	33.9%	<100	21.9%	Entrepreneurs	1.6%
5-10,000 €	27.4%	101-500	20.3%	Housekeeping	1.6%
10-15,000 €	21.0%	501-1,000	14.1%		
15-20,000 €	12.9%	1,000-2,000	4.7%		
>20,000 €	4,8%	2,000-5,000	12.5%		
		>5,000	26.6%		

Table 1: The profile of the respondents in the mountainous area of Pyli

Local economy and employment are mainly based in agriculture and its interdependence with the livestock production in the mountainous areas of the region, by creating a strong relationship for the productive sector of local economy. Forest exploitation in the area is limited to the production of forest products, especially timber and forage production. The manufacturing activity in the area focuses on the exploitation, processing and the utilization of the products of the primary sector, mainly with the production of dairy and wood-furniture products. There are a few small enterprises in the area, most of which are family enterprises. Because of their small size, the enterprises cannot achieve economies of scale which would make their products competitive not only among products from countries with low labor costs, but also among products from developed countries.

Tertiary sector constitutes the 43.8% of the employment in the Municipality of Pyli. There is a significant increase in tourist accommodation units in the last few years in the study area. Since 1992, there has been an increase (about 60%) in tourist accommodation units in the area.

RESULTS

The results indicate that the majority of the residents of the Pyli area are rather unfamiliar with the concepts of social entrepreneurship and social economy (Papadopoulos et al., 2016). However, the 96.9% of the respondents stated at the end of the interview that the issues got their interest. More precisely, a 44.6% stated that social enterprises could definitely support the effort to confront the problems caused by the severe socio-economic crisis. The same percentage indicated their will to participate in a social enterprise targeting social benefit at least for the local community. Regarding the gender, it is quite interesting that all females were positive although somewhat hesitant in participating in the creation of a social enterprise. Consequently, the negative answers belonged only to males. The female predominance is in line with relevant literature (e.g Haugh, 2005). According to Levie and Hart (2011), child-rearing duties increase the awareness of women to pressing social issues in the community.

Age appeared to play its role as well; crosstabs correlation indicated a statistically significant relationship between the intention to participate in a social enterprise and age (Cramer's $V=0.301$ for a significance level $>95\%$ Approx. Sig= 0.019). Older respondents were keener to participate. This is also in line with literature on entrepreneurship in general and social entrepreneurship in particular. Levie et al. (2006) related the tendency to SE in older ages, while they claim that middle-agers tend more to become active entrepreneurs than turn to social entrepreneurship. In the same vein, according to Ladeira et al.,(2013), in Israel 58% of the SE founders were women, and a 90% were over 40 years of age.

On the other hand, it appeared that neither the educational level nor the family income affected this intention of the surveyed sample. However, this is not questionable, since there is no consensus in literature so far in regard of these two parameters. For instance, according to GEM (2004), the social entrepreneur is someone who “is older, usually a woman, with high levels of education and income” while in Denmark those involved in social entrepreneurship are of higher incomes and levels of education GEM (2009); on the contrary, Yiu et al. (2014) claim that lower educational background spur agents to engage in more social entrepreneurial activities.

The present paper focuses on the perceptions of the respondents regarding the environmental context; i.e. the political-structural, economic, social, and cultural trends that might influence the development of social entrepreneurship in their area.

Accordingly, bureaucracy has been rated as the most significant constrain in regard of the creation of a new enterprise as well as during its operation especially under the quite novel and unknown to public servants form of social entrepreneurship (1.64). The inadequate education regarding social entrepreneurship and entrepreneurial skills in general for the locals was rated as the second barrier (1.67), while the rather high production costs (1.73) seemed to be a further constraint of the development of social entrepreneurship (Table 2).

Barriers	Mean	Std. Deviation
Bureaucracy	1.64	1.07
Inadequate education regarding social entrepreneurship and entrepreneurial skills in general	1.67	1.19
High production costs	1.73	0.99
Lack of links among the institutions and enterprises of the area	1.95	1.03
Severe environmental legislation	1.98	1.02
Small size of enterprises	2.00	1.10
Weaknesses in the organization and operation of cooperative associations	2.10	1.10
Low-level technical and organizational support of producers	2.15	1.30
Inability to exploit the opportunities due to the various subsidy projects	2.21	1.09
Inability of existing enterprises to adapt to the new market conditions	2.23	1.09
Problems due to the exclusion of certain population groups of mountainous areas in regards of entrepreneurial opportunities	2.29	1.14
A significant number of non-patented or protected products	2.31	1.24
Low level of competitiveness and use of the area's competitive advantages	2.31	1.14
Inadequate supply of expertise, relevant education / training and skills	2.31	1.40
Geographical exclusion	2.45	1.37
Introversion and inability to form extrovert strategies	2.66	1.31
Significant competition from other relevant business in Greece	2.92	1.18

Table 2: *Barriers of social entrepreneurship development in the mountainous area of Pyli (Likert scale: 1-5; 1= very important)*

The constraints that are presented in Table 2 are correlated; actually, the relevant analysis using the Pearson correlation coefficient (Pcc) indicated the following positive or negative relations:

- Bureaucracy and all kind of administrative difficulties that appear when agents try to create or run a business seem to affect to a significant level:

a) the ability of the businesses to adapt to the new market trends and demands which are changing very fast and in unexpected ways (Pcc = 0.444 for significant level=0.01);

b) the level of technical and organizational support of the business agents since they consume their time and money in non-production bureaucratic processes (Pcc = 0.383 for significant level=0.01);

c) in deepening the gap between the entrepreneurial world and the institutions at local or national level due to the increase of mis-trust and even negative feelings for the public sector (Pcc = 0.381 for significant level=0.01); and

d) the maintenance of inadequate expert knowledge, training and development of skills due to the need to focus on their every-day practical problems and the increasing mistrust in relevant offers by the state or state-supported institutes (Pcc = 0.361 for significant level=0.01).

- The difficulty to confront the competition of similar business at national level seems to be due to:

a) inadequate expert knowledge, training and development of skills (Pcc = 0.264 for significant level=0.05), and

b) the local introversion and the inability to form satisfactory and efficient extrovert strategies (Pcc = 0.259 for significant level=0.05) which in turn seems to enhance the inability of the businesses a) to adapt to the new market trends and demands (Pcc = 0.501 for significant level=0.01) and b) to exploit the various subsidy projects in Greece (Pcc = 0.501 for significant level=0.01).

- The weaknesses in the organization and operation of the co-operative associations create significant problems regarding a) the exclusion of certain population groups of mountainous areas in regard of entrepreneurial opportunities (Pcc = 0.477 for significant level=0.01) and b) the inability of the businesses to adapt to the new market trends and demands (Pcc = 0.369 for significant level=0.01).

- The low-level technical and organizational support of producers appears to affect a) the level of competition and the exploitation of the physical and other competitive advantages of the area (Pcc = 0.488 for significant level=0.01) and b) the ability of the enterprises to co-operate with local and national institutes (Pcc = 0.469 for significant level=0.01).

Reflecting the hesitation of the respondents that were in favor of the development of social entrepreneurship but also conscious of the significant constraints of the environmental context as evident above, Figure 1 presents the major areas of SE support according to the results. Subsidies of Innovation, Entrepreneurship and Digital Ecosystems

the initial business plans seem to be the most important issue (1.70) indicating both the lack of investment funds within the crisis framework as well as their familiarization with the EU or State support in former entrepreneurial undertakings; b) the creation of specific funding mechanisms which should focus on SE (1.73) indicating a wish and tendency for continuation of the SE phenomenon in a crisis-hit nation; c) the development of collaborations at local level (1.80); d) education / training of public servants regarding social economy and entrepreneurship (1.81) and e) the counseling support by Academia and other expertise (1.82), (Likert scale 1-5, 1= very important).

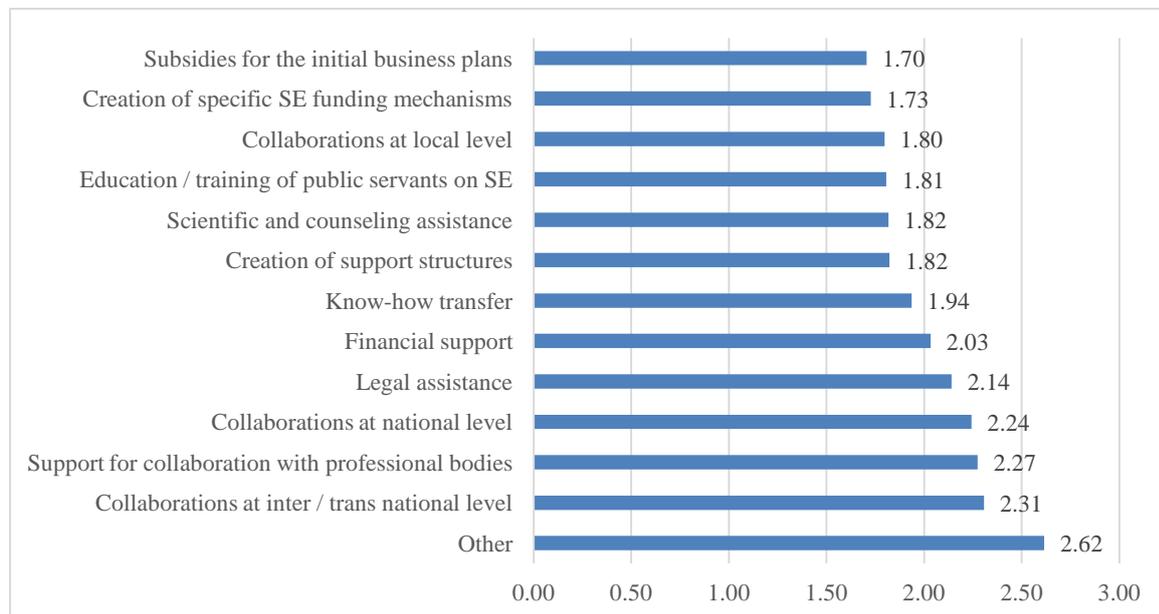

Figure 1: Major areas for the support of social entrepreneurship development in the mountainous area of Pyli (Likert scale: 1-5; 1= very important)

In regard of the socio-cultural level of the environmental context for the development of social entrepreneurship, education and training appear to be of significant importance. More specifically, 87.9% of the respondents state that further education on production technologies (wood and food processing, farming, livestock etc.) related with the main business activities should be vital for SE development. Besides this type of knowledge, training is needed in regard of SE funding mechanisms (84.4%); entrepreneurship and innovation principles in general (83.9%) and business planning processes (79.7%). A special interest in renewable energy sources brings this educational need in the fifth position (78.7) (Table 3).

Rates of Subjects education	Means	(1) Extremely important	(2) Very important	(3) Quite important	(4) Somewhat important	(4) Unimportant	(1)+(2)

Table 3: Suggested subjects of education / training / counseling support in regard of SE development in the mountainous area of Pyli (Likert scale: 1-5; 1= extremely important)

According to the results, local self-government authorities can support the SE development in the area under research mainly by providing motives to locals to develop social entrepreneurship (1.56) and by promoting the concept in order to make it more familiar through seminars and workshops (1.76). Collaborations with neighboring municipalities and the regional authorities (1.90), the creation of incubators (1.97) and the development of a five-year business plan (1.98) could further facilitate SE development in the area regarding always the results analysis. (Table 4).

Cronbach's Alpha (= 0.906) indicates that the deterministic variables of the research constitute compact and reliable structures, able to contribute to the measurement of the agent to which they belong. The high communalities produced by the Factor Analysis indicating the amount of variance in each variable of the first column (Table 4) that is accounted for, indicate that all variables co-relate with some other agent. The Total Variance Explained of Factor Analysis indicates that the calculated eigenvalues are also quite high only for two groups that contain the factors of the first column in Table Innovation, Entrepreneurship and Digital Ecosystems

4. These two groups are then included in the analysis, since they actually explain a satisfactory 67.3% of the total variation (bigger than 50%; Siomkos and Vasilikopoulou 2005).

Furthermore, factor analysis indicated, after matrix rotation, that all ten variables of Table 4 appear in two groups; the first group regards the variables (2, 7,3,4,8 and 1) and the second one the rest (9, 5, 10, 6). The first group reflects facilitating initiatives to support the preparation of SE creation while the second one to support the actual creation and sustenance of established social enterprises or a cluster of social businesses (Table 5).

The two groups actually explain the 77.6% of the total variation (Eigenvalues).

DISCUSSION

After the global crisis in 2008, social problems are dominant in both developed and developing countries. Social entrepreneurship seems to be able to confront them by the generation of social value especially in highly disadvantaged areas. In this context, specific environmental factors that affect the emergence and implementation of social enterprises become of core importance; however they remain unexplored. This research tries to outline the perceptions and views regarding constraints and facilitators of social entrepreneurship in a specific Greek mountainous area in Greece (Pyli, Region of Thessaly) within the current and long-lasting crisis framework.

According to the findings, social entrepreneurship seems to be rather unknown to most Greeks while its nature and benefits are quite ambiguous. However, when explained, it seems to attract interest mainly among women.

A core conclusion of the research is that social entrepreneurship, similar to usual entrepreneurship, is driven by combinations of factors. Bureaucracy appears to be the core hindering factor for any entrepreneurial activity, social or not especially when combined with mistrust of the public sector and the estimations that the SE framework is a new area for the public decision-makers. The deep antipathy to bureaucracy constitutes one of the central critiques of the public sector been considered as source of unreasonable waste of time and money as well as a sample of inefficiency. It is also claimed to be responsible for the inability of Greek SMEs to follow the global market trends or become extrovert. Therefore, it appears that the elimination of unnecessary bureaucracy is a key concept in encouraging people to try social entrepreneurship.

One of the key external factors in order to develop the necessary infrastructure to support social is according to the findings, the emphasis on entrepreneurship education and training. This ranges from basic knowledge on entrepreneurial issues and skills' development to specific knowledge on SE funding mechanisms and business management. It is quite interesting that respondents are aware of weaknesses in their current businesses' basic knowledge. This is in line with relevant literature; for instance, Piasecki and Rogut (2004) suggest paying special attention to education and training provision besides market institutions and the banking system.

Such knowledge provision and training demands sufficient physical and social infrastructure as well as a certain quality level of local institutions. The weaknesses as highlighted by the research indicate that an efficient SE development in the mountainous area of Pyli demands significant policies and measures aimed at overcoming barriers to social enterprise development. Institutional development is unanimously central to the successful implementation of all these suggestions and should go hand in hand with greater local self- governance.

How can social entrepreneurship be encouraged in disadvantaged mountainous areas? According to the respondents, local authorities and communities together with the regional and state governance have to create and implement appropriate policy priorities in such regions emphasizing their applicability to the specific needs of the local economies. This issue highlights the importance of local development partnerships that include representatives of government, local authorities, agencies, professional associations and community organizations extending collaboration with neighboring areas as well. Indicative activities could be awareness campaigns to support the new SE phenomenon and to strengthen entrepreneurial culture and spirit as well as appropriate motivation initiating a long term learning process; for example, the EU's Leader+ programs or similar ones could extend to establish local action groups, raising awareness for SE development action and representing a strong „bottom-up“ community-based approach to SE development. In practical terms, support can also regard subsidy initiatives and relevant projects and the creation of specific funding mechanisms

The findings seem to provide strong implications for both practice and theory. From a practical point of view, agents aspiring to start a social enterprise should be well aware of the unstable institutional framework, the non-existent relevant legislation and the unfavorable conditions in Greece at least. A number of conflicting pressures and constraints may hinder even well-prepared business plans and aspirations.

The study also contributes to the provision of a potentially transferable set of policy principles that may be used to guide social entrepreneurship policy development in disadvantaged areas.

Public policy makers need to outline an appropriate institutional framework in order to encourage the development and support the sustenance of social entrepreneurship by developing and promoting positive SE models to influence social attitudes towards social entrepreneurship. They have to take into consideration that there is no SE background and therefore they have to curve the way to this new entrepreneurial mode; social entrepreneurship has to be portrayed as an alternative process explaining that it catalyzes socio-economic change and that it varies according to the different environments (Mair and Marti, 2006). The policy principles can be further elaborated to suit the local needs; for example, in cases of little or no entrepreneurial culture, emphasis may be given to links with educational institution and other advisers, while a separate part of policies could focus on institutions and self-government authorities' role. Indicatively, it is highly questionable whether people of these organizations are really aware of the benefits provided by social entrepreneurship or the ways to implement it and promote collective well-being serving the community. Moreover, the use of formal and informal collaborations and the creation of networks can facilitate financial support mechanisms, learning and training, extroversion and SE sustenance.

In terms of academic relevance, the study contributes adding to the SE theory in regard of the analysis of the impact of certain contextual variables and more precisely a number of constraints and facilitators. Social entrepreneurship cannot flourish in all environments; instead the existence of an enabling environment is quite critical. This means that there are certain preconditions to be fulfilled such as central authorities' commitment, elimination of bureaucratic obstacles, knowledge on entrepreneurship, development of collaborations, and active involvement of private and public institutions. Therefore, there are certain factors that shape specific social entrepreneurial goals, behaviors, and intentions. The study further adds to empirical research on social entrepreneurship.

CONCLUSIONS

The present research purported to explore certain macro-level and contextual factors that stimulate or impede social entrepreneurship development and sustenance in the Municipality of Pyli, a mountainous area in Central Greece. Results confirmed the view that average people are not aware of the benefits of social entrepreneurship and indicated the core role of women in encouraging SE development in the area. The role of local and central governmental authorities seems to be of core importance in order to eliminate the negative impact of constraints such as bureaucracy and to foster institutional support for SE development. This denotes the significant role of active governments confirming former relevant theories. Education and training regarding entrepreneurship itself as well as more specific business subjects such as production technologies appears to be needed in order to stimulate and sustain SE. Furthermore, collaborations and networking enhance the possibility for success in SE efforts. The study contributes mainly empirically to SE literature in terms of policy making, while it may add to the relevant theory regarding facilitators and constraints within the environmental context.

The results of the research bear certain limitations. Firstly, the size of the sample and the lack of sample diversity are significant drawbacks; the field study was limited to only one geographically bounded sample limiting the generalizability of the findings. However, this choice increased the internal validity and provided the main contribution of the study highlighting the significance of bottom-up approach of every single area of interest when regarding social entrepreneurship and policy making. Furthermore, the questionnaire focused on very specific variables.

Researchers are welcomed to extend the questionnaire including the institutional and environmental context as offered in the general entrepreneurship literature. Further research could also attempt to replicate similar analyses in bigger samples, different geographic, sectoral and territorial contexts, exploring further the phenomenon of social entrepreneurship.

ACKNOWLEDGMENTS

The research leading to these results has received funding from the EEA Mechanism 2009-2014, under Project Contract n° 3580 and under the title “Establishment of a Supporting Mechanism for the Development and Promotion of Social Entrepreneurship for Populations of Mountainous Areas”.

**LEADERSHIP AND INTERNATIONALIZATION IN FAMILY AND NON-FAMILY FIRMS' CROSS-BORDER MERGERS AND ACQUISITIONS
FROM THE ARABIAN GULF**

ABSTRACT

The internationalization of family firms from economically developing regions has become an issue of increasing interest within strategic management. International expansion extends beyond a business phenomenon into a wider-ranging engagement with countries, societies and various collectivities. The family represents one such collectivity; when business and family intersect within an expansion imperative, complications can ensue, especially as family businesses transition from exclusively private ownership to listings on public exchanges and from management by the family to the involvement of outsiders. We explore leadership dynamics for family and non-family firms—in particular state-owned enterprises (SOEs) as well as publicly- and privately-held family businesses—expanding via cross-border acquisitions from the Arabian Gulf into multiple regions of the world. In a historically tribal and highly interconnected context, we draw on in-depth, ethnographic-style interview research, as well as supplementary archival evidence, to examine how leadership characteristics, intergenerational succession, ownership structure, and intercultural elements impact internationalization through cross-border acquisitions. Our findings indicate the intertwining of cultural heritage and tradition with modern business imperatives and the increasing penetration of non-Western firms into the global milieu. Each of the three types of firms examined demonstrates a different pattern of international expansion, with the FF-private remaining in general regional; the FF-public increasing in internationalization and also technological orientation concomitant with the public listing and involvement of outsiders; and the SOEs, including energy firms and sovereign wealth investment firms, achieving worldwide presence in reflection of the global nature of the extractive energy industry and the high-income resources of the region.

INTRODUCTION

This paper addresses the research question, theory, methodology and analysis, and anticipated contributions and implications of our research into leadership and internationalization in a geographic and cultural milieu (Pukall and Calabrò, 2014; Cuervo-Cazurra *et al.*, 2015)—the Arabian Gulf—where the presence of family firms that are privately held, family firms that are publicly traded, and government entities makes the leadership, acquisitions and internationalization interplay intriguing to investigate. The Arabian Gulf M&A activity merits attention because the six economically and culturally interconnected countries of the region have been on rapid development trajectories due to continuing high demand for fossil fuel/ extractive energy resources. The region has both historically and in modern times served as a geographic and trade crossroads with prospective lessons for both earlier and later-industrialized—developed and developing—regions (Basco, 2013). The multicultural and resource-rich endowments of the region have facilitated rapid business globalization in a manner providing insights for the more established and developed Western and Asian economies, as well as the economically developing areas of the world such as in Southeast Asia, Latin America, North and Sub-Saharan Africa, and Eastern Europe. We examine the following research question: What are the influences of leadership and family business on patterns of internationalization from rapidly economically advancing regions of the world, as manifested in cross-border mergers and acquisitions from the Arabian Gulf? We note that although the Arabian Gulf countries do not meet all definitions of “emerging markets” or “developing economies,” our field research strongly revealed the self-perception among business executives that the region belongs in those categories—and the countries in the region meet various criteria for consideration, with the high per capita GDPs being a primary anomalous factor for strict inclusion.

BACKGROUND AND LITERATURE

Leadership and family business have been separately and extensively studied for decades in various regions of the world [e.g.,] (Luo and Chung, 2005; Gómez-Mejía *et al.*, 2007; Nicholson, 2008), yet the emergence and impact of leadership in family businesses that are publicly-traded, internationalizing, and from economically developing regions have been less explored. In the Arabian Gulf, there exists a high degree of family business and private ownership of firms, dynastic wealth accumulation and inheritance, and government ownership of oil and other nationally significant assets, as well as

interconnections into family firms. In more recent years, many traditionally family or government-owned firms have been having public offerings and experiencing more diffuse ownership (Schulze *et al.*, 2003), while expanding internationally (Cuervo-Cazurra *et al.*, 2015). At the same time, the family and cultural influences in the historically tribal societies of the Gulf remain strong. Given the backdrop of family, national and cultural factors, we explore how the top corporate leadership of Arabian Gulf firms can affect the patterns of internationalization and expansion of those firms into other areas of the world (Casillas and Acedo, 2005; Chari, 2013). Specifically we examine influences of leadership and family business on internationalization from companies in countries of the Gulf Cooperation Council (GCC)—the six economically and culturally affiliated nations of the Arabian Gulf (Bahrain, Kuwait, Oman, Qatar, Saudi Arabia and United Arab Emirates)—as seen in cross-border acquisitions into other areas of the world. We use the phrases Gulf, Arabian Gulf and GCC interchangeably in the paper, as in the region itself. We further note that Yemen, while geographically in the Gulf, is not a member nation of the GCC and is not included in the vernacular meaning of “Gulf” or “Arabian Gulf” in the region.

The analysis of key issues of leadership and internationalization in acquisitions starts from the basic premise of a close interrelationship between top leadership and firm strategy (Miller *et al.*, 2010). Who the leaders are exerts a tremendous influence and impact on the selection and implementation of strategies by the firm. More precisely, leadership style has been a construct of interest in strategic management research in contexts including innovation [e.g.], (Kang *et al.*, 2015) and entrepreneurship (Simsek *et al.*, 2015), corporate social responsibility [e.g.], (Waldman *et al.*, 2006; Maak *et al.*, 2016) and overall in strategy and organizational performance (Nahavandi and Malekzadeh, 1993). Various aspects of leadership characteristics and behavior have been found to be influential in acquisition integration (Lind and Stevens, 2004; Kavanagh and Ashkanasy, 2006; Nemanich and Keller, 2007) and postacquisition satisfaction (Covin *et al.*, 1997) as well.

In contrast to the previous research, which has emphasized the post-deal implementation/ integration/ evaluation phase of the impact of leadership style (Schweizer and Patzelt, 2012; Zhang *et al.*, 2015), we concentrate on leadership style in the making of the deal—specifically with respect to the antecedent strategic elements of motivation, selection and realization of the acquisition as a legal instrument joining two companies. The cultural and operational integration and postacquisition satisfaction dimensions could become part of an extended model, but in the present paper we focus on the earlier phases in making the deal. We view the motivation, selection, and realization of the acquisitions as pivotal in the expansion imperatives specifically for cross-border strategizing drawing on the linguistically, culturally and experientially multimodal leadership backgrounds that enable these

international acquisitions to be conceived and negotiated. Hence we ground our research more fundamentally in the aforementioned perspective of the close connections between top leadership and firm strategy (Child, 1972; Ibrahim and Kelly, 1986; Bertrand and Schoar, 2003)—leading into choosing and closing acquisitions for purposes of a corporate internationalization reflecting national economic diversification needs and personal educational and career experiences—than in the particulars of leadership style and postacquisition integration. For instance, in this vein Waldman (2004) applied upper echelons theory in examining the impact of charismatic leadership in the formulation of strategic change and the assessment of firm performance.

We therefore return to the premise that most top business leaders in the GCC are highly internationalized in experience and education, which suggests and reinforces their outward-looking strategies of internationalization for their firms. An interest in internationalization implies the need for a modality to achieve this objective. Cross-border mergers and acquisitions have been one of the most often used of the six typically recognized methods of internationalization. The frequency of cross-border acquisitions belies their difficulties and overall low success rate in lasting terms. Previous research has found that cross-border mergers and acquisitions can be just as risky—if not riskier than—domestic acquisitions. The overall success rate would typically be 50% or less in terms of measurable impact on shareholder value and outcome measures such as operating cash flows, revenues, profitability and even more impressionistic signs of success with respect to firm reputation and brand impact. In addition, there are factors such as market penetration and global reach, which could appear to be enhancements and therefore markers of success from cross-border acquisitions; but these market reach indicators are not necessarily translating into increased profitability and shareholder value.

Moreover, it is essential to take into account the specific countries and varying levels of national economic development involved in the transactions. The flow of foreign direct investment (FDI) has typically been from developed to developed countries—although there has increasingly been FDI from developing to developed economies or between developing regions of the world (Bhaumik *et al.*, 2010; Dau *et al.*, 2015). It is in these latter categories—from developing to developed economies or between developing economies (Filatotchev *et al.*, 2007)—the present study focuses, with particular reference to transactions emanating from the Arabian Gulf. Family business incidence and influence are especially strong within this region, where the countries of the Gulf have emerged from traditionally tribal societies promoting enduring interconnections among families for purposes of business, marriage and overall life interactions. The business leadership from these regions has roots in this family and tribal-based society, while having also increasingly bilingual and bicultural capabilities and international orientations. The economic resources, family backgrounds, and

multicultural competencies have accelerated the international expansion of Arabian Gulf firms through cross-border mergers and acquisitions.

Cross-border acquisitions benefit firms via the immediate enhancement of firm size and presence in multiple countries of the world—especially attractive for companies with fast-paced agendas and deep pockets. International business scholars have extended the concept of resource allocation opportunities to include a geographic diversification perspective (Lu and Beamish, 2004). This view recognizes that an extra benefit arises from gaining access to acquired firms with resources in varied geographic locations, with diverse tangible and intangible assets (Seth *et al.*, 2002). Acquisitions represent a prime means of internationalization, in part because they are typically speedier than greenfields (organic growth) and more sophisticated and far-reaching than for instance exporting, licensing, franchising or partnerships. Acquisitions provide the benefits of ownership and control. As previously mentioned, they also carry considerable risk, commensurate to or sometimes outstripping the probable level of rewards. There is a great bulk of empirical studies measuring performance of cross-border acquisitions that show ambiguous results (Moeller and Schlingemann, 2005). Such ambiguity suggests that the relationship between the international nature of the deal and post-acquisition performance is more complex than simply a matter of sovereign and cultural boundaries (Hennart, 2009). The enactment and performance of international acquisitions hence merit a more fine-grained analysis. In this paper we contend that knowing how to evaluate the risks and attain the rewards of cross-border purchasing of firms becomes a fundamental leadership challenge in internationalization through acquisitions. Indeed the GCC region provides an excellent location for strategic analysis of leadership and internationalization (Banalieva and Eddleston, 2011), as the economies and companies of the Arabian Gulf have very rapidly advanced within the past decades from local to regional to global in orientation. We investigate the complexities of leadership dynamics—especially in the comparison of various family and non-family types of firms—in internationalization through acquisitions.

METHODS

In order to get a handle on the scope, occurrence and dynamics of cross-border acquisitions in the enactment of expansion and internationalization emanating from the Arabian Gulf, we have developed a twofold research approach. First, one of the authors has been extensively involved in field research among business leaders and firms of the Arabian Gulf region. Within the past three years, data have been collected through ethnographic interviews and observations within firms of the GCC. Observational data, according to a research protocol, have been collected within over 10 firms and in-depth interviews conducted with over 50 business leaders and executives coming in particular

from the second-most oil-producing country of the region, Kuwait. Because of the originally tribal and presently economic interrelatedness, these interviews have provided rich insights into more nuanced aspects of business conduct and internationalization from the region into both developing and developed areas of the world. In addition to the field research data, we have obtained a customized dataset based on the Thomson Reuters SDC Platinum database. SDC Platinum contains records of both domestic and international acquisitions and related financial transactions (such as equity and debt capital market deals, public financings, syndicated loans, joint ventures, spinoffs and repurchases) for over 70 countries and close to 1 million M&A transactions, beginning from the 1970s, with hundreds of descriptors at the industry, firm and transaction level. We initially captured all acquisitions in the database made by firms from any of the six countries of the Arabian Gulf from 1981-2015. This initial data pull resulted in 4110 transactions. Eliminating government and private ownership narrowed the dataset to 165 transactions, involving publicly-traded acquiring firms. We are focusing on the publicly traded firms—for the quantitative dataset and imminent hypothesis development and analysis—because they include the vanguard of the third generation of family firms, as well as some of the leading MNCs in the region. In addition, the publicly traded firms can be researched with secondary data sources, supplementing the data on firms with varying ownership structures from the field research. Moreover, some of the private and government transactions that surfaced within the field research can be corroborated within the SDC Platinum dataset, apart from the 165 focal deals. Both the field research and the secondary data reveal that even traditionally privately-held family business are moving toward partial or full public equity structures, in order to facilitate their international expansion, access to capital markets and global brand recognition.

FINDINGS

In the first phase of the study, which has involved field research in companies of the Arabian Gulf, we have obtained data from in-depth interviews and ethnographic observations within three types of firms: family firms that are privately held (FF-private), family firms that are publicly traded (but with majority ownership or control from within the family) (FF-public), and government firms, also known as state-owned enterprises (SOEs). Two types of managers have been interviewed: family and non-family members. Presently there have been 53 interviews (20 family managers and 33 non-family managers) conducted in 10 firms (5 FF-private, 2 FF-public, and 3 SOEs). The firms are in the industries of financial services, brick-and-mortar and online retail, logistics and warehousing, food services, and energy). We elected to use ethnographic research as our starting point because of the novelty of the research investigation into this topic for this part of the world and to obtain deeper insights to enrich our understanding of intertwined cultural, business, family, economic and

developmental issues. The companies all have English as the exclusive or one of the central business languages; all interviews were conducted in English by one of the authors, a native-English speaker accompanied by a bilingual native-Arabic speaker for assistance with linguistic and cultural nuances, involving for instance translation of very occasional Arabic aphorisms into English and cultural and historical contextualization of certain remarks. The level of English conversational fluency among the top managers was extremely high, as all had received one or more university or postgraduate degrees from abroad. In addition, some had received their entire primary or secondary schooling in English-language or bilingual English-Arabic international schools in the Arabian Gulf or abroad.

From the ethnographic analysis we have furthermore identified salient family firm leadership decisions, which can be labeled as “to join or not to join the family business, to buy or not to buy assets available for privatization, to lead or not to lead the privatized business, to expand from regional to global or not, and to rebrand in a global marketing strategy or not.” These decision areas have the potential for conflict and also for resolution within the expanding family firm. Within the family, there can be sharing of responsibilities as well as separation of interests. Agreement or disagreement around issues such as stock allocations, management positions or succession plans can create or destroy organizational esprit de corps. The complex interplay among the leader, family, firm, transaction and national dimensions suggests the value of further investigation in the upcoming quantitative (to be combined with the qualitative) analysis.

These understandings have led us to make sense of this complexity with an aim of identifying patterns. To achieve this end we propose a two-dimensional matrix based on ownership structure and family. We have identified three categories already within the matrix: FF-private can be held by several interrelated families, typically from within the same tribe; FF-public again can have governance and ownership from within interrelated family structures and also partial ownership from government-owned sovereign funds, as well as more diffuse public ownership; and SOE can have managers who are appointed based at least partially on kinship ties with government ministers. Hence, the public, private and government sectors function in close interconnection. Here is an example of the ownership structure of a FF-public from the field research sample: all board members, the chairman, the CEO and two of the five SVPs are members of the same extended family within a particular tribe, and that family collectively owns 30% of the stock; the government pension fund holds 10%, one major bank in the GCC 21% and one private investment company in the GCC 7% of the stock; and of the 62% of the free float not owned by the immediate family (30% as mentioned above), an undetermined amount is owned by interrelated families within the tribe and the remainder of the shares are unspecified dispersed global ownership as available through shares

traded on regional exchanges. Some of the shareholding amounts are publicly disclosed, while other figures have been obtained and corroborated from multiple sources within the field research.

Various leadership and internationalization-through-acquisition patterns exist within the three types of firms of the field research.

FF-Private: The FF-private firms have very strong regional expansion within most or all of the six countries of the GCC and into the larger Middle East North Africa (MENA) countries as well. Acquisitions tend to be relatively small-scale, horizontal, regional, cash funded and by agreement among cooperating families or family members. The leadership tends to be first or second-generation family members, who are often the first generation of university graduates within their families. These leaders have strong technological, entrepreneurial and international orientations based on their upbringings, education and their use of first instance social media, in both English and Arabic, for marketing and distributing their products and services.

FF-Public: The FF-public firms are third-generation family businesses that have branched into other areas of the world—typically Europe, North America, Southeast Asia, Sub-Saharan Africa and sometimes East Asia—and have undertaken initial public offerings on regional exchanges to increase their access to global capital markets and to ease financial arrangements among an increasing number of descendants of the original founders. Acquisitions for the FF-public are farther-reaching, venturing into additional regions of the world, still predominantly cash funded, but now requiring and relying on agreements and coordination among family and non-family, as the newly acquired firms come from countries and cultural frameworks outside the scope of the GCC/MENA, and can be horizontal or vertical or for other investment purposes. The ownership tends to remain strongly family-influenced or controlled. The top corporate leadership consists still of some family members—typically the more business- and intellectually-inclined members of the family, with undergraduate and MBA degrees from English-speaking countries— increasingly collaborating with non-family management. Although men dominate the top management ranks, women family and non-family managers are present as well. In the third-generation FF-private firms studied, the public offering option has been increasingly considered.

In addition, we have determined in our research that the FF-public have displaying an especially intensive and increased technological orientation. This increase in technological knowledge and capabilities has been fostered by the acquisition of innovation—whether in full or partial-stakes deals to obtain access to emergent technologies and business as well as technical innovations—and also by the encouragement of an internal inventiveness and entrepreneurial mindset. The cultural dynamics here are then not only issues of overall national and predominant organizational cultures but of creating and sustaining cultures of innovation within organizations. These innovation islets could be

separately run (non-integrated) acquisitions, greenfield ventures with a separate management structure and brand identity, or board membership in a technology and innovation-oriented firm, where the investment stake could be later raised. The technological capabilities facilitate global communications and interventions and even fundamental paradigm shifts to new, platform-based and asset-reduced business models for leveraging capacity. Longstanding cultural traditions have coexisted with and indeed complemented new-world, cutting-edge forays, resulting in an intriguing blend of heritage and innovation.

SOEs: The SOEs in the field research sample have been either sovereign wealth/ investment/ pension funds or energy industry companies. The top managers interviewed have been Western-educated members of elite, interconnected families. The internationalization has been global—either because of the wide-ranging nature of investments of the pension funds or because of the extensive worldwide reliance on petroleum products—and has been a matter of expediency and also overwhelmingly of national interest. Acquisitions by the SOEs are anywhere in the world as needed with a few observations: smaller in size than the acquiring firm (which will be a very large state-owned entity), purchased with cash for full or controlling interest—or entered into as part of a joint venture agreement for common goals—and in clear support of national sovereignty and national interests. For interest, an SOE oil company could acquire an upstream exploration company or a downstream refining or petrochemicals company, but not in any type of contested transaction or any type of transaction that could be perceived as a threat to national security. The parent company (the SOE) is controlling or cooperating with the acquired firm, and also constraining access by that firm into the parent. That is, post-acquisition integration will be very much controlled by the parent, with access and entry only on an as needed basis. The acquisitions will tend to be vertical or for investment purposes.

CONTRIBUTIONS

This research enhances understanding of cross-border mergers and acquisitions, family business, and leadership dimensions particularly with respect to the Arabian Gulf. The SDC Platinum database—for establishing the dataset of acquisitions originating from the GCC—and the field research on business leadership in the region together examine the leader, family, firm, transaction and national dimensions. Our findings indicate the intertwining of cultural heritage and tradition with modern business imperatives and the increasing penetration of non-Western firms into the global milieu. Each of the three types of firms examined—privately-held family firms (FF-private), publicly-held family firms (FF-public), and SOEs—demonstrates a different pattern of international expansion, with the FF-private remaining in general regional; the FF-public experiencing an increase in internationalization

and also heightened technological orientation concomitant with the public listing and involvement of outsiders; and the SOEs, including energy firms and sovereign wealth investment firms, achieving worldwide presence in reflection of the global nature of the extractive energy industry and the high-wealth/high-income resources of the countries of the Arabian Gulf region. The expansion of the three types of firms suggests the centralization—tempered by moderate circulation—of leadership authority, whether in successfully transitioning family firms into the third generation and beyond or in developing state-owned firms with high returns, alongside the quest for economic diversification. These firms have additionally overcome the liability of foreignness [e.g.](Zaheer and Mosakowski, 1997; Johanson and Vahlne, 2009)—and what has also become known as a “liability of emergingness” (Held and Berg, 2015)—to successfully enter new markets abroad while strongly maintaining home country affiliations and cultural heritage identity.

The contributions from our present and ongoing research are primarily in the areas of family business, leadership and strategy interconnections; internationalization and expansion from rapidly developing, high-income economies; cultural and demographic aspects of the leadership of internationalization; intergenerational family business leadership succession and the transition from private or government into publicly traded ownership; cross-border acquisitions as a mechanism of internationalization with the attendant intercultural and postacquisition integration issues; and region of the world. We contribute in these areas and also to theoretical perspectives on firm ownership and forms of contracts between owners and managers. For instance, this research has implications for agency theory and the separation of ownership and control when the agents are third generation family members within an increasingly diverse corporate ownership structure and an organizational design including non-family management. The research has further implications for contests for corporate control and changes of control involving rapid expansion agendas funded by extensive financial resources. Moreover there are implications for theories of cultural quotient or cultural intelligence in that the internationalizing business leadership from developing regions often has the advantage in a cultural information asymmetry in their interactions with Western business leaders—in that the Gulf region business top business leaders have most often been educated abroad, know multiple languages, and can more easily converse and move within Western business settings than vice versa.

²University of Turin, School of Management and Economics, SME, Turin, Italy

ABSTRACT

Kemin is a family business set up by Rolland and Mary Nelson in 1961 in Des Moines (Iowa). Its core business is the production of ingredients and nutritional solutions.

At the beginning, they had two product lines, an office in their family room and a manufacturing plant in an old wool barn. The founders, who are still active in the business today, have started by serving the animal food market with ingredients such as antioxidants, flavors and mold inhibitors.

From these humble beginnings, Kemin has grown to serve the needs of customers in the global feed and food industries as well as the health, nutrition and beauty markets.

Kemin is more than a supplier to their worldwide customers. It's a researcher, a resource, and a partner. Kemin is a company committed to innovation and technology. Through constant innovation it creates innovative products for different industries. There are many factors that lead the company to continuous investments in research and development.

Among these:

- Market trends
- Competition
- New types of consumers
- Company philosophy (constant innovation)
- The need to improve

Innovation in Family Business is identified with the need and the courage to keep doing what you can do best. Kemin today is currently composed of 14 independent operating units, each with their own president. Together, they produce more than 500 ingredients to serve their customers. The net sales reached in 2014 was \$585 million.

Keywords: *leadership team, family business, innovations, technology, social responsibility, ability to evolve, entrepreneurship approach.*

1. INTRODUCTION

The changes that have occurred in recent years have led to a change in the competitive environment. Today companies are continuously looking for new competitive strategies.

Several factors impact on the companies' propensity to innovate, such as the organisational structure of the companies, their size, the impact of their sectors and strategic approach to changes in the context. Some scholars argue that the role of innovation is the opening to the newness. The innovation for family businesses¹ may be considered as a means to reach and to maintain a competitive advantage in a long-term perspective.

Not only, as some research has emerged as family businesses invest a lot in terms of innovative strategies.² In the light of this, the paper has as objective the study of innovation management within a family company, Kemin.

2. THE CASE HISTORY: KEMIN

Kemin was created in 1961 by Rolland W and Mary Nelson in Des Moines, Iowa (United States). It's a globally family business that produces innovative nutritional and health solutions for a growing and constantly changing world. Kemin combines molecular science with human creativity to improve the lives of humans and animals worldwide. Using science, it produces more than 500 ingredients, therefore providing important nutritional benefits for humans and animals. From these humble beginnings, Kemin has grown to meet the needs of customers in the feed and food sector globally, as well as in the health, beauty and nutrition markets. It's production and organizational expansion dates back to the '60s.

It's precisely in the years of the economic boom that the company felt the need to expand outside the United States of America. The small company settlement turned into an industrial production. This allowed the company to take advantage of the extremely positive historical moment to invest and to find new opportunities in the market.

At the end of the '60s, Kemin was exporting its products to distributors in the United Kingdom, the Netherlands and Spain. With reference to the constantly changing and growing European demand, in 1970 Kemin opened its first regional office in Herentals, Belgium. After the '80s, convinced of the idea of expanding effectively in other territories the company established manufacturing facilities in many other countries outside the Usa, fully respecting the local cultures and customs. The internalization

¹ Source: Dreux 1990: "Family Business are companies that appear to be controlled by one or more families, who have a level of incidence in organizational governance sufficient to substantially influence the company's decisions".

² Source: Craig, Moores 2006

strategy consisted in use of qualified staff and management chosen locally. This smart production choice allowed the company to achieve significant results not only in the relevant markets, but also with local distributors. During these years, a new approach to R&D was introduced. Not by chance, in fact, the development of Kemin translates into the ability to continuously invest in research and development. In reference to the ever changing, Kemin decided to found his second regional headquarters in Singapore in 1988. Then through continuous investments, the company expanded its global presence through further openings of new subsidiaries:

- In 1994, it opened an additional production site and sales in Zhuhai, China. Since then its philosophy was to use science and education to address market requirements and therefore provide better quality products.
- Shortly after that, the company turned its attention to the Indian market, taking on sales and manufacturing operations and displacing an additional site in Chennai¹.
- The increasing amount of products exported to Europe, made it necessary to establish production facilities, R&D and administration by implementing a penetration in the European market. To this regard, in 2010, Kemin opened a cutting-edge production facility in Verona, Italy².

Thanks to the increasing quality of products and the distribution capillary action, there was a decisive step forward not only in terms of sales but also in industrial investment. During these years, the company implemented significant investments in R&D in fact, since 1980, it expanded the range of products to the human food sector as well. By means of constant research they discovered that the same chemical products used for the production of animal feed was also effective to the inhibition of mold, bacteria and microorganisms that may arise also in human food. All these improvements make Kemin a bioscience company that produces nutritional and innovative solutions for a world that is growing and changing.

Kemin now has wide range of ingredients (about 500) and more than 200 patents. Its peculiarities and its values are well known in the United States and around the world, in fact, they sell in more than 90 countries including Belgium, Brazil, China, Italy, Singapore, South Africa and the USA.

Mission and Vision

Kemin's intent is to work in partnership with its customers to satisfy their needs.

Through the mission the company reaches its target, with primary emphasis on the satisfaction of customer needs; through a combination of talent and science Kemin aims to find innovative

¹ India

nutritional and health solutions for a changing world.

With constant innovation at the molecular level, thanks to new technologies and research and development, the company promotes steady improvements in its products and processes.

In 2005, the International Electrotechnical Commission (IEC) 17025 awarded Kemin an international recognition. Through this quality standard the company's competence in the conduct of laboratory tests was certified. It is easy to identify those values that best represent the company's essence:¹

- Integrity, communication, respect for colleagues, customers and suppliers.
- constant work maintaining high product excellence
- Constant change as a business model to be pursued
- Teamwork across functional and business units.
- Passion in serving customers.
- Confidence in the value of the products.
- Innovation and quality in processes, products and services.

Business Unit

The company is structured into seven divisions².

- *Animal Nutrition and Health*: Kemin intends to meet the animal's nutritional requirements and completely eliminate from its feed all toxic substances and bacteria.
In addition such innovative solutions help manufacturers and meat breeders reduce production costs.
- *Pet Food Technologies*: For more than three decades Kemin has cooperated with many of the major pet food producers of the world. In close collaboration with its suppliers they create innovative ingredients that meet the formulation needs, taste and attractiveness of the products.
- *Rendering*: As an active partner in the pet food industry for more than 30 years, Kemin has realized important relationships that help provide solutions and unique services for the rendering industry.
- *Dietary Ingredients*: Kemin offers a diverse line of scientifically developed nutritional ingredients. It provides supplements designed to encourage the hiring of certain elements and substances not present in some foods.
- *Food Technologies*: Extensive knowledge of oxidation processes and molecular food, made Kemin a leading choice for comestible preservation and safety. To best meet the particular

¹ Source: <http://www.kemin.com/about>

² Source: <https://www.kemin.com/en/europe/markets>

needs of diverse economic and geographic regions, as well as the needs of multi-national companies, Kemin Food Technologies has production facilities around the world.

- *Personal Care*: Their personal care line is composed of ingredients that improve skin appearance, formulation texture, stability, performance, and delivery of actives. ingredients consistent, reliable, effective and safe, for the various sectors in which it operates, including the cosmetics sector. Moreover, it is able to offer active and functional ingredients, with the aim of offering further benefits to the final consumer.
- *Pharma & MedDevices*: Kemin was the first company to introduce lutein-based intraocular dyes. Today, Kemin Pharma offers one of the most comprehensive lines of intraocular dyes available for the ophthalmology surgical device market.

Today, these seven divisions are held together by Kemin's mission. The current market penetration of the company is estimated to "touch" to 2.5 billion people every day; this clearly show Kemin is vision and a values.

Swot Analysis

The SWOT analysis is one of the main measures undertaken within the strategic analysis.

It is a structured planning method used evaluate the strengths, weaknesses, opportunities and threats.

The SWOT analysis (also called SWOT Matrix) is the kind of analysis that can be used for a company, a product or even on a person. The starting point is focusing on the goal the company wants to achieve. Thanks to this tool the company makes an analysis of its:¹

Strengths (S): characteristics of the business or project that give it an advantage over others; *Weaknesses (W)*: characteristics that place the business or project at a disadvantage relative to others; *Opportunities (O)*: elements that the business or project could exploit to its advantage; *Threats (T)*: elements in the environment that could cause trouble for the business or project.

From the intersection of these four points we get many different strategies that can be adopted by an enterprise:² **SO** strategies use their strengths to take advantage of opportunities; **ST** strategies use their strengths to avoid threats; **WO** strategies take advantage of the opportunities overcoming weaknesses; **WT** strategies make minimal weaknesses and avoid threats. Applying the Swot Analysis allows Kemin to identify its strengths, weaknesses, opportunities and threats as follows.

3. FAMILY BUSINESS INNOVATION

In this section, we examine the impact of this changes in all services offered by the company and we explain the many factors that push the company to constant investments in innovation. First of all, these changes consist in an evolution of the operating businesses and their organizational structure. The opinions in the field of innovation in family firms do not seem to be unique. Dunn (1996) says that family businesses tend to be less innovative but more traditional and conservative; very often these companies focus on the internal dynamics of the company and are less prone to develop external collaborations.

Contrary to what some scholars say, family businesses invest a lot on innovation in order to maintain a sustainable competitive advantage in the long term. In fact, according to Craig and Moores² "consolidated family businesses seem to attribute much importance to the practices and innovative strategies". According to these theories, the family owned businesses are more creative and innovative. There are many factors that drive companies to constant investments in innovation. An examination of the literature in the field of high-tech companies emerge a variety of definitions. It may be useful to summarize one of the most significant.

According Kleingartner and Anderson (1987), the high-tech companies as a feature of the primary objective of transferring new ideas in the market. To achieve this goal:

¹ Source: Results of the strategies carried out by the authors

² 2006, pp. 1-10

- Devote significant resources to R & D, with an R & D ratio / sales at least twice the average of other sectors;
- Take on employees and develop professionalism highly technology-oriented;
- Research of new products for existing markets and new markets.

This feature provides a strong scientific/technical content to the sector which result in pressures that make different competition from that of other sectors. One of the reasons why Kemin is considered a high-tech company is given by the impact that its R&D has of sales. The net sales recorded in 2015 amounted to about \$3,4 billion and the impact of R&D represent 13%¹ of it.² This data is a clear proof of how the company follows this market trend to offer more quality products and services. Despite Kemin is a family business, innovation represents the means of strategic change. The innovation for Kemin may be considered as a means to reach and to maintain a competitive advantage in a long-term perspective.

Hereinafter is a list of some of the factors that drive a company like Kemin to innovate:

- Competition: great global competition means that companies continue to invest in R&D to maintain their competitive advantage. In a constantly changing world, innovation is the first tool to compete.
- Company philosophy (constant innovation): As our world continues to change and evolve, it is necessary to provide innovative solutions for the consumer designed to meet the increasing needs following the market trends. Motivated by personal health, animal welfare, Kemin invests in R&D to create new solutions for the new consumer.
- Need to evolve: The rapid economic growth and the population growth lead to the need to evolve. To evolve means to be able to change and adapt to new market drives.

Whatever the specific goal of an enterprise is, this is due to the desire to build its competitive advantage by exploiting the opportunities that arise in the macroeconomic environment. In the specific case of Kemin, that advantage is represented by constant innovation of products and processes. This innovation is surely guaranteed by high training staff, maintenance of hygiene factors (Those factors the absence of Which demotivates people), quality production guaranteed by sustainable methods and international certifications as well as in the high investment in scientific research laboratories. The strategic tool that takes into account the trends dictated by the industry is PEST. PEST represent the analysis of the following detailed environments:

- *Political-legal*: the political environment surrounding the company has an important influence on its strategies. The legislative measures and upgrades, both national and international, are

¹ Result obtained using the following formula: R&D as % of sales = (Expenditure on R&D/Total Net sales)*100

Source: Kleingartner and Anderson (1987)

² Source: Data provided by the company - Kemin

increasingly regulating the operation of businesses and represent indispensable guidelines for placing products on the market.

It is clear that a company like Kemin, a manufacturer of ingredients and natural extracts, operating internationally, must necessarily comply with the rules followed by each of the countries they wish to operate in.

- *Economical*: is the collection of forces acting on the economy and interacting with the operations of the enterprise. Such an environment is influenced by factors such as income, unemployment, inflation and interest rates; items to be evaluated with particular care when planning a strategy. The constantly increasing globalization and emerging markets, make the economic dynamics more complex, with respect to both paying attention to the local rules and the instability of the money exchange.
- *Socio-cultural*: this field refers to population characteristics, education, consumer habits and their lifestyles. The different trends, changes in perceptions and attitudes in relation to certain themes can have significant effects on both the demand and the supply of goods and services offered by the company. Focusing more on the consumer preferences, companies need to adapt their offers to new trends that keep manifesting within the industry.
- *Technology*: technological trends have a significant impact on the company's products and services. Substantial and constant technological improvements are carried out within the industry as far as the R&D of new ingredients, materials and solutions. The technological impact on the products of the company and its production processes make it cutting-edge and able to protect itself against potential threats.

4. CONCLUSION

An analysis carried out has emerged as family businesses play a fundamental role in the global economy. Innovation in a family business plays a very important role, acknowledged by all stakeholders. Like other companies, Kemin, over the years, is structured internally with a specific area of R&D. Kemin like family owned have some advantages over other companies, in their focus on the long term, their commitment to quality and their care and concern for employees. They separate individual business and coordinate them in order to create value and customer satisfaction. They have to coordinate the individual business in order to cut the costs and create synergies. The advantages of organising a business like Kemin in independent business units is that they care about them in a separate way which is meaning that they can take separate risk, and less risk as well. It is necessary that the entrepreneurial family never cease to study the market and its dynamics (SWOT).

In fact, the supervision of the family is essential to innovate while retaining the values and corporate culture. This research has analyzed a large-size operating in different sectors, in particular in the food ingredients market.

Innovation is an important element that is also affected by the economic environment, social, technological (PEST) in which the company operates.

**HOW MARKETING COMMUNICATIONS PROFESSIONALS
UNDERSTAND AND USE TRADITIONAL AND CONTEMPORARY
PERSUASION METHODS?: A QUALITATIVE STUDY IN ARMENIA
AND GREECE**

Petrosyan, Armine¹; Dimitriadis, Nikolaos²

¹Business Administration and Economics Department, The University of Sheffield International Faculty- CITY College, Thessaloniki, Greece

²Executive Development Institute, The University of Sheffield International Faculty- CITY College, Thessaloniki, Greece

ABSTRACT

Purpose: This paper explores the adoption of both contemporary and traditional persuasion methods by marketing communication professionals in Armenia and Greece. In particular, it investigates how communication professionals in four marketing communications sectors, namely public relations, social media, advertising, and marketing/consulting, implement traditional and contemporary persuasion methods, with an additional emphasis on neuromarketing techniques.

Design/methodology/approach: The study used semi-structured, in-depth personal interviews and a sample of 18 participants in four marketing communication areas: specialists of public relations, advertising, social media, marketing/consulting in both Armenia and Greece.

Findings: Results indicate that approaches of marketing communications professionals in both countries coincide to some extent and that there is a need for more education related to action-based persuasion techniques among those professionals.

Research limitations/implications: This research is exploratory in nature and restricted to communication professionals in Armenia and Greece. Suggestions are presented regarding future studies and generalization of the findings.

Practical implications: Increasing need for action-based persuasion approaches; making the messages more customer-oriented (self-centered), more visual, more emotional and more tangible are the main implications for the communication professionals in the field.

Originality/value: This is the first cross-national study that explores adoption of persuasion methods from different perspectives and approaches. The study extends the body of knowledge of adoption of persuasion methods by marketing communication professionals, offering empirical findings from both Armenia and Greece.

Keywords: *persuasion, persuasion methods, persuasion principles, marketing communication professionals, neuromarketing*

INTRODUCTION

Persuasion in marketing communications is an old phenomenon (Petty and Cacioppo, 1986; Myers, Abell and Sani, 2014). However, contemporary literature suggests that the extent of persuasion has increased, taking into consideration some of the new approaches supported by empirical studies, giving rise to the development arena of experimental data of new behavioral and neurological models (Yeung 2011; Lindstrom, 2011).

According to Shelby (1986), persuasion is a process by which a message induces change in beliefs, attitudes or behaviors. Efforts to persuade are controversial and beneficial. Myers, Abell and Sani (2014) state that persuasion is neither inherently good nor bad. It is rather a message's purpose, form and content that elicits judgments of good or bad: "the bad we call "propaganda", the good we call "education" or "information"" (p. 203). Similarly, Kruglanski and Thompson (1999) highlight that beside its "darker side" and the potential for misuse, persuasion has a positive aspect. As authors state it constitutes the mainstay of psychotherapy, effective education, counseling as well as successful negotiation, without which, "good interpersonal, intergroup, and international relations are unthinkable" (p. 83). Funkhouser (1984) describes persuasion as "a process of information management aimed at engineering the decision to act" (p. 18). Author points out three main information flows that lead to persuasion: status information, persuasive messages and feedback. Funkhouser and Parker (1999), while discussing the process of persuasion from two distinct parties, the persuader and the actor, viewed persuasion as "...a matter of Persuader's engineering Actor's decisions to produce the desired action" (p. 28).

Petty and Cacioppo (1986) claimed that even though there was an enormous quantity of data and a notable number of theories, "perhaps more data and theory than on any other single topic in the social sciences" (p. 2), it was still an area of research with several literature gaps, and with a need for more rigorous research. The interest in the topic has been more highlighted recently, especially because of the introduction of new technologies of persuasion that have led to action-based approaches to the phenomenon. This paper charts the modern preference within the literature for the use of action-based persuasion rather than other models of persuasion. This issue has provided the initial impetus for this study.

Additionally, majority of empirical studies apply quantitative approaches and experiments and only a few are qualitative in nature (Horn, Fries and Gedenk, 2013). To our knowledge, there has not been an empirical cross-national study on exploring the adoption of persuasion methods from different

viewpoints by using a qualitative methodological approach. Last but not least, although there are several studies focused on persuasion techniques from developed countries (Eser, Isin and Tolon, 2011; Va, 2015), this is the first to touch such issues in the two countries involved, alongside introducing neuromarketing in the light of persuasion methods.

If we are to understand more fully the implications of persuasion tools for relational strategies, then a close examination of action-based theories of the approach called “neuromarketing” is also required (Pilelienè, 2012; Senior and Lee, 2008). Hence, a special attention is given to neuromarketing issues throughout the review. As Lindstrom (2008) claims understanding the human brain will help specialists develop better methods for selling products. Meckl-Sloan (2015) asserts that neuromarketing as a relatively new discipline and a tool used for persuasion purposes is becoming an important field of study for academic researchers and practitioners, since “the development of a “biological model” that addresses “context-situated human behavior such as consumption” (p.133) has not been adequately researched.

On that basis, the aim of the study is to explore and attempt to explain the adoption of traditional and contemporary (with an emphasis on neuromarketing) persuasion methods by marketing communication professionals in Armenia and Greece.

Moreover, the objectives of the study are fourfold:

- (1) to investigate attitudes of marketing communication professionals concerning persuasion methods
- (2) to highlight which specific persuasion principles they apply and why/how
- (3) to examine potential differences between different approaches of marketing communication professionals in Armenia and Greece
- (4) to develop suggestions of how persuasion methods can be improved for marketing communication professionals

The prime focus was to obtain preliminary insights rather than test theory.

Conclusively, our findings could be a value to both academics and practitioners and could serve as a reference for future research on persuasion.

MAJOR THEORIES OF PERSUASION IN MARKETING

In the persuasion context, there are widely embraced models such as the Elaboration Likelihood Model (ELM) (Cacioppo and Petty, 1986; Petty *et al.*, 2000; Jones, 2004), Heuristic-Systematic Model (HSM) (Chaiken, 1987; Chen and Chaiken, 1999), Information-Processing Model (IMP) (McGuire, 1968; Flay *et al.*, 1980; Scholten, 1996), and Unimodel (Kruglanski and Thompson 1999; Kruglanski, 2013). However,

Funkhouser and Parker (1999) claim that the theory of persuasion in marketing is mostly based on opinion or attitudinal rather than behavioral change. From a marketing communication perspective, these attitudinal theories do not provide useful assumptions and implications. Yet “practical persuaders” such as advertisement, PR, social media professionals, as well as marketing executives, focus not on changing attitudes but “on getting other people to do what they want them to do” (p. 27). One of the theories that gives practical assumptions and explanations of the mechanisms of persuasion is the Action Theory of Persuasion (ATP).

Contemporary academic literature on persuasion offers some empirical research, but habitually following fields of social psychology and communications in spite of the fact that these scholarly studies “focus primarily on changing social attitude through mass communication” (Funkhouser, 1984, p. 17). He states that experimental behavioral science research is “at a disadvantage in studying the selling process because selling is interpersonal and dynamic”, hence it is “inaccessible” to traditional research methodologies such as surveys or experiments. Surveys can deliver “static descriptions” of respondents’ beliefs, attitudes, perceptions, knowledge and feelings but cannot capture the dynamics of the process. Experiments must employ standardized messages and tools for proper control and consequently apply better “to mass communication than to interpersonal communications” (p. 17). A key assumption of Action Theory of Persuasion (ATP) theory is that every action is headed “...by a decision to act” (Funkhouser, 1999, p. 28).

CIALDINI’S CLASSIC MODEL OF PERSUASION

According to Goldstein *et al.* (2008) there are a number of scientifically proven persuasion methods and tactics accessible to communication specialists for designing persuasive messages, the most widely known and influential one being Cialdini’s. In Cialdini’s (2007) model, the most common types of persuasion principles or shortcuts are the following six.

Conformity and consensus. People look to the actions and behaviors of others to determine their own. Conformity arises when there is a change in behavior due to social pressure (either implicit or explicit). According to the science of consensus, rather than relying on personal ability to persuade others, communication specialists can point to a customer what many others are already doing, especially many similar others. This form of social influence is designated; still it is crucial for the smooth functioning of any social group, especially in collectivistic cultures (Gleitman *et al.*, 2011).

Reciprocity. By virtue of the reciprocity rule, people are obligated to the future “reimbursement” of smiles, favors, gifts, offerings, invitations, and the like or in other words obligation to give when they receive. Appeals of reciprocity in communication campaigns include such marketing techniques as free samples, giving tips, mints, fortune cookies, etc. In this context of social obligation, important is not

what is given but *how* it is given. The key of using the principle of reciprocation is the factor of being the first to give and to ensure that what is given is personalized and unexpected (Goldstein *et al.*, 2008).

Scarcity. The idea of possible loss plays a large role in decision-making process. According to this rule, people want more of those things there are less. It is not enough to tell them about the *benefits* they will gain though. Marketing communication professionals should point out what's *unique* about the proposition and what they stand to lose if they fail to consider the proposal (Cialdini, 2009). Becheur *et al.* (2008) highlight that fear has a positive impact on persuasion process, as it "...leads to the acceptance of the message and to persuasion..." (p. 103). Scarcity influences the content of customers' cognition, the tendency of consumers from lower socioeconomic circumstances "to become materialistic", and even the "reciprocal nature of parent-child relationships from the context of evolutionary biology" (Roux and Goldsmith, 2014, p. 215).

Authority. Authority is the tendency of following credible and knowledgeable experts (e.g. diplomas, uniform, experience, etc.). This principle is widely used in advertisement campaigns with celebrity endorsement (Starcevic, 2013; Hung 2014; Mishra, 2015). Tran (2013) assets that 25% of all ads use celebrities taking into account the fact that the target market has awareness and strong favorable unique perceptions of the external source. This justifies the excessive investments by companies to engage celebrities as respected and positive role models, in turn, impacting endorsed brand equity (Aureliano-Silva *et al.*, 2015; Dwivedi *et al.*, 2015).

Liking. People prefer to say YES to those whom they like. There are three important factors for this: they like those who are similar to them, who pass compliments and who cooperate with them towards mutual goals. This can be projected to an online environment as well (Lipsman *et al.*, 2012).

NEUROMARKETING AS A CONTEMPORARY PERSUASION APPROACH

A contemporary and "intriguing marriage of marketing and science" (Lindstrom, 2008, p. 5) that is considered to be the new approach used for persuasion purposes, is neuromarketing. As Andrejevic (2012) states, it is merely the latest attempt by marketers "to take advantage of the promise of new media technologies for the purposes of persuasion" (p. 199), in other words, neuromarketing is the "marketing industry's embrace of the 'neurocultural' turn" (p. 199).

Neuromarketing is the study of brain processes that are relevant to economic decision-making (Hart, 2015; Krauss, 2015; Reinman, 2013). It is directed not at medical professionals, but rather at marketing communication professionals that are considered to be practical persuaders. Studies on neuromarketing have already investigated the phenomenon from different perspectives. They have focused on ethical issues (Flores *et al.*, 2014; Murphy *et al.*, 2008; Stokes, 2015), consumer preferences, expectation and motivation (Adhami, 2013; McDowell and Dick, 2013), behavioral prediction

(Penenberg, 2011; Zoëga Ramsøy *et al.*, 2015), and evaluation of the effectiveness of advertising (Almiron-Chamadoira and Dubernat, 2015; Dos Santos, 2015).

Importantly, Lindstrom (2008) believes that the process of uncovering what is going on in consumers' brains, what information passes through brain's filter and what information doesn't, leads "...to better understand ourselves- our wants, our drives, and our motivations- and use that knowledge for benevolent, and practical, purposes..." (p.5). This proposition may be attributed to the recognition that in the new marketplace this "...would not only help sculpt the future of advertising, it would also revolutionize the way all of us think and behave as consumers" (*ibid*, p. 5). The study of Eser *et al.* (2011) offers an interesting overview related to the perception of marketing academics, neurologists, and marketing professionals about neuromarketing. As authors state, neuromarketing is "not a manipulative way of selling unnecessary goods and services" (p. 854). Three factors, interest and participation, knowledge and awareness, and ethics, should be perceived as the most important aspects of neuromarketing. Thus, "...neuroscience is not something new; the new thing is its use in business in order to make business more "intelligent" with the help of the doors which are open to knowledge" (Ciprian-Marcel *et al.*, 2009, p. 807).

In the light of classic persuasion approaches and of the more contemporary one of neuromarketing, this study strived to explore current opinions and adoption among four types of communications professionals in both Armenia and Greece.

METHODOLOGY

In order to understand the adoption of persuasion methods by marketing communication professionals, a qualitative approach was applied, taking into account the fact that the reward of qualitative approach involves direct engagement with everyday realities and prospects to make considerable contributions to the field (Gephart, 2004). Moreover, it expands the knowledge by providing "unique, memorable, socially important and theoretically meaningful contributions to scholarly discourse..." (p. 461). As mentioned before, qualitative research has been used less in persuasion studies in the business context.

Semi-structured, in-depth personal interviews were used for obtaining adequate information related to the studied phenomenon as is recommended for such studies (Dilley, 2000; Mojtahed *et al.*, 2014). In order to acquire multiple perspectives and explore the adoption of persuasion methods by various marketing communication professionals, maximum variation sampling was used. This sampling approach is considered to be one of the most frequently used purposeful sampling techniques (Leech and Onwuegbuzie, 2010). Within the sample of 18 marketing communication professionals, variations included: sector or industry: social media, advertising, PR and marketing/consulting, interviewee's

experience in the related field and two different countries. The sample units were chosen taking into account Ritchie *et al.* (2003) argumentation that they do understand “the central theme and puzzles” (p. 78) of the phenomenon under investigation, which are reflected at the experiences and roles that the participants possess. The total of 18 professionals included nine in Armenia (three in social media, two in advertising, two in PR and two in marketing/consulting) and nine in Greece (two in social media, two in advertising, three in PR and two in Marketing/Consulting).

Each interview lasted approximately for one hour and, if needed, additional clarification was obtained via mail, phone or Skype. Interviews were recorded, transcribed and then translated into English whenever needed.

Concerning data analysis, coding was used to arrange the large amount of textual data, synthesize it and create meaningful categories, as recommended in relevant literature (Lawrence and Tar, 2013).

FINDINGS AND IMPLICATIONS

In terms of the participants' attitude and perceptions about persuasion, the majority defined persuasion as a “cornerstone for what I do” (1.2a., Advertising PROF, Armenia); “one of the important elements for my job” (1.1c., Social Media PROF, Armenia); “absolutely necessary” (2.2b., Social Media PROF, Greece.) which is in agreement with the extensive body of literature. At this stage of discussion related to the main attitudes concerning persuasion methods, interviewees both from Armenia and Greece described the core persuasion in fairly stark terms: persuasion as a term is used in order “to make people think, feel, choose whatever you want” (1.3.b., PR PROF, Armenia), in some cases “in a subtle imposing manner” (2.3.a., PR PROF, Greece).

Both country representatives mostly portrayed persuasion from two angles: persuasion as communication and persuasion as manipulation. However, one specific tendency was noticed: specialists of Armenia perceived and discussed persuasion in some cases more from the manipulative perspective than Greek specialists. This fact is probably related to the fact that specialists in Armenia are more involved in suchlike activities taking into account the fact that the country is situated in a geographically problematic area and have a certain Soviet Union experience.

Those that described persuasion as an action-inducing approach held a very strong opinion about it: “the mechanism should lead to a specific action: purchase, call, order (1.4a., Marketing PROF, Armenia). Similarly, “...marketers do not feel deep down that everything they design is to produce action, whatever action, maybe to buy, to visit us, to go, to participate in a completion, to have a test drive... even to talk to other people, which is also an action” (2.4a., Marketing PROF, Greece).

Specialists from both countries highlighted that the use of persuasion on conscious or subconscious level is “situational” (2.3.a., PR PROF, Greece), “...spherical and depends on the target, as some argumentative

cues can be accepted subjectively" (1.3b., PR PROF, Armenia). Or, *"the process combines both: mostly the unconscious (give them reasons to believe) and then to satisfy the conscious"* (2.4a., Marketing PROF, Greece).

However, comparing the answers from the two countries, it seems that the code *conscious level* prevail in Greek professionals' responses more than in Armenia. Specialists from Armenia mentioned that the country is in a development stage, going through a generational change period. Marketing Communication as a profession has been in a way reinvented after the collapse of the Soviet Union; *"that is why this is a specialists' formation phase for the Republic of Armenia* (1.1a., Social Media PROF, Armenia). In contrast, the interviews with Greek professionals do not reveal the same approach.

What is common for both country specialists is that they emphasized the fact that professionals in their field do not understand much or use persuasion correctly. As one of the interviewees mentioned, *"they think very introspective, they are very inwards-looking, the only think that they think about, that is it going to look nice, liked by my CEO, win me an award, am I going to look cool when I meet with other marketing directors"* (2.4a., Marketing PROF, Greece). Similarly, *"it is a necessity for people working in communications not only to use persuasion but first to understand it deeply"* (1.2a., Advertising PROF, Armenia). Correspondingly, other professionals underlined the problematic parts and drawbacks while dealing with the issue, *"...need of specialists, professional team, practice; and the existing resources are not used productively"* (1.4b., Marketing PROF, Armenia). This leads to the discussion of the main problem, *"the fact that we don't have persuasion schools"* (1.2b., Advertising PROF, Armenia), and that, *"there is a need of specialized education in the related field"* (2.2a., Advertising PROF, Greece).

Discussing specific persuasion principles and ways of applying them, interviewees both from Armenia and Greece stated that the application process is complex, with a range of tools, that depends on several factors, such as *"...on an audience, product, and the level of creativity..."* (1.1a., Social Media PROF, Armenia). Comparing the two countries on neuromarketing, findings reveal that Greece is a step ahead of Armenia taking into account the fact that in Greece there are already several companies/agencies dealing with neuromarketing techniques. What is common in both countries though is the need expressed by professionals for further research in the field of neuromarketing. Few Armenian and Greek specialists, even though they consider it important, they do not accept it fully as a tool to be used. For example, *"the application of neuromarketing is a little bit frightening as it goes against the will of a customer* (2.1b., Social Media PROF, Greece), and, *"I think it is used for the products that there is no need to have them, in fact* (2.2a., Advertising PROF, Greece). In most cases where experts in both countries expressed skepticism towards neuromarketing, ethical concerns were the main reason. For other applicable tools opinions overlapped. What needs to be stressed here is that professionals from both countries proclaimed that, broadly taken, mass market persuasion platforms such as PR or advertisement, are less important than online marketing communications and even personal selling,

nowadays. Concerning objectives, the majority of participants emphasized informational, motivational or attitudinal (e.g. "top of mind", "top of heart") over behavioral-oriented objectives.

Among the six main persuasion shortcuts selected and presented in the scope of this research, communication specialists highlighted the extensive use of *authority and liking*. The use of the latter was more referred to the online environments such as company page likes, votes, comments, etc. In accordance, majority of participants stressed the importance of company's online presence nowadays. As for authority, it is the most often used persuasion technique by companies in both countries. Interviewees indicated that authority techniques such as use of experts, government officials, celebrities, etc. could help to assure customers' willingness to cooperate. Answers lead us to the point that marketing/consulting professionals are more into the action-persuasion than other fields of communication, "...without thinking in advance of persuasion, we cannot achieve it as it would a matter of luck, unfortunately though this not how the market operates or marketers are trained" (2.4a., Marketing PROF, Greece). Focusing on attitudinal rather than behavioral communication objectives was widely observed. Somewhat surprising, this was the case with social media professionals as well; this group highlighted the importance of "liking" than sharing, staying, interacting and engaging.

CONCLUSIONS

The importance of using persuasion methods in marketing communications to induce action cannot be overstated. Although this study found that professionals considered persuasion techniques inevitable and vital, most didn't use persuasion for leading customers to a specific action. The aim in most cases is for the brand to be top-of-mind or top-of-heart. This means that professionals' attitudes do not match their actions. In order for persuasion to be applied for behavioral purposes education, training and more research is needed to show to them how it is done. The ethical issue of persuasion, especially for neuromarketing, needs to be addressed effectively in order for adoption in the field to accelerate.

In an online environment is the first step, but unfortunately many companies stop there. "I have so many likes" is not the point; due to the online algorithms used by many online platforms, customer is not even seeing any update on their wall. Persuasion has to be applied in all the steps: professionals have to persuade the customer to like, to stay, to interact and engage. This is undoubtedly difficult, challenging, risky, energy consuming effort.

Practice of credible people/experts, endorsers works in practice but practitioners need to establish expertise, identify problems solved and search for fit between celebrity and the brand. And this is also related to social media activities, since in online platforms endorsers are closer to the target.

It is worth highlighting that some persuasion methods have been already used a lot and customers developed kind of immunity. Marketing communication professionals should always be looking for

creative, fitting and fresh ways of using persuasion methods. Without thinking in advance of persuasion, specialists cannot achieve on purpose but rather as a matter of luck.

LIMITATIONS AND FUTURE RESEARCH

The sample used in this study, although sufficient for achieving objectives, it cannot be considered representative for all marketing communication professionals, of Armenia and Greece. In regard to the effects of source credibility and message frame, future studies should involve larger samples in terms of size and geography and quantitative measures should be used to strengthen the current findings and acquire better view of the phenomenon under investigation. Also, as the focus was only on marketing communication specialists, future studies should include consumers' perspectives to present a more complete picture of persuasion, principles, methods and other related issues discussed in the research. In addition, this study raises many opportunities for future research in specific variables. For instance, what is the incremental effectiveness of each of the various persuasion techniques presented in this research and to what extent are these persuasion techniques important and how are measured by separately. The future will be very exciting and revealing indeed, concerning persuasion in marketing communications.

WHEN ASEA BECOME ABB – THE DECONSTRUCTION OF THE MYTH OF THE “SUPREMACY OF THE PLANTS”

Philipson, Sarah

Business Administration, University of Gävle, Sweden

ABSTRACT

Purpose – This paper aims to investigate how the dominating myths of a company changes.

Design/methodology/approach – The article is based on action research, and an analysis based on Marx and Gramsci.

Findings – In contrast to institutional theory and the individualistic so called top-echelon theories it is shown that top management is not necessarily in control of a company’s direction and that it is necessary also for top-management to liberate themselves from hegemonic minds that threaten company survival.

Research limitations/implications – This is based on a case, and more research is needed to generalize the findings.

Practical implications – Elements of how to play the political games of subcultural conflicts It is shown.

Originality/value – The article shows that top management is neither necessarily in control of the company and neither have a clear understanding how to gain control, but that such control can be achieved as a truce between subcultures of acceptable intentionality.

Keywords: *Subculture, Hegemony, Political process.*

BACKGROUND

In 1980 Percy Barnevik took over as CEO of ASEA, a Swedish Electrical Engineering giant (the only global competitor of General Electric). His lieutenant was Bert-Olof Svanholm. With Mr Barnevik as the strategist and Mr Svanholm as change manager, ASEA went through radical changes during the 1980s.

This article tells the story on how the myth of the competitiveness of the production of turnkey plants, as opposed to products and components (motors, generators, contactors, etc.) and services, was constructed and de-constructed.

During the realm of the predecessor of Mr. Barnevik, Mr. Nicolin, the company had become a very complex matrix organization with several “plant”-divisions, producing water power plants, atomic Innovation, Entrepreneurship and Digital Ecosystems

ISBN: 978-9963-711-43-7

power plants, steel iron foundries, etc. On the other side of the matrix, were producers of products and components going into those plants, as well as sold outside the company. There were also separate divisions for the service of these plants, products, and components.

During the leadership of Mr. Nicolin, the company "truth" was that the plant divisions were competitive and profitable, while the products and services divisions had limited competitiveness and profitability. Hence, the logical conclusion was to phase out the product divisions and concentrate all resources to increase the competitiveness of the plant divisions.

Mr. Svanholm came to question that. He saw a reverse logic.

This paper tells the story about the alliances between different sub-cultures that constructed the myth of plant supremacy. It goes on to tell how this was questioned and finally de-constructed and the new alliances of sub-cultures that made this de-construction possible. The "play" between the sub-cultures is dissected and analyzed.

METHOD

As one of three consultants working for Mr. Svanholm in the changes that took place between 1982 and the rest of the 80's, this case was conducted as action research by the author. The length of the work for the company and the character of the work did not allow the luxury of "theoretical saturation"; during the eleven years between 1983 and 1994, I made several hundreds of *formal interviews* and had some thousands *informal talks* with personnel on all levels, the most prominent of which were Bert-Olof Svanholm and the CEO's of ABB Motors, ABB Järnkunst, ABB Installations, ABB Truck, and the CFO of ABB Service. I also had talks with many of the union leaders. Notes were taken during the interviews, but they were generally not recorded and transcribed. Many *observations* were also made.

"...culture needs to be observed, more than measured, if organization studies is to advance."
(Schein, 1996b:229).

This *case study* (Eisenhardt, 1989; Yin, 1994) use multiple data collection methods (Eisenhardt, 1989). It is an example of *action research*, using a set of methodological approaches (based on Dewey, 1933; Lewin, 1946; and Argyris, 1993; all after Lüscher & Lewis, 2008).

"Action research is an iterative process involving researchers and practitioners acting together on a particular cycle of activities, including problem diagnosis, action intervention and reflective learning." (Avison, Lau, Myers & Nielsen, 1999:94).

Action research is not mentioned as one of the case study approaches in Eisenhardt's (1989:535) list of such, and has, according to Avison et al. (1999), not been used frequently in business administration,

but a query on Google Scholar found more than 57,000 articles published from 2000, with the cut between “action research” and “business administration”.

Action research also have the advantage of overcoming the limits of many studies of cultures:

“Even within sociology and anthropology, the disciplines most concerned with cultural matters, the published studies devoted to socialisation practices of groups, organizations, subcultures, societies, tribes, and so forth tend to be more often than not anecdotal, non-comparative, and based upon retrospective informant accounts of the process rather than the observation of the process *in situ*.” (Van Maanen & Schein, 1977:7)

The analysis method is a *dialectical analysis* of gradual change in positions, used by Marx in “The 18th Brumaire of Louis Bonaparte” (Marx and Engels, 1979). Marx analyzed the coup d’état of Napoleon III in 1852, as the result of changing alliances of different political parties, gradually shifting the political foundation of French society, making the coup d’état possible.

In the tradition of Gramsci (1929-1935/1971) it displays the consequences for company culture as the hegemony of plant supremacy is deconstructed and discovered to be mythical; eventually resulting in a new governing myth.

MINDS

Our senses continually receive an infinite amount of information. However intricate our brain, it can only interpret a minor part of this information. A part of growing up is to develop experience structures (“grids”), censoring our sensorial information, thus giving our brain a limited amount of information to interpret. These grids are built on our experiences and our earlier experiences, the grid itself. Limited experiences give us limited possibilities to interpret reality and to understand it. Together we call these grids and the experiences that have shaped it for minds. We use the concept mind in the meaning of Bateson (1980), as a concept for the whole as a unity of value system and reality. You have a certain value system, because you have a certain reality and the same value system will affect not only your understanding of reality, but also the way you change this reality. Minds consists of systems of common values and a, with these values coupled (cf. Thompson, 1967), reality, in the form of form of work tools, educational background, personality traits, etc.

Minds are generally very stable. New information is interpreted into the grid, rather than allowing the grid to be questioned. Information that questions the grid is suppressed or distorted. If you are forced to revise it, the revision is limited to a single mind or a few minds, not fundamental parts of the structure (Vygotsky, 1970). Without this inbuilt “conservatism” in human minds, we would, to a larger extent than is common, be “autistic”, because of an information overload.

A collective mind is the common tacit knowing (Polanyi, 1961, 1962, 1968) of a community of praxis ((Weick & Roberts, 1993; Wenger, 2000), a group of individuals, a team, who collectively perform a larger task in an institution and society. The collective mind is developed in the teams' performance of their collective task. When groups of individuals have similar minds and a common reality, they constitute a culture.

"Culture is the result of group problem solving. " (Van Maanen & Barley, 1983:3)

"...the nature of human work groups and their interaction with work processes; that is, how people are organized to accomplish work, how they interact with one another and with technology, and how they conceptualize work and understand the meaning of their actions." (Rouse & Baba, 2006:70)

VALUES

With values we mean the *existential* values (views of the world), out of which individuals and groups of individuals interpret reality and makes decisions. And the motivations of the employees, what gives them "kicks", (Schein, 1996).

VALUE SUPPORTING AND VALUE BUILDING REALITY

Techniques, control systems and other parts of firm reality are not value neutral, but built by people with a certain view of the world, their minds. This view of the world is mediated to the people that use the techniques and the systems and in certain cases transform their view of the world. The objects both embody our culture and tell its story to new generations (Marx, 1970:178; Schein, 1996).

SUBCULTURES

In larger organizations and in society there are always individuals and groups with different minds and hence different attitudes to proposed visions, strategies, and their organizational implications. These different minds have been developed in a historical process, where the groups' role in the organization, their education, their experiences, their working methods, and tools of trade (artifacts) have influenced the development of the minds of those making it up. In their turn, these tools of trade will express and embody the minds of these people. These artifacts become from those bearers of minds detached and materialized; cf. class or character masks (Marx, 1970I:178).

Within most organizations several different cultures, with different views of the world and different visions and goals for the organization, *different intentionality*, exist at the same time. These

subcultures show up in conflicts over working methods, motivation, and communication problems and in the worst cases as reciprocal mistrust (Schein, 1996).

“...we will define an organizational subculture as a set of organizational members who: (1) interact regularly with one another; (2) identify themselves as a group within the organization that is distinct from other groups; (3) share a set of problems commonly defined to be the problems of all; and (4) routinely take action on the basis of collective understandings unique to the group.” (Van Maanen & Barley, 1983:12).

“...commitment is more strongly related to perceived subculture (ward culture) than organisational culture (hospital culture).” (Lok, Westwood & Crawford, 2005:504).

“...the conceptualisation of the work and the understanding of the actions’ meaning are related to the values of a subculture that determine for example which tasks are perceived as more important than others.” (Niemetz, De Kinderen & Constantinidis, 2013:4)

This is consistent with the findings of Ahrens & Mollona (2007:328):

“Organisational members can be shown to enact organisational subcultures through practices of control by combining heterogeneous materials and bodies of knowledge.”

HEGEMONIC CULTURES

The dominance of a culture, verbally, visually and emotionally in formulating the agenda of the époque and the responses to that agenda, can make other cultures unable to formulate independent strategies. This means that the dominating culture has a hegemonic (Gramsci, 1929-1935/1971), influence over other cultures.

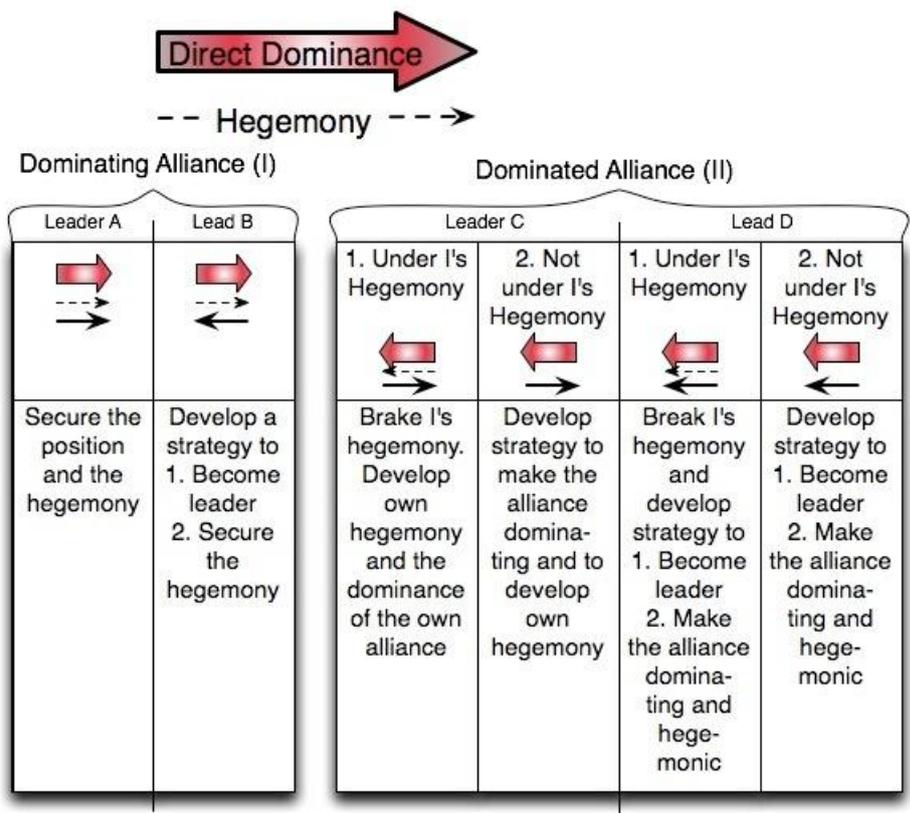

“...the subtle and sophisticated ways managers "manage meaning" to obscure employees' real choices.” (Sinclair, 1993:68)

Hegemony is the blocking of the cultural independence of other groups. They develop a collective “mental illness”, in the sense that they are unable to act out of their own interests, instead formulating those in the terms of the hegemonic culture; within the frame of the interests of the hegemonic culture. E.g.: up until the mid 1960’s, IBM educated almost all computer users in the world. These users later became the teachers of the next generation of computer users. IBM came to formulate what a computer could be used for, and how this should be done. IBM defined the thinking about computers, in such complex interlaced minds that all other suppliers found themselves playing on the “home turf” of IBM. Always, away matches! Their competitors were still unable to pursue wholly independent strategies in the 1980’s. Either they lived in symbiosis, as *subsumed* (cf Bettelheim, 1970) allies to IBM, as most software developers (MSA, IBS, e.g.) or as parasites, but still in the whole subsumed allies (for example producers of PC-clones). Digital Equipment had an independent line but lost it, eventually

being bought by HP. Others tried to formulate an independent strategy, but were forced to give up, but would try again soon (Apple).

Figure 1. A five-megabyte hard drive is shipped by IBM, 1956 (Mundo, 2016-06-30)

“...organizations [are] beset by conflicts of interest between subgroups possessing alternative ideologies and interpretive systems.” (Van Maanen & Barley, 1983:14)

Figure 2. Strategic Position (Philipson, 1970; Philipson & Oghazi, 2013).

POSITION AND STRATEGY

With position is meant where in “power game” you are. The tactical task is radically different, depending on the position, Philipson (1980:86-90).

If we are not power oriented (the negative aspect of power), we are only engaged in this political game of positions, this tactical maneuvering, as an instrumental activity (McClelland, 1971). It is necessary to become leader in a domineering alliance to fully realize our interests., to become empowered. And when in power, it is suitable to become hegemonic in this position, to defend our interests.

The real difficulty arises when we have to choose between being subsumed in a dominating alliance and being leader in a dominated alliance. Often this is a warning bell that we are subsumed under someone else’s hegemony, hence formulating our understanding of the conflict wrongly.

MYTHS AND MINDS

“Myth provides a set of ideas which enable humans to answer the most vital questions, socializes the individual, and guides him or her towards maturation (Bowles, 1989, after Campbell, 1976).” (Dobosz-Bourne & Kostera, 2007:62).

This way of using myth is akin to my use of the concept of culture, especially a hegemonic culture that provides the governing minds. The ABB-ASEA case shows how the governing minds changed to be replaced by new governing minds, as the alliances of different sub-cultures evolve. Depending on if these are suitable to the economic realities of the époque, these minds are at the time and in hindsight viewed as positive or negative. Whether viewed one way or another, this judgment is only *transient*, as they will not function as governing minds for more than a limited time.

ASEA, PHASE 0

In 1980 Percy Barnevik took over as CEO in Allmänna Svenska Elektriska Aktiebolaget (ASEA), a Swedish Electrical Engineering giant. His lieutenant was Bert-Olof Svanholm, later to become chairman of Volvo and of the Swedish Confederation of Employers, until he met a premature death in the 1997.

In the beginning of the 1980’s ASEA had a matrix organization. This meant that goods were produced in product divisions (motors, generators, contactors, etc.) and so-called plant divisions (metallurgy, power distribution, ASEA-Atom, etc.).

The ideology of ASEA was “central planning”: Centralized information should give the central management possibility to make the “right” decisions.

ORGANISATIONAL SCLEROSIS

Mintzberg (1979) pointed out that the theory of “the Economic Man” has spread the myth that information can be broken down into small parts, “atoms” (called “data”), which are sent to centrally placed decision makers. At the head-quarter data is re-assembled and transformed into a “rational” basis for decision-making.

Taylor’s “Scientific Management” (1911) presumed that production should be organized in the simplest possible division of individual operations. This made possible the mechanization and automating of most elements of work, also conditioning the workers as only arms and legs of production. The division of labor presupposed an “Economic man”-mindset, top management having the intelligence. In a more and more advanced production, where the workers must have engineering competence on university college or university level, this mindset has given industry urgent problems in recruiting and motivating workers.

Since reality is not that engineered, but considerably more complex (Lindkvist, 1979:8), this myth has legitimized the development of the big centrally planned bureaucracies, whether the state-planned bureaucracies of Eastern Europe in the 1900’s, or bureaucratic decision-making structures of big corporate enterprises. Both Lenin and Ford had Taylor as their idol.

In the same way that the centrally planned Eastern European societies today have died of elephantiasis, many private corporations are threatened by their own irrational rationality, often called inertia.

To meet this development, some corporations try to break up their organization; by forming separate business areas and companies, by forcing certain unites of the corporation to sell their services internally and by sometimes enforcing absolute limits for how big unites are allowed to become before they are broken up.

To interpret the information gathered at the central head quarters, they needed a large centralized technostructure (Galbraith, 1967; Mintzberg, 1979), cf. also Gramsci’s (1929-1935/1971) concept of “cadre”.

During the 1960’s and the 1970’s a pattern had evolved in ASEA, where the civil engineers of the technostructures for construction (design), pre-production, and sales, together run the company in anonymous “process-like” decision-making, in practice making top management very weak.

Products and turn-key plants were sold by ASEA Svenska Försäljning AB, ASF, in Sweden and by sales subsidiaries outside Sweden; they were designed by a central construction *staff*; their pre-production *structure* and the production *processes* were developed by a central production staff. A central replenishment unit bought *integrated components*.

The sales companies lived on commissions, which made plants more interesting as a business than simple standard products, demanding many small sales to give the same commissions as a single plant. However, the sale of plants demanded complex design, material supply and production systems to deliver quotes rapidly and correctly.

“Research cautions that strong organisational cultures tend to uphold conformity and drive out dissension producing "strategic myopia" and rigidity (Lorsch, 1985; Bourgeois, 1984), inhibiting the organisation's capacity to scan its environment, to anticipate and respond to the rapidly changing needs of customers and other stakeholders.” (Sinclair, 1993:67)

ABB, PHASE I AND II

To optimize their revenues, ASEA Svenska Försäljning, ASF (the largest sales unit), saw the need of making the design of plants rapidly, in order to respond to inquiries quickly. To that end, ASF supported the growth of a design technostructure. To guarantee the fastest possible delivery, they needed an accounting system that could block the necessary products and components in the stocks of the product divisions. In the first phase ASF was the leader of a dominating alliance. But the design technostructure rapidly rose to supremacy, because of the immediate effects on and structural dominance of pre-production, replenishment and divisions.

The company developed advanced design, material replenishment, and production systems in an IBM 43xx-environment (mainframe computers).

The systems, and the profit calculation model used, became governing minds (Bateson, 1980) for the whole company. Through these, the minds of the central technostructure became hegemonic (cf. Gramsci, 1929-1935/1971).

With such systems it became easy to create *variants* of existing products, at a lower price than most competitors. For the sales organization, this gave the possibility to let the clients to “talk themselves into a Christmas tree” of functional wishes, making ASEA the only possible fulfiller of these Christmas tree needs. Since the product became unique, you never had to discuss the price of the product, selling became relatively “easy”.

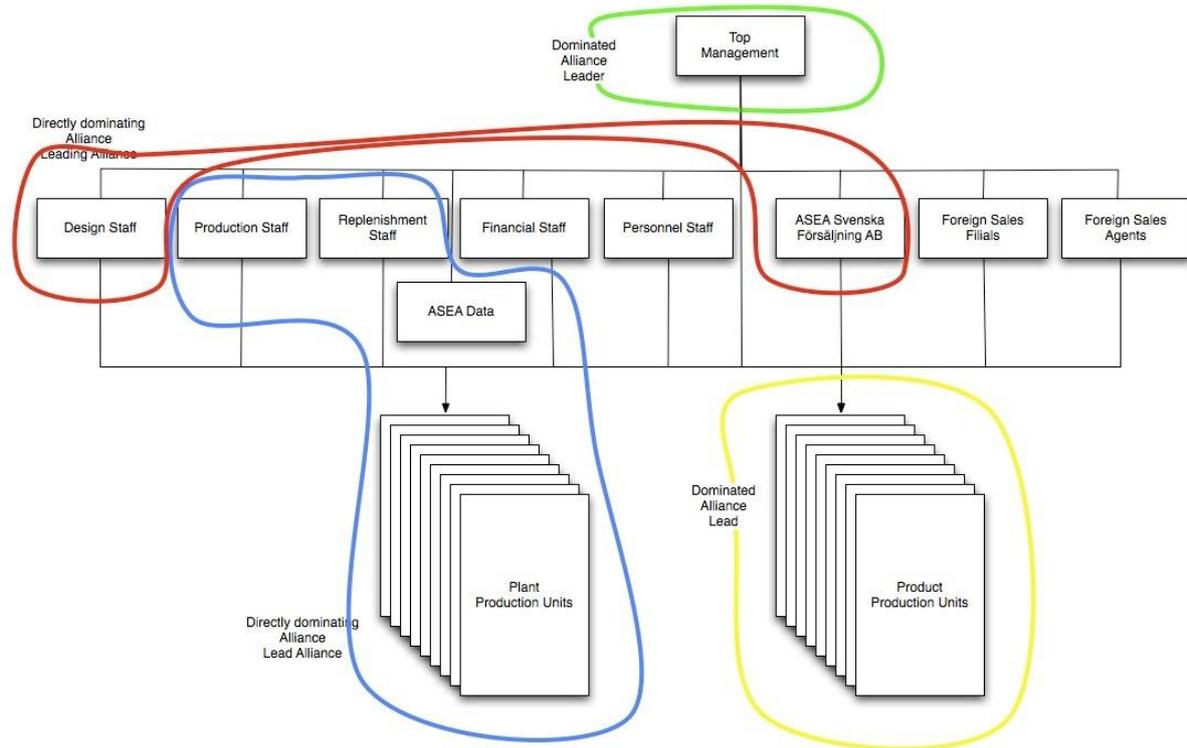

Figure 3. Alliances under Nicolin, own.

ABB, PHASE III

The problem for ASEA was that all products became unique; the firm did not reach economies of scale. The standard products became expensive, because they were imposed with heavy “overhead costs”, because of expensive systems and the large technostructure. When the markets no longer were the sellers’, as the had been from the end of the IInd WW until the 1973 oil crises, clients reacted on the high prices, and the sales of standard products and total profits declined.

The design and sales minds in alliance were hegemonic over top management, as well as over marketing and production.

ABB PHASE IV

To begin with, top management didn’t understand what happened. The governing minds had it that plant divisions were more profitable than product divisions. Demands that standard products really had to be standardized, were met with the idea that the clients requested “Christmas trees”, else they would not buy. When in 1983, I interviewed the CEO of ABB Motors, a product company with production and marketing, but not sales, responsibility, the CEO sincerely believed that the only relevant information about the needs of the clients were that the demand was a statistical distribution of tap height and motor effect.

Using formal power, the new top management dissolved ASEA Svenska Försäljning, giving the plant and product divisions' full responsibility for marketing and sales. The centralization paradigm still reigned, by a reinforced alliance between ABB Construction and ABB Data. We tried to weaken it, by implementing mini-computing instead of main frames at divisional level. It was difficult to get a break-through, but at the end of the 1980's, most divisions had taken control of their own computing. By making divisions more independent – certain even became independent companies - the top management tried to break up the hegemonic alliance. It became evident that the product divisions were the most sustainable. Already in the latter half of the 1980's most plant divisions had been sold, closed-down, or shrunk.

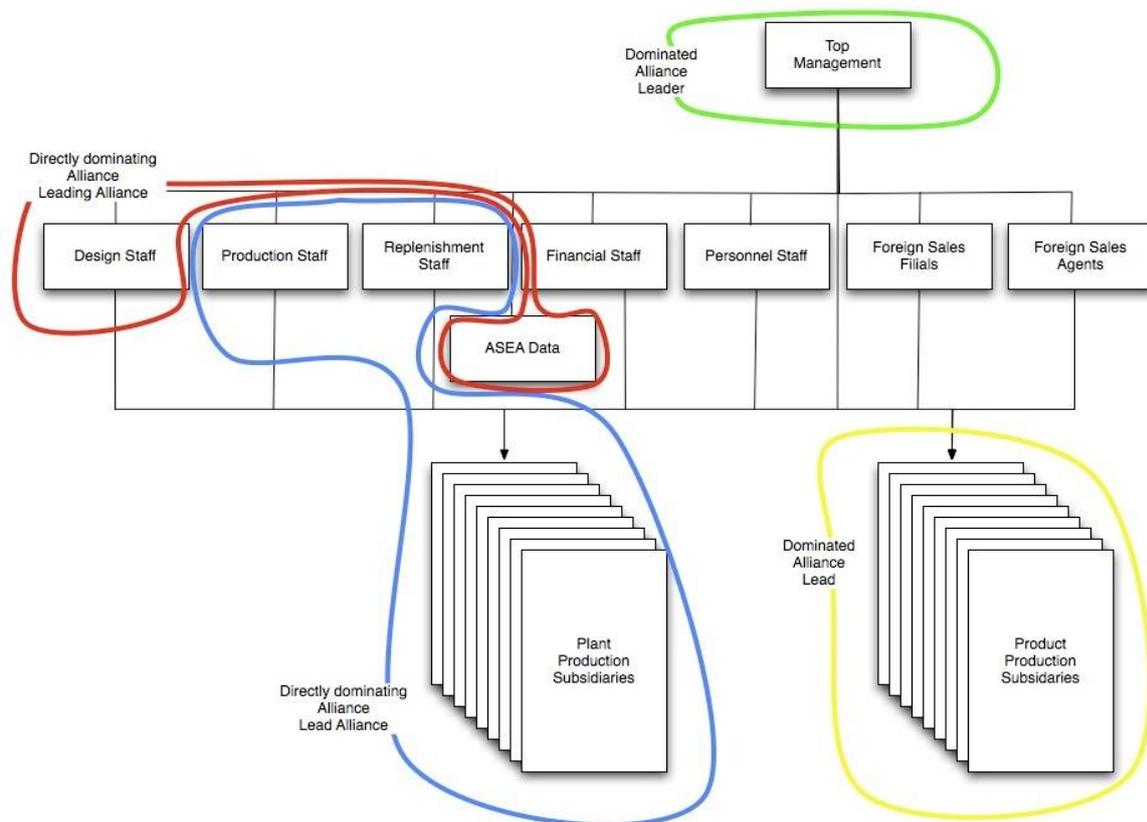

Figure 4. Alliances under Barnevik own.

“The first step is to develop an understanding of the "native" subcultures (Gregory, 1983), of the terrain of existing ethics and values and the points of difference. In identifying areas of controversy, points of potential consensus are developed or a cohesion profile (Arogyaswamy and Byles, 1987)... Finally, the organisation needs to devote considerable resources to working out how various subcultural practices and norms are to be reconciled without compromising core values and ethics.” (Sinclair, 1993:70).

ABB, LA SUITE...

Many of the problems still existed, but now on a subsidiary level. Many subsidiaries were unable to throw out old computer systems, and reality was often un-transparent for the management of these subsidiaries. Often, they themselves built big central staff, resulting in too large overhead-costs.

However, by viewing subsidiaries as “portfolio investments”, the level of control increased for ABB’s top management..

CONCLUSIONS

We have shown how the governing minds in a larger company are the result of the “power-play” between different sub-cultures, all with their more or less well-formulated agenda for the future of the organization. Depending on structural, political, and economic shifts, the alliances of such sub-cultures results in different governing minds, the manifestations of a hegemonic subculture. This contradicts the prevailing view of top management as rational or even bounded rational decision-makers *in control* of the company as in “upper echelons theory” (Quigley, & Hambrick, 2015), and also the conventional wisdom of institutional theory that holds that

“Formal organizations are generally understood to be systems of coordinated and controlled activities...”, but “...decrease internal coordination and control *in order to maintain legitimacy*. “ (Meyer & Rowan, 1977:340) [our highlight]

Instead alliances of subcultures install a hegemonic view of the *acceptable intentionality* of the company.

MANAGERIAL IMPLICATIONS

Sub-cultures have to be analyzed and the minds with which it is possible to be allied have to be identified and strengthened, and minds that are threatening company survival must be “eliminated”. The “political” process of managing such processes demand skills of transformational or transactional leadership. However, the very idea of transformational leadership is to impose a hegemonic mind, which might be successful in the short run, but might become disastrous in the long run (Gramsci, 1929-1935/1971; Levitt, 1960; Hedberg & Jönsson, 1978).

INTERNAL RATING SYSTEMS: THE PROCYCLICALITY OF BANK CREDIT AND NON-PERFORMING LOANS

Pia, Patrizia; Damilano, Marina; De Vincentiis, Paola; Isaia, Eleonora

Department of management, University of Turin, Unito, Turin, Italy

ABSTRACT

The procyclical effects of capital regulation and the quality of IRB models in measuring credit risk are topics of the utmost interest. The first question is whether the rules established by the Basel II Agreement, which are more sensitive to the risk exposure of the bank's portfolio, can expand fluctuations in the economic cycle. The second question is whether the IRB method can actually measure the credit risk, either avoiding or attenuating the weight of non-performing loans.

This paper makes use of data concerning Italian banks to ascertain whether the use of IRB methods has had a quantitative and qualitative effect on the provision of funding in the period 2010-2014.

The analysis carried out underscored the fact that banks that have implemented internal rating models present a greater credit crunch. Said crunch was more intensive for those who adopted the basic IRB approach, rather than the advanced one, and for larger banks. At the same time, banks that adopted IRB methods had a larger number of non-performing loans.

Keywords: *Internal rating, Procyclicality, Non-performing loans, Bank credit, Risk management*

INTRODUCTION

The increased procyclical nature of banking activities is an unpleasant consequence of regulatory innovations on the adequacy of banks' own funds and of the very rationale that underpins credit risk management. The basic difference between the Basel I and Basel II Agreements concerns the introduction of weighted capital, which is extremely sensitive to the risk presented by the loans portfolio. The former weighting system, which was based on statistical coefficients attributed to each exposure category, has been replaced by ratings that correspond to the creditworthiness of the individual counterparties. Two types of weighting methods are envisaged, as decided by the bank, namely the standard method, based on the rating opinions formulated by agencies acknowledged as suitable by supervisory authorities, and the internal ratings-based (IRB) approach. The latter allows banks to develop their own rating systems, which are validated by the supervisory authority. Hence, the possible procyclical consequences do not only trigger from non-performing loans (Basel I) but also

from performing loans (Basel II), whose creditworthiness has deteriorated. Moreover, internal ratings usually defined by banks have a tendency to lean towards the point-in-time (PiT) model. The increase in the loans portfolio riskiness recorded during a period of recession corresponds to a significant and sudden increase in the migration of counterparties from the best rating categories to the worst ones. The models used by rating agencies, instead, estimate the risk of default over a period that covers the entire economic cycle (through-the-cycle - TTC). In this case, the changes in the portfolio's riskiness resulting from cyclic effects do not entail immediate variations, thus limiting the volatility of capital requirements. The change in the credit offer, determined by the need to meet capital requirements, has been extensively documented and quantified by scientific literature, so much so that the new Basel III Agreement has established a dedicated corrective intervention to limit the volatility of capital requirements. Instead, empirical checks performed on procyclicality related to the adoption of more advanced rating systems are still limited. The increase in procyclicality resulting from the adoption of assessment methods that are more sensitive to risk might be a minor cost, if the methods in question could correctly estimate the default rates. In other words, a banking system that can correctly and promptly assess the riskiness of its portfolio can temporarily expand the economic cycles but it should also be able to attenuate the negative effects of the recession on the quality of the credit portfolio. This paper has two objectives, which are closely related. The first is to ascertain whether, during a recession period, the banks that implemented internal rating systems provided less credit than the amount granted by banks that relied on standard rating systems. The theory described below is that the credit crunch implemented during a period of recession is more intensive when internal rating systems are adopted that, besides mainly referring to the PiT model, are more structured and stricter. Indeed, the validation of internal ratings entails the adoption of a credit provision policy that is closely related to the outcome of internally formulated ratings, with limited override options. The second objective is to ascertain whether the banks that adopted the most sophisticated risk assessment methods have experienced a lower incidence of non-performing loans or of problem credits than those who did not use them. The paper is organised as described below. Section 2 summarises the literature regarding the procyclicality resulting from capital requirements and from the implementation of internal ratings, and the effects on the quality of credit. Section 3 describes the sample used. Section 4 presents the method used for the two questions, while section 5 illustrates the results obtained by each econometric processing method. Section 6 closes with some considerations.

LITERATURE REVIEW

The procyclicality of the financial system and the subsequent variation in credit provisions is an endemic phenomenon, regardless of capital requirements (Lowe 2002; Amato and Furfine 2004).

Capital regulation should impact financial stability, both by discouraging banks from taking excessive risks—though empirical analyses have not reached a unanimous conclusion in this regard—and by allowing them to better absorb losses. Gambacorta and Mistrulli (2004), for instance, observe that well-capitalised Italian banks have been able to preserve their relations with clients by better absorbing the temporary difficulties of parties that relied on them in the period 1992-2001. The analysis conducted by Kapan and Minoiu (2013) reveals that, when faced with market-related shocks, banks that had a lower financial lever reduced their loans to a lesser degree than others. Extensive literature has focused on the progress of the credit offer after the enforcement of stricter capital requirements. Francis and Osborne (2012) observe that the gap between the current and the desired capital ratio has significant negative consequences on the credit offer. Aiyar et al. (2014) test whether the variable capital requirements enforced by the British regulator have any effects on the credit offer. They provide evidence that banks subjected to stricter capital requirements reduces the growth rate in real lending. By analysing the loans provided by French banks during the transition period from Basel I to Basel II, Fraisse et al. (2015) measure the variation in credit provided to companies based on capital requirements, and estimate that a 1% increase in capital requirement entails an 8% reduction in loans. Instead, some studies identify positive relations between capital requirements and the credit offer. In particular, Bernanke and Lown (1991), and Berrospide and Edge (2010) detect a slight increment for US banks when they estimate the impact of capital on the progress of loans. Several analyses enhance the fact that relations between capital requirements and the credit offer are not linear. Albertazzi and Marchetti (2010) underscore the fact that only the credit offer made by Italian banks has become stricter with a low capital endowment during the crisis period 2008-2009. Carlson et al. (2013) show that the variation in capital ratio has a greater impact on loans when it is low, rather than when it is high. Bridges et al. (2014) use an extensive dataset from the Bank of England for the period 1990-2011. The study shows that the variation in capital requirements triggers heterogeneous reactions in terms of credit offer related to the various economic sectors.

Relatively few studies have focused on the possible effects on the credit offer resulting from the adoption of internal rating systems, and are mostly based on simulations as the actual data were not available at the time. Carling et al. (2002) suggest that adopting internal rating systems for the leading Swedish banks in the period 1994-2000 would have increased their sensitivity to the credit risk of minimum capital, and enhanced the procyclical trends of the banks. Altman et al. (2005) state that the procyclical effects of the Basel II Agreement can be stronger when the banks use their own LDG estimates (Advanced IRB). Catarineu et al. (2005) claim that the banks prefer to implement internal rating models following the point-in-time approach because it is more precise, rather than the through-the-cycle approach, which is less procyclical. Repullo and Suarez (2008) claim that the banking industry

uses internal point-in-time ratings, which entail a capital endowment that is closer to the actual riskiness of the portfolio. An international comparison, conducted on the budgets of 1,380 banks in 76 countries provided by Bankscope, underscored the fact that, in terms of aggregate, during the 2007-2012 crisis, the adoption of the Basel II Agreement had no impact on the credit offer for companies. But subsequent tests reveal that the interaction between the implementation of new requirements and the size of the banks entailed a growing reduction in loans as the size of the providers increased. In particular, 20% of the leading banks had implemented a more than 3% credit crunch. The authors attribute this result to the fact that the larger banks prevalently relied on internal rating methods rather than on the standard one (Mascia et al. 2015). The latest literature that analysed the capacity of scoring techniques and/or of the framework of the Basel II to assess the riskiness of the portfolios is prevalently consistent in expressing negative opinions. Berger et al. (2005) have underscored the fact that the automatic use of these procedures entails higher default rates of loans granted than those experienced by the banks that use scoring techniques in a complementary manner to other tools. The authors deem that the automated processes encourage an increase in credit provisions to marginal clients, who are more profitable but also more risky. Once again Berger et al. (2011) observe that the scoring techniques to grant credit to small companies are associated with an increase in the funds provided but is unable to influence the quality of the loans portfolio. According to De Laurentiis and Maino (2010), the underestimation of the default rates is due to problems of calibration and assignment of IRB models, and to the indiscriminate use of the same model for different purposes. The excellent properties for a rating system for management purposes contrast with those hoped for in an IRB for regulatory purposes.

STATISTICAL DESCRIPTION OF THE SAMPLE

The sample is an unbalanced panel made up of 89 Italian commercial banks that formed joint-stock banks, and which conducted business, without interruption, during five years (2010-2014). It was decided to narrow the analysis to the sample of only joint-stock banks because, despite the small number of subjects observed, it is the group that most represents the dimensional variety of the Italian banking system. Conversely, the analysis of the whole banking framework would have entailed the inclusion of hundreds of cooperative credit banks that, by their very nature, do not use the IRB methods, thus attributing an excessive weight to minor banks and subsequently affecting the significance of our results. Subjects to be observed were chosen starting from the Association of banks authorised to work in our country. The Association was established by Banca d'Italia, and included 172 joint-stock banks on 31 December 2014. Only 96 of these were classified as commercial banks and acknowledged as fully operative between 2010 and 2014. Finally, after removing subjects who

presented an abnormal progress of the “credits” variable mainly due to the new entity established during the five-year period examined, the above sample of 89 banks was defined. Before discussing the temporal evolution of the key variables of our econometric analyses, it can be useful to discuss, in detail, the knowledge of the main morphological characteristics of banks that form the panel. To this end Table 1 offers a photograph of the sample taken on 31 December 2014 and compared with that of the entire Italian banking system on the same date.

	Sample	System	Representativeness of the sample
No. banks belonging to a group	66	150	44%
No. independent banks	23	513	4%
No. desks	17.931	30.740	58%
No. employees	185.051	299.684	62%
Deposits	683.290	1.369.230	50%
Loans	887.018	1.754.322	51%
Non-performing loans	98.461	197.127	50%
Deteriorated credits	178.578	349.763	51%
Active total	1.543.305	2.957.103	52%
Assets	135.646	214.210	63%

Table 2 – *The dependent variables: some descriptive statistics (data in thousands of euro)*

Table 3. Let us now explore the evolution of the key variables of our model in the course of the five-year period 2010-2014 with the assistance of some descriptive statistics. In the first place, data in Table 2 show a rising progress of the credit portfolio until 2012 (+6.5% compared to late 2010,) followed by a

clearer crunch for two years (overall -10% in the period 2013-2014). Analysing the individual descriptive statistics, we notice an increase, however small, in the median data in 2014 after four years of an uninterrupted slump (that is further confirmed both in the greater value of the minimum exposure and in the lower value of the maximum one), while the variability of the credit portfolio, compared to mean data, shows a fluctuating progress in the course of the five-year period, reaching its lowest in 2014. Conversely, the progress of deteriorated credit features a positive trend throughout the entire period analysed, both in absolute terms and in relative terms, and all the statistics describe a growing phenomenon that gives due reason for concern.

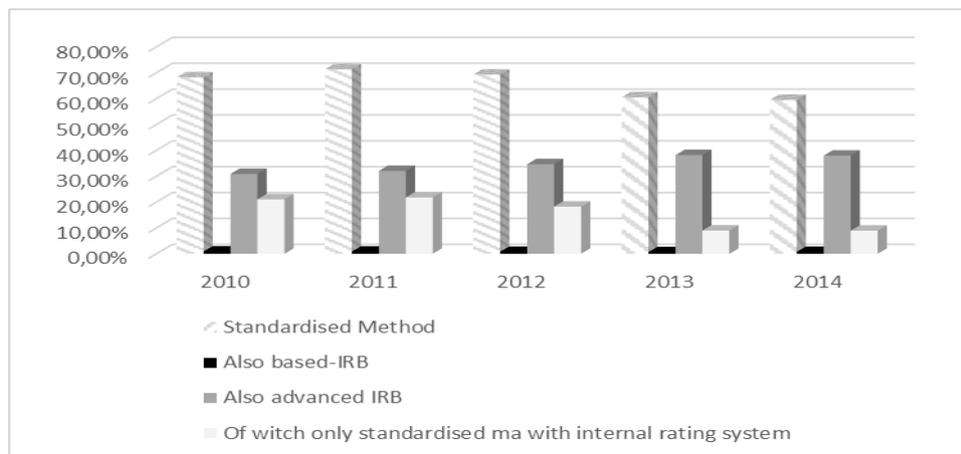

Figure 1 - Evolution of systems adopted to measure the credit risk (data by portfolio quotas)

To ascertain whether, during the 2010-2014 recession, the use of internal rating systems could have emphasised the credit crunch phenomenon, compared to the adoption of standard risk measurement systems, and also to test the greater reliability of internal ratings, compared to more discretionary methods, the multivariate analyses carried out on the sample of 89 commercial joint-stock banks were performed using as main independent variables the adoption or not of a validated internal rating system as a precautionary supervisory tool, namely the application of an internal rating system only for management purposes. Figure 1 completes the statistical description of the above banks in terms of methods adopted to measure exposure to the credit risk, the counterpart and the subsequent allocation of capital. To ensure correct interpretation of the results, the graph presents the distribution of risk measurement systems on the total portfolio, instead of by number of banks.

METHOD

Regarding the first research question, namely the assessment of the impact of greater “industrialisation” of the credit providing process on the volume of loans provided by the bank—the dependent variable used is the annual percentage variation of loans allocated to clients.

The main independent variables considered include:

- a) The adoption of an internal rating system that is validated for precautionary supervisory purposes - the expected sign of the variable is negative. We expect a bank that has a structured and quantitative system to measure the credit risk to become stricter regarding loan provisions at a time of crisis in order to face an aggravation of the economic-asset indices of clients. The variable is developed in three versions, precisely a dummy version with value 1 associated with the presence of a validated rating system (DUMMY_IRB); a percentage value that is equal to the exposure quota that is assessed through the IRB method, rather than through the standardised one (PESO_IRB); two percentage values equal respectively to the exposure quota assessed with the basic IRB method and with the advanced IRB method (PESO_IRB_BASE and PESO_IRB_AV). The subsequent adjustments of the variable allow to represent not only the presence of an internal rating system but also the progressive extension of the degree of use and of the complexity of the IRB method at growing quotas of the credit portfolio.
- b) The adoption of an internal rating system only for management purposes (RATING_SOLOGEST) - the expected sign of the variable is once again negative for the same reasons stated in the previous point. But, in this case, we expect relations to be less clearly defined because a non-validated rating system can more easily contain a more intense qualitative component or envisage a lesser degree of automation applied to decisions regarding loan provisions.
- c) The capital strength of the bank, measured through the total capital ratio, recorded during the last year (TCR) or the previous one (LAG_TCR) - the expected coefficient of this variable is positive, since the banks presenting the highest capital strength should be more inclined to expand the uses or at least to contrast them less. The tier 1 ratio, recorded both in the year examined (TIER1) and in the previous one (LAG_TIER1), and the equity multiplier (EM), calculated as ratio between the active total and the net assets, were also used as an alternative to the total capital ratio, always to indicate the degree of capital strength of the bank. The latter indicator, which is purely based on accounts and on active weighting, allows to purify the effect of the risk measurement method adopted on the assets indicator.
- d) The weight of deteriorated positions on the total exposure to clients, once again recorded for the current year (DET) or for the previous one (LAG_DET) - the expected coefficient is negative in this case. In fact, we expect a bank that puts the credit obligation on non-accrued status to become highly selective by narrowing loan provisions to a greater extent.
- e) The variation in deteriorated cases during the year (DELTA_DET) - the expected coefficient is negative since it is reasonable to expect a bank, faced with an increment in the amount of critical cases, to adopt a more cautious attitude towards new loan provisions.

The various analyses have also tested some additional control variables, such as the size of the bank, indicated by the ratio between the active total and the mean value of the sample of banks considered in the specific year (ATTIVO_MEDIA), the fact that the bank belongs to a group (DUMMY_GRUPPO), the profitability level of management, measured in terms of return-on-assets (ROA), and the quota of corrected deteriorated positions (NETTO_LORDO). Moreover, regressions have all been estimated with fixed temporal effects to take into account a series of common factors of the macro-economic context that have affected the business of the banks considered during the extremely challenging time interval considered.

The second part of the research question will measure the efficacy of IRB systems in the client selection phase, limiting the credit risk. The research theory is based on the assumption that, if highly structured and sophisticated systems ensure a more precise assessment of the riskiness of providing loans, they should allow a better quality composition of the credit portfolio. Hence, we expect the banks that adopt validated internal rating systems to present a lesser burden of deteriorated cases, compared to banks that use the standard measuring system. The analysis of relations between IRB systems and the quality of credit portfolios was conducted by taking into account both the stock and the gross deteriorated credit flows to clients, within which context non-performing loans play a considerable part. The dependent variable was, therefore, developed in four versions, namely the logarithm of the gross deteriorated credit to clients (LN_DET); effect of deteriorated credit on total credit to clients (INCID_DET); the decay rate of deteriorated credit (TASSO_DEC_DET); and the decay rate of non-performing loans (TASSO_DEC_SOFF).

The main independent variables considered include:

a) The adoption of a validated internal rating system (PESO_IRB), measured by the ratio between the exposure quota to the credit risk (gross credit to clients) assessed with IRB methods and the overall exposure. The expected sign of the variable is negative, since the statistical-quantitative measurements should lead to more precise assessments of the potential borrowers and to the choice of less risky clients. The same variable was also tested in the dummy version (use or not of IRB systems), consistently with what was done for the first research question.

b) The adoption of an internal rating system for management purposes (RATING_SOLOGEST), to verify whether, even without validation, the internal models affect the overall quality of the credit portfolio. the expected sign of the variable is once again negative for the above reasons.

c) The size of the bank, given by the logarithm of the active total (LN_ATTIVO) or by the ratio between the active total of the bank and the mean of the system for the reference year (ATTIVO_MEDIA). We expect the regressor LN_ATTIVO to be positive, since, reasonably, the leading banks have overall exposures in absolute value that are more consistent. Instead, a negative sign is

expected for the ratio (ATTIVO_MEDIA) because smaller banks should be more exposed to the economic cycle and suffer a lesser diversification of the portfolio, thus recording a budget with a higher incidence of deteriorated credit.

d) The profitability of the bank, expressed by the typical profitability indicator (ROA), whose expected sign is negative, since higher profitability should lead to containment of the deteriorated credit. An additional variable was then tested, given by the ratio between the margin of interest and the intermediation margin (MIS_MIN). It allows to gauge the contribution given by loan provisions to typical profitability. In this case the expected sign is positive, since a bank that is more oriented to the traditional activity of credit intermediation is naturally more exposed to the credit risk. However, there is another possible explanation. The positive sign might, in fact, also be justified by a higher interest margin resulting from the bank's position in a client category that is more risky and which, in adverse conditions, generates a more significant deterioration of exposure.
