e) The fundraising policy (or the liquidity status) of the bank, summarised in the ratio between credit provided to clients and deposits made by clients (LOAN_DEPO). This variable proposes to detect the relations between resorting to deposits as a source of stable and non-burdensome supplies and the caution/aggressiveness of the loans policy. The variable is expected to be positive. In fact, we expect the fundraising capacity on the markets and, hence, the lesser dependence on deposits, to increase the resources available and allow credit expansion. The greater exposure, in periods of prolonged economic crisis, such as the ones studied, leads to an increase in credit-related 'diseases,' since the beneficial effect of diversification is deficient, even when it is present. Besides the above variables, a series of other factors that are, however, not significant, were then tested. These include the level of capital strength of the bank, measured in terms of net assets, of supervisory capital requirement, and being part of a group, either Italian or foreign. Instead, taking into account the macroeconomic factors of the context, which have affected the credit-related activities of banks and the growth of deteriorated exposures, regressions were conducted with fixed temporal effects as in the first research question. Finally, since it has become necessary to manage the outliers, 2% of extreme observations were winsorised, corresponding to values that are about 3 standard deviations away from the mean.

RESULTS

Table 3 summarises the most interesting results of the analyses performed regarding the volume of loans. Consistently with expectations, a first result is the strong negative correlation between the burden of the deteriorated positions and the rate of variation of the credit portfolio. In fact, it is quite

reasonable for a bank that is burdened by non-performing loans to limit the provision of new loans more intensively than a competitor who presents a portfolio that is less deteriorated overall, especially in an extremely negative economic moment. The variable that measures the variation in deteriorated positions during the year is also negative and strongly significant. Hence, a sudden increase in problematic positions leads the bank to implement a credit crunch. The reduced provision of new loans could also be combined with the effect of sales of quotas of the loans portfolio through securitisation operations to recover liquidity. Unfortunately, considering the database available, we are unable to distinguish the two effects. Instead, regarding the degree of capital strength, the variable is not significant in any of the alternative specifications adopted. This applies both whether we consider the regulatory indices—total capital ratio and tier 1 ratio—and whether we use an accounting measure, such as the equity multiplier. The question slightly changes if, along with the total indicator, we were to introduce a mean square deviation. In this case, the degree of capital strength is positively related to the variation in the portfolio of credit provided to clients. But the negative mean square indicates that, above a certain level, the additional availability of assets does not have a positive effect on the loans policy. We must also note that the statistics of significance of coefficients are rather low for both variables. Regarding the impact of the risk measuring method adopted, all cases confirm that the adoption of a validated internal rating system is negatively related to the variation in credit provided to clients. The effect is already obvious when we consider, in case (1), the phenomenon dichotomously by comparing banks that have applied a validated internal rating system against those which, instead, only use the standardised method for the regulatory assessment of exposure to the credit risk. The link is more obvious if we consider the quota of assets that is evaluated by a basic and advanced IRB method, respectively. Indeed, it must be said that the risk assessment performed with internal methods rarely involves the entire loans portfolio. Generally, a quota of the assets is, anyhow, assessed with the standardised method, while a part, which usually increases in time, is evaluated with internal methods. In cases from (2) to (4), we note that both the variables IRB_PESO_BASE and IRB_PESO_AVANZ are strongly significant, and present the expected negative coefficient. The progressive extension of the assessment through internal rating at growing quotas of the portfolio is accompanied, during an economic crisis, by an enhanced credit crunch. Observing the value of the coefficients of the two variables, we notice that the stronger effect is related to the weight of the basic IRB. Always concerning the topic of risk assessment methods, the adoption of an internal rating system for purely management purposes, hence without applying regulatory validation, has no statistically evident effect on the variation of credit provided to clients, though the coefficient of the variable presents the expected sign in all the proposed cases. Said evidence can be explained by saying that, in order to be validated, an internal rating system must be actively inserted in the organisational procedures of the bank, and must

not be a mere risk measurement tool. Hence, it is natural that loan provision policies are closely related to the formulated credit rating assessments in a bank that adopts the IRB method, while the association can be less binding in a bank that adopts the system only for management purposes, and not for regulatory ones.

Table 3: *The determinants of the variation in the credit portfolio for clients*

Analysing the additional control variables entered, the only one that is significant is *ATTIVO_MEDIA*. The sign of the coefficient is negative, thus configuring a more intensive credit crunch on the part of larger banks. A check of the level of correlation between this variable and the measures related to the dissemination of internal rating systems has yielded comforting results. It is interesting to note that, despite the addition of a check on the dimensional factor, variables related to the level of sophistication of the credit risk management system still remain significant. Moreover, both the value of the coefficient and the t-stat remain more or less unchanged. This removes the doubt that the variables in question mirror purely dimensional factors, and that the size of the bank, gauged by its overall assets,

can be the main decisive factor that affects its attitude to credit during a crisis. To ascertain the robustness of the results obtained, the regressions were repeated by using the variation in gross exposure to clients as dependent variable, rather than the variation only in the loans portfolio. It must be said that the overall exposure also contains the securities portfolio. The results confirm the negative coefficient associated with the variables IRB_PESO_BASE and IRB_PESO_AVANZ. From this standpoint the variable RATING_SOLOGEST also becomes significant with the expected negative sign. Moving on to the second research question, namely the relations between IRB systems and the riskiness of the credit portfolio, the main results of the analyses are summarised in Table 4, in which every column represents the model tested on each of the four dependent variables used. All analyses indicate a positive association between the use of the validated internal rating systems and the worst quality of the credit portfolio for clients. The sign of the ratio gives rise to questions and doubts regarding the actual superiority of statistical-quantitative models in measuring the credit risk. This evidence is further confirmed by observing the variable dummy RATING_SOLOGEST that is positive and presents a strong statistical significance. Hence, not only the adoption of validated IRB models but also the use of an internal rating system only for management purposes has a positive impact on the volume of non-performing loans, confirming the ineffective protection offered by non-standard systems against the credit risk. Relations between IRB methods and deteriorated credit are further explored by adding a series of bank specific control variables, and separating the analysis of the entity of the credit from that of flows. Considering, in the first place, the stock of deteriorated cases, represented as logarithmic value in column (1) and related to the total credit provided to clients in column (2), the size of the bank and its profitability are significant, thus confirming the results reported by previous literature. In detail, it is interesting to observe not so much that larger banks detain the larger volume of deteriorated loans (LN(ATTIVO)), but rather that the deteriorated volume grows as the bank's size diminishes. The negative sign of the independent variable (ATTIVO_MEDIA) confirms expectations regarding the greater exposure to the economic cycle and the lesser diversification of the loans portfolio of smaller banks. The impact of typical profitability (ROA) presents the expected sign, underscoring reverse relations between credit deterioration and profitability. When it is measured in terms of impact of the interest margin on the intermediation margin (MIS_MIN), the coefficient acquires a positive sign, confirming the initial theories. In fact, we expected a greater inclination of the bank to provide credit and/or an increase in the riskiness of the clients served, who are applied higher rates of interest, to elevate the exposure to risk and, hence, the presence of higher deteriorated amounts in the budget. Finally, the last variable of the model, namely the association between loans and deposits (LOAN_DEPO), measures the impact of the liquidity of funding sources on the quality of loans. The sign is positive and consistent with expectations, and statistical significance is strong. Hence, credit

deterioration grows as fundraising sources other than deposits increase as a result of the probable causes already mentioned in the description of the regressor. Moving on to the flow analysis, columns (3) and (4), respectively, report the determinants of the variation in the decay rate of deteriorated credit provided to clients and in the decay rate of non-performing loans. Observing the data in Table 4, we can briefly say that all relations described above in the stocks analysis remain, with the related coefficient signs and statistical significance, thus validating the robustness of the results obtained.

CONCLUSIONS

The application of a validated internal rating system is negatively related to the variation in credit provided to clients, and positively associated with the riskiness of the loans portfolio. Regarding loan-related variations, the effect is already evident when we consider the phenomenon dichotomously by comparing banks that have a validated internal rating system against those which, instead, only use the standardised method, and when we consider the quota of assets assessed respectively with the basic and advanced IRB method. Econometric analyses also reveal that the credit crunch was more evident in larger banks. Our study provides empirical evidence of the procyclical nature of internal ratings in the period 2010-2014. Regarding the second question, all the econometric analyses indicate a positive association between the use of validated internal rating systems and the worst quality credit portfolio for clients. This challenges the presumed superiority of statistical-quantitative models in measuring credit risk. Said evidence is further confirmed by observing the variable dummy RATING_SOLOGEST that is positive and presents strong statistical significance. Hence, not only the use of validated IRB models but also the application of an internal rating system only for management purposes has a

positive effect on the volume of non-performing loans, confirming the ineffective protection offered by non-standard systems against the credit risk.

THE RELEVANCE OF MARKET ANALYSIS IN UNIVERSITY SPIN OFF CREATION: A CASE STUDY

Piccarozzi, Michela; Silvestri, Cecilia

Department of Economics and Management, University of Tuscia, Unitus, Viterbo, Italy

ABSTRACT

The third mission of universities has assumed a strategic role and primary importance in governance policies both in Europe and worldwide. Although the question has raised interest around topics such as technology transfer and university (academic) spin-offs, the scarcity of available financial resources and traditional university culture haven't reached the optimization of the potentialities related to this type of activities yet. The aim of this work is to investigate the phenomenon of USOs through an in-depth analysis of the related literature and offer a case study analysis. Analyzing the process of creation we want to underline how the analysis of potential customers is an essential element in the phase of creation of university spin-off. In literature the process of creation is limited only to promote a business plan implementation, but often this is just a descriptive document and not inclusive of the required customer analysis. This can cause the incorrect initial analysis of the USO and lead to failure of the initiative. The case study allows us to demonstrate how a correct analysis of potential customers can influence and be crucial to the proper strategy setting.

Keywords: *spin-off, academic research, innovation, cluster analysis, customer, entrepreneurship, business plan.*

1. INTRODUCTION

Modern economics is based on an information and knowledge systems. By consequence success is increasingly related to innovation and technology transfer, main strategy elements for the development of economics. Growing attention has recently been granted, in fact, to spin-offs (especially USOs). The term spin-off refers to the creation of new economy units run by individuals previously working in other companies or other existing institutions. The two aspects characterizing factors of a spin-off are: the support for the creators of the new business companies and the process through which a spin-off is made. The essence of a spin-off is to help an aspiring entrepreneur to transform an idea, a potentiality, a technological or market opportunity of production, that someone else does not or cannot use in commercial terms, into a new company. USO is a company established by a group of researchers, professors or PhD students. It is a start-up company whose formation depends on the formal transfer of

intellectual property rights from the university and in which the university holds an equity stake (Wright M. et al. 2006). So USOs can help to better the relationships between universities and business companies to improve knowledge transfers and become competitive. In the present case study we first introduce the main characteristics of university USOs and its related national and international literature; secondly, we present one case study of Tuscia University to underline the creation process, in its following steps, and to understand the importance of analysis of potential customers for the feasibility of the project. Often these initiatives forget having to operate in a market, and focus on the aspects of research and technology transfer, forgetting consumers and analysis of potential demand (De Cleyn et. al, 2013) It aims to show how the study of potential customers can be a key tool to check the feasibility of the project. The analysis can be crucial for the preparation of an accurate business plan.

2. UNIVERSITY SPIN-OFFS: A TECHNOLOGY TRANSFER INSTRUMENT

Universities have always played a central role in the process of transferring knowledge and technologies to the industrial sector, especially important for regional development policies. One of the most relevant aspects analyzed in literature concerning the USOs is the definition of their issues. There are not, in fact, any clear frameworks for USOs, and researchers often use the same approach for studying and describing different realities. Some authors defined the topics (Weatherstone 1995; Steffensen et al. 2000; Clarysse et. al 2004). In the present paper we'll define USOs as new companies created by universities to develop knowledge resulting from academic research into a profit making activity (Klofsten, et. al 2000). When we refer to USOs, we want to underline the following features (Klofsten et. al. 2000): a new company independent from the university, with a separate legal identity, and created by the university - thus excluding all other research organizations or institutions – aimed at the development of the results arising from academic research, not just patentable results, but also all technical and scientific knowledge acquired during the academic activity, whose aim is to obtain profits. This allows us to exclude all other non-profit activities. Another topic emphasized in the literature is the creation process of USOs (Clarysse et. al., 2004 ; Degroof et. al., 2004; Lockett et. al. 2002; Ndonzuau et. al., 2002). All the authors describe the creation of a USOs as a set of steps each of these characterized by one or more documents or a bureaucratic compliance. In particular, in in each process described by the authors, the main document is the business plan that is regarded as the guide for USOs's start-up. Analyzing literature we can say that the business plan is considered a key tool with a strong link with the business success of the initiative (Bracker et. al., 1998; Castrogiovanni, 1996; Timmons et.al, 1985). In this process the Technology Transfer Offices (TTO) have a key role (DeGroof et.al, 2004; Lockett and Wright 2005) . These support proposers with all the skills and tools you need when starting the spin-off.

3. FROM INNOVATION TO A NEW PRODUCT: EVIDENCE FROM TUSCIA USOS.

The University of Tuscia in Viterbo began to create spin-offs in 2007. To be approved, the USO idea has to pass several steps. These are the three phases inspired by Clarysse and Moray's process (2004): pre-incubation phase; incubation phase and post-incubation phase. The Pre-incubation phase is focused on the organization of support activities and on all the information for the development of an action plan. The Incubation phase is the central step of this process and it is the most important one. The business plan is drafted and the link between USOs and University, in particular with the Department of Economy and Management, that is strategic to acquire all necessary skills to manage a business company. However, the process not given specific details of the business plan, and the planning is thorough qualitative and not by specific market analysis. For the purposes of our analysis, we consider that at this stage there is an information gap on market characteristics and potential customers. This is the stage in which plays an important role in the TTO. The Support to the business plans is one of the fundamental tasks of TTO. Fundamental importance It is the analysis of the potential customer and the reference market, as will be seen from the analysis of the case study. Finally, in the Post-Incubation phase, the USO is ready to start its activities and to sell goods and services. The approval of the University organs, through a parallel process to the one described, allows the start of the spin-off. They approve the USO based on the description of the activity and the details of the business plan.

3.1 Case study analysis and market analysis

We present a case of a spin-off of the University in which the analysis of potential customers has been suggested as the basis for the elaboration of the business plan. We want to demonstrate how the results have led deep considerations in the strategic plan set by the proponents thanks to prior knowledge of potential consumers and their preferences. The case study is about a proposed USO of the department of Agriculture. For a better definition of their business goals and the preparation of the related strategies, all companies must know the characteristics, the needs of their potential customer behavior (Bracalente et al. 2009). One of the most critical points is, in fact, the definition of a strategic plan of the entrepreneurial activity and obviously the identification and selection of the "clusters of clients" to serve (Valdani 1986). Since both the characteristics and behaviors will be surely characterized by a more or less percentage of heterogeneity, new strategies especially aimed at the different typologies of potential customers will be necessary (Fabbris 1997; De Luca 2006; Molteni and Troilo 2007; Bracalente et al. 2009). The joint use in modern markets of the price lever with other market levers (product, packaging, communication and distribution) allows a differentiation that can justify the price difference. Stretching the limits of this perspective, each potential consumer should be studied as an

independent segment, because bearer of specific needs, and become object of specific market strategies. This option, though, is impossible to put into practice in most of the cases, because the costs of such operation could exceed by far the benefits for the company. So, they are brought together in the same segment of demand, a sufficient number of potential customers, to assure an adequate profitability. The more similar the segments, the higher the probability that once they have become the object of the same marketing strategy, the different units will respond in the same way. In other respects, the requirements for those in charge of preparing those strategies are, on the contrary, to limit the number of segments in order to reduce the strategic alternatives and, by consequence, the costs. From an applicative point of view it is possible to distinguish between two patterns of market segmentation: homogeneity segmentation, chosen for the present case study with a traditional approach, and the goals of market segmentation. Homogeneity segmentation with traditional approach uses the group practices of analysis (cluster analysis), possibly preceded by factor analysis in order to summarize variable choice macro-elements. In the present survey we have not used applied factor analysis since the referent variable of cluster analysis was only one. Cluster analysis is then a method of automatic classification in homogeneous and uneven groups usually used in marketing strategies to support both strategic and operational decisions (De Luca 1990; De Luca 2006; Molteni and Troilo 2007). Among the many types of the known strategies we can mention: (i) segmentation analysis and customer behavior analysis; (ii) development and research of opportunities for potential new products; (iii) problem solving evaluation instruments related to the choose of area sampling. In the present survey cluster analysis has been used in order to determine the sociodemographic and behavioral characteristics of potential customers in relation to a new product: the apple with red flesh. Main goal of our survey was to understand consumers real needs and expectations from the gathered opinions and answers this new variety of apples.

3.2 Methods

The data of the present survey were collected in the week between the month of May (30-31) and the month of June (1-4) 2012 at a hypermarket located in the city of Viterbo where a questionnaire was handed out to customers (direct interview and self-administered questionnaire). The difficulty in identifying unambiguously the exact population of the customers of the hypermarket produced, as it usually happens in market surveys, the adoption of a non probabilistic sampling method and in particular of accidental sampling. The sample of the respondents was of 514 individuals. The whole phase of data collection was completed within one week and in different time slots of the day, in order to guarantee on one hand a certain homogeneity of the conditions of the data gathering (that could not be respected in the case of longer time slots data gathering), on the other, to obtain the best

representative sample of hypermarkets customers. As already explained, the tool used in our survey was a questionnaire divided into three main areas of analysis: (i) customer profile; (ii) customer behavior; (iii) consumer consumption habits and level of interest in the new product, the apple with red flesh. Consumer response modalities concerning purchase behavior and consumption propensity and level of interest in the new product, were structured on the basis of a Likert scale, with a score assigned by the respondents, between 1 and 6, where 6 was the highest positive response (very much) and 1 the least (not at all). For our survey we preferred an even scale to an uneven one. Our aim was, in fact, to make a neat distinction between those interested and those showing propensity for consumption (or those that gave a score of 4, 5 and 6), and the cluster of the not interested (those who gave a score of 1, 2 and 3), avoiding that respondents would choose a non-response option showing indifference to the choices they were asked to make. The questionnaire was composed of 6 closed questions with the Likert scale from 1 to 6, related to consumer purchase behavior of the apple in general; 3 relative to customer propensity to consume and the level of interest of the respondent both in the new product and its by-products; 3 dichotomous questions in the part of general purchase of apples necessary to develop the stratifications sample; 3 closed questions with multiple choice; 2 in the section of the analysis of the level of interest for the new product and 1 on the general purchase and, finally, 3 single choice questions about the customer profile. The data processing of the survey was made using tools of simple statistics, such as the average, both applying the instruments of multivariate statistics such as Cluster Analysis. The cluster analysis enables us to identify groups of consumers according to preference and define variables (Keen et al., 2004), measure of distance, relatedness, or similarities between importance ratings or utility measures (Aldenderfer and Blashfield, 1984). The effectiveness of the cluster analysis has been widely demonstrated in literature (Johnson, 1967; Park and Baik, 2006;) particularly for understanding the food consumption behaviour (Sahmer et al., 2006; Visschers et al., 2013; Müller and Hamm, 2014; Walthouwer et al., 2014). First goal of our survey will be to describe the sample, and on a later stage, we will analyze the relationships between the variables. The elaborations of multivariate statistics were obtained using the "STATA Statistics/Data Analysis, 12" software (www.stata.com).

3.3 Findings and discussion

59% of the respondents was female, the remaining part 40.1% was male. It must be said that the age of most part of the respondents was between 18-33, even if large part of the responses were also given by individuals between 42-49 and over 57. The resulting percentages were: 3.7% under 18; 24.4% 18-25, 16% 26-33, 3.5% 34-41, 15.8% 42-49, 10.9% 50-57, and finally 15.6% over 58. As for their professions the percentages were: 24.6% students, 19.9% clercks, 7% teachers, 3.7% female shop assistants, 5.1%

workers, 13.1% housewives, 2.9% entrepreneurs, 1.9% artisans, 4.1% unemployed, 10.3% retired and the remaining 7.4% other (self-employed, soldiers). The collected data concerning general information about the consumption of apples and by-products, highlight consumers' habits and customers purchase preferences. It is possible that a closer analysis could lead to a more favorable knowledge of their taste, degree of satisfaction and consumption relevant attributes. 72.5% of the respondents consume apples. Of them 72.2% know their nutritional properties while the remaining 27.8% though consuming the product, totally ignore their nutritional properties. The variety of apple mainly purchased and consumed is the Golden delicious, preferred by 29.9% of respondents, followed by red Golden, 17.7%, Fuji 16.6%, Annurca 14%, Pippin 11.3%, Emperor 5.3%, and the remaining varieties not specifically indicated 5.3%. At a later stage, the respondents were asked what by-products of the apple they usually buy. For the question we used a Likert scale in order to understand, for a more accurate analysis, the frequency of purchase of these products, indicating with 1 the non-consumption and 6 a high consumption of the product. The dominant preference attributed to the consumption of a singular product (yogurt, jam, apple juice, apple vinegar, candies, baby food, jelly, cider) was 1, no propensity to purchase, with some minimum interest in yogurt, apple juice, and vinegar. The characteristics chosen for the analysis of purchase behavior concerning the apple, have been divided into two groups: in the first group we considered those factors, especially exogenous factors, influencing the purchase (brand, price, quality, publicity, offers and type of apple); and in the second group, we referred to the technical characteristics of the product apple (color of the skin, appearance, sweetness, crunchy flesh, acidity and floury flesh). The data analysis shows that the characteristics influencing the purchase of the first group is quality (average value 5.01%, type of apple (4.4%), offer (3.84%) and price (3.74%); on the other hand, what seems not relevant is publicity (1.79%) and in large part the brand (2.93). The data concerning the variables publicity and brand, though, are not totally reliable. In the phase of the handing out of questionnaires we realized how many consumers were influenced by publicity/brand though being unaware of the fact. In facts, thanks to the chosen type of interview (direct interview in most of the cases) for gathering the data, we could understand that the respondent at the question "What type of apple you usually consume?", in the correspondent section Other (specify), showed the name of well known brands (revealing the confusion of brand and variety). Paradoxically then, they resulted to be the same respondents attributing a minimum relevance to publicity and brand, as factors influencing their choices during the purchase. As for the second group, instead, we found that the characteristic exerting a major influence on the respondents was the color of the peel (average value 3.92%, followed by the appearance (3.67%), crunchy flesh (3.55%), sweetness (3.50%), flourity (3.25%), and level of acidity (2.83%). The first phase of our survey was aimed at a better understanding of the characteristics of consumption of apples in order to determine, at a later stage, homogeneous clusters of customers

interested in the consumption of the new product, that is the “red apple”. Main goal of the following step was the analysis of customers propensity to consume and their level of interest for the new product, that is the red flesh apple. After a short introduction about the organoleptic properties and nutritional values of the new apple variety, we asked the respondents how many of them had ever heard before of the line “red pulp”. To this question only the 16.2% answered they had, while the remaining 83.3% admitted they had never heard of it. At a following stage we asked, using a Likert scale from 1 (not at all) to 6 (very much), how much they would be interested in trying the new product (Table 1). Dividing, in fact, the sample into “not interested” (those who gave scores 1,2,3) and “interested” (those who gave scores 4,5,6) we notice that the 73.4% of the respondents are interested in the product red flesh apple: 69.2% because curious, 22.4% for its nutritional properties and the remaining 8.4% for its appearance (red outside and inside). Conversely, 26.6% were not interested in the most part because diffident (58.2%), secondly for its nutritional properties (14.5%), and finally for its appearance (27.3%).

	Level of interest in the new product	Influence of the innovative characteristics of the apple in the decision making process
1= not all	12.2%	12.2%
2	4.3%	5.6%
3	10.0%	17.2%
4	23.0%	26.1%
5	24.0%	21.8%
6 = very much	26.4%	17.2%

Table 1 - Level of interest of new product and Influence of innovative characteristics of apple in the decision making process

Further, in our survey we tried to understand, how much the innovative characteristics of the red apple, as OGM free product and with high antioxidant properties, would influence interested customers purchase of the new product. Table 1 shows that the innovative characteristics of the product exert a particular influence on customers purchase of the product. The answers given by the respondents, in fact, are to be found in the part of the scale with the highest scores. Finally, once tried the apple with red flesh, the respondents were asked how much, on a Likert scale from 1 (not at all) to 6 (very much), they would be willing to purchase by-products. As already confirmed by previously obtained results concerning the consumption of by-products of the apple in general, the respondents interest on the part of the respondents was very low, especially for cider and baby food. The average values were, in fact: yogurt 2.88%, jam, 2.36%, apple juice 2.95%, vinegar 2.10%, candies 1.95%, baby food 1.57%, jellies 1.71%, cider 1.62%.

3.4 Cluster Analysis

Once determined the sociodemographic and behavioral characteristics of the interviewed sample, and the relationship between those characteristics and the respondents interest to purchase and consume the new product, we turned to Cluster Analysis where respondents were gathered in segments, according to their higher or lesser homogeneity. Main goal of the above mentioned analysis was to understand what clusters of consumers were really inclined to try the new product. For the present survey we used Ward hierarchical clustering method (Fabbris 1997; Bracalente et al. 2009) and the number of clusters was determined according to the Caliski-Harabasz index (Calinski and Harabasz, 1974). Ward hierarchical clustering method is based on the decomposition of total variance within groups and between groups. At every iteration we consider both the sum of all possible pairs, and the pair with lesser variance between groups. This method is particularly used in market analysis, especially in sectors, such as hypermarkets customers whose aim is to find a small group of customers who can eventually become object of targeted marketing activities. Sociodemographical and behavioral characteristics considered in the present case study were: sex, age, profession, knowledge of nutritional properties of the apple fruit in general, and the level of influence of innovative characteristics on purchase decision making, along with quality and price. It would have been more appropriated for the present survey to include the variable Publicity. However we decided to exclude it because during the handing out of questionnaires we realized that many respondents were subconsciously influenced by it. For this reason, considering the low reliability of the data in our possession, it was not included in the present cluster analysis. For the data processing we used the STATA "Statistics/Data Anaysis" software and we considered 4 groups according to the Caliski-Harabasz index (Tab. 2)

<u>Calinski/Number of Harabasz</u>	
<u>clusters pseudo-F</u>	
2	1353.62
3	1704.3
4	2811.09

Table 2 –Caliski-Harabasz index

Tab. 3 offers the analysis of 4 clusters in relation to the variable measuring the level of interest of respondents to purchase the new product (the apple with red flesh) and according to the intensity of the correlation function it was possible to define different clusters: "very interested", "interested", "not interested", and "absolutely not interested".

<u>Cluster4</u>	<u>Mean</u>
1 - Very interested	6.000
2 –Interested	4.510
3 - Not Interested	2.699
4 - Absolutely not interested	1.000
<u>Average profile</u>	<u>4.215</u>

Table 3 –Analysis of clusters according to the "interest" variable

cl4	Freq.	%	Cum.
1 - Very interested	134	26.38	26.38
2 -Interested	239	47.05	73.43
3 - Not Interested	73	14.37	87.8
4 - Absolutely not interested	62	12.2	100
Average profile	508	100	

Table 4 –Frequency and Percentages of the 4 clusters

Table 4 shows that the most consistent group, the “interested” 47.5%, followed by the cluster “very interested”, 26.38%, “not interested”, 14.37% and, finally, the “absolutely not interested” 12.2%. Once defined the clusters, we turned to sociodemographical and behavioral characteristics of respondents of each single cluster. We considered then, as already said, the following variables (Tab. 5)

Socio demographical variables	Sex Age Profession
Behavioral variables	Level of knowledge of nutritional properties of the apple fruit in general Level of influence of the innovative characteristics of the red apple at the moment of purchase Level of influence of quality Level of influence of the price

Table 5 – Sociodemographical and behavioral variables

From the analysis of results it is possible to define the sociodemographical and behavioral characteristics of the 4 clusters.

Variables	Very interested	Interested	Not Interested	absolutely not Interested
Cluster dimension	26.38%	47.05%	14.37%	12.20%
Sex	F	M/F	F	M/F
Age	26-33; 42-49; 50-57	> 18; 34-41; 42-49; >57	<18; 18-25; 26-33	18-25; 26-33; 34-41; >57
Profession	teacher; housewife; Unemployed; (Self-employed	worker; Artisan; Other female assistantante	students; Clercks; shop	Student; housewife; entrepreneur; Artisan; Other (Self employed F.A.)
Influence of innovative characteristics	5;6	3;4;5	2;3	1;2

Knowledge of the nutritional properties of the apple in general	SI	SI	NO	NO
Influence of price	3;5	4	1	6
Influence of quality	3;4	5	6	6

Table 6 –Cluster profiles

Table 6 shows that the cluster “very interested” and “not interested” is mainly composed of women, whilst the cluster “interested” and “absolutely not interested” are composed of both men and women. As for the age, we can observe that the cluster “very interested” refers to the group aged 26-33 and 42-57, clusters referring to individuals divided by a small age gap. We find these characteristics also in other groups. It is, in fact, particularly evident in the “not interested” cluster (< 18-33), followed by the “absolutely not interested” (18-41; >57) and finally the “interested” (< 18; 34-49; > 57). The age groups are confirmed in the professions. The “very interested” are: teachers, workers, housewives, artisan, unemployed, while the category “other” is mainly composed of self-employed and soldiers. The second cluster, the “interested” is composed of students, clerks, female shop assistants and the retired; the third, “not interested” by students, entrepreneurs and unemployed. Finally, in the cluster “absolutely not interested” are included students, housewives, entrepreneurs, artisans and the category “other”, then self-employed and soldiers. As for behavioral variables, as it was predictable, results show that for the “very interested” the innovative nutritional characteristics of the red apple strongly influence the choice of the product and then customers propensity to purchase the apple with red flesh (values of 5-6 on a Likert scale). The lower the interest, the lower the related way of the level of interest of the clusters. Finally, very interesting is the awareness those groups show in the nutritional properties of the apple in general. The clusters “very interested” and “interested” declared they knew the nutritional characteristics of apples, while the “not interested” declared they totally ignored them. This shows how the information about the properties of food products is a factor influencing, or at least in the present case study an encouragement to try better quality food products. Conversely, the analysis of the data concerning the relationship between the different clusters and quality/price, were discordant. However, if we consider only the higher discriminatory values, it results that the relationship quality/price is very important to the cluster “absolutely not interested”, because they attributed 6 to both (on a Likert scale 1, not at all, to 6, very much). Also the “interested” give importance to the quality/price relationship, attributing respectively a score of 5 and 4. Conversely, the “not interested” give much importance to quality (score 6) and no relevance whatsoever to price (1). We are dealing then with individuals willing

to consume high quality products and that don't attribute relevance to how much they are asked to pay. Finally, the "very interested" gave a score of 3 and 5 to price and 3 and 4 to the quality of the product.

4. CONCLUSIONS

Innovation is a key element of economic development and spin-offs are a valuable tool in the technology transfer. The build process does not provide for the elaboration of a detailed market study and often ignores the potential consumers. So, main goals of the present survey were in primis to determine the market and consumers reactions to innovation, in our case of food innovation, through the use of indexes that take into consideration contextual and individual characteristics that could identify the estimations expressed. Further, the use of statistical tools allowed to predict possible reactions of consumers to these new products. The results of our analysis showed that 73% of the sample usually consume apples and 72% is aware of their nutritional properties. This latter information is very important, since it was those respondents who declared they knew the nutritional properties of the apple that constitute the clusters of those who were particularly inclined to consume the apple with red flesh. Through cluster analysis we were able to identify four different groups, with individuals gathered according to their level of interest in the new product. USO then will choose the groups of customers on which personalize the supply of products, differentiating and specializing its market supplies. Once defined the four groups the planning of activities will be necessarily aimed at each one of them. In particular, the company will reinforce the groups of the "very interested" and "interested", giving them more detailed information about the product's nutritional properties (underlining its qualities), being them composed of individuals particularly interested in this kind of information. As for the cluster of "not interested" and "absolutely not interested", our case study shows that they are individuals who pay more attention to the quality of the product apple they purchase. In particular, while the cluster of "not interested" finds unimportant the price the contrary is true when we consider the "absolutely not interested". This means that, while they focus their direct their attention only on quality, and not on price, for the other cluster the two factors, quality-price are not only very relevant but they are also perfectly balanced. For these clusters it would be necessary a planning of strategy that could give detailed and punctual information and that would also be accompanied by objective validations on the safety of the new apple and of its positive returns in terms of health. These strategies would also be supported by appropriated price politics, being that variable a relatively important factor for all groups. Despite the goals achieved by the survey from a marketing perspective, it presents some limitations. It would be more expedient, to validate the results on more than one year to confirm and control the level of interest and customer propensity to consume the new product, also in the light of

the difficult economic trends. Another limitation is related to the number of respondents. A greater sample would, in fact, lead to more reliable results, to reject or confirm our starting hypotheses. Further, the model should be developed not only on a temporal scale but also on a geographical one, proposing the same survey to other supermarkets of the wholesale distribution established not only in the same local area, but also in other provinces or regions. In this way we could have the possibility to work on more heterogeneous samples and the related results would be highly validated. Finally, it would also be expedient to interview not only the customers of supermarkets but also those of retailers, fairs and marketplaces. Only then we could have a full picture of all the potential consumers of the new product. According to these observations and to complete and validate the obtained model, we aim at verifying the reliability of the final results in order to bridge the gap. For this reason, our survey will focus on specific aspects such as the dimension of the sample and its homogeneity. Our target will be then to increase the number of respondents and, in particular, repeat the survey for several years and in different locations and points of sale, developing both a temporal and geographical comparison. The analysis of the questionnaires adds a wealth of information for the definition of a strategic plan. With this tool, and attention to potential market USO have greater trust in the elaboration of its business plan. This type of analysis should be integrated into the process of creating and becoming a focal aspect to validate the potential of the USO. In particular, the TTO should support and organize for proposers the analysis of potential customers. The analysis of the consumer and his preferences should become a strategic element in the creation process of the USO. Unfortunately, often the resources are not sufficient to allow universities to provide all the necessary tools for aspiring entrepreneurs. So, the creation process is sometimes limited as well as being a mere bureaucratic process and no real analysis of the market.

ABSTRACT

The importance of a firm's collaborations on its performance is well recognized by open innovation literature. However, not all collaborations are equal. Adding to extant research on the breadth and depth of external sources of knowledge, this paper distinguishes among two types of collaborations, namely innovation-oriented and operational-oriented collaborations, on the basis of their scope and looks at their impact on reducing time-to-market, as an indicator of the firm's performance. In doing it, it also considers the moderating role of two organizational capabilities, namely managerial capabilities and internationalization capability. A hierarchical multiple and moderated hierarchical multiple regressions are developed based on a composite dataset of 151 Tuscan (Italy) firms in the life science sector. The results show that a U-shaped relationship characterizes the impact of both collaborations on firm's time-to-market, but also that this link is moderated by managerial and internationalization capabilities.

Keywords: *collaborations; managerial capabilities, internationalization capability; time-to-market; Life Sciences*

1. INTRODUCTION

This paper focuses on the role of open innovation (OI) in the life science (LS) sector, looking at the moderating impact of core competences on the collaboration-innovation performance link. The importance of collaborations is central to the OI research (Gesing et al. 2015). OI, in fact, requires firms to systematically perform "*knowledge exploration, retention, and exploitation inside and outside an organization's boundaries through the innovation process*" (Lichtenthaler 2011: 77), thus requiring firms to look beyond their boundaries searching for partners to involve in their innovation and commercialization processes. Empirical evidence, however, shows that collaborations may have ambiguous and contradictory effects on the several facets of organizational performance. Among the reasons of such ambiguities and beyond industry characteristics, previous studies have distinguished among two broad categories of factors that may explain heterogeneous results. On the one hand, there

are *firm-related factors*, such as the stages of product development, the firm's size (Rothaermel and Deeds 2004), and, in particular, the firm's capabilities (Caner & Tyler, 2014; Ferreras-Méndez et al., 2015; Lee et al., 2001; Mitrega et al., 2012), such as absorptive capacity (Laursen and Salter 2006). On the other hand, we can distinguish *collaboration-related factors*. Most of OI scholars' attention has been deserved to the breadth and the depth of collaborations (Laursen and Salter 2006; Verbano et al., 2015), and in particular, more recent debate is about the effect collaboration partner types have on the payoff from the collaboration (Bengtsson et al. 2015, Gesing et al., 2015). However, little attention has been deserved to the heterogeneity of collaborations a firm deals with (Kim & Lui, 2015; Knudsen, 2007; Laursen and Salter, 2006; Vereecke & Muylle, 2006). Companies, in fact, may collaborate for several reasons, but previous studies have only analysed how the nature of the partners, whether scientific- or market-focused innovation partners (Gesing et al., 2015), contribute to innovation performance, thus overlooking at how different scope of collaborations affect its performance.

This study investigates the impact of the interaction between firm-related and collaboration-related factors on time-to-market (T2M), chosen as a crucial performance indicator in the LS sector. Albeit it is rather intuitive that firms with different capabilities are able to manage different types of collaborations, previous research has mainly focused on relational or networking capabilities as the capabilities needed to engage with partners. Nonetheless, firms possess other capabilities that may be important for exploiting the value of external collaborations. In particular, the outcome from the collaboration may rest upon a firm's capabilities in managing the type of collaborations.

This paper aims to complement extant research via a twofold contribution. A first contribution refers to the distinction between the scope of the network: based on the relational view of the firm, we distinguish between firms that collaborate for innovation-oriented (Caner & Tyler 2014) or operational-oriented (Aarikka-Stenroos et al., 2014) scopes. Second, moving from the resource-based view of the firm, this paper extends previous research by introducing two new capabilities that may moderate the collaboration scope-performance link. In particular, we investigate whether firms possessing managerial and internationalization capabilities (Cruz-Ros & Gonzalez-Cruz, 2015; Fitjar et al. 2013; Wang et al. 2015) are better able to realize the inherent benefits of innovation-oriented and operational-oriented collaborations.

In doing that, we test hypotheses on data collected from an original and unique database based on 151 Tuscan (Italy) organizations operating in the LSs sector, a high-technology-intensive sector (De Luca and Verona and Vicari, 2010), that is characterized by a strong role of collaborations among firms. In particular, we look at the impact of capabilities and type of collaborations on an under-researched new product development performance measure, i.e. the time to market (Tatikonda and Montoya-Weiss 2001). Having a short time to market is an important factor in determining competitive

advantage, in particular in industries where R&D is long and complex (Rothaermel and Deeds 2004; Shan, Walker, and Kogut 1994). Results from the regression model adopted contribute to both, theory and practice. Drawing upon the notion of collaboration, we offer empirical evidence on how to decrease the T2M through combining different types of collaborations and capabilities.

The paper is structured as follows. In the next section we review the literature on collaborations and capabilities and propose a theoretical model with four main research hypotheses. In Section 3, data collection and measurement development are described. The analysis and results are presented in Section 4. Section 5 discusses the results. Finally, concluding remarks which include both theoretical and managerial implications, as well as limitations and future research, are provided.

2. THE HETEROGENEITY OF OPEN INNOVATION COLLABORATIONS

2.1 *Effects of collaborations on firms' performance*

OI scholars have often looked at collaborations between firms as a key determinant of firm's performance. Firms often collaborate with third parties to get access to the resources they need. In doing that, firms choose among different types of partners (Bengtsson et al., 2015; Kim & Lui, 2015; Laursen & Salter, 2006; Lopez-Vega et al. 2015).

When looking at collaborations, OI scholars have mainly looked at two measures: the breadth and the depth of relationships (Egbetokun 2015; Laursen & Salter, 2005). Collaborations may happen with a variety of actors such as suppliers, customers, competitors, private laboratories, universities and public research institutes (Egbetokun 2015; Fitjar et al. 2013; Laursen & Salter 2006). How the combination of relationships impacts the performance of the firms depends on the type of industry (Knudsen, 2007; Vereecke & Muylle, 2006) and are usually characterized by an inverted U-shaped relationship with respect to innovation performance. Firms, in fact, may benefit from collaborations up to a certain level since collaborations affect knowledge sharing, complementarity, the emergence of scale economies, knowledge spill-overs and information access as well as risk sharing and access to resources and markets (Pittaway, Robertson, Munir, & Denyer 2004; Pucci and Zanni, 2016), but this effect turns to be negative since collaborating implies costs that cause non-linear relationships on partners- innovation performance link (Laursen and Salter 2006; Bengtsson et al. 2015).

Little attention, however, has been given to the *scope* collaborations are settled up (Rothaermel and Deeds 2004; 2006). Albeit it is tacitly intuitive that the reasons collaborations are made rely on either (or both) the generation and the diffusion of innovation (Nooteboom, 1999; 2000; Rothaermel & Deeds, 2004), literature does not usually distinguish between different collaborations on the basis of their scope. However, academic community often refers to either *innovation-oriented collaborations*, aimed at introducing radical or incremental product or service innovations (Laursen and Salter 2006; Caner and

Tyler 2014), and *operational-oriented collaborations* (Aarikka-Stenroos and Lehtimäki 2014), aimed at enhancing manufacturing, distribution and commercialization/marketing (Caner and Tyler 2014; Rothaermel and Deeds 2004; Wang et al. 2015). We define innovation-oriented collaborations as those collaborations aimed at enhancing the innovativeness and the development of new products and acquiring new knowledge from external partners, while operational-oriented collaborations as those collaborations aimed at acquiring market power, sharing risks, entering in new markets. We want to look at whether these two kinds of collaborations have a different influence on a firm's performance. Considering extant research on external search breadth and depth (Laursen and Salter, 2006), we make a further step in OI research via distinguishing among the scope (innovation-oriented vs. operational oriented) of the collaborations (Wang et al. 2015; Aarikka-Stenroos et al. 2014; Shan et al. 1994; Bengtsson et al. 2015). We suggest a curvilinear relationship between the scope and the innovation performance. This curvilinear relationship is rooted in a social capital perspective (Molina-Morales and Martinez-Fernandez 2009; Mishra, Chandrasekaran, and MacCormack 2015). Firms that collaborate benefit from an increase in the exchange of information and resources, but after a certain threshold, they incur in higher costs due to ongoing relationship maintenance, time and effort. Consequently, we suggest that:

Hypothesis 1: innovation-oriented collaboration is curvilinearly (inverted U-shaped) related to the firm's performance;

Hypothesis 2: operational-oriented collaboration is curvilinearly (inverted U-shaped) related to the firm's performance.

2.2 The moderating role of managerial and internationalization capabilities

The central argument of this paper is that internal capabilities moderate the collaborations – performance relation. This belief is rooted in the resource-based view of the firm, according to which firms differ in their performance due to their resources and capabilities (Amit and Schoemaker 1993). Usually, extant research has focused on relational capabilities (Fitjar et al., 2013; Walter et al. 2006), defined as “*the ability to integrate a large periphery of heterogeneous weak ties and a core of strong ties*” (Capaldo 2007: 585). These capabilities facilitate learning, share knowledge (Im and Rai 2008), and reduce transaction costs via increasing trust. However, previous studies have not investigated the role of other capabilities in making the collaborations effective. In particular, in this paper we look at two organizational capabilities: the managerial capabilities and the internationalization capability.

Managerial capabilities represent the ability of the firm to manage its financial, human resources and operational activities (Cruz-Ros & Gonzalez-Cruz, 2015; Fitjar et al., 2013; Hooley et al., 2005; Lee et

al., 2001). Managerial capabilities are different from absorptive capacity in that the latter represents prior ability to “recognize the value of new information, assimilate it, and apply it to commercial ends” (Cohen and Levinthal, 1990:128). In this sense, absorptive capacity refers to the ability to evaluate and utilize outside knowledge, while managerial capabilities look not at the knowledge but at the financial, human and operational activities of the partners. The rationale of considering managerial capabilities as a factor impacting the collaboration-performance relationship lies on two main reasons. First, human resources represent one of the means via which an organization reaches its goals. Being able to manage the human resources is important for extracting value from collaborations. Second, managers should also be expert in dealing with operation and managing financial resources in order to internally exploit the external resources of the collaboration. Managers, in fact, control resources, filter ideas and set strategies (Fitjar et al. 2013; Lee et al., 2001) and managerial capabilities may enhance collaborations via reducing operational costs, reducing business risk exposure, streamlining business processes and capitalizing on market opportunities (Wang et al. 2015). On the basis of the previous considerations, we hypothesised that:

Hypothesis 3a: the higher the managerial capabilities of the firm, the more effective the innovation-oriented collaboration will be in influencing firm’s performance;

Hypothesis 3b: the higher the managerial capabilities of the firm, the more effective the operational-oriented collaboration will be in influencing firm’s performance.

An underdeveloped stream of research is instead represented by the capacity of the firm in being international. Firms often collaborate with external partners for entering new markets or reinforcing their presence in existing markets. On the one hand, companies may benefit from having international activities since they may increase market opportunities (Kotabe et al., 2002), fasten new product development and introduction (Bartlett and Goshal 1989). Firms need also to manage international partnerships (Fitjar et al., 2013) and choose among alliances/licensing agreements, the level of integration into customers and supplier channels, among the others (Freeman et al. 2006). However, being international may have also costs that relate mainly to select the proper foreign market entry mode, to choose the markets where to sell products/provide services, to manage the international process. Hence, the capability of managing international activities requires costs in term of transaction, management and coordination (Kotabe et al., 2002) that may hamper the performance of the firm. In particular, Kafouros et al. (2008) find that the internationalization activity needs to be under a certain threshold level in order to benefit from innovation. Firms “are unable to benefit from innovation if their international activity is below a threshold level” (Kafouros et al. 2008). The curvilinear relationship the literature finds, may be the result of excessive management costs (Tallman and Li 1996). Consequently, firms that have greater capability in managing their internationalization

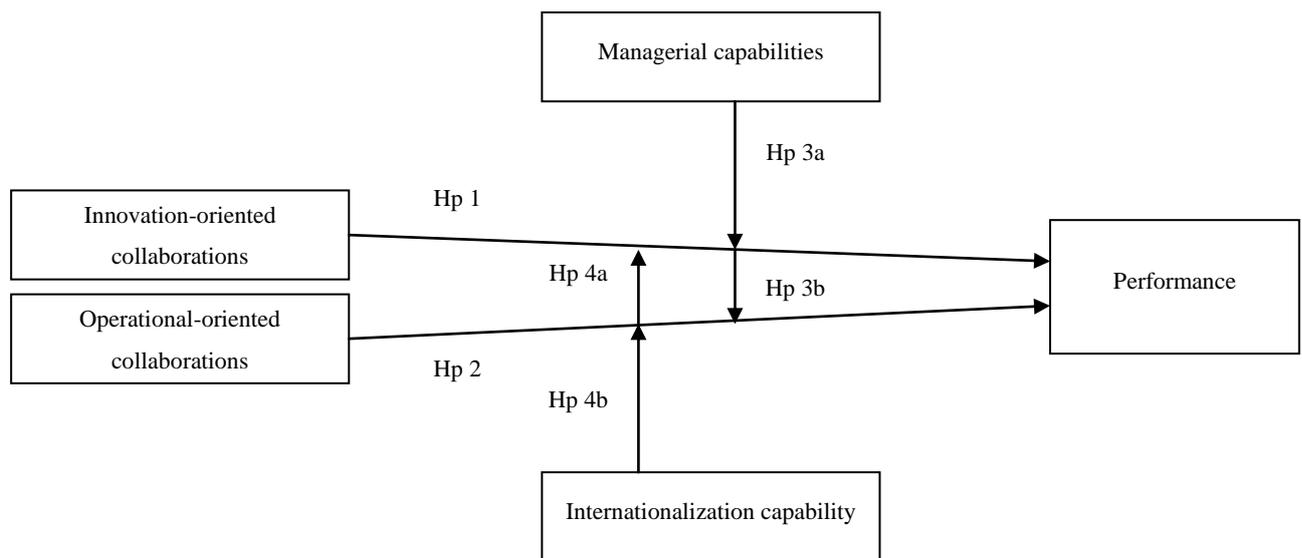

processes, may perform better than companies that are not able to do that. Moreover, the fact that firms are able to compete on international markets may also impact the way firms benefit from their collaborations. Henceforth, we suggest that:

Hypothesis 4a: the higher the internationalization capabilities of the firm, the more effective the external innovation-oriented search height will be in influencing firm's performance;

Hypothesis 4b: the higher the internationalization capabilities of the firm, the more effective the external operational-oriented search height will be in influencing firm's performance.

Adding to previous research noticing that firms need to possess specific capabilities in managing collaborations (Mitrega et al., 2012), we look at the managerial capabilities and the internationalization capability on the relationship between numbers of innovation-oriented and operational-oriented collaborations and firm's performance (as measured by T2M) in the LS sector. Our theoretical framework is presented in Figure 1.

Figure 1. The conceptual model

3. METHODOLOGY AND MEASUREMENT

3.1. Sample and data collection

We tested our hypotheses by looking at the LS sector, characterized by 3 main industries, namely pharmaceuticals, biotechnology and medical devices, and the emerging segment of cosmeceuticals and nutraceuticals. A fourth segment comprises firms specialized in delivering services to support these industries. The choice of focusing on the LS sector is led by the fact that firms tend to be involved in various kinds of partnerships (Ferrerias-Méndez et al., 2015; Liebeskind et al., 1996; Shan et

al., 1994) and external to the firm knowledge sources is increasingly relevant (Belussi et al., 2010) since knowledge base is complex and the sources of expertise widely dispersed (Powell et al., 1996).

We carried out our questionnaire on the firms operating in the LS sector in Tuscany. The Tuscan LS sector is third in Italy for its concentration of pharmaceutical and biotechnological industries (Farmindustria, 2011; AssoBiotech, 2012; Pucci and Zanni, 2012) and was geographically proximate to the research team, thus simplifying control of the consistency and quality of the research data. The list of all firms was built by the research team considering national censuses of professional associations (AssoBiotech, Farmindustria, and AssoBiomedica) and data from the Chamber of Commerce. A final list of 317 for-profit firms was created and that list was updated to December 2012. The firms employed a total of 19,419 people.

The questionnaire was tested with founders and managers belonging to all the segments of LS sector, with two managers of the Tuscan Life Sciences Foundation and two members of the Steering Committee of the Tuscan Regional LS District. Data were collected via email from March to May 2012. A presentation letter with the research objectives and privacy assurance was sent via email to all the 317 firms. Subsequently, the research team verified the information obtained through the questionnaire through secondary sources, namely the Chamber of Commerce for the structural data of the firms and the number of patents in the Qpat database, and, if necessary, carried out follow-up telephone interviews with the person (entrepreneurs, owners or CEOs) who had completed the questionnaire. A total of 151 firms, representing 47.63% of the target population, returned the questionnaires. Table 1 presents the sample.

Firms of the Tuscan LSs sector	Population				Sampled firms			
	Firms		Employees		Firms		Employees	
	N	%	N	%	N	%	N	%
Biotechnology	36	11.36	673	3.47	24	15.89	487	3.56
Pharmaceuticals	47	14.83	11919	61.37	25	16.56	8297	60.58

Table 13. Sectoral classification of LSs firms: universe and sample of firms

3.2 Definitions and measurements of the constructs

Dependent variable. The dependent variable chosen in our study is the elapsed time (months) between the start of the R&D phase and the market launch of the new product (*fR&DtM*) (Griffin

2002). The choice of focusing on T2M rather than on innovation-performance or financial performance has been led by that having a short time to market is an important factor in determining competitive advantage, in particular in industries where R&D is long and complex (Rothaermel and Deeds 2004; Shan et al., 1994) such as LS. Moreover, T2M is the largest industry challenge in sectors such as LS (Prašnikar and Škerlj 2006), characterized by ever-shortening technology development cycles, long product development cycles and short product cycles (Liebeskind et al. 1996).

Innovation-oriented and operational-oriented collaborations. To construct the measurements relative to collaborations for each firm, the questionnaire asked for the name and location of those partners considered strategically relevant to each firm's activity. For each partner the type of activity was requested as well, that is, if it was another firm/private entity, a public research organization (PRO), a public institution (not research) or a scientific park/incubator. Lastly, firms were asked to specify the reason for the collaboration, if it was for operational reasons (supply, distribution, sales) or rather for reasons related to R&D and improvement of innovation.

The total number of innovation-oriented collaborations (Inn_coll) and the total number of operational-oriented collaborations (Op_coll) are counted for each firm and used in the analysis which follows. It is interesting to note that we introduce a third dimension to Laursen & Salter (2006)'s contribution via considering the *height* of external sources, i.e. the number of external search partners, no matter the relative importance (depth) nor the kind of partners (breadth). Hence, not only the type of partners (breadth), whether science- or market-focused innovation partners (Gesing et al. 2015), and the extent to which a firm draw from search channels (depth) matter (Laursen & Salter, 2006), but also the number of collaborations a firm has is important.

Capabilities. The managerial capability construct (*Man. Cap.*), developed by Hooley *et al.* (2005), is measured by three items that evaluate the competences of the firm in managing its financial and human resources as well as its operational activities. The construct has a Cronbach's of 0.89, indicating a high level of reliability (see Appendix A). Furthermore, total correlations vary from 0.72 to 0.74, thus all above the threshold of 0.45 suggested in the literature (Parker *et al.*, 1997). The evidence furnished by the validity and reliability measurements allows us to use the average score of the items in the analysis which follows. The ratio of foreign sales on total sales is used as proxy of the internationalization capacity of the firm (*Internat. Cap.*) (Tallman and Li 1996; Pucci et al., 2016).

Control variables. Therefore, during the tests conducted to verify the relationships hypothesized, some control variables were introduced which could have an influence on the time to market of the firm. The dimensions of firms (*Size*) were measured as logarithms of the number of employees. The age (*Age*) of the firm was measured by the logarithms of the number of years passed since the firm was founded. The segment a firm belonged to was controlled by introducing three dummy variables

for the pharmaceutical (*Pharma*), biotechnological (*Biotech*) and medical devices (*Med. Dev.*) segments. *R&D Exp.* is the logarithm of the expenditures in research and development (Belussi et al., 2010).

Table 2 furnishes the descriptive statistics and the correlations among all the variables used in the study. Appendix B reports the VIF scores and the tolerances of the explanatory variables for the model. These values (compared as well to the correlation values of Table 2) do not indicate significant issues of multicollinearity among variables.

4. ANALYSIS AND RESULTS

In order to investigate the relation between collaborations and T2M as moderated by firm's capabilities we utilize hierarchical multiple and moderated hierarchical multiple regressions (Cohen and Cohen, 1983). Before analysing the data, it is important to note that due to the specific nature of the dependent variable (T2M), the lower is the dependent variable, the higher the firm's performance. Henceforth, the inverted U-shape relationship as hypothesized in Hypotheses 1-4 is here reversed in a

U-shape relationship. Table 3 reports the results of the analysis. In the first model (Model A) the control variables were entered. In the second model (Model B) the main effects were entered. In the models C moderator effects (capabilities) were entered. Models D, E and F test for a curvilinear U-shaped effect of R&D expenditures, operational-oriented and innovation-oriented collaborations on T2M respectively. In models from G to L interactions terms were entered.

The results show that both innovative-oriented and operational-oriented collaborations have a negative impact on T2M: increasing the number of collaborations the company has with external partners reduces the number of months between the start of the R&D phase and the launch of a new product in the market (model B), thus improving the firm's performance. However, there is a U-shaped curvilinear effect on the T2M of the firm as showed in models D-F. Beyond a certain threshold, increasing the R&D expenditures as well as the number of relationships (innovative and operational) increases the time to market.

Managerial and internationalization capabilities do not have a direct impact on T2M (model C) but they are positive moderators of the collaboration-T2M relationship (models I-L). Figures 2 and 3 show this moderator effect. Beyond a certain threshold of complexity generated by the number of collaborations (both innovative and operational) management and internationalization capabilities play a decisive role in reducing the time of research, development and marketing of the new product.

5. CONCLUSIONS AND IMPLICATIONS

Firms increasingly use their networks in order to get access to missing resources and improving their performance (Pittaway et al., 2004). In deepening this stream of research, however, OI scholars have noticed that collaborations are not always positive (Laursen and Salter 2006) and that their impact on the firm’s performance may be moderated by the firm’s capabilities (Järvensivu & Möller, 2009; Lee et al., 2001; Mitrega et al., 2012). These studies have mainly looked at capabilities needed to manage the network of relationships such as the relational capabilities (Mitrega et al. 2012), thus overlooking at other types of capabilities that may affect the collaboration-performance relationship. Moreover, research on collaborations has not distinguished the heterogeneity of the scope of collaborations,

considering them as a one-fits-all concept whose variety is given only by the types of partners or the intensity of relationships.

The present study enhances our understanding in two ways: distinguishing between two types of collaborations based on their scope (Aarikka-Stenroos et al., 2014; Shan et al., 1994; Bengtsson et al. 2015) and introducing and investigating the role of two types of capabilities, namely the managerial capabilities and the internationalization capability. Our results show that collaborations are important for reducing T2M, but up to a certain point. The quadratic effects that we found for both innovation-oriented and operation-oriented collaborations show that the effect of partners on T2M is positive up to a certain level. After that threshold, the impact of collaborations on T2M reverses. The fact that T2M increases when the number of collaborations increases too much stresses that managing collaborations becomes difficult after a certain level. Henceforth, firms should develop specific capabilities in order to mitigate this effect. From a practical perspective this study suggests that to fasten T2M in LS sector firms should be able to manage the number of collaborations they have and that those firms with lower levels of managerial and internationalization capabilities benefits more from increasing the number of collaborations than those with higher managerial and internationalization capabilities, at least up to a certain number of collaborations.

This paper presents some limitations that could be solved by future research. A first limitation is inherent to the usual problem of survey research: although the controls did not indicate significant problems of common method variance, its potential influence cannot be completely excluded in a self-report research study (Podsakoff *et al.*, 2003; Podsakoff and Organ, 1986) as regards the constructs for the capabilities within the firms. Secondly, the cross-sectional nature of the research could be a potential source of criticism, and future studies could employ a longitudinal research design to examine the dynamics and timing of the examined relationships. Lastly, the work is entirely based on the evidence from a particular regional network. Henceforth, a national or international comparison among LS networks at the same developmental level would help to further validate the results.

PERFORMANCE SUCCESS FACTORS IN HYBRID ORGANIZATIONS

Raišienė, Agota Giedrė

Faculty of Politics and Management, Mykolas Romeris University, Vilnius, Lithuania

ABSTRACT

The question discussed in this article is what key factors affect the success of hybrid organizations? Hence, organization's performance success factors in a context of sustainability are described as well as the results of an interview which was conducted in two hybrid organizations in Lithuania are presented.

The research has shown that issues of management-in-organization (arrangement of activities and processes in inside of entity) and management-of-organization (decisions in respect of organization's external environment) are intertwined in the hybrid organizations. In other words, managerial competencies, personnel life-long learning and organizational culture as well as entrepreneurship, knowledge on market and finances are all important for hybrid organizations in order to embody organization's performance strategy and to create products and services that meet the clients' needs best etc.

Although our research was pilot, a conclusion can be made that organization success factors are general, conceptual category. Furthermore, the capacities of the top managers to act in the context of external conditions seems directly affecting the potential of organization's sustainability.

Keywords: *management success factors, hybrid organizations, organization performance, sustainability, Lithuania.*

INTRODUCTION

The scientific discourse still lacks generalizations in discussion on organizational management effectiveness. In the publications, the issue is seen on different scales: analysis is either pointed to managerial challenges or to the business challenges. The boundaries and links between these two heads of organization management are not analyzed.

Systemized knowledge about organization performance success factors is especially important to hybrid organizations, which fit goals of both for-profit and non-profit organizations, and face the specific obstacles of performance as regard to their dual aims. In turn, the question discussed in this

article is: what key factors affect the success of hybrid organizations? Also, the results of an interview which was conducted in two hybrid organizations in Lithuania are presented.

The article consists of three parts. The first part describes organization's performance success factors in a context of sustainability. The second part is subject of research methodology. The third part presents the key factors that are perceived as beneficial for practitioners of hybrid organizations. At the end of the article, brief conclusions of the research are delivered.

ORGANIZATION PERFORMANCE SUCCESS FACTORS

When considering organizations, some factors have the greatest influence on organization performance success in the context of sustainability.

Key success factors as a long-term and successful organizational performance strategy concept were found by Ronald Daniel, according to whom, every industry has 3 to 6 factors that ensure business success and all operations must be executed with responsible evaluation of these factors (Daniel, 1961, cited in Huang et al., 2011). This concept was later developed by Rockart (cited in Farhadi et al., 2012). He defined the success factors as areas common to business in which the work results must be satisfactory in order to ensure a successful organization's competitiveness (Rockart, 1979, cited in Huang et al., 2011). In the 1980s, Peter and Waterman examined 43 successful organizations in the USA and determined 8 common factors that lead to high results (Peters, Waterman, 1982, cited in Farhadi et al., 2012). Similar research results were given by Grant in 1998. He concluded that every organization has individual success factors because each one of them is characterized by a unique set of resources and abilities (Grant, 1998, cited in Huang et al., 2011). Nevertheless, the pursuit of success factors should not be understood as a general strategy that necessarily provides exclusive profitability. These factors are an important assumption that may help the organization to be competitive. It is extremely important that the *disregard* of success factors is the leading cause of an organization's failure (Huang et al., 2011, p. 9364).

On the other hand, researchers and especially practitioners do not always understand the substance of business and management concepts and, sometimes, misunderstandings arise. It is important to distinguish management and business concepts, when striving to be a competitive and sustainable organization. Many restraints in organization performance might be overcome more effectively if organization managers would understand what problem is to be solved in a particular situation: management-in-organization or management-of-organization.

The integrity of management structures, tools and processes is a fundamental condition that enables organization to effectively refer to essential business area success factors and to obtain the positive effect carried by them (Belak, Duh, 2012).

Moreover, some assumptions of organization performance success factors become common when comparing different countries and cultures. After carrying out a meta-analysis in China and the West, Huang, Bruzga and Wang (2011) state that common success factors may be identified globally; the only difference is the ranked order of their importance. For comparison, Farhadi et al. (2012) gives the ten most important success factors of the Iranian ceramics industry. As the research shows, financial resources, clients' needs, managerial competences and human resource management remain important, despite the fact that in this country, organizations develop their activity in much more difficult economic, political and social conditions. A similar situation is observed in Sri Lanka. In this country, the skills of financial management, orientation to market needs and entrepreneurship in micro and macro levels compose the top three success factors (Jinadasa et al., 2011).

Unfortunately, there is a lack of exhaustive research in Europe that would present a well-grounded and structured list of organization performance success factors. Nevertheless, it is obvious that recently more attention has been given to human resource management in the West. As Mishra and Mishra (2010) notice, impressive productivity increases and quality amelioration results were reached by implementing and developing new technologies in organizations. In addition, significant achievements were influenced by the emerging of so called smart work place. However, an obvious turn from technologies to human potential may be observed when searching for opportunities in increasing organizational efficiency. For example, Bishop et al. (2008) carried out research in the UK showing that the most important success factors in that country are teamwork and naturally derived team leaders, support from the strategic heads, balance between information technologies and people, and communication. In addition, a complex research project executed by a team of scientists in the post-Soviet countries and described by Belak and Duh (2012) has shown that several factors have gained significant importance, that are: compatibility of internal and external policy of organizations, reliability, organizational culture, ethics, entrepreneurship, synergy and ecology — aspects that mostly rely on individuals' values, characteristics, activity and interaction.

Scientific research may be found that examines not only macro, but also micro success factors of organizations related to the characteristics of employees that are realizing the organizations' goals. For example, Fritsch (2010) revealed that employees' individual achievements are directly influenced by their ability to perceive the organization's goals and reach for their personal goals in harmony with the organizational goals. In other words, the most successful employees are those that are able to operationalize organization's policy in their everyday activity. Organizations gain benefits together with such employees, if they formulate their goals and organize their activity based on the abovementioned principles of successful activity.

In addition, reliability, ethical decisions and social responsibility are mandatory when evaluating not only external policies, but an organization's internal activities as well. For example, ethical activity and the institutionalization of social responsibility helps to reduce employee turnover, increases the organization's attractiveness to investors, and significantly contributes to the development of an organization's good reputation (Viinamaki, 2009).

As a conclusion, it can be stated that boundary between organization *business success* and organization *management success* could be delineated. Business success is determined by the following factors: organizational strategy; human resource management; innovations, R&D; use of informational technologies and electronic business; entrepreneurship; quality of products and services; creation a long-term value by ensuring an efficient organization's internal management. Defining the *management success*, the following elements can be named as common: accuracy and accessibility of information and quality of communication (feedback); inter-personal relationships, teamwork and inter-group collaboration; employees' dedication to organization and support from the highest management; managerial competences of formal leaders; life-long learning and (self-) development; and organizational culture. Nevertheless, *organization performance success* in the context of sustainability is mostly influenced by the balance of management-in-organization and management-of-organization.

RESEARCH METHODOLOGY

This research was intended to set guidelines for future researches on hybrid organization success factors. Two focus groups participated in the research: leaders and administration personnel of two organizations. These organizations were The Craftsmanship School SODŽIAUS MEISTRAI and Children's Home "Šv. Jono vaikai" ("St. John's Children").

According to the definition of hybrid organizations, these are organizations that satisfy the public interest, serve the society and carry out activity oriented to profit and growth at the same time. Although ideal examples of hybrid organization are social companies, private custody and education institutions meet the criteria of hybrid organization, too.

When proceeding research, focus groups of both organizations were introduced with the goal of the research and followed by a list of organization activity success factors for their evaluation. The list was created based on organization key success factors' meta-analysis carried out by Raisiene et al. (2014). Focus groups were asked to discuss, evaluate and rank the factors by their importance in a 5 position scale from *extremely important* for organization success and sustainability in a long term to *unimportant* for organization success and sustainability in a long term. The list of factors consisted of 20 positions. Also, the respondents were asked to make additions to the list in case an important factor is missing. In

order to narrow down the field for interpretation of the results, the researcher checked what content (meaning of conception) do the participants assign to particular factors.

The research took place in February and March of 2016.

The generalized results of the research are provided below. This research serves as a pilot stage for wider hybrid organization success factor researches.

Short presentation of researched organizations

The Craftsmanship School SODŽIAUS MEISTRAI was established in 2002 with the aim to implement a program for helping the so called street children. The goal of the program is both to care for the children and to prepare them to live independently. At the school, pupils are learning a trade for which there is demand in a country, as well as are getting a general education. Craftsmanship School SODŽIAUS MEISTRAI is the first private vocational schools in Lithuania using apprenticeship model. This method provides students with 2 weeks theoretical training in the classroom followed by 2 weeks practical training in companies. Professions taught at the school are carpenter, roofer, confectioner, and cook.

Children's Home "Šv. Jono vaikai" provide family-based child care for boys from 4 to 24 years old. After finishing their secondary education young men have possibility to stay in the Children's Home if they are willing to continue their studies. Social workers of "Šv. Jono vaikai" permanently live with children and teach them how to take care of their everyday needs. In 1996 brothers of St John's congregation Vilnius abbey started caring for children living in the streets. After making a first contact and gaining mutual trust children were invited to a shelter near Vilnius Bus Station where they could spend a night and get something to eat. Later on in four villages in Trakai district in Lithuania permanent children's homes were established. First home was established in 1998. Living there children started going back to school and learning to take responsibility for their lives. In 2012 Children's Home "Šv. Jono vaikai" became a public institution. St John's congregation as a founder is still supervising the activities of "Šv. Jono vaikai". Also, in spite of the municipality supporting this Children's home, the funding is not enough to ensure the quality of work. Due to this reason, the leaders of the organization are working hard in order to attract enough funds for ensuring children's wholesome life, after-school education and hiring social workers and managers.

RESULTS

As mentioned above, focus groups consisted of leaders and administration members from two organizations. They were asked to rank the provided list of organizational success factors. Generalized

results of the interview have shown that leaders of organizations firstly couple organization's success with five factors:

- Clear, well-grounded and long-term strategy of performance;
- Entrepreneurship;
- Quality of products and services;
- Knowledge about the market and competitors;
- Organizational culture.

It is important to note that both focus groups distinguished these factors in particular to be amongst the five most important.

The second in importance group consisted of the following factors:

- Accessibility of the capital;
- Knowledge about clients and their needs;
- Accuracy, sufficiency and accessibility of information for all employees;
- Leaders' knowledge and managerial skills;
- Continuous learning and development;
- Ability to effectively manage finances;
- Organization's image.

The research participants assigned the following factors to the third group of importance:

- Efficient management of human resources;
- Innovations and research;
- Modern ICT (for collaboration with other organizations);
- Employees' commitment;
- Management's support to employees in seeking organizational goals and carrying out everyday assignments;
- Qualified personnel.

Finally, it should be said that in spite of factors "Interpersonal relations, teamwork and collaboration" and "Organization's geographical location" being recognized as the least significant, no factors were assigned to the fifth group of factors - unimportant.

During the discussion, focus groups highlighted that they could not evaluate any factor as absolutely unimportant and ranking the whole list was easy. The respondents emphasized that all factors named by the researchers are important and their importance varies from extremely important to important and to moderately important depending on the situation of organization and challenges from external environment. For example, in the year when a project is won or huge sponsors are attracted, the accessibility of capital may move to the second plan of attention and the importance of employee commitment may increase. On the other hand, extremely important factors tend not to change, because according to the focus groups, they include some of the other factors. This could be said about the organizational culture if speaking about human resource management, as well as could be said about managerial competences if consider about employee commitment, motivation etc. and entrepreneurship. However, the fact that practically all factors were identified as important does not help to increase the probability of organizations remaining sustainable in the future. Every organization should think over its goals and work specifics well and by following that, to decide which fields of care should be always kept at front and which may be only a utility.

CONCLUSIONS

The research has shown that issues of management-in-organization (arrangement of activities and processes in inside of entity) and management-of-organization (decisions in respect of organization's external environment) are intertwined in the hybrid organizations. In other words, managerial competencies, personnel life-long learning and organizational culture as well as entrepreneurship, knowledge on market and finance are all important for hybrid organizations in order to embody organization's performance strategy and to create products and services that meet the clients' needs best etc.

Although our research was pilot, its results practically prognosticate conclusions similar to those obtained in other researches which examined the organizations working in various fields. A conclusion can be made that organizational success factors are general, conceptual category. Indeed, capacities of the top managers to act in the context of external conditions seems directly affecting the potential of organization's sustainability. However, theoretical knowledge of organizational success factors doesn't determine the substantial success of the organization.

Analyzing driver forces of hybrid organizations in the future, it would be purposeful not to focus on success factors only, but to get deeper into specific, inherent issues of hybrid organizations and the possible solutions of identified problems.

E-RETAIL OF LUXURY PRODUCTS IN THE FASHION INDUSTRY

Ribeiro, Rui¹; Nobre, Helena²

¹EEG, University of Minho, Braga, Portugal

²GOVCOPP, DEGEIT, University of Aveiro, Aveiro, Portugal

ABSTRACT

This paper aims to analyze the influence of the online presence and e-retailing of luxury brands in the fashion industry. E-retail allows consumers to purchase products and services through internet, providing them with advantages in terms of convenience, time and range of choice. Simultaneously, it allows brands to have a global reach, eliminating physical constraints while broadening their number of potential consumers. In the beginning, e-retailing was seen by brands as a useful mean for cheap and undifferentiated products. But the paradigm has changed and today almost every luxury brand has an e-store. A multiple-case study was performed. Four e-retailers of luxury fashion products were analyzed based on semi-structured interviews directed to their managers, in order to gain knowledge on their experiences and perceptions about e-retailing of luxury brands. Results indicate that multi-brand sales websites must be particularly careful with the brands that they select to sell. Priority must be given to brands that have a dynamic and consolidated online presence, and, ideally, be able to blend their on-line presence with physical stores.

Keywords: *E-Retail, Fashion Industry, Luxury Brand, Luxury Product.*

INTRODUCTION

Initially, internet sales were perceived for mass consumption, incompatible with the identity and values associated with luxury and fashion marketing. However, the last few years have noticed a remarkable turn on this idea. Despite the initial resistance of traditional luxury brands to on-line sales, it is unthinkable nowadays for them not have an online presence. The question now is about how to be present, namely, how to use this tool effectively, which contents to publish and in what way.

E-Retail of luxury products appears as a natural consequence of this new paradigm. Nowadays consumers reach easily brands' websites, as well as their social network pages and related blogs. Thus, it seems natural that luxury brands, in particular fashion industry, want to take advantage of this enormous market of active consumers, promoting and selling their products there (Okonkwo, 2009b).

The main purpose of this paper is to study the electronic retail of luxury products in the fashion industry, being the main research question: In what way can online presence and the specific characteristics of e-retail be expanded and strengthened in the luxury fashion industry?

The paper is divided in four sections. The first section consists of the theoretical background, the second comprises the methodology used for the research, the third sections incorporates the results and discussion, and the final section encompasses the conclusions drawn from the paper.

THEORETICAL BACKGROUND

To market luxury one needs first to understand what luxury is about. Luxury is first of all a social marker that drives people to acquire brands. Luxury's DNA sets on the symbolic desire to belong to an upper class. The high price of the products is not enough to define luxury assets. It only measures the wealth of the buyer, but it says nothing about his taste. Therefore, a luxury brand must encode a social distinction (Kapferer and Bastien, 2009).

Luxury is a concept defined within the scope of social psychology as the result of its connection to a culture, way of being and lifestyle, either personal or collective. When related to brands, luxury is characterized by its recognizable style, distinct identity, high notoriety and strong emotional and symbolical associations. It evokes singularity and exclusivity, and reflects on the physical products through quality, controlled distribution and premium price (Okonkwo, 2009). The essence of a luxury product requires the offer of referential quality, followed by an high price, as well as charming and differentiated aesthetics. Luxury is enhanced by the brand by making the product hard to obtain, as well as by adding extraordinary features (Becker and Nobre, 2013).

The meaning of consumer goods exceeds products' functional character and commercial value, becoming a vehicle of cultural significance (McCracken, 1986). That significance traditionally follows the same trajectory: it is usually absorbed by the cultural constituted world and transferred to a consumer good. Afterwards, that significance is absorbed from the object and transferred to an individual consumer (McCracken, 1986). Individuals seek to satisfy their need of freedom and self-definition by looking for a systematic appropriation of the significant object properties. This mission isn't always well succeeded, with a search of significance in objects that do not have it, or building a life around the significance of objects. Usually, however, the individual uses the goods in a free way to build crucial parts of himself and the world (Belk, 1988).

Consumption is increasingly becoming more hedonist and individualist, and consumers buy products not so much for what they are, but especially for what they stand for. This statement does not mean that the primary function of a product is discarded, rather it means that people acquire concepts, not products (Solomon, 1999). Simmel (1904) advocates that fashion has its foundation on two opposite

tendencies: imitation and distinction. It perceives imitation has the transmission of the social to the individual, that is, a phenomenon that allows the incorporation of the values of the group, sustaining the values and actions of the individual. Distinction works by contrast as a need of internal individualization that differentiates individual from the group he belongs, and external individualization that differentiates individual from other social groups.

For decades, luxury brands were managed by the founding family, in a product-centered business, and without any sort of professional marketing. A major turnover point for luxury brands happened when Louis Vuitton and Moët Hennessy merged in 1987, creating the LVMH group, which would become the undisputed leader of the current luxury market, with a portfolio of over 60 luxury brands, evaluated at over 57 billion euros (Heine, 2012). Unlike old times of family management, new investors and stockholders put a constant pressure on luxury brands for profits, but at the same time allow firms to have access to capital to invest in design, marketing and expansion to other countries and market segments (Heine, 2012).

To market luxury is, in itself, a paradox. On one hand, brands want to sell their product as much as they can, but, on the other hand, the traditional definition of luxury implies exclusivity. Luxury product consumers, particularly those with no time or availability to reach physical stores, demand an increase in e-retailing (Chadel, 2009). Thus, to increase profits is nowadays a challenge to luxury brands, as they have to keep themselves apart of mass consumption (Radón, 2012).

Luxury products target consumers at the top of the income ladder. A luxury product is a type of product associated with the senses: the look, the touch, the feeling. Top brands like Chanel, Dior and Louis Vuitton have created incredibly strong brands not just based on the design and quality of their products, but also through the aura of their brand, particularly reflected on the store atmosphere and brand communication (Okonkwo, 2005). The online world is incredibly dynamic and it is constantly changing. It involves interactive and participant consumers, with blogs, brand communities, social networks and other ways of communication. This takes away from the brands some of their image control, but it is also an opportunity from them to promote themselves (Rosa, 2012).

The great challenge of online retailing is set on being able to replicate the luxury physical experience on on-line. The online store design must possess more than just the basic and functional characteristics. It must be able to present a constant influx of innovative methods of differentiation. In that sense, it must resort to key elements like a well sophisticated visual component, a simple and error-proof usability, and the possibility of a substantial website personalization, adapting the experience to the consumer's needs, making him feel special (Okonkwo, 2005).

From the literature review the following exploratory propositions of study are formulated:

Proposition 1: The characteristics of fashion and luxury products are reconcilable with electronic retail.

Proposition 2: Luxury consumers are increasingly open to e-retail and began to prefer this medium instead traditional retail.

Proposition 3: Online presence may contribute to a better performance of luxury brands, in terms of both sales and brand identity.

METHODOLOGY

This paper aims to study the electronic retail of luxury products in the fashion industry. The study, of exploratory nature, was guided by the main research question: in what way can online presence and the specific characteristics of e-retail be expanded and strengthened in the luxury fashion industry?

In that sense, a cross-case study was performed in order to understand the context of luxury e-retail in depth, guided by the three propositions of study above mentioned. From these three propositions of study three main categories and several sub-categories of analyses were generated (see Table 1). Four cases of luxury fashion firms with experience on e-retailing were analyzed.

Yin (1994) states that multiple-case studies are relevant in studies that have exploratory questions as a starting point, whose purpose is to develop hypotheses and reinforce study propositions that can afterwards be tested. The study of several cases instead of just one ensures a more robust information. Each one of the cases should be analyzed individually, so that afterwards a comparison can be made among all of them (Yin, 1994).

The selection of the firms followed two main criteria. Firstly, firms had to sell luxury fashion brands; secondly, they had an own e-store.

Three multi-brand luxury retailers were selected: a new player named J. LISBON, a small e-retailer Quartier Latin, and a large well-known e-retailer Net-A-Porter. The fourth case is a mono brand company branded with the name of its designer, Egídio Alves, which is one of the major Portuguese brands in the luxury shoes industry. J. LISBON and Net-A-Porter are two cases of pure e-retailers. By contrast, Quartier Latin and Egídio Alves are two firms where physical and digital presence coexist. In these latter cases, e-retail was recognized as not being the company's central priorities, despite both recognizing that it is a growing market.

The only firm for which no primary data was possible to collect was Net-A-Porter. Given that Net-A-Porter is one of the biggest e-retailers in luxury fashion industry, it was considered to be a fundamental piece in this study.

The method of data collection focused on in depth semi-structured interviews directed to firms' website and online store managers. According to semi-structured interview methodology, the

researcher has a series of questions, relatively open, that give guidance to the interview but at the same time favors an open environment where respondent can talk about his perceptions and opinions freely (Quivy and Campenhoudt, 1995). Three managers were interviewed: the founders and current managers of Quartier Latin, J. LISBON, and Egídio Alves. The fourth case, Net-A-Porter, was analyzed through secondary data.

The interviews in the cases of Quartier Latin and Egídio Alves were made in person, at the companies head offices, after previous scheduling. The founders and managers of both companies were interviewed. The interviews were recorded, with the consent of the interviewees, and were later transcript to a text document. In the J. LISBON case, the interview was made through e-mail. The founder and manager of the brand sent his answers by email.

The information collected through the interviews was complemented with secondary data gathered from the firm' websites, and other websites with news and articles about the companies.

RESULTS AND DISCUSSION

From the cross-analysis of the four cases it is possible to withdraw some conclusions. Considering the intrinsic characteristics of luxury opposing to the ones of e-retail, it seems consensual that it is possible to replicate the emotional characteristics of luxury in a digital medium, especially using tools like an adequate website and strong multimedia content, such as photos, music and videos. The replication of the physical characteristics of luxury is less consensual, prevailing the idea that it is possible an approach between the two means, but it will never be possible to replace the physical experience, whether the store environment or the touch on a piece of clothing.

There is also a widespread idea that luxury brands have to fight the exclusivity/accessibility paradox to avoid the trivialization of their products. The recommended formula is the creation of sub-brands, as well as different ranges within the same brand, to ensure the access of different types of consumer to different types of product, enabling, at the same time, to retain customers that look for more exclusive products, while opening the brand to new consumers.

Despite the efforts of trying to make the brand's website a similar experience to the store environment, in the majority of the studied cases it became clear that digital and physical are far from delivering the same shopping experience. As seen in the case of Quartier Latin, physical and online experiences may co-exist and be complementary, providing consumers with alternative buying channels. The consensual idea is that physical and online digital means work simultaneously and in a complementary way.

Three of the cases pointed out that age is not an important factor in e-retail, where all age groups are similarly represented. Only in the case of Egídio Alves was detected a prevalence of consumers ranging from 20 to 40 years old, which can be related with the brand's target.

Category and respective sub-categories of analysis	Quartier Latin	J. LISBON	Egídio Alves	Net-A-Porter
Luxury vs. E-Retail				
Replication of luxury's emotional characteristics in e-Retail	X	X	X	X
Replication of luxury's physical characteristics in E-Retail		X		X
Brand identity communicated through the website	X	X	X	X
Keeping the brand's exclusivity while maintaining sales	X	X		X
E-retail as a priority for the company		X		X
Traditional Retail vs. E-Retail				
Online and physical brand experiences merges in just one brand experience		X		
E-retail is used by different consumer age groups	X	X		X
Convenience and time as the main strengths of e-retail	X	X	X	X
Online as a tool for the brand value				
Online presence decreases the perception of differences between luxury and mass fashion.		X		
Online presence makes the entrance of a new brand in the market easier.	X	X	X	X
Difficulties for brand's growth in the online environment	X	X		
Web 2.0 as a fundamental tool in the construction of the brand image and sales growth	X	X		X

It is consensual that the major advantages of e-retail for consumers are time and convenience. Factors like quick delivery and pre and post-sale service have been also mentioned as crucial. Another important positive characteristic of e-retail that was also mentioned is the bigger selection and quantity of products available, in contrast to a physical store. In sum, time, convenience and stock diversity are considered the three major advantages of e-retail.

The risk of attenuating the differences in luxury versus mass fashion consumer perceptions about their products is something that does not appear to frighten these companies. Only one of the cases

pointed out that possibility. However, results indicate that a strong brand identity and emotional connection with consumers seems to prevent luxury brands to lose their value in e-retail.

It was also clear from the interviews that the online presence favors the entrance of a new brand in the market, benefiting mainly the smaller firms with less resources. However, two of the cases indicated that, after the initial implementation, new brands have struggled with great difficulties to grow online. While the initial investment is almost irrelevant, the investment needed for a sustained growth is very high. Thus, it is very difficult for a small brand to grown in a market dominated by giants.

Web was pointed out in three of the cases as fundamental for luxury brands and their growth, in terms of both sales and brand awareness. Fashion blogs and social media, like Facebook or Instagram, play an increasingly important role in the fashion world. In such way they became a business on its own, and quite expensive as referred in the cases of Quartier Latin and J. LISBON. The Egídio Alves's manager recognized the importance of Web, but claimed that this tool is not essential for the brand and if it disappeared other solutions would be found.

CONCLUSIONS

E-retail has significant advantages comparing to physical retail, such as its global reach, speed, convenience, great diversity of products, accessibility and availability. On the other hand, it has limitations: the inexistent of physical contact between sellers and buyers, the low cost of exchange (it takes just one click to move to another website) and a less persuasive ability of selling (it is easier to say no to a computer).

The constant novelty in on-line channels makes the task of following these active consumers difficult for brands. Moreover, replicate a phenomenon based on the senses as luxury seems to be so far an unfinished task. The greatest development in the ecommerce of luxury products in the last few years has been the replication of luxury's emotional characteristics, instead of the physical ones. It is not easy to replicate the smell or touch through a digital medium, but it is possible to communicate the brand's values and identity, creating an emotional connection with the consumer. These speed and quick changes are something that were not part of the luxury brands genetic code, traditionally sustained on continuity and heritage (Kim and Ko, 2010). But the online paradigm forced the brands to a fast adaptation, putting pressure on the need to change.

E-Retail is deeply dependent on the online brand image, so it must be seen as part of a whole, and not something able to subsist on its own. Therefore, multi-brand sales websites must be particularly careful with the brands they select to sell. Priority must be given to brands that have a dynamic and consolidated online presence, and, ideally, be able to blend their on-line presence with physical stores. E-retail is growing exponentially, but nothing can truly match the environment of a luxury physical

store. The co-existence of physical stores and e-retail with mutual benefits seems to be the trend for the years ahead for the luxury fashion industry.

ABSTRACT

The problem of corruption affecting economic sectors and institutions has been at the center of a lively political and doctrinal debate for some years now, and despite the introduction of several measures intended to curb such phenomenon, it continues to cause ill-effects in a range of industries, not least of which is the professional sports industry.

This paper focuses on the issue of corruption in professional football and specifically on match-fixing, because of the topicality and international scope of the phenomenon.

Building upon available literature on the subject, this paper discusses the negative consequences of match-fixing from an economic standpoint. It then lays out some potentially useful suggestions for preventing and reducing its occurrence.

Keywords: *Match fixing, corruption, professional football industry, institutional perspective, transaction costs.*

INTRODUCTION

Much of the economic analysis of sports has concentrated on the optimal design of sport competitions, with the aim to devise appropriate incentives for athletes to perform to the best of their capabilities. For example, Rosen (1986) explains the incentive properties of prizes in sequential elimination tournaments. However, empirical research has returned mixed results. For instance, Ehrenberg and Bognanno (1990) demonstrate that the structure of the award-giving process in the Professional Golfers Association directly influences the athletes' performance, whereas Orszag (1994) suggests that the level of the total prize money has an insignificant effect on the total score of the players.

¹ Even though this paper has been jointly conceived by the authors, for academic purposes the Introduction section is attributable to Vincenzo Scafarto, the Background section to Bruno Marsigalia, the Discussion section and the conclusions to Federica Ricci.

Another strand of economic analysis, also concerned with the optimal design of sport competitions, has concentrated on the market structure of the sports enterprise (e.g. Ehrenberg and Bognanno, 1990; Ross and Szymanski, 2003, Taylor and Trogdon, 2002).

In particular, Neale (1964) notes that the production function in the professional sport industry is unusual in comparison to other industries. As a product, professional sport requires coordination among contesting participants, since by the very nature of the product (a game), teams must agree on a number of matters before the game or competition takes place. This coordination is essential if there is to be any competition in professional team sports, where the central coordinating body is the sport association or league.

As such, Neale (1964) suggests the view of the sports association as a multi-divisional enterprise comprised of different members, the member clubs, which would represent simply multi-plant divisions of the sports association. The multi-divisional sports enterprise delivers the sport product through the cooperation of the member clubs. As a result, the quality of the team sport product is determined by the quality of the interaction between the contestants, namely the displayed skills and performance.

The parallelism between a sports association and a multi-divisional enterprise is conducive to the aims of this paper, since it brings into focus the role of the sport association as a key governing body, which has to play its role in addressing the issue of corruption in football.

Suppose the demand of interested fans rises as the quality of sports competition rises, the sports association has then a clear interest in improving the structure of competition in order to maximize the quality of the product being offered. Thus, via the contest design, including the prescription of the rules subject to which the game is to be played, the sport association tries to provide the contestants with incentives to expend their best playing efforts.

This paper aims to contribute to the literature on the optimal design of sports competitions. In particular, it attempts to provide the sport associations with innovative instruments in order to reduce the probability of match-fixing. The phenomenon of match-fixing tends to reduce the unpredictability (i.e. outcome uncertainty) that characterizes the sport contest, thus reducing the value of the product delivered by the sports association, which could adversely affect spectators' demand and sponsor interest.

On the basis of such considerations, this paper analyzes the phenomenon of match-fixing in professional football, discussing its negative consequences from an economic perspective. Using the institutional theory as a theoretical framework, it then attempts to devise tools for reducing the diffusion of the phenomenon.

BACKGROUND

Economic research on sports has grown dramatically in the last few years. While a substantial part of the literature has concentrated on the theme of competitive equilibrium (Késenne, 2000; Szymanski and Késenne, 2004), many studies have also been devoted to the issue of corruption in sports.

Sports have always been affected by corruption phenomena since the earliest organized sporting events (Decker, 1995).

In contemporary sports, a number of cases or attempts of corruption have also been documented (Maennig, 2005), notably in the context of team sports. Cricket was one of the first team sports to be affected by corruption scandals. Several authors such as Condon (2001) and Preston, Ross and Szymanski (2001) point out that the poor pay of cricketers relative to sports of comparable significance has favored the rise in bribery cases in cricket.

Duggan and Levitt (2000) found a high corruption rate within the highest spheres of Japanese sumo wrestling, due to a non-linearity in the incentive structure of promotion, leading to gains from trade between wrestlers on the margin for achieving a winning record and their opponents. These findings have been further substantiated by the work of Dietl and Werner (2010), who have found evidence that the structure of promotion offers sumo wrestlers a potential incentive to fix matches.

Preston and Szymanski (2003) have examined match-fixing along with other forms of corruption in sports, such as sabotage and doping. They maintain that match-fixing occurs either because one side “needs” to win to the extent that is willing to make side-payments to persuade the other side not to make an effort or to persuade the referees towards making biased decisions, or because players or officials stand to gain financially from gambling on the outcome of a match.

Considering the connection between betting and match-fixing, it has been noted that the latter can be influenced either by the individual inclination of agents towards betting or by the development of betting social networks. Analogously, in his analysis of gambling in North American football, Scott (1990) revealed a connection between the legalization of gambling and the spread of illegal gambling connected to football matches. More recently, Bag and Saha (2011) have shown that in the presence of a high rate of fixed matches, there are at least three contributing factors: strong illegal gambling networks, high levels of relative exploitation of players and perceived corrupt officials.

According to Caruso (2009), match-fixing could be largely determined by the asymmetry in the evaluation of the stake between the contesting teams, which would leave room for implicit collusion.

Anyway, the phenomenon of match-fixing represents a real threat to the world of sports to such an extent that sponsors and fans could be dissuaded. In this respect, Hing and Zhouxiang (2013) show that episodes of fixed matches in Chinese football between 1990 and 2000 have transformed the passion of

fans into resentment. Given such, match-fixing can be regarded as a form of corruption in that it robs the sport competition of its essential characteristic—that of outcome uncertainty (McLaren, 2008).

DISCUSSION

According to the classical approach as elaborated by Becker (1968), corruption (and any other intentional or negligent perpetration of an illicit activity) can generally be regarded as a choice made by an individual among a number of legal and illegal alternatives to pursue the course of action which promises the greatest expected net utility for him at the time of deciding.

Specifically, an agent chooses the corrupt alternative when the expected net utility exceeds the level of satisfaction corresponding to the legal alternative.

The formula stipulates:

$$O_j = OJ(p_{ji}, f_{ji}, u_{ji})$$

where:

- O_j the number of corrupt actions committed by a generic, rational agent in period j ;
- p_j the probability that the individual is discovered and sanctioned for having committed a crime;
- f_j the expected sanction for the crime committed;
- u_j the cumulative variable of residual factors that influence the agent's preference for corrupt action over that of legal action.

Following the Becker's approach, one can argue that the choice of a corrupt alternative is connected to several individual variables acting as motivating factors.

Generally, in team sports, a match takes place between opposing teams that attempt to prevail over each other, aiming to attain a higher score. From a strictly sports perspective, the contest is dominated by the competition, which is inherent in the nature of team sports and represents the attempt of attaining victory in a sports dispute, subject to the established rules (Simon, 2004).

However, part of the literature points out that, under particular conditions, contesting teams may be motivated to pervert the nature of sport, looking at cooperation as means to maximize their utility function (Caruso, 2009).

The phenomenon of match-fixing is one of the most common forms of cooperation in sports, in which contestants agree on the objective to alter the regular course of the game by fixing match results.

Generally speaking, it is well-known that the world of betting relies on the logic of risk, which consists in gambling money (or other assets) on the uncertain outcome of a future event. Clearly, when the result of a future event is fixed in advance by means of an agreement between economic agents, the risk component falls notably.

In match-fixing, the illegal bookmaker (or the network of illegal bookmakers) agrees with the players upon achieving a certain result, in order to bet money and obtain an economic return. The football players (and/or the referees) that take part in the corrupt agreement obtain a profit which is not necessarily measurable in monetary terms.

The planning behind a corrupt agreement has inherent difficulties, these including the search for corrupt partners and the mode by which the agreement is performed. These difficulties are mainly due to the fact that the agents meet in a parallel (illegal) market, where information circulates with less transparency due to its illegal nature.

In fact, if on the one hand the agents that take part in match-fixing may benefit from an extraordinary profit, on the other they face transaction costs that are generally much higher compared to legally-made agreements.

Economic literature posits that transaction costs play a role of prior importance within economic systems, whether in reference to a firm activity (Coase, 1937; Williamson, 1985; Heannart, 1988; Walker and Weber, 1984; Hill, 1990; North, 1990) or to the economic development of a country (North, 1984).

According to the institutional theory, the costs of transaction in the context of corrupt contracts can ideally be broken down into three groups (Lamsdroff, 2008):

- the cost of accessing corruption;
- the cost of using corruption;
- the cost of maintaining a corrupt agreement.

The costs of accessing corruption include the costs of finding partners prone to corruption, as well as the costs of gathering enough information to allow for an assessment of their trustworthiness. In fact, an explicit offer of bribery exposes the briber to the risk of being charged; on this point, empirical studies demonstrate how the circulation of information on individuals' willingness to take part in a corrupt act increases dramatically the probability of being discovered (Alam, 1990; Borner and Schwyzer, 1999; Rose-Ackerman, 1998). The lack of conventional channels to find potential partners makes it difficult to obtain information on their trustworthiness. In order to overcome such problems, the usual procedure of a bribery deal is to rely on a mediator between the briber and the potentially bribed person, who not only protects the briber from direct exposure but also allows to make an offer towards a wider public (Lamsdroff, p. 141).

With regard to match-fixing in professional football, Hill notes that some contingent factors could facilitate the approach between the briber and the football player. Referring back to fixed matches recorded in the 1950's in the UK, direct testimony has demonstrated the existence of a positive correlation between the player's attitude towards bribery, his social background, and his contractual conditions. Particularly, the contractual obligations of professional football players in the UK at that

time included compliance to severe regulations issued by the club the players belonged to, which were not counterbalanced by an appropriate treatment in terms of social security and compensation.

In general, the presence of precarious conditions facilitates the spreading of corrupt phenomena insofar as individuals seek to obtain an earning through manipulating and/or exploiting the economic environment; in that case, corruption would function as a source of income.

In the context of professional football clubs, players may show a greater inclination to take part in match-fixing when there exist marked differences in wages among players belonging to the same club, as an attempt to bridge the gap.

As regards the motivations behind athletes' inclination to corruption, part of the existing literature considers the player's act of fraud as a way to get a 'revenge' on their rivals (Leaman, 2001). In this respect, Balsdon, Fong and Thayer (2007) view corruption as a likely motivation for systematic under performance in NCCA.

A further variable that may facilitate match-fixing relates to the perception of football players by their own managers. That is, the higher the level of suspicion by managers towards a player, the higher the probability that the player will get involved in a bribery deal.

It should be noted, however, that match-fixing could also take place independently of contingent variables, as a result of individual inclination. Rose-Ackerman (1992) argues that corrupt opportunities can still be encountered at random. The most common opportunities arise between business partners that have well-established legal relationships.

Hill (2008) reveals that athletes who are more aggressive and self-confident are typically more inclined to risk and to match-fixing.

A high rate of fixed matches is most likely found in contests where structured networks of clandestine bookmakers exist, since the physical proximity between players and corrupt agents could increase the probability of corrupt deals. For instance, Sandholtz and Gray (2003) demonstrate that, in general, the geographical proximity with countries notoriously affected by corrupt phenomena correlates with higher levels of corruption.

However, due to the implications of match-fixing for the sports industry, it is necessary to have an active participation of professional football players and/or referees. On this point, empirical studies have revealed that it is more advantageous to involve players rather than referees in match-fixing since, in the former case, the probability of success is equal to roughly 83%, whereas it is 79% in the latter case (Hill, 2008).

After the bookmakers have identified the agents with whom to make a deal, it is necessary to establish the ways of approaching them; in this respect, one can distinguish a direct approach from an indirect one. In the former case, the bookmakers contact the players without any mediator whereas a mediator

is employed in the latter case. A direct approach is generally opted for when an enduring relationship exists between agents, or when some knowledge of an athlete's personality has already been attained. Instead, an indirect approach is generally chosen when there is no pre-existing relationship between bookmakers and players; usually, the mediator is selected from a short-list of former professional players, since they could have easier access to confidential information, as well as to the places where the athletes usually meet, whether during their weekly training sessions or in their free time.

Once the potential corrupt partners have been approached, it is necessary to define the agreement in order to actualize the match-fixing operation. In this phase, the transaction costs of using corruption arise, these including the costs incurred to come to an agreement on such issues as the time period within which the parties should fulfill their performance obligations, the mode of payment, as well as the protective measures against the event of non-fulfillment.

The impossibility to enforce a corrupt deal through legal actions prompts agents to devise alternative instruments of protection (Klein, 1996; Klein et al., 1978; Williamson, 1985).

Among the most frequently used methods for enforcing corrupt contracts, the hostage arrangement must be mentioned (Wiggins, 1991; Williamson, 1983), whereby the stronger party of the corrupt agreement delivers a valuable asset to its counterpart, as a guarantee against opportunistic behaviors; in case of opportunistic behavior, the injured party holds the hostage as a compensation.

Another useful device could be that of paying an advance on the promised payments in order to corrupt agents with an incentive to fulfill their performance obligations. Empirical studies have revealed that corrupt officials in the public sector have often requested advances on payments (Moody Stuart, 1994).

In reference to the phenomenon of match-fixing in professional football, the sporting results to be achieved and the related payments are established in the execution phase of the agreement.

Once the corrupt agreement is finalized, the bookmakers place their bets. The aim of illegal bookmakers is clearly to maximize individual profits; in this phase, the utmost secrecy is to be observed to avoid that other betters could intuitively grasp the presence of an 'information privilege' and thus emulate their decisions.

In the world of bet-fixing, several 'distracting' strategies have been devised to divert the attention of betters towards results opposite to those fixed by illegal bookmakers, even going so far as to tip the 'wrong' team as the winner.

The outcome of bet-fixing is also affected by the time factor, because the later bookmakers place their bets, the higher the probability of attaining a high profit. Indeed, evidence exists that the corrupt players are told the match result to be achieved very close to the beginning of the match. For instance,

an Indonesian bookmaker claimed that he told the 'fixed' outcome to players only a few seconds before the beginning of the match (Hill, 2008).

At the end of the sports competition, the payments agreed upon are delivered to the involved individuals by bookmakers, whether in monetary or non-monetary form.

When the payment is stipulated in cash, it is usually split in two parts; the first being dispensed in advance and the second after the sporting event in order to motivate the players not to disregard the agreement. Also, a tricky question arises as to how such money transfers can be justified: the earnings of professional football players are in fact widely disclosed, for it is necessary to disguise these illegal extra-earnings as legal ones.

In order to deal with this issue, the usual procedure is that the bookmaker re-purchases winning lottery tickets (paying the real winners the prize money) and then transfer them to players so that they can get the payment without drawing suspicion.

Instead, when personal requests are made by players involved, they usually consist of luxury and niche items. In many instances, the mode of payment influences the outcome of match-fixing; in some cases, it has been found that when football players hesitate to take part in match-fixing, the bookmakers may even promise to transfer the player to a more prestigious category and club. Barin and Bernès reported a number of fixed matches, such as those at the AEK Athens and Marseilles in the Cup of Champions between October and November 1989. In Athens, the adversary players were paid to lose the game. Years later, one of the players involved in the scandal at Marseilles – Jean-Jacques Eydelie – exacerbated the controversy, revealing that other players were involved in the match-fixing circle. In particular, he claimed that the usual procedure was that one or two days before a big match former players from the opposing team were asked to contact their friends to ascertain whether someone was potentially open to accept a bribe offer (Hill, 2008).

In any case, one major weak point in match-fixing is the inherent difficulty of predicting whether the parties involved will respect the agreement. Such a difficulty is usually overcome by relying on the 'reputation factor': indeed the degree of trust among the agents appears to be a prerequisite condition for the success of the corrupt contract. In particular, reputation plays a major role in shaping expectations, to the extent that a corrupt individual, despite a past void of opportunistic behavior, can be supposed to re-enact the same behavior patterns in the future.

In this respect, Husted (1994) observes that the choice of corruption does not necessarily imply dishonesty: the aim for a reputation as a honest man is not foreign to corrupt agents since upholding one's reputation over time could prove to be profitable.

Lamsdroff suggests that, somewhat paradoxically, the preference for honesty could have an ambiguous effect on corruption; a negative attitude toward opportunism, along with an inclination to cooperation, could promote rather than inhibit corruption.

Additionally, the higher transaction costs that are involved in corrupt contracts compared to legal ones also relate to the time that follows on the fulfillment of such contracts.

While a legal contract ends with the exchange of goods or services for set profit, the corrupt pact does not end with the agents achieving their aims. In fact, an agent may attempt to extort further payments by threatening a criminal charge.

The corrupt agents may be motivated to file a criminal charge, given that mass media often offer money awards to get access to confidential information. This appears to be particularly the case in the professional football industry given the substantial amount of media exposure.

CONCLUSION

The above analysis of the weak points in corrupt agreements is conducive to the aim of proposing appropriate measures to reduce and prevent corruption phenomena in the professional football industry, with particular stress on match-fixing.

From this perspective, if the already-high transaction costs involved in corrupt agreements were to be further increased (and unless compensation is adjusted correspondingly), corruption would be no longer a profitable choice.

For this purpose, there appears to be a pressing need for a prevention system against corruption in football, whether in reference to referees or match-fixing, with both sporting and economic ends.

Secondly, harsher punishment for sports corruption is needed, which could be based on an 'asymmetrical logic'. In fact, if agents who turn state's evidence were granted a mitigation in penalty, the self-perpetuating connection between corrupt partners would be threatened and, as a result, risks could increase for both corrupters and corrupted. Furthermore, if the latter were to suffer less severe sanctions in comparison to those applied to the corrupters, the selection for individuals potentially open to corruption would become even more complex, undermining the system efficiency.

To strengthen the sanction system, an international collaboration is urgently needed since the phenomenon of match-fixing and corrupt referees is rarely occasional: instead, it generally represents the by-product of an organized system of transnational reach.

From a strict 'sporting' or 'competitive' standpoint, it would be necessary to review the format or technical rules of the tournament; in fact, previous works emphasize that bribing opponents usually occurs since the rewards for winning are highly asymmetric (Preston and Szymanski, 2010). The asymmetry in the evaluation of the stake between contesting teams could be particularly marked in

some stages of the championship, most notably in the final stages. Arguably, it could prove useful to propose a system of qualification and direct elimination at the end of the regular season in order to determine the winning team, that is, the team that has the right to qualify for a possible successive competition. Such a method, commonly known as the “play-off and play-out mechanisms” could strengthen the sporting competition: since both contesting teams would aim for victory, the possibility of cooperation would be significantly reduced.

The play-off and play-out method is presently adopted in various team sports, including tennis, basketball, volleyball, rugby, water polo and baseball.

In the 1990’s, this method was introduced in Italian football, too: it was first adhered in the lower (C1 and C2) championship divisions.

In the second division of Italian football (“Serie B”), direct elimination rounds were introduced instead in the 2004/2005 season, determining the promotion of the third team to the Serie A (first-League); the model derives from the Football League Championship, the second English division, where the system has been in use for a number of years now.

Generally, in order to prevent and reduce the phenomenon of match-fixing in professional football, it is necessary to consider the social impact of the phenomenon. Sports is in fact a largely studied proxy for social identity, both at national and regional level; for instance, some studies have examined the role of social identity in the context of rugby in New Zealand (Fouguere, 1989) as well as in the context of cricket in the County of Yorkshire (Russel, 1996). Other numerous studies have focused on social identity in football as shaped by different national cultures (e.g. Falk, 2005; Gebrmann, 1997; Armstrong and Giulianotti, 1999).

The role of sports has also been studied considering its strong bearing on the level of economic development of a country. Developing countries suffer from a deficiency in physical and sport education, as well as from a lack of financial support and adequate infrastructures. The level of sports diffusion represents, therefore, another indicator of economic development (Andreff, 2001).

If sport is to be a chance for socio-economic growth and development, orienting agents towards an ethically-correct behavior in sports is all the more necessary.

In the professional football industry, such an objective could be achieved both through a more conscientious media coverage and through a contribution by players’ agents.

Conscientious media coverage implies a steady monitoring of information, such as to disclose only the cases of sports corruption that have actually been proven. Such a monitoring system could prove useful as a means of raising awareness – among players and other stakeholders – of the risk associated with corruption, playing on the fact that corruption, once discovered, will be appropriately sanctioned and disclosed, thus affecting their reputation.

Secondly, the spread of only verified information could be useful in reducing media opportunism, which could favor the spreading of a distorted “culture of corruption.” In this regard, studies claim that the higher the level of corruption perceived by individuals involved in the sports industry, the lower their moral threshold registers (Warren e Lufer, 2009).

If, on the one hand, an appropriate monitoring system on the range of media that revolve around the world of professional sports would be desirable, it is important not to understate the possible obstacles to its effective implementation. These are mainly due to the fact that the very same *media* have an interest in spreading information since they invest substantial resources for the rights to broadcast the sporting events.

On the other hand, the role of players’ agents has gained prominence in the last few years, as regards the responsibility to assist and negotiate on behalf of football players on one or more issues, such as the agreement and transfer of players’ contracts. So, arguably, their role as ‘guardians’ of the players’ best interests should also include preventing them from getting involved in match-fixing, e.g. through raising their awareness on the risks and consequences.

The reduction of corruption in professional football calls for a structured maneuver focused on the inherent weak points of corrupt agreements; in particular, there appears to be a pressing need to raise awareness on the possible impacts of corruption on the welfare of relevant stakeholders.

In the mid-to-long term, if the phenomenon of corruption should not be curbed, football would risk losing its appeal to the extent that it is deprived of the components of uncertainty and suspense that by its very nature permeate the sports competition. This could adversely affect the role and interests of several stakeholders: so, for instance, the role of referees that could over time be superseded by technology-based mechanisms in an attempt to reduce discretion and human error to a minimum; also, professional football players would also risk to incur a cut in wages; eventually, a decrease in the uncertainty of the competition outcomes could also affect the interests of the press and new media, which could lose customers.

In light of the discussion herein, one could conclude that corruption benefits above all the agents belonging to organized crime, though it exposes them to huge risks are associated to the possibility of being discovered and criminally charged.

From this perspective, future research should aim on the one hand to quantify the overall negative effects arising from corruption, and on the other to explore the existence, at club level, of a relationship between corruption, organizational behavior and performance.

ABSTRACT

One of the most important principles used in measuring the market's efficiency is the ability of prices to reflect all available information. The Efficient Market Hypothesis (EMH) is the proposition that current stock prices reflect all available information about the value of the firm (Fama, 1965) and that there is no way to earn excess profits by using this information. However, evidence against the EMH is growing. Scholars have been studying the calendar anomalies that are one of the characteristics of financial markets, and these anomalies are found to contradict the EMH. This paper examines day of the week and month of the year effects in four European stock market indexes in the period 1998-2007. Recognizing that returns are non-normally distributed, auto correlated and that the residuals of linear regressions are variant over time, I use statically robust estimation methodologies, including bootstrapping and GARCH modelling. Although returns tend to be lower in the months of August and September, I do not find strong evidence of across-the-board calendar effects, as the most favourable evidence is only country-specific. Additionally, using rolling windows regressions, I find that the stronger country-specific calendar effects are not stable over the whole sample period, casting additional doubt on the economic significance of calendar effects.

1. INTRODUCTION

One of the most important criteria used in measuring the market's efficiency is whether or not prices reflect all available information (information efficiency). The Efficient Market Hypothesis (EMH) is the proposition that current stock prices fully reflect all available information about the value of the firm and that when using this information, there is no way to earn higher profits.. Consequently, there is no reason to believe that prices are too high or too low. Security prices adjust before an investor has time to trade on and profit from a new piece of information. So in an efficient market prices reflect all accessible information: it's impossible to beat the market. Investors pay a fair price. This means that

the only thing investors have to worry about is selecting which risk-returns-trade-off they want to be involved with.

However, the EMH has received a plenty of attention since its inception. At first glance, it may be easy to see a number of lacks in the efficient market theory. In fact, evidence against the EMH is mounting, and numerous studies have documented return predictability (Rossi, 2016). Despite its relative simplicity, this hypothesis has also generated considerable controversy. After all, the EMH questions the capability of investors to consistently perceive mispriced securities (Rossi, 2015). For these reasons, scholars have recently been studying calendar anomalies that are characteristic of the financial markets and finding that they contradict the EMH (Nasir et al., 2016). The purpose of the paper is to investigate the calendar effects in four European market.

2. A BRIEF LITERATURE REVIEW

During the 1970s, many empirical tests were conducted to demonstrate the informational efficiency of stock markets. In contrast, during the 1980s, 1990s, and over the last fifteen years, much has been written with the goal of demonstrating the markets' inefficiency by identifying orderly variations in stock prices related to the calendar of the civil year (Rossi, 2015). In this section I describe calendar anomalies across the globe among markets with different micro-structures. Calendar effects (or 'seasonal effects') are cyclical anomalies in returns, where the cycle is based on the calendar. The calendar time hypothesis states that the market works differently at different hours of the day, on different days of the week, and at various times of the month and year. Various studies have been conducted on this topic. The most important calendar anomaly is the January effect: "as goes January, so goes the year" is a popular rule in the stock market. The earliest evidence of abnormal stock returns in January for U.S. stock markets was underlined by Wachtel (1942). Rozeff and Kinney (1976) were the first to properly report this effect in the U.S. equity market. They found a seasonality in monthly rates of return on the New York Stock Exchange (NYSE) from 1904–1974. Similar results were reported by Gultekin and Gultekin (1983), Barone (1990), and Agrawal and Tondon, 1994. They showed abnormal positive returns in major industrialized countries. Another important anomaly is the day of the week effect. This was first documented by Osborne (1962) in the US stock market and was later analysed by many scholars (Cross, 1973; French, 1980; Gibbons and Hess, 1981; Lakonishok and Levi, 1982; Keim and Stambaugh, 1984; Rogalski, 1984; Jaffe and Westerfield, 1985; Jacobs and Levy, 1988; Jaffe et al., 1989; Barone, 1990; Wang et al., 1997). Typically in the US., low mean returns are observed on Monday in comparison to the other days of week. Mean returns on Friday are observed to be positive and abnormally higher than the mean returns on other days of the week

The turn-of-the-month (TOM) effect was first identified by Ariel in 1987 for the US equity market. His study covered a period of nineteen years (1963-1981), focusing on the last day of one month and the first three days of the following month. He observed that mean returns are higher at the end of one month and at the beginning of the next month. Lakonishok and Smidt (1988) extended Ariel's analysis. They used a ninety-year sample period (1897-1986) and a narrow study window of front-trading days comprising the final trading day of one month and first four trading days of the next month. They find evidence of strange returns around the turn of the week, around the turn of the month, around the turn of the year, and around holidays. Barone (1990) analyses the Italian stock market. He found a difference between the first and second halves of the calendar month.

Although the efficient market hypothesis was widely accepted by academic financial economists, over the last few years the evidence against the EMH has grown. The analysis of calendar anomalies have attracted the attention of a large number of scholars, but results have often been mixed.

3. DATA AND METHODS

We collect from the webpage of Yahoo finance daily data on four European stock market indexes, for the period beginning in January, 1998 through to December, 2007. The countries are: France, Germany, Italy, Spain.

For all indexes, daily returns are computed as:

$$r_t = \ln (P_t/P_{t-1})$$

Where r_t is the daily return of the stock market index and P_t is the stock index at date t .

We find that the mean daily returns range between 0.017% in France and 0.033% in Spain. In that fourteen year period, the maximum daily returns have been registered in Germany (+7.27%), while the minimum daily returns happened in Italy (-10.64%). The standard error of the mean is lower in Italy (0.0002091), suggestive of lower return volatility, and higher in Germany (0.0002455), a signal of relatively higher volatility. This paper analyses daily returns of stock market indexes, comparing the daily returns on specific calendar periods (e.g. the day of the week and the month of the year, with the daily returns of the remaining days outside the period under scrutiny). Calendar effects can be studied either using observations of returns of individual stocks of a specific country, or by examining the behaviour of a stock market index (French, 1980, Keim and Stambaugh, 1984, Rogalski, 1984, Chang et al, 1983, Basher and Sodorsky, 2006). Officer (1975) affirms that calendar effects are more easily detected in market indexes than in individual stock prices. For the stock market indexes, a common method in the literature consists in estimating the following formula. For the day of the week effect, the formula coding Monday as 1, Tuesday as 2, Wednesday as 3, Thursday as 4 and Friday as 5:

$$r_t = \alpha + \beta_1 D_{2t} + \beta_2 D_{3t} + \beta_3 D_{4t} + \beta_4 D_{5t} + \epsilon_t$$

Where:

- r_t is the daily return of the stock market index,
- D_{it} are dummy variables which take on the value of 1 if the corresponding return for day t is a Tuesday, Wednesday, Thursday or Friday, respectively and 0 otherwise,
- β_i are coefficients which represent the mean excess daily returns on the remaining days of the week, relative to Mondays,
- ε_t is the error term.

In this specification, the t-tests of the β_i coefficients inform us if they are statistically significant: i.e., if the excess daily returns on Tuesdays, Wednesdays, Thursdays and Fridays, either positive or negative, are significantly different from Mondays' mean return. With this model I hope to recognize a Monday effect, if I find out that the mean daily return of that day differs significantly from the mean daily return of non-Mondays.

An alternative approach is to estimate five equations separately, each aiming to detect a specific day of the week effect:

$$r_t = \alpha + \beta_i D_{it} + \varepsilon_t \quad (1)$$

For the month effect analysis, the approach is to estimate twelve equations separately, each aiming to detect a specific month of the year. I've twelve different dummies, M_i ($i=1$ to 12), each taking on the value of 1 if the corresponding return for day t is of January, February, through December, respectively and 0 otherwise. With this approach, month effect analysis is more burdensome, because I need to estimate twelve separate equations, one for each month:

$$r_t = \alpha + \beta_i M_{it} + \varepsilon_t \quad (2)$$

This is a general model, that any specific calendar effect can be studied in this way. We need to construct the dummy variable to take the value of 1 in the relevant days. Some authors (Engle, 1982) propose the use of autoregressive conditional heteroscedasticity (ARCH) models in order to correct the variability in the variance of the residuals. These models assume that the variance of the residuals (σ^2) is not constant over time and that the error term can't be showed $\varepsilon_t \sim iid(0, \sigma^2)$, as assumed in OLS regressions.

The generalized version of these models (GARCH) is developed by Bollerslev (1986), where the variance of the residuals is expressed as the sum of a moving-average polynomial of order q on past residuals (the ARCH term) plus an autoregressive polynomial of order p , on past variances (the GARCH term):

The aim of this research is to detect calendar effects in two cases:

- a. month effects, and
- b. day-of-the-week effects.

We first address the problem of heteroscedasticity by regressing the models in Stata 10 software, with the option of robust standard errors switched on. We perform a test of ARCH effects on data, and confirm that it is present in the data for all countries. Therefore I re-estimate all our models with the GARCH (1,1) approach.

4. DATA ANALYSIS

Considering the previous discussion, we use the following procedures to detect calendar effects in the daily returns of all four stock market indexes, in the period 1998 to 2007.

4.1 OLS regression

We start by computing individual OLS regressions for each of the four countries, using model (1) for day of the week effects and (2) for month effects.

One of the important critiques to previous studies of calendar effects, is that it may well be exclusively a result of data mining (Sullivan et al., 2001). To control for data-snooping, Cooper et al. (2006) propose a randomized-bootstrap technique, and Schwert (2003) suggests the use of data from other countries. In this analysis the first results aren't immune to the critique of Sullivan et al. (2001). In day of the week effects, the number of significant coefficients is 2 at the 1% significance level, 5 at the 5% and 5 at the 10%. The number of significant coefficients that I might expect to find, in random data, would be around 1 (at 1%), around 3 (at 5%) and around 7 (at 10%). So, overall results for day of the week effects aren't very different from those we might expect to obtain, in a randomly constructed sample. For month effects, the number of significant coefficients is 5 (at 1%), 8 (at 5%) and 15 (at 10%). Global results are similar to the number of significant coefficients I might suppose to find in random data at 5% (9) and 10% (15).

As first consideration, January returns tend to be higher than in other months, but are only significant, at 5%, in two countries (Italy and Spain). Second, for all countries, daily returns tend also to be higher in April (but not significant at 5% level) and in the October, November and December (but only significant in one countries). Third, all countries show lower returns than average in August and September. The stronger month effect is clearly September. If no month effects existed, the probability that in any given month excess returns are negative is 0.5, for any country. If we assume independence between the stock markets, the probability that all countries have negative excess returns in the same month is $0.5^{12} = 0.024\%$. As there are 12 months, the probability of getting this result in our study would be small: $0.024\% \times 12 = 0.288\%$. However, these stock markets are correlated with each other, so contemporaneous movements in all stock markets are expected to happen, and are not necessarily evidence of an investor behaviour based month effect.

4.2 GARCH Model

To test the robustness of the results presented in previous section, bootstrapping can be applied to the OLS regressions, as Sullivan et al. (2001) propose. We perform a test of ARCH effects on data, and confirm that it is present in the data for all four countries. Therefore we reestimate all our models with the GARCH (1,1) approach. As additional evidence, we compute a Kruskal-Wallis equality-of-populations rank test, by dividing daily returns in different groups (months or days of the week), and determining if the null hypothesis that all groups come from the same population. This is similar to a one-way analysis of variance with the data replaced by their ranks. Because this a non-parametric test, it does not depend on the data being normally distributed. I choose to consider exclusively which day of the week effects remain significant, at a level of 5%, for each of the statistical methodologies applied.

Overall, the only country who reveal a stronger day of the week effect are Germany. In fact, the day of the week effect is significant in Germany. In particular data show a positive Tuesdays for this country. As in day of the week effects, we find no overall effect covering the full spectrum of countries under study, as there are no month effects for all countries and the effects initially detected in some countries do not resist to more robust statistical methodologies, such as France and Italy. On the other hand, the stronger month effects include:

- a. Germany has positive excess returns in February and negative in September;
- b. Spain has positive excess returns in January, and negative in May.

The sample covers a period of ten years, between 1998 and 2007. As an additional robustness check, we investigate if the calendar effects perceived are constant, over the whole period under analysis. It may be the case that the global results are affected by short-run phenomena, in only a few of the years under study. To test the time stability of the coefficients, we compute rolling window OLS regressions on the most significant coefficients detected in day of the week and monthly effects, both for positive and negative excess returns. We choose four cases: (i) for positive day of the week: Germany/Tuesday; (ii) for negative day of the week: France/Monday; (iii) for positive month: Spain/ January; (iv) and for negative month: Germany/September. In the rolling window OLS regressions, we use a window size of 1000 observations (roughly equivalent to four or five years of observations), and a step size of 200 observations. This means that the first regression uses observations [1;1000], the second regression uses observations [201;1200] and so on. Given the number of observations available, we compute rolling regressions for each coefficient.

In all four cases, the coefficient that captures the calendar effect fluctuates significantly, as the windows of observations evolve. In the case of Germany/September, the coefficient becomes positive both in the 9th and 10th regression, decreasing again sharply after that. In more than half the

regressions, the upper bound on the 95% confidence interval is a positive return. In the case of Spain, the January effect seems to be due mainly to the observations in the first years in the sample, as the effect wears out in the last eight windows of observations. In the case of Germany, the Tuesday effect changes radically from window to window, with periods of higher returns shortly followed by periods of lower returns. It is only in the last window that the lower bound of the confidence interval is clearly positive. Finally, the Monday effect in France seems to be only a recent phenomenon, as it did not exist in the first windows of observations. Taken together with the results of the previous sections, this evidence of high instability of the calendar effects coefficients casts further doubt on the significance of the month and day of the week effects in European stock markets.

5. CONCLUSIONS

There are a lot of studies documenting day of the week and month of the year effects, particularly in US markets, although international evidence is constantly growing, but with mixed results.

In this study, we apply robust statistical methodologies and consider only the calendar effects that are significant under all alternative methodologies. Main findings are the following. First, we find no strong convincing evidence of an across-the-board calendar effect in four European countries. In particular, these countries seem to be mostly immune to day of the week effects. The only across-the-board calendar effect that warrants further investigation is the general tendency for lower returns in the months of August and September. All the calendar effects are basically country-specific.

Second, the number of significant coefficients we detect is very similar to the number we would expect to find in random data.

So, some of the apparently stronger calendar effects may well not be the result of economic motives, market microstructure, or behavioural traits, but may rather be only lucky snapshots of capricious movements in the stock market indexes. For this reason, I suggest as avenues for further research, the following. First, some preliminary results I obtain on day of the month effects, which I do not report, signal that this may be the type of calendar effect more relevant in European countries, justifying specific research. Second, the use of data on firms instead of indexes, allows the study of calendar effects by firm characteristics. Third, I need more studies using broader sets of countries, to determine if calendar effects are across-the-board or only country-specific. Fourth, a closer look at the low August/September returns in Europe, and the study of the reasons behind that effect, if it is confirmed.

EMPLOYABILITY ATTRIBUTES REQUIRED FOR ENTRY-LEVEL MARKETING JOBS IN SELECTED SECTORS IN SOUTH AFRICA

Roux, Thérèse; De Jager, Johan

Department of Marketing, Logistics and Sport Management, TUT, PRETORIA, South Africa

ABSTRACT

The diversification of the marketing industry offers graduates a whole range of new job opportunities in a variety of sectors. This study is one of the first to examine the employability attributes required from graduates across four large sectors in the marketing industry of South Africa. The data for this research were collected via an online survey with 390 respondents in marketing positions across South Africa. There were notable differences in the skills dimensions required for entry-level marketing jobs between the selected sectors. Integrity or ethics appear to be much more important than that which was documented in earlier research; while leadership was regarded as the least important skill. The findings have several implications for the development and redesign of curricula, in order to produce employable marketing undergraduates, and to assist universities in retaining the competitive edge in the Higher Education market.

Keywords: *Marketing industry sectors, Higher Education, South Africa, skills conceptual knowledge.*

INTRODUCTION

The intense competition amongst Higher Educational Institutions for human and financial capital has forced them to become more business-oriented. This has resulted in greater emphasis on marketing strategies, in order to gain a competitive advantage, and a larger national – as well as an international market share (Constantinides and Stagno 2011; Lee and Schoole 2015). The increased focus on marketization in Higher Education, and the potential benefits of applying marketing theories – in addition to those concepts that have been effective in the business world – are also being recognised by prominent researchers in the field of Higher Education marketing (Hemsley-Brown and Oplatka 2006).

The current research literature focuses on three areas within the supply-side of Higher Education marketing: firstly, marketing communications, such as marketing communication techniques (Constantinides and Zinck Stagno 2011), communicating image and reputation (Lee and Schoole 2015), as well as consumer behaviour or decision-making issues (De Jager and Du Plooy 2010). Secondly,

there is the applicability of marketing models, such as transactional versus relationship marketing (Sultan and Yin Wong 2012) and marketing products versus service marketing (Hemsley-Brown and Oplatka 2006). And thirdly, there is strategic marketing that incorporates segmentation and targeting (Constantinides and Stagno, 2011), as well as positioning and branding (Pinar et al. 2011). Whilst these are all vital issues in Higher Education marketing, there is a paucity of research on the demand-side of Higher Education marketing (de Boer and Jongbloed, 2012).

Consequently, the focus of this article is on the employability attributes of new marketing graduates, as demanded by employers in different marketing sectors. Some researchers have investigated the attributes required from students, in order to be successful in businesses in general (Andrews and Higson, 2008); as well as within marketing – such as the expertise needed for specific posts (Gray et al. 2007), at different levels (Shlee and Harich 2010; Kelley and Bridges, 2005), or at undergraduate-entry level (Davis et al. 2002; Stringfellow et al. 2006; Walker et al. 2009; Wellman 2013). However, these have all been conducted in developed markets, such as Europe (Andrews and Higson 2008; Wellman, 2013), the USA (Shlee and Harich 2010) and Australia (Walker et al. 2009), but not yet in a developing context, such as that of South Africa. Furthermore, none of these studies have determined whether the various sectors in the marketing industry differ with regard to their perspective on the skills and knowledge areas required from marketing graduates. To fill this gap, this study investigates the employability attributes required of new marketing graduates seeking employment in different sectors.

In the next section, the relevant literature on Higher Education marketing, and the employability of graduates, will be reviewed. It then discusses the research methodology and presents the results. Finally, the article provides conclusions, summarises the limitations, and recommends some areas for future research.

THE LITERATURE REVIEW

Before reviewing empirical studies, it is important to distinguish between conceptual knowledge and skills, which pertain to the acquisition of employability attributes. Student employability refers to a set of achievements – understandings, skills and personal attributes – which make graduates more likely to gain employment and be successful in their chosen occupations. These attributes benefit them personally, as well as the workforce, the community and the economy (Wellman 2010).

Understanding or conceptual knowledge refers to the subject areas found in most marketing curricula; and it focuses on the theoretical background of the discipline (Schlee and Harich, 2010). The focus of this article is on the skills required. There has been considerable debate in the literature about the terminology for skills, which can also be referred to as ‘core skills’, ‘key skills’, ‘competency’ or

'transferable skills. For the purpose of this article, those skills that are broad-based skill types are generally applicable to all jobs in businesses (Wellman 2010).

A number of studies have been published examining the employability attributes required for success in the workplace – from the perspective of both the alumni and employers. Some authors have focused on the requirements at entry-level. Middleton and Long (1990) used the content analysis of advertised vacancies and surveys with employers, to assess the marketing curriculum, in order to produce graduates with the appropriate skills. Interestingly, employers were not really able to grasp or articulate the specific skills they required from these applicants. Perhaps even more worrying, is the extent to which employers could not distinguish between the performance of marketing and non-marketing trained entrants to their companies – either at the stage of recruitment, or when they are already in a post. Kelly and Gaedeke (1990) examined the student and employer evaluations of the potential hiring criteria for entry-level marketing positions. Oral and written communication, interpersonal skills, personal attributes, enthusiasm/motivation and related work experience were identified as being the most important criteria for filling entry-level marketing positions. The lack of communication skills, practical experience and clear career goals of newly graduates were a major concern for most of these employers. Davis et al. (2002) compared the importance of key skills and knowledge areas with the perceptions of marketing alumni in the USA on their academic preparation in these areas. The findings indicated that graduates seem to be underprepared in terms of skills and over-prepared in knowledge areas.

The importance of skills was also confirmed in more recent studies. For example, Walker et al. (2009) conducted in-depth interviews with graduates and employers, in order to explore their perceptions of graduates and their employers as regards the skills, knowledge, and competencies that are essential to make any progress in a marketing position. Employers emphasized the importance of soft skills, such as communication and analytical skills, when entering the marketing industry. However, graduates have to be prepared to show an appropriate blend of these soft skills, together with some conceptual knowledge of marketing, in order to be effective. Once again, it was revealed that knowledge per se is not the most sought after requirement; but the ability, comprehension, and experience to be able to use that knowledge in the correct way for a specific business situation constitutes the top priority. This ability should provide graduates with an explicit competitive advantage in the job market.

Shlee and Harich (2010) conducted a study to identify the skills and conceptual knowledge required; and they did so by analysing the content of vacancies advertised on Monster.com (highly visited employment website). Fascinatingly, personal ethics or ethical decision-making skills were indicated as far more important for entry-level jobs, than for all other job levels. The findings revealed that extensive

and specific skills were required for success at entry- or lower-level marketing jobs. In addition to oral and written communications and the ability to work in multicultural teams, contemporary marketing graduates must now also possess significant technical skills to allow them to analyze information in databases and on the Internet. Thus, marketing graduates can no longer be taught solely about the importance of Internet marketing and CRM; but they should also be able to analyze the relevant information in those areas. It was emphasized that new and recent marketing graduates rely more on skills, than on marketing knowledge for their jobs.

Wellman (2010) also used content analysis of internet-advertised posts on a number of web sites to develop profiles of the common attributes required from new and early career marketing graduates. The value employers place on marketing degrees seemed to be a concern, as most did not demand a degree; but it was experience that was generally required. The most common skill areas required included communications, interpersonal relationships, information and communication technology, planning, self-management, decision-making and problem-solving. A number of personal attributes, such as creativity and confidence, were also commonly required.

Some focused on the employability attributes required for being successful in businesses in general. For instance, Andrews and Higson (2008) analysed graduate and employer perspectives on business-graduate employability in four European countries (UK, Austria, Slovenia and Romania). Employers in all four countries expected the graduates to be employable or employment-ready; and thus, they should be equipped with the necessary skills and competencies, and able to practically apply knowledge to solve business problems. It was evident that both graduates and employers valued the experiences and knowledge gained during work placements, internships and other part-time employment. Both these role-players regarded written and oral communication skills as important factors impacting graduates' employability. A concern raised by graduates was that they had not been able to gain sufficient expertise or experience in making verbal presentations whilst in Higher Education, implying that the lack of communication skills inhibits employability, and should therefore form part of the undergraduate curriculum. An interesting finding is that graduates identified team-working skills as being a vital part of their portfolio; while employers appreciated graduates that are able to think independently and innovatively.

Other studies also documented the importance of training in oral and written communication and critical thinking skills – not only for entry-level jobs in businesses – but also for advancing into higher-level marketing jobs. Grey et al. (2007) surveyed marketing managers, academics and senior students in New Zealand on the skills essential for working as a marketing manager. An ability and willingness to learn about product-markets, to solve marketing problems, to communicate with any internal and

external stakeholders, and to work in teams, in addition to the knowledge of a wide range of marketing subject areas, were regarded as essential skills. In order to progress from lower-level posts to higher posts, marketing graduates need to develop strategic thinking, leadership and management skills; and they must demonstrate some knowledge of strategic planning, product and brand management, communication and promotion, and consumer behaviour.

PURPOSE AND OBJECTIVES

In the light of the above discussion, the research object of this article is as follows:

To establish whether there are differences in the perspectives of potential marketing employers in each sector on the employability attributes required from marketing graduates.

From the research object, the following hypotheses were formulated:

- H₁: Marketing industry sectors differ regarding the personal attributes required from new marketing graduates seeking employment.
- H₂: Marketing industry sectors differ regarding the communication skills required from new marketing graduates seeking employment.
- H₃: Marketing industry sectors differ regarding the cognitive abilities required from new marketing graduates seeking employment.
- H₄: Marketing industry sectors differ regarding the interpersonal skills required from new marketing graduates seeking employment.
- H₅: Marketing industry sectors differ regarding the knowledge areas required from new marketing graduates seeking employment.

THE RESEARCH METHOD

Data collection and sampling

The target population comprised respondents in marketing-related positions across seven sectors in the marketing area of South Africa. Selected industry members from the advisory board of the marketing department at a larger Higher Education institution helped the researcher with the designing of the sample plan, and to access the relevant sample databases. This sampling method was deemed most appropriate; since a reliable and professional authority in the marketing field helped with assembling a

representative sample of the seven sectors in the marketing industry; and this resulted in saving time and money (Iacobucci and Churchill, 2010).

The sample was quasi-randomly drawn from three frames. Firstly, 400 questionnaires were distributed to clients in a marketing-related position of a reputable marketing and sales recruitment agency. Consequently, 600 questionnaires were sent to the subscribers of two specialist online publications in the marketing environment. The sample databases were screened, to avoid duplication, and to ensure that only one questionnaire was sent to each of those in marketing-related positions in each of the companies.

On online survey was distributed via email to the respondents on the databases. Continuous reminder emails were sent to the non-respondents until a 39% response rate, or a total of 390 questionnaires, had been received. This was deemed as adequate, based on the recommendations of Nulty (2008). This author maintained that online surveys are much less likely to achieve lower response rates (on average, 33%) compared to paper-based surveys (56%). A comparison of the results of the questionnaires submitted early (one month) and those returned later (after one month) was also done, in order to minimize any non-response bias. Since those replying later did not differ significantly from those who had applied earlier, it may be assumed there was no non-response bias from those who had previously failed to respond (Iacobucci and Churchill, 2010). The reasonable sample size helped to ensure data stability and to enable selective hypothesis testing.

The measuring instrument

The questionnaire consisted of two sections: (1) The characteristics of the sample; (2) the importance of skills areas. Dichotomous and multiple-choice questions were used for sections one, while the items in the scales of section two were measured on a five-point scale, with 1 representing 'Very important', and 5 representing 'Not important at all'; so that the researcher could establish the level of importance for the particular items included in each category.

The scales by Gray et al. (2007) and Andrews and Higson (2008) were used as the basis to quantify the industry's perspective on the skill areas required from the marketing graduates. After a series of discussions with seven marketing managers from each of the sectors included, some items were added or adopted, in order to meet the context of contemporary marketing in South Africa. For example, the ability to communicate by using electronic means, such as emails, and to work in a multicultural team, had to be included in the skill dimension.

A pilot test with the questionnaire was carried out with 20 subjects. These were not included in the sample utilised to establish the reliability. Construct validity refers to the extent to which the variables in the study are accurately and completely identified before hypothesizing any relationships; while face validity is simply whether the test appears, at face value, to measure what it claims to measure (Hair, Bush and Ortinau, 2010). For this study, construct validity was ensured by using a questionnaire based on a research instrument used in similar studies by Gray et al., (2007) and by Andrews and Higs (2008). When pretesting, the questionnaire tested the face validity; and the feedback from the respondents was used to identify and address any potential problems. Reliability refers to the accuracy or precision of the measuring instrument (Hair, Wolfinbarger, Ortinau and Bush, 2010). In this study, the reliability was established by using a pilot test and collecting the data from twenty subjects who were not included in the sample – with a Cronbach's alpha coefficient for the four skill and knowledge dimensions meeting the minimum criterion of 0.7 (Nulty, 2008).

The data analysis

A statistical data analysis was performed using the IBM Statistical Package for the Social Sciences (SPSS) Version 23 software. For the hypotheses, the assumption of normality was assessed through the Kolmogorov-Smirnov test; and via a visual examination of the histograms and normal-probability plots. This showed that the data deviated to a great extent from a normal distribution. Therefore, the non-parametric Kruskal-Wallis H test, using the SPSS Statistics' new non-parametric procedure, which includes a post hoc test to determine where the differences lie between the sectors that were used. The researcher relied on a 95% level of confidence, and a subsequent significance level of 5% ($p\text{-value} \leq 0.05$) to interpret the results of the hypothesis testing.

THE RESULTS

The profile of the sample in Table 1 reveals that involving selected industry members in designing the sample plan, and using the relevant sample databases clearly helped to obtain a high response rate and a sample representing a variety of marketing employers in each of the targeted sectors. Most of the respondents had worked in companies of between 101- 500 persons (69; 18%) or large companies with more than 500 employees (94; 24%). Almost one third of the respondents had between two and five years' experience in a marketing position (123; 32%) and one third had between five and ten years (124; 32%); and only 8% had had more than twenty years. The majority of these were males (225, 58%) and more than three quarters of them held university qualifications: 52% at degree or diploma level; and only 10 % were postgraduates with a Masters or PhD degree.

	Total	Count	%
		390	
Sector in marketing industry	Advertising /communications/ media	83	21
	Tele/direct marketing/sales	98	25
	Fast moving consumer goods/beverages (FMCG)	106	27
	Financial services/insurance/ banking	103	26

	11 - 50 persons	9	2
	51-100 persons	67	17
	101- 500 persons	69	18
	More than 500 persons	94	24
Gender:	Male	225	58
	Female	165	42
Years of marketing experience	2-5 years	123	32
	More than 5 -10 years	124	32
	More than 10 -15 years	73	19
	More than 15 - 20 years	41	10
	More than 20 years	30	8
Highest qualification:	Grade 12	51	13
	Degree/diploma	204	52
	Hons degree/ BTech	97	26
	Masters/MBA	26	7
	PHD	12	3

Table 1. *Profile of sample**Skills areas required from new marketing graduates in each sector*

Respondents in all the sectors were asked to rate how essential a wide variety of skills were for marketing graduates when entering the market on a scale from 5 = very important to 1 = not important at all. The results are presented in Table 4; and they will be discussed by firstly considering the overall findings, where the different sectors will be compared.

As noted in the literature, personal traits are at times difficult to differentiate from associated skills (Wellman, 2010). Nevertheless, all traits and “trait-like” attributes were grouped together as “personal traits”; and they were generally regarded as the most important category (M=4,75, Rank mean = 2536.74). In this category, all the traits seem to be rather critical.

Ability to work under pressure and integrity clearly stand out, and they are regarded as the most important traits, followed by personal drive and time management. Interpersonal skills were generally regarded as the least-important category (M=4,10; Rank mean =1570.22). Skills, such as the ability to motivate team members (M= 4.00), and leadership skills (M=4.12) were regarded as the least-important.

These skills are probably not expected by employers for entry-level jobs; but they would be required for managerial positions in marketing.

Hypothesis 1: Personal traits

In terms of the personal traits required from new marketing graduates seeking employment in the different marketing industry sectors, there were no significant differences between the groups. The alternative hypothesis (H_1) was thus rejected, as there is support for the null hypothesis, $H_{1(0)}$. Further inspection revealed that personal traits are very important for employers in all the sectors included. A noteworthy aspect is that the ability to work under pressure and /work ethics were the most important traits for all the sectors.

Hypothesis 2: Communication

There is a significant difference in the level of importance of communication skills required from new marketing graduates across the marketing industry sectors ($H(4) = 75.24, p < .05$). The second hypothesis ($H_{2(0)}$) was thus rejected; as there is support for the alternative hypothesis (H_2), which states that marketing industry sectors differ regarding the communication skills required from new marketing graduates when seeking employment.

Within the communication category, similar views were held by all the sectors about the importance of communication with clients and electronic/IT communication. However, the post hoc test revealed that there are significant differences in the views of the groups, as to how essential a number of communication skills are, with a rank mean in this category of 425.52 for the advertising and media sector; 413.10 for the sales sector; 366.33 for the Fast-moving consumer goods/beverages sector; and 346.33 for the Financial services/insurance/ banking sector.

A notable difference in the ranking order was evident in the importance attached to business writing skills across the various sectors. Within the communication category, business writing skills were deemed the least important for the sales sector. In this sector, entry-level employees seem to rely more on oral presentation skills to perform their job. Writing was rather regarded as essential in the advertising & media sector (1st); because of the nature of the industry, which is characterized by a constant demand for proposals to the clients.

Hypothesis 3: Cognitive abilities

It was also revealed that there was a significant difference between the marketing industry sectors regarding the cognitive abilities required from new marketing graduates seeking employment. ($H(4) = 76.05, p < .05$). Therefore, H_3 can be accepted. Further inspection of the sector means ranks suggests that the ability for analytical reasoning in the sectors, such as the Advertising & Media, FMCG and

Financial services, are significantly more important than the Sales sector. In contrast, their agreement regarding the ability for strategic thinking/insight was indicated as the least-important skill across all the different sectors.

	Total		Advertising Media	Sales	FMCG	Financial services	
Skills dimensions	Mean	Std	Mean	Mean	Mean	Mean	
PERSONAL TRAITS	4.75	0.6	4.66	4.76	4.81	4.77	< 0,001
Integrity/work ethics	4.85	0.42	4.84	4.8	4.86	4.89	
Ability to work under pressure	4.85	0.68	4.88	4.83	4.86	4.81	
Personal drive / ability to work independently	4.65	0.6	4.48	4.77	4.73	4.61

Table 2. *The marketing industry's perspective on the skills required from marketing graduates*

Hypothesis 4: Interpersonal skills

There is a significant difference in the level of importance of the skills required from new marketing graduates across the marketing industry sectors ($H(4) = 128.65, p < .05$). The fourth hypothesis ($H_{4(0)}$) was thus rejected; as there is support for the alternative hypothesis $H_{4(1)}$ which states that marketing industry sectors differ regarding the interpersonal skills required from new marketing graduates seeking employment.

Post hoc tests revealed that there are significant differences in the views of the group. For example, leadership skills are less important in the advertising & media and financial services sectors, when compared with the sales and FMCG sectors. Furthermore, the sales sector regards the ability to motivate team members as essential; while most others do not.

There also is a significant difference in the level of importance of interpersonal skills between the different company sizes. In particular, the mean rank in companies with more than 500 employees (383.50) is higher than the mean rank for companies with 1-10 employees (345.91) and those with 11-50 employees (325.65); and the difference is significant ($H(4) = 4.61, p < 0.05$).

DISCUSSION

The results of this survey support many previous studies with respect to the importance of softer or transferable skills (Davis et al. 2002; Kelly and Gaedeke 1990, Walker et al. 2009). However, some discrepancies between the findings and other studies were also revealed. The relatively low rankings of interpersonal and cognitive skills are contradictory to the results of the European study by Andrews and Higson (2008). The explanation for the low rating is probably that these skills become more important when moving to higher levels of employment.

The relative high ranking of integrity or ethics contradicts the findings of Gray et al. (2007), but is aligned with the more recent study by Schlee and Harich (2010), in which personal ethics or ethical decision-making skills were the most-cited skill listed in marketing jobs on the largest employment website in the USA. Thus, marketing ethics is viewed as important, now that it has been linked to financial performance, and because of marketing's interface with many diverse stakeholders.

Previous studies revealed that employers require different skills for marketing positions at different levels (Shlee and Harich 2010) and for a specific context (Gray et al. 2007). The findings of this research revealed that even at the entry level, there are significant differences between the sectors in terms of the importance they attach to the respective skills areas.

Consumer groups and the social media have contributed to raising public awareness of ethically questionable corporate activities. Marketing is often blamed for corporate misbehaviour. Contemporary marketing students must, therefore, be equipped to deal with the ethical challenges and paradoxes faced by organisations. The teaching and learning of marketing ethics cannot be achieved by lecturers alone; but it must be combined with case studies, videos, group discussions and blogs – to allow students to actively contribute to, participate in, and reflect on.

It is also recommended that subject areas included in the curricula must be adopted for specialization in the marketing discipline. In addition, potential interventions to transfer the critical skills identified must be developed in consultation with industrial bodies incorporating, building and assessing

employability skills in the curriculum. These specialist offerings should be delivered by staff with personal experience of these sectors and/or research interests in these areas. It is essential that practitioners must not consider it the duty of academics to supply graduates who are employment-ready, but should rather help them to incorporate more opportunities for practical experience in the marketing curriculum.

CONCLUSIONS AND LIMITATIONS

The focus of this study has been on the employability attributes required of new marketing graduates, and specifically from the perspective of employers in seven marketing sectors in South Africa. Research, therefore, could be extended to include other stakeholders within Higher education, such as students or alumni, as well as academics supplying the services, such as lecturers and tutors. This could help to overcome the gaps between practitioner requirements, academic teaching and student interests, in order to produce the relevant marketing programmes. It might be sensible to replicate the study in other African and developing countries and other institutions, in order to assess the generalisability of the results. Another worthwhile future research would be to explore alternative pedagogical approaches for instructing marketing undergraduates about ethics and work-integrated, or project-based learning options.

This study is one of the first to examine the employability attributes required from graduates across sectors in the marketing industry. Further value will be obtained if this paper is used as part of the re-engineering of specialist marketing programmes in each of these sectors.

In conclusion, the findings of this study make some important contributions to the body of knowledge on marketing education, and might help in the updating of marketing curricula, so that marketing graduates are better prepared for many of the jobs available in the emerging sectors within the marketing discipline.

ABSTRACT

The aim of the paper is to examine positive psychological capital (PsyCap) as well as individual factors in the relationship with thriving in the multicultural work environment of multinational corporations (MNCs). We conducted a quantitative study on the sample of 127 individuals from subsidiaries of various MNCs located in Poland and involved in intercultural interactions. The results of cross-sectional study show that employees who have a higher level of PsyCap as resource caravans experience more vitality. Moreover, employees who have a higher level of PsyCap experience more learning at work in MNCs. We also observed that the learning component of thriving was more vivid than vitality. In contrast, individual factors, i.e. job tenure, language proficiency or prior international experience, were insignificant. Our results demonstrate that PsyCap of individuals is a significant factor that triggers their thriving at work in multicultural environments of MNCs.

Keywords: *learning, multicultural workplace, multinational corporations, positive cross-cultural scholarship, positive psychological capital, thriving, vitality*

INTRODUCTION

Globalization with its evident manifestations of multinational corporations (MNCs) worldwide and the global mobility of workforce have considerably contributed to the changes in the work landscape over the years. Accordingly, working in multicultural environments has become a daily reality for a growing number of people (Nolan 2012; Abdul Malek & Budhwar 2013). The main features of such demanding work environments are cultural and language diversity (Lauring & Selmer 2011), which pose unique challenges to employees since they face cultural barriers (Mäkelä et al. 2012), but may also utilize opportunities (Youssef & Luthans 2012a) that, among other outcomes, promote their thriving.

The studies on thriving in a work context are becoming a vital domain of inquiry. The phenomenon attracts attention of scholars since it produces many positive outcomes for organizations. Positive psychological capital (PsyCap) is another construct which has recently received growing interest in research. Nevertheless, there is still a need “to examine thriving in relation to (...) psychological capital” (Porath et al. 2012, p. 270) and to expand “the boundaries of PsyCap to other contexts” by conducting research in new organizational contexts and cultures (Youssef & Luthans 2012b, p. 22). Therefore, the aim of the paper is to examine both positive psychological capital and individual factors in the relationship with thriving in the multicultural work environment of MNCs. We consider the multicultural work setting of MNCs as new organizational contexts since, to the best of our knowledge, only a few studies so far have analyzed thriving and PsyCap in MNCs with regard to intercultural interactions of their staff.

Our paper begins with a literature review on PsyCap and thriving. We also portray major features of multicultural work environments. In the subsequent section we present the methodology and results. In discussion and conclusions we put forward contributions, limitations, practical implications and directions for future research.

LITERATURE REVIEW

Psychological capital and its components

Psychological capital (PsyCap) is defined as “an individual’s positive state of development that is “composed of four personal resources, i.e. self-efficacy, optimism, hope and resilience (Youssef & Luthans 2012, p. 18). Self-efficacy is defined “as having confidence (...) to take on and put in the necessary effort to succeed at challenging tasks” (Luthans et al. 2007, p. 3). Optimism exhibits an individual’s expectations of positive outcomes and positive events. Hope involves energy to attain desired goals and to choose alternative paths if needed by circumstances. Resilience reflects a person’s ability to sustain, bounce back and even beyond to attain success in the face of problems and adversity, being particularly helpful in a demanding or stressful environment (Luthans et al. 2007; Luthans et al. 2010). These personal resources constitute the so-called resource caravans, which means that they can aggregate in time, build upon one another and their interplay leads to the effect of synergy (Hobfoll 2001). For example, when an effective job performance enhances an individual’s feeling of self-efficacy, it will also build their optimism concerning their ability to work effectively in the future.

PsyCap is a dynamic and developable state, which can be modeled and enhanced since organizations may help their employees to improve their level of PsyCap by training interventions, organizational

activities and resources (Luthans et al. 2007; Peterson et al. 2011; Walumbwa et al. 2011; Rego et al. 2012). Accordingly, PsyCap has a rewarding value since resources invested in its development will benefit in the future (Hobfoll 2011). Moreover, the return on investment in PsyCap development is more sustainable in the work settings (Youssef & Luthans 2012b).

The concept of thriving

Thriving is referred to individual psychological experience of a sense of vitality and learning in the work context. Vitality, i.e. positive energy and enthusiasm, is a pleasurable psychological experience and it represents the affective dimension of thriving. Vitality reflects aliveness, energy and high arousal job-related positive emotions. Learning, which comprises people growth through gaining new and applicable knowledge and skills, is a cognitive component of thriving (Porath et al. 2012; Spreitzer & Sutcliffe 2007). It is a socially embedded process since employees learn at work and while interacting with other people, which helps them “to determine what needs improving and how to do it” (Carmeli et al. 2009, p. 81). Additionally, learning enables actualization of an individual’s potential both as an employee and as a human being. It also promotes individuals’ growth since people enact an agentic role in interactions with others (Spreitzer et al. 2005; Spreitzer & Sutcliffe 2007).

Psychological capital and thriving in prior research

A number of studies so far has demonstrated that PsyCap influences desired outcomes in the workplace. First and foremost, PsyCap affects individual functioning in an organization, which is represented by psychological well-being in the work context as well as impacts on organizational performance (Walumbwa et al. 2011). It also triggers positive emotions of employees and has implications for combating their stress (Avey et al. 2009; Avey et al. 2010). Moreover, recent research indicates that PsyCap may foster a positive organizational change (Avey et al. 2008) and be a mediator in the relationship between a supportive organizational climate and an employee’s performance (Luthans et al. 2008). As previous studies have also shown, PsyCap is significantly and positively associated with desired employee attitudes (e.g. commitment), behaviors (e.g. citizenship behaviors) and performance (Avey et al. 2010; Paek et al. 2015). Additionally, other positive outcomes related to PsyCap include task mastery, improved leadership, lower absenteeism and intention to leave and promoted creativity and innovation (Avey et al. 2010; Rego et al. 2012).

As far as prior research on thriving is concerned, we found out that thriving has been scrutinized in a work setting. Those studies demonstrate that thriving relates more to a positive affect than a negative one (Porath et al. 2012) and can be strengthened by personal and organizational resources. With regard to personal resources, fresh empirical evidence backs up that thriving is related to PsyCap (Paterson et al. 2014; Boyd 2015). Other research shows that thriving enhances both personal potential

and organizational growth (Baruch et al. 2014; Paterson et al. 2014; Wallace et al. 2013). In another study, Rozkwitalska and Basinska (2015a) assign thriving to the central position in their theoretical model of intercultural interactions and job satisfaction. Similarly, Baruch et al. (2014) and Wallace et al. (2013) consider thriving as a mediator between the antecedents (the regulatory focus, career commitment) and the outcomes (innovation, career and life satisfaction). Considering the demographics of the respondents, such as job tenure, the results are inconsistent. For example, Niessen et al. (2012) found out that job tenure is negatively correlated with vitality, yet it does not relate to learning, while Porath et al. (2012) did not observe a correlation between job tenure and thriving.

With regard to thriving in a multicultural work environment, still more research is needed since, to the best of our knowledge, only a few studies, to date, have explored it in such a context. For example, Rozkwitalska and Basinska (2015b) in their qualitative research demonstrate that PsyCap may enhance both components of thriving in a multicultural work setting of MNCs. They also posit that self-efficacy and resilience can be instrumental in learning, whereas vitality relies more on hope and optimism (Basinska & Rozkwitalska 2016).

Multicultural work environments

MNCs are nowadays perceived as one of the most important institutions in the world economy (Erez & Shokef 2008). These organizations are involved in multinational business, which compels them to manage interdependencies among multicultural staff in their foreign subsidiaries (Hennart 2010). Consequently, their work environment is distinct and differs from any other organization, constructing its own rules of conduct (Erez & Shokef 2008).

Owing to the fact that MNCs operate in many countries, where they hire various nationalities representing different and sometimes intertwining cultures, they can be seen as organizations with multicultural work environments (Darawong & Igel 2012; Rozkwitalska & Basinska 2015a), which confront the interactions among their employees with cultural differences and language diversity (Lauring & Klitmøller 2015). Due to unique characteristics of multicultural workplaces, managers and employees in MNCs are expected to adjust (Darawong & Igel 2012) and be able to communicate in the corporate functional language (Lauring & Klitmøller 2015). Since MNCs' staff differs in the level of functional language fluency, "language barriers are a widespread and profound feature affecting vital processes in the MNC" and impeding intercultural interactions (Lauring & Klitmøller 2015, p. 2). Therefore, language proficiency appears to be a matter of importance in MNCs.

Concerning prior international experience, the extant literature does not offer a consistent argument whether it facilitates adjustment to multicultural environments, at least as far as expatriates are

considered (Takeuchi & Chen 2013). Nevertheless, it is perceived as a crucial factor that builds cross-cultural competence of individuals (Caligiuri & Tarique 2012) and, to some extent, MNCs may look for employees with prior international experience.

METHODOLOGY AND RESULTS

Aim and hypotheses

The aim of this study was to examine the relationship between two groups of factors and thriving (see Figure 1). The first group consisted of individual factors, i.e. demographics such as job tenure, and factors which can support efficient functioning of employees in MNCs' environments, i.e. international experience and functional language proficiency (Takeuchi & Chen 2013; Caligiuri & Tarique 2012). The second group included a personal resource, namely PsyCap. In accordance with the prior research (Hobfoll 2001; Luthans et al. 2007), we consider PsyCap as the resource caravans, which means that self-efficacy, hope, optimism and resilience are combined in PsyCap index. Despite the inconclusive results concerning demographics in prior research (Niessen et al. 2012; Porath et al. 2012), we posit that individual factors can be important for thriving (Porath et al. 2012; Paterson et al. 2014; Boyd 2015) in multicultural environments of MNCs, yet, in accordance with previous studies (Rozkwitalska & Basinska 2015b; Basinska & Rozkwitalska 2016), we assume that PsyCap plays a more vital role in enhancing thriving.

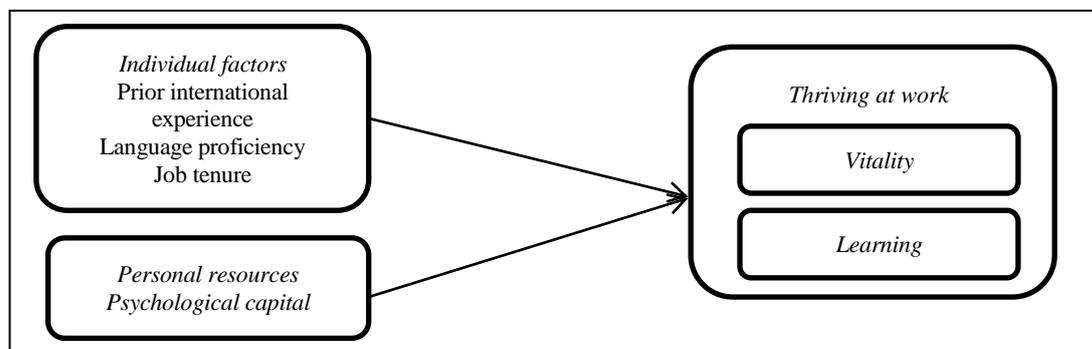

Figure 1. *The model of individual factors, psychological capital and thriving in MNC's work environment.*

Thus, we put forward the following hypotheses:

Hypothesis 1: In multicultural work settings, individual factors and PsyCap are related to vitality. However, PsyCap has a stronger relationship with vitality than international experience, functional language proficiency and job tenure.

Hypothesis 2: In multicultural work settings, individual factors and PsyCap are related to learning. However, PsyCap has a stronger relationship with learning than international experience, functional language proficiency and job tenure.

Participants

We conducted a cross-sectional study between March and May 2015. Our sample consisted of 171 individuals (purposive and snow-ball techniques were applied) who are employed in Polish subsidiaries of MNCs and work as managers and specialists. Our main criterion to include a participant to the study was the fact that s/he was involved in intercultural interactions at work. With regard to this criterion, fully completed questionnaires, done voluntarily and anonymously, we received from 127 participants aged 35 on average ($SD = 8.6$; range: 21–60) and with an average tenure of 6.2 years ($SD = 4.8$; range: 0.5 – 20 years). As far as the other demographics are concerned, we have 62 women (49%) in the sample and 56 respondents (43%) holding managerial positions.

Instruments

Individual factors: We measured the prior international experience of the respondents as an index composed of a set of different experiences, i.e. work for a MNC in the past, work abroad, life abroad, studies abroad, overseas private and business trips as well as having a close family member of other nationality. The respondents evaluated their experiences on the bimodal scale (*no* = 0, *yes* = 1). To calculate each participant's index, we added all the 'yes' answers. Thus, the index could range from 0 (a lack of international experience) to 7 (high international experience). We assessed proficiency in functional language using the question: "Overall, I am fluent in the foreign language (functional language of my corporation)", and a six-point scale (from 1 - *strongly disagree* to 6 - *strongly agree*). The higher the scores, the higher level of proficiency was indicated.

Personal resources: We measured psychological capital using the shortened version of PsyCap (Luthans et al. 2014). This 12-item questionnaire assesses the four psychological resources such as efficacy (3 items), resilience (3 items), hope (4 items) and optimism (2 items), and uses the six-point Likert scale (from 1- *strongly disagree* to 6 - *strongly agree*). To calculate the PsyCap index, we summarized the scores and divided them by the number of the items. The higher the scores, the higher level of psychological capital was indicated.

Thriving at work as an outcome: We separately evaluated the two components of thriving. Vigor, an indicator of vitality, was measured with a 3-item subscale of Utrecht Work Engagement Scale (Schaufeli et al. 2006). For example, one of the statements was: "At my work, I feel that I am bursting with energy". Each item was rated by a participant by means of a seven-point scale, ranging from 0 (*never*) to 6 (*always/every day*). The average of the sum of the scores was divided by the number of the

items, which indicated the level of vitality (the higher the scores, the higher the level of vitality). We assessed learning by using a 5-item scale (Vandewalle 1997); as a result, the higher the scores, the higher the level of learning was indicated. For example, one of the three statements was: "At work, I take challenging jobs in order to learn new things". The respondents rated each item using a six-point scale, ranging from 1 (*strongly disagree*) to 6 (*strongly agree*). In the case of each participant, the average of the sum of the scores was then divided by the number of the items, which indicated his/her level of learning. The higher the scores, the higher the level of learning was presented.

Data analysis

We analysed the data by using Statistica 10.0. In order to assess the relationship between individual factors, PsyCap and thriving, we used the Pearson product-moment correlation coefficient. We conducted regression analyses to estimate the models of the relationship between individual factors, PsyCap and thriving. These regression analyses were performed separately for two outcome variables: vitality and learning. The regression models included individual factors (language proficiency and prior international experience, job tenure) and PsyCap estimated for both components of thriving. Some simple rules of thumb are $N > 104 + m$, where m is the number of independent variables for testing the individual predictors (Tabachnick & Fidell 2013). Taking the above into account, our group of respondents is appropriate since 110 cases were needed for testing the proposed model of regression. In order to assess the effect size of these relationships, we calculated Cohen's f^2 . The rule of thumb indicates that Cohen's f^2 higher than .35 is viewed as a large, .15 as a moderate, and .02 as a small effect size (Cohen 1998).

Results

We present the descriptive statistics of the analyzed variables and the correlational coefficients among them in Table 1.

	M	SD	[1]	[2]	[3]	[4]	[5]	[6]
[1] Language proficiency	4.94	1.00	-					
[2] International experience	0.58	0.21	0.35***	.75a				
[3] Job Tenure	6.15	4.81	-0.14	-0.00	-			
[4] Psychological capital	4.63	0.60	0.34***	0.16	0.29***	.87		
[5] Vigor	3.75	1.20	0.19*	0.07	0.23**	0.58***	.87	
[6] Learning	4.73	0.80	0.28**	0.20*	0.12	0.55***	0.39***	.89

Note. * $p < .05$; ** $p < .01$; *** $p < .001$. On the diagonal are Cronbach's alpha coefficients. ^a r – tetrachoric coefficient. M = mean; SD = standard deviation

Table 1. *The descriptive statistics and the Pearson product-moment correlation coefficients between individual factors, psychological capital and thriving*

The analysis demonstrates that the participants working in MNCs experienced thriving at work, yet the learning component of thriving was higher than vitality. Both components of thriving were related to the individual factors. Vitality was weakly related to language proficiency and job tenure, while learning was also weakly related to language proficiency and international experience. Additionally, vitality and learning moderately correlated with PsyCap. As far as PsyCap is concerned, it was associated with language proficiency and job tenure in a weak and moderate degree respectively. We also found out that, which is not surprising, higher prior international experience was related to language proficiency.

Moreover, we estimated the role of individual factors and PsyCap in thriving. The details are presented in Table 2 and Table 3.

First, we performed the analysis of regression for vitality.

Model for vitality	B	SE	t	Adjusted R2	F
				.32	15.62***
Intercept	-1.50	0.75	2.41*		
Prior international experience	0.02	0.45	-0.22		
Language proficiency	0.02	0.10	0.17		
Job tenure	0.02	0.02	0.87		
Psychological capital	1.10	0.17	6.75***		

Note: * $p < .05$; ** $p < .01$; *** $p < .001$. B = unstandardized regression weight; SE = standard error of unstandardized regression weight; t = Student t -test; adjusted R^2 = the coefficient of determination; F = F -test.

Table 2. *Vitality regressed on individual factors and psychological capital*

The results show that the individual factors and PsyCap explained 32% of the variance in vitality. We found out that PsyCap was moderately related to vitality ($\beta = .56$ $p < .001$), while the relationship between the individual factors and vitality was insignificant. The effect size was large (Cohen's $f^2 = .52$). Thus hypothesis 1 was partly supported in our data. The analysis demonstrated that vitality was related to PsyCap, which means that employees who have higher level of PsyCap as resource caravans experience more vitality at work in MNCs.

Second, we conducted the analysis of regression for learning (Table 3).

Model for learning	B	SE	t	Adjusted R2	F
				.30	14.32***
Intercept	1.511	0.49	2.29**		
Prior international experience	0.36	0.07	0.79		
Language proficiency	0.06	0.07	0.79		
Job tenure	-0.01	0.01	-0.30		
Psychological capital	0.68	0.11	6.04***		

Note: * $p < .05$; ** $p < .01$; *** $p < .001$. B = unstandardized regression weight; SE = standard error of unstandardized regression weight; t = Student t -test; adjusted R^2 = the coefficient of determination; F = F -test.

Table 3. *Learning regressed on individual factors and psychological capital*

The regression analysis indicates that the individual factors and PsyCap explained 30% of the variance in learning. The relationship between PsyCap and learning was significant ($\beta = .52$ $p < .001$), while the relationship between the individual factors and learning was insignificant. The effect size for this model was large (Cohen's $f^2 = .43$). Taking the above results into account, hypothesis 2 was partly supported. Since learning correlated with PsyCap, we posit that employees who have a higher level of PsyCap experience more learning at work in MNCs.

DISCUSSION AND CONCLUSIONS

The aim of this paper was to examine the relationship between positive psychological capital and thriving in multicultural environments of MNCs. Additionally, we included individual factors in our analysis, predicting that their role in explaining thriving in multicultural environments of MNCs would be weaker if compared to PsyCap. Our hypotheses were partly confirmed. The results have revealed that higher proficiency of language and longer job tenure correlated with vitality, yet their roles were insignificant when PsyCap was taken into account. The PsyCap of the employees working in the MNCs was related to their stronger vitality (a large effect size). Furthermore, higher language proficiency and international experience correlated with learning, however their roles were insignificant when PsyCap was included. The PsyCap of the employees working in the MNCs was related to their sense of learning (large effect size).

Our results demonstrate that PsyCap of individuals is a significant factor that triggers their thriving at work. We also notice that environments of MNCs can bring new opportunities to foster the learning component of personnel's thriving. Our data show that the learning component of thriving was more vivid than vitality. It can suggest that MNCs' environments are instrumental in thriving, whereas the very thriving is more stimulated by PsyCap than one's language proficiency, prior international experience or job tenure. The results of our study are consisted with the previous research, which note Innovation, Entrepreneurship and Digital Ecosystems

that thriving is more associated with PsyCap than individual factors (Porath et al. 2012; Paterson et al. 2014; Boyd 2015). Moreover, our research supports the prior qualitative study, which demonstrated that learning is more salient than vitality in the multicultural work setting of MNCs (Rozkwitalska & Basinska 2015b). Other researchers have also found out that working in MNCs is a natural source of learning (Puck et al. 2008) and the novelty and diversity experienced in such an environment create an opportunity for learning (Stahl et al. 2010).

Our paper contributes to the intercultural management literature and positive cross-cultural research with regard to the relationship between PsyCap and thriving of individuals working in multicultural environments of MNCs. It adds to the knowledge on psychological capital in the context of MNCs.

With regard to practical implications, we posit that since PsyCap is a personal resource of employees, which can be supported by organizational practices, MNCs may improve an individual's PsyCap by providing more organizational resources, and consequently enhance thriving of their personnel. Our study also suggests that managers in MNCs should look for employees with a significant capacity of PsyCap to enhance their thriving.

The limitations of our study are as follows: the sample size was small yet acceptable, its composition included only Poles (on the other hand, it responds to the calls of Youssef and Luthans (2012b) to expand the boundaries of PsyCap to other cultures than the ones of the U.S.), employees of various MNCs (the industry context could not be captured in our data), the non-probabilistic sampling techniques limit the generalizations of our results, the correlations in our analyses did not allow for scrutinizing the cause-and-effect relationships. Future research should respond to these limitations. We also recommend comparing whether the relationship between PsyCap and thriving is stronger in multicultural environments of MNCs than in other organizational contexts. Finally, future research can focus on organizational interventions that stimulate thriving.

ACKNOWLEDGMENTS

We gratefully acknowledge the financial support from National Science Centre of Poland within the research "Cross-cultural interactions in foreign subsidiaries of multinational corporations - traditional and Positive Organizational Scholarship approaches" (No. DEC-2013/09/B/HS4/00498). We also thank our research team, namely Łukasz Sułkowski, Michał Chmielecki and Sylwia Przytuła for their help in collecting the data.

ABSTRACT

The processes for exploitation of knowledge became an essential element for firms to adapt to changes in the competitive environment. The exploitation of this knowledge should be undertaken with proactivity, innovation and risk-taking. Building on well established theories, our research explores the influence of entrepreneurial orientation in exploitation of knowledge of Portuguese small and medium enterprises (SMEs) of footwear associated to the Portuguese Footwear, Components and Leather Goods Association (APICCAPS). Based on survey data from 42 firms, our empirical results indicate that globally entrepreneurial orientation have a positive and significant influence on exploitation of knowledge, and that the entrepreneurial orientation's dimensions that most contribute to this end are innovation and risk-taking.

Keywords: *entrepreneurial orientation, absorptive capacities, exploitation of knowledge, SMEs, Portuguese footwear industry.*

INTRODUCTION

In a dynamic and turbulent environment, knowledge represents a critical resource to create value and to develop and sustain competitive advantages (Teece, Pisano and Shuen, 1997). However, fast changing environments, technologies and competitiveness intensify the challenges firms face in attaining self-sufficiency in knowledge creation (Camisón and Forés, 2010).

Entrepreneurial orientation is a strategic orientation of a company that encompasses specific entrepreneurs aspects such as style, methods and decision-making practices (Frank, Kessler and Fink, 2010), constituting a capacity that can attract resources to exploit opportunities (Alvarez and Busenitz, 2001). On the other hand, literature in the field of strategic management has focused on dynamic capabilities (for a review see Barreto, 2010). The firms' success depends not only on its' resources and capabilities, but also the ability to adapt itself to the industry contingencies and the markets in which

operates. Firms may possess resources but must display dynamic capabilities otherwise shareholder value will be destroyed (Bowman and Ambrosini, 2003). It is in this context that emerges the Dynamic Capabilities View (DCV) (Amit and Schoemaker, 1993; Teece et al., 1997) to support the adjustment to environmental change.

DCV is not divergent but rather an important stream of Resource-Based View (RBV) to gain competitive advantage in increasingly demanding environments (Ambrosini and Bowman, 2009; Barreto, 2010; Eisenhardt and Martin, 2000; Wang and Ahmed, 2007). Monteiro, Soares and Rua (in press) defend that in versatile markets the firms' capabilities should be dynamic and managers must display the ability to ensure consistency between the business environment and strategy in order to continuously renew skills.

Dynamic capabilities as a mind-set constantly integrate, reconfigure, renew and recreate its core capabilities in response to the ever changing environment in order to achieve and sustain competitive advantage (Wang and Ahmed, 2007). Moreover, these capabilities sense and shape opportunities and threats, seize opportunities, and maintain competitiveness by enhancing, combining, protecting, and reconfiguring the businesses' intangible and tangible resources (Teece, 2007).

Absorptive capacity (ACAP) has become one of the most significant constructs in the last twenty years. Absorptive capacity is the dynamic capability that allows firms to gain and sustain a competitive advantage through the management of the external knowledge (Camisón and Forés, 2010).

Building on well established theories, our research aims at exploring the influence of entrepreneurial orientation in exploitation of knowledge of Portuguese SMEs exporting footwear, by analyzing the contributions of this capability in such construct.

THEORETICAL FRAMEWORK

Entrepreneurial orientation

Entrepreneurial orientation emerged from entrepreneurship definition which suggests that a company's entrepreneurial degree can be measured by how it take risks, innovate and act proactively (Miller, 1983). Entrepreneurship is connected to new business and entrepreneurial orientation relates to the process of undertaking, namely, methods, practices and decision-making styles used to act entrepreneurially. Thus, the focus is not on the person but in the process of undertake (Wiklund, 2006).

Companies can be regarded as entrepreneurial entities and entrepreneurial behaviour can be part of its activities (Covin and Slevin, 1991). Entrepreneurial orientation emerges from a deliberate strategic

choice, where new business opportunities can be successfully undertaken (Lumpkin and Dess, 1996). Thus, there is an entrepreneurial attitude mediating the vision and operations of an organization (Covin and Miles, 1999).

Several empirical studies indicate a positive correlation between entrepreneurial orientation and organizational growth (e.g. Miller, 1983; Covin and Slevin, 1991; Lumpkin and Dess, 1996; Wiklund, 2006; Davis, Bell, Payne and Kreiser, 2010; Frank, Kessler and Fink, 2010). Similarly, other studies also confirm that entrepreneurial orientation has a positive correlation with export's performance, enhancing business growth (e.g. Zahra and Garvis, 2000; Okpara, 2009).

The underlying theory of entrepreneurial orientation scale is based on the assumption that the entrepreneurial companies are different from the remaining (Kreiser, Marino and Weaver, 2002), since such are likely to take more risks, act more proactive in seeking new businesses and opportunities (Khandwalla, 1977; Mintzberg, 1973).

Entrepreneurial orientation has been characterized by certain constructs that represent organization's behaviour. Starting from the Miller (1983) definition, three dimensions were identified: innovation, proactiveness and risk-taking, which collectively increase companies' capacity to recognize and exploit market opportunities well ahead of competitors (Zahra and Garvis, 2000). However, Lumpkin and Dess (1996) propose two more dimensions to characterize and distinguish entrepreneurial process: competitive aggressiveness and autonomy. In this study only innovation, risk-taking and proactiveness will be considered, as they are the most consensual and used dimensions to measure entrepreneurial orientation (e.g. Covin and Miller, 2014; Covin and Slevin, 1989, 1991; Davis et al, 2010; Frank et al, 2010; Kreiser et al, 2002; Lisboa, Skarmeas and Lages, 2011; Miller, 1983; Okpara, 2009; Wiklund and Shepherd, 2005; Zahra and Covin, 1995; Zahra and Garvis, 2000).

Absorptive capacity of exploitation of knowledge

In order to survive certain pressures, companies need to recognize, assimilate and apply new external knowledge for commercial purposes (Jansen, Van Den Bosch and Volberda, 2005). This ability, known as absorptive capacity (Cohen and Levinthal, 1990), emerges as an underlying theme in the organizational strategy research (Jansen et al., 2005). Cohen and Levinthal (1990) conceptualize ACAP as the firms' ability to identify, assimilate, and exploit knowledge acquired from external sources. As such, ACAP facilitates knowledge accumulation and its subsequent use. Thus, this ability access and use new external knowledge, regarded as an intangible asset, is critical to success and depends mainly on prior knowledge level, since it is this knowledge that will facilitate the identification and processing of new one. This prior knowledge not only includes the basic capabilities, such as shared language, but also recent technological and scientific data or learning skills. By analyzing this definition is found that absorptive capacity of knowledge only three dimensions: the ability to acquire

external knowledge; the ability to assimilate it inside; and the ability to apply it (Cohen and Levinthal, 1990). Zahra and George (2002) broaden the concept of ACAP from the original three dimensions (identify, assimilate, and exploit) to four dimensions (acquire, assimilate, transform, and exploit).

ACAP is a good example of a dynamic capability since it is embedded in a firm's routines. It combines the firm's resources and capabilities in such a way that together they influence "the firm's ability to create and deploy the knowledge necessary to build other organizational capabilities" (Zahra and George, 2002, p. 188).

According to Zahra and George (2002) ACAP is divided in Potential Absorptive Capacity (PACAP), including knowledge acquisition and assimilation, and Realized Absorptive Capacity (RACAP) that focuses on transformation and exploitation of that knowledge. PACAP reflects the companies' ability to acquire and assimilate knowledge that is vital for their activities. Knowledge acquisition the identification and acquisition and assimilation is related to routines and processes that permit to analyze, process, interpret and understand the external information. RACAP includes knowledge transformation and exploitation, where transformation is the ability to develop and perfect routines that facilitate the integration of newly acquired knowledge in existing one, exploitation are routines which enhance existing skills or create new ones by incorporating acquired and transformed knowledge internally.

Jansen et al. (2005) defend that, although company's exposure to new knowledge, is not sufficient condition to successfully incorporate it, as it needs to develop organizational mechanisms which enable to synthesize and apply newly acquired knowledge in order to cope and enhance each ACAP dimension. Thus, there are coordination mechanisms that increase the exchange of knowledge between sectors and hierarchies, like multitasking teams, participation in decision-making and job rotation. These mechanisms bring together different sources of expertise and increase lateral interaction between functional areas. The system mechanisms are behaviour programs that reduce established deviations, such as routines and formalization. Socialization mechanisms create a broad and tacit understanding of appropriate rules of action, contributing to a common code of communication.

Studying absorptive capacity offers fascinating insights for the strategic management literature and provide new information regarding how firms may develop important sources of sustainable competitive advantages (Jansen et al., 2005). In this paper the focus is on the exploitation of knowledge.

HYPOTHESES

Dynamic capabilities refer to “the firm’s ability to integrate, build, and reconfigure internal and external competences to address rapidly changing environments” (Teece et al., 1997, p. 516).

Barreto (2010, p. 271) argued that a “dynamic capability is the firm’s potential to systematically solve problems, formed by its propensity to sense opportunities and threats, to make timely and market-oriented decisions, and to change its resource base”. On the other hand, dynamic capabilities enable companies to create, develop and protect resources allowing them to attain superior performance in the long run, are constructed (not acquired in the market), dependent on experience and are embedded in the company’s organizational processes (Ambrosini and Bowman, 2009), not directly affecting the outputs, but contributing through the impact they have on operational capabilities (Teece et al., 1997). These capabilities refer to a firm’s capacity to deploy resources, usually in combination, using both explicit and tacit elements (such as know-how and leadership). For this reason, capabilities are often firm-specific and are developed over time through complex interactions between the firm’s resources (Amit and Schoemaker, 1993). Maintaining these capabilities requires a management that is able to recognize adversity and trends configure and reconfigure resources, adapt processes and organizational structures in order to create and seize opportunities, while remaining aligned with customer preferences. Indeed, dynamic capabilities allow businesses to achieve superior long-term performance (Teece, 2007).

Firms, therefore, need to continually analyze and interpret changing market trends and quickly recognize new opportunities in order to create competitive products (Tzokas, Kim, Akbar and Al-Dajani, 2015). The ACAP construct encompasses an outward-looking perspective that deals with the identification and generation of useful external knowledge and information and an inward-looking component that is related with how this knowledge is analyzed, combined with existing knowledge, and implemented in new products, new technological approaches, or new organizational capabilities (Cohen and Levinthal, 1990).

Ultimately, the following hypotheses is tested:

H1: Entrepreneurial orientation influences positively exploiting of knowledge.

METHODOLOGY

Setting and Data Collection

To test the hypothesis a sample of Portuguese footwear companies was used, that meet the following criteria: companies in which at least 50% of income comes from exports of goods, or companies in which at least 10% of income comes from exports of goods and the export value is higher than 150.000 Euros (INE, 2011).

Data collection was implemented through electronic questionnaire, associating a link to the survey that was online. To reduce misunderstandings, the questionnaire was validated by the research department of Portuguese Footwear, Components and Leather Goods Association (APICCAPS).

We were provided with a database of 231 companies (company name, telephone contact, email, economic activity classification, export markets, export intensity and capital origin). Only 167 companies fulfilled the parameters, and were contacted by email by APICCAPS to respond to the questionnaire. Subsequently, all companies were contacted by the authors via e-mail and telephone, to ensure a higher rate of valid responses. The questionnaires began on April 22, 2014 and ended on July 22, 2014. After finishing the data collection period, 42 valid questionnaires were received, representing a 25% response rate (Table 1). This response rate is considered quite satisfactory, given that the average of top management survey response rates are in the range of 15%-20% (Menon, Bharadwaj, Adidam and Edison, 1999).

Universe of analysis - Portuguese SMEs of footwear
Sample - a non-probabilistic and convenient
Population – 367 firms
Sample – 167 firms
Response rate – 25%
Valid responses - 42
Time period – April 22 to July 22 of 2014

Table 1. *Data summary*

In this investigation we chose a non-probabilistic and convenient sample since its respondents were chosen for being members of APICCAPS.

Measures

For assessment of entrepreneurial orientation was used Covin and Slevin's scale (1989), that consists in nine items: three for innovation, three for proactiveness and three for risk-taking, having been used a five point Likert scale, where 1 means "strongly disagree" and 5 "strongly agree".

To measure exploitation of knowledge, and based in Jansen et al. (2005), it was operationalized the company's ability to explore new external knowledge into their current operations, through six questions (e.g. Jansen et al., 2005; Zahra and George, 2002). A five point Likert scale was used to measure each item, where 1 means "strongly disagree" and 5 "strongly agree".

RESULTS

Reliability analysis

In order to verify the reliability of overall variables we estimated the stability and internal consistency through Cronbach's alpha (α). Generally, an instrument or test is classified with appropriate reliability when α is higher or equal to 0.70 (Nunnally, 1978). However, in some research scenarios in social

sciences an α of 0.60 is considered acceptable, as long as the results are interpreted with caution and the context is taken into account (DeVellis, 2012). For the present study we used the scale proposed by Pestana and Gageiro (2008).

The result of 0.855 achieved for all of variables is considered very good, confirming the sample's internal consistency. It was also conducted an internal consistency test for all variables in each construct to assess their reliability (Table 2).

Construct	Cronbach's α	Items Nr.	N	Analysis
Entrepreneurial orientation	.739	9	42	Good
Exploitation of knowledge	.897	6	42	Very good

Table 2. *Internal consistency test by construct (Cronbach's Alpha)*

We found that entrepreneurial orientation has good consistency and that exploitation of knowledge presents very good reliability.

Exploratory factor analysis

We performed a factor analysis, with Varimax rotation, of entrepreneurial orientation construct items that comprise the scale, with the purpose of finding a solution that was more easily interpretable. Three factors were extracted and there was no need to delete items. Thus, we obtained a scale composed of 9 items, distributed over three factors that explain 77.09% of total variance, with 35.52% of variance explained by the first factor, *Proactiveness*, 27.48% for the second factor, *Innovation*, and 14.09% by the third factor, *Risk-taking*. Analyzing the internal consistency of the three factors, we found that Cronbach's Alphas have a good internal consistency. KMO test indicates that there is a reasonable correlation between the variables (0.695). Bartlett's sphericity test registered a value of $\chi^2(36, N=42)=171.176, p<0.05$, therefore is confirmed that $\chi^2>\chi_{0.95}^2$, so the null hypothesis is rejected, i.e. the variables are correlated.

In the factor analysis, with Varimax rotation, of exploitation of knowledge we got a scale with 6 items, distributed by 1 factor, that explained 69.17% of total variance, whose saturations range between 0.804 and 0.578. The internal consistency of the factor is $\alpha=0.897$, indicating this value that these dimension presented a very good internal consistency. KMO test confirm a good correlation between the variables (0.831). Bartlett's sphericity test registered a value of $\chi^2(10, N=42)=114.439, p<0.05$, therefore is confirmed that $\chi^2>\chi_{0.95}^2$, so the null hypothesis is rejected and the variables are correlated.

Multiple regression analysis

Multiple regression analysis is a statistical technique that is used to analyze the relationship between a single dependent (criterion) variable and several independent (predictor) variables. The objective of multiple regression analysis is to use the independent variables whose values are known to predict the single dependent value selected by the researcher. Each independent variable is weighted by the regression analysis procedure to ensure maximal prediction from the set of independent variables.

The most commonly used measure of predictive accuracy for the regression model is the coefficient of determination (R^2). This coefficient measures the proportion of total variability that can be explained by regression ($0 \leq R \leq 1$), measuring the effect of independent variables on the dependent variable. When $R^2=0$ the model clearly does not adjust to data and when $R^2=1$ the adjustment is perfect. In social sciences when $R^2 > 0.500$ the adjustment is considered acceptable (Marôco, 2011). In the table 3 we present the results of the multiple regression analysis of our model.

Model	R	R ²	Adj. R ²	Standard Error	F	Sig.
1	.556 ^a	.309	.254	.86350080	5.662	.003*

a. Predictors: (Constante), Entrepreneurial orientation.

b. Dependent variable: Knowledge exploitation.

* $p < 0.05$.

Tabela 3. *Summary and ANOVA of multiple regression analysis^b*

The previous table presents for model 1 a value of $F=5.662$, with $q\text{-value} < 0.05$ (Sig.), so H_0 is rejected in favour of H_1 . Thus, this hypotheses is supported.

A mere comparison of the regression coefficients is not valid to evaluate the importance of each independent variable models, since these variables have different magnitudes. Thus, it is essential to use standard variables, known as Beta (β) coefficients, in the models adjustment so that the independent variables can be compared.

Variables	Beta	Sig.
ENTREPRENEURIAL ORIENTATION		
Proactiveness	.076	n.s.
Innovation	.445	.002*
Risk-taking	.325	.021*

* $p < 0.05$.

n.s. – non significant.

a. Dependent variable: Knowledge exploitation.

Table 4. *Standardized beta coefficient*^a

Beta coefficient allows a direct comparison between coefficients as to their relative explanatory power of the dependent variable. Table 4 shows that the variables that have higher contribution to knowledge exploitation are *Innovation* ($\beta=0.445$) and *Risk-taking* ($\beta=0.325$).

DISCUSSION AND CONCLUSION

The main purpose of this study is to analyze the influence of entrepreneurial orientation on knowledge exploitation. We conducted an empirical research based on a sample of 42 companies, which were applied a questionnaire in order to exploit data to test hypotheses, using proceedings and statistical techniques. It is important to note that companies evaluated entrepreneurial orientation and exploitation of knowledge relative to their major competitors in the export market(s), so the results should be interpreted based on these two aspects.

The Portuguese footwear industry faces considerable challenges, not only concerning the international markets crisis, but also regarding consumption patterns. The reduction of shoe design lifecycles has consequences on the offer. On one hand, the products have to be adapted to different segments specific needs and tastes (custom design, new models in small series, etc.), on the other hand, manufacture processes must be increasingly flexible, adopt just-in-time production, invest in the brand, qualified personnel, technology and innovation (APICCAPS, 2013).

This study demonstrated that the company's innovation and risk-taking have a positive and significant influence on knowledge exploitation. The analyzed companies are able to exploit knowledge through informal knowledge gather, clear definition of tasks, analysis and discussion of market trends and new product development, among others.

Dynamic capabilities can take a variety of forms and be involved in different functions, but the most important common characteristics are that they are higher level capabilities which provide opportunities for knowledge gathering and sharing, constant updating the operational processes, interaction with the environment, and decision-making evaluations (Easterby-Smith, Lyles and Peteraf, 2009). However, the existence of common features does not imply that any particular dynamic

capability is exactly alike across firms, rather they could be developed from different starting points and take unique paths (Eisenhardt and Martin, 2000).

In fact, according to the industrial organization, a company should find a favourable position in its industry from which it can better defend against competitive forces, or to influence them in his favour through strategic actions such as raising barriers to entry, etc. (Porter, 1980). This perspective is consistent with Eisenhardt and Martin (2000) regarding the uniqueness of paths. The results of this study confirm that exploitation of knowledge enable firms to achieve superior long-term performance (Teece, 2007).

Theoretical and practical implications

It is known that strategy includes deliberate and emergent initiatives adopted by management, comprising resource and capabilities use to improve business performance (Nag, Hambrick and Chen, 2007). The findings are a contribution to clarify the influence of entrepreneurial orientation on the company's knowledge exploitation. This study also enabled a thorough analysis of a highly important industry for national exports, such as footwear industry, allowing understanding that entrepreneurial orientation, as an industry strategic determinant, enhancing exploitation of knowledge.

Jansen et al. (2005) defend that companies need to develop organizational mechanisms to combine and apply newly acquired knowledge in order to deal and enhance each absorptive capacity dimension. In this study is notorious the importance of knowledge absorptive capacity to business performance. It is essential that business owners are able to interpret, integrate and apply external knowledge in order to systematically analyze change in the target market and to incorporate this knowledge in their processes to enhance performance.

In addition, the results provide guidance to business practitioners; because they indicate entrepreneurial orientation as a predictor for exploitation of knowledge. Companies are a bundle of resources and capabilities (Peteraf, 1993), it is essential to understand and identify which resources are relevant to gain competitive advantage and superior performance. In this study it is obvious the importance of entrepreneurial orientation to the firms' exploitation of knowledge. Business owners must be able to interpret, integrate and apply external knowledge in order to systematically analyze the changes that arise in their target market(s) and to incorporate this knowledge into their processes, to identify the present and future needs and market trends, anticipate changes in demand and seek new business opportunities.

By building on the literature of entrepreneurial orientation, absorptive capacity and exploitation of knowledge, this study aims to support the strategic development of business management policies designed to increase firms' performance in foreign markets and add value to the current context of change.

Research limitations

The main limitation of this study is related to the sample size, since it was difficult to find companies with the willingness to collaborate in this type of research. The sample is non-probabilistic and convenience and cannot be used to infer to the general population. The study findings should therefore be analyzed with caution.

The fact that the research does not consider the effect of control variables such as size, age, location and target market of the respondents can be seen as a limitation.

Finally, the fact that this study considered only exploitation of knowledge as an absorptive capacity can also be appointed as a limitation.

Future Lines of Research

In future work, we suggest that the model is used in a sample with a higher number of observations to confirm these results.

We further suggest pursuing with the investigation of strategic management in Portugal, focusing in other sectors of national economy, so that in the future one can make a comparison with similar studies, allowing realizing and finding new factors that enhance absorptive capacity.

Finally, the moderating effect of strategic variables (e.g. competitive advantage) in the relationship between entrepreneurial orientation and exploitation of knowledge should be studied.

OPEN INNOVATION IN THE SOCIAL SECTOR: A THEORETICAL APPROACH

Santoro, Gabriele

Department of Management, University of Turin, Italy

ABSTRACT

Open innovation has gain lot of interest in the last decade and its main practices have been analyzed in various context and in several sectors. Recently, literature has shifted attention to the connection between open innovation and social innovation, proving the presence of flows of knowledge and collaborations among different actors for the development of social solutions. Nevertheless, the focus of these studies remains on public and non-profit organizations. Rather, in this paper we propose that open social innovation involves also NGOs and companies which possess knowledge, assets and technology to sustain the social challenges and to promote social innovations.

In this framework, this is a discussion paper with the purpose of further our understanding on open social innovation. Moreover, it outlines the open aspect of social innovation, with emphasis on the actors and processes that are involved in the process of generating and spread ideas that can address to a social change.

Keywords: *social innovation, open innovation, open social innovation, social collaboration.*

INTRODUCTION

The open innovation paradigm has established as one of the most discussed topic in the past decade within innovation management studies (Chesbrough, 2003; Gassman and Enkel, 2004; West and Gallagher, 2006; Dahlander and Gann, 2010; Brunswicker and Vanhaverbeke, 2014), both in the academic and in the industrial world. Since its birth, more than a decade ago by now, this stream of literature has embraced several areas and contexts of analysis. In particular, the effectiveness of open innovation practices has been recognized in various sector and for firms of different size. Recently, some scholars have attempted to apply open innovation paradigm to social innovation (Chalmers, 2013; Chesbrough and Di Minim, 2014; Martins and de Souza Bermejo, 2015), coining a new term, “open social innovation”, stimulating discussions and research on this field. As a result, although the concepts of social innovation and open innovation remain separated and their interconnections have only been investigated recently by the above-mentioned studies, cues to open a debate are attractive and interesting, for at least two reasons.

First, the concept of social innovation is not yet clear and is very vague and ambiguous, and, thus, the boundaries are not well defined. Second, it is interesting to understand how key aspects of open innovation processes may contribute to the development of social innovations. For the latter, it is clear that more and more in modern society, social solutions are not developed by an individual or organization alone, but rather they are the result of collaboration and exchange of knowledge.

This work is a discussion paper with the aim of contribute to this still-gaunt topic for a better theoretical and conceptual understanding of the phenomenon. Moreover, it feeds the current debates on social innovation, reviewing the extant literature in order to clarify its concept and analyzing its connections with open innovation. Finally, this paper aims at understanding how open innovation can affect social innovation, following a research question emerged in recent literature: how open innovation can contribute to social innovation? (Chalmers, 2013; Chesbrough and Di Minim, 2014). To reach this goal, it will be carried out a broad and critical review of the literature and two propositions will be proposed.

SOCIAL INNOVATION

Literature offers many definitions of social innovation demonstrating how hard is to draw boundaries to a phenomenon whose essential hallmarks are expressed in practices (Mulgan et al., 2007; Dawson and Daniels, 2010; Howaldt and Schwarz, 2010; OECD, 2010). For these reasons, the uses of the term "social innovation" is sometimes inappropriate or hard to interpret; in fact, researchers continued struggling to delineate boundaries of the field (Mulgan, 2006).

Many scholars try to explain the phenomenon separating social innovation from business innovation (also technical innovation for many authors), while others completely abandon the notion of social innovation, arguing that is nothing new with respect to innovation and is too ambiguous to be useful. The greatest distinction can be done based on the final goals of innovation. According to the OECD (2010), "Social innovation seeks new answers to social problems by: identifying and delivering new services that improve the quality of life of individuals and communities; identifying and implementing new labour market integration processes, new competencies, new jobs, and new forms of participation, as diverse elements that each contribute to improving the position of individuals in the workforce".

Thus, given this widely accepted definition, every innovation can be considered relatively social, such as the watch, the smartphone, the computer, internet and in general any innovation that has allowed the improvement of human life over time. In this sense, it is interesting the contribution of Pol and Ville (2009) who state that the primary purpose of any firm is social, including profit-seeking firms. The authors claim that the "social" aspect of innovation regards that when an innovation is successful,

people and communities can benefit from this new idea. Therefore, social innovation and business innovation very often may coincide. In this sense, many authors stress that some tools and mechanisms typical of business innovation can perfectly fit in the social innovation process (Murray et al. 2010; Saul, 2010). Moreover, a social problem can be satisfied by both social innovation and business innovation (Cajaiba-Santana, 2013). In fact, already in 1995, the European Commission underlined that "the social aspect" is intrinsic in the concept of innovation.

However, Mulgan et al. (2007) have thought the opposite, highlighting that social innovation is different from business innovation, since the latter is often motivated by profit maximization and is supported by firms that have as their primary purpose the profit. Still according to OECD (2010), the biggest difference with business innovation, is that social innovation aim at satisfying new needs not provided by the market.

In line with this branch of study, social innovation is intended different from another innovation that comes from outright market competition and which purpose is the seek for profit. Moreover, at the origin of these innovation processes there are social pressures exerted by the existence of unmet needs (eg. health services), of wasted resources (eg. land consumption), environmental emergencies (eg. air quality towns) or social aspects (eg. the growing areas of discomfort and marginality) (Davies and Simon, 2013).

A middle way between the two theoretical strands, is represented by the contribution of Westley and Antdadze (2010), who highlight that social innovation does not necessarily involve a commercial interest, though it does not preclude such interest.

Finally, from the point of view of the actor that promotes and supports social innovation, Cajaiba-Santana (2013), proposes two perspectives of analysis. On one side, social innovation is created and sustained by a single individual through an individualistic and behavioral approach, the social entrepreneur proposed by Lettice and Parekh (2010). On the other side, social innovation is fostered in a broader context and in an external perspective. In this sense, social innovations can be derived not only from public organizations, but also from firms and informal groups of citizens (Mair and Martì, 2006; Dacin et al. 2011, Nicholls and Murdock, 2011).

OPEN SOCIAL INNOVATION: A NEW PHENOMENON?

Analyzing the open innovation paradigm, the point of break with the past concerns the shift from a vertically integrated innovation process system within the firm, with a large focus on internal R&D, to an open approach in every phase of the innovation process, through strategies of acquiring, sourcing, selling and revealing (Chesbrough, 2003; Dahlander and Gann, 2010). Similarly, within the context of open social innovation, we would propose that the point of break with the past concerns the transition

from a new idea to satisfy a social problem promoted by a single non-profit entity (social entrepreneur as presented by Lettice and Parekh, 2010), to a collaborative approach which includes several entities of different nature and with different purposes.

In this sense, recent qualitative studies are univocal in emphasizing the importance of alliances in sustaining social changes and systematic relationships between different entities (Murray et al., 2010; Ferraris and Santoro, 2014), even through the creation and exploitation of ecosystems (Ranga and Etzkowitz, 2013; Ferraris and Grieco, 2014).

Table 1. *From social to open social innovation.*

	Social innovation	Open social innovation
Final goal	Satisfy social needs, improve life of individuals and communities (OECD, 2010)	Join social and commercial interest (Pol and Ville, 2009; Westley and Antadze, 2010)
Actors involved	Individuals (Lettice and Parekh, 2010; Cajaiba-Santana 2013), foundations, social entrepreneurs, NGOs, governments (Murray et al. 2010).	Private (Huizingh, 2011), users (Chalmers, 2013), ecosystem involving public, private, users, university and research centers (Nicholls and Murdock, 2011; Ranga and Etzkowitz, 2013; Ferraris and Grieco, 2014), governments and communities (Martins and de Souza Bermejo, 2015)
Innovation process	Single-entity actions (Lettice and Parekh, 2010)	Collaborative actions through inbound, outbound and coupled processes (Chesbrough and Di Minin, 2014; Martins and de Souza Bermejo, 2015)

Source: adapted from Martins and de Souza Bermejo (2015)

Chesbrough and Di Minin (2014) highlight the importance of inbound and outbound activities even for NGOs and organizations from public sector, to reach social goals. The inbound activities identify the seek for external innovative solutions, idea, knowledge and technology. The outbound activities refer to bring ideas to market selling IP and transferring technology and knowledge to other entities. Chalmers (2013) emphasized how “openness” can overcome common barriers to social innovation

and mitigate some of the risk of the innovation process. Within open social innovation context, Martins and de Souza Bermejo (2015), emphasized the role of the continuous collaboration between several actors of different nature, approaching the so-called coupled process, the third archetype present in the literature on open innovation (Gassmann and Enkel, 2004).

Among all the external sources widely individuated in the literature, the customers play a key role both within business innovation (Franke and Piller, 2004; von Hippel, 2005; von Hippel and Katz, 2002), and social innovations (Henkel and von Hippel, 2003; Broberg, 2010; Neumeier, 2012; Chalmers, 2013). In particular, they own and can directly transfer specific knowledge about their needs, so an engagement process would help a better understanding of the problems to ensure a fast track towards the solution.

The following table shows the transition from social innovation to open social innovation based on major literature contributions.

DISCUSSION AND PROPOSITIONS

Consequently, the considerations made so far lead us to define open social innovation as all those activities and processes that support the promotion of new ideas (products or services), through the transfer of knowledge and technologies (inbound and outbound activities) and collaborations between different entities (coupled processes), that lead to social impact. From this point of view, different fields of study may be related. For example, the topic of Smart City falls right into open social innovation borders, since it concerns collaborations between different actors (including public and private), for the implementation of innovations which aim to make the city a better place for the citizens. Furthermore, the concept of Public-Private Partnership (PPP) take part in the same stream. From this perspective, well-known companies in the ICT sector, such as Microsoft, IBM and Cisco are involved in Smart City projects in close collaboration with local governments to provide a technological support to reach social change.

Therefore, the present work would suggest two propositions regarding open social innovation. First, a business innovation can be considered a social innovation to the extent that produces any positive effects on the quality of people's life with no negative effects. In this way, as Westley and Antdadze (2010) noted, social innovation could involve commercial interest opening to the "market mechanisms" typical of the business world. Thus, organizations that seek to meet social needs, may rely on the main pecuniary and non-pecuniary processes of open innovation such as revealing, selling, sourcing, and acquiring (Dahlander and Gann, 2010), leading greater efficiency and effectiveness in the innovation process. A business interest can also involve technology or business model testing that could bring future profits in other areas of application. For example, Google is actually testing various

technologies such as Google Glass, in the social, medical and cultural fields. In addition, a business model can ensure the scalability and sustainability of the social innovation over time (Prahalad, 2012).

Proposition 1: open social innovation can involve both social and commercial interests, bringing to pecuniary and non-pecuniary open innovation activities.

Second, the development of social innovations can arise from transferring knowledge and technology between different organizations or from a constant collaboration between several actors, including companies, public entities, NGOs and people. Thus, even the “pure social innovations”, that are all those that satisfy unmet needs (Pol and Ville, 2009), may benefit from inbound activities. In fact, the governments can seek and acquire knowledge and resources from private, which may profit from outbound activities, with the final aim at satisfying these social needs.

As stated before, social innovations must be ignited by different parties that work synergistically and between them acquires great importance the private organization (Porter and Kramer, 2011), for at least two reasons. First, the economic crisis has reduced the possibility of spending of public administrations and local governments. Second, the private side has capabilities, competencies and technologies that the public does not own. One of these competences regard the development of a business model that can ensure a financial sustainability to social programs (Chesbrough et al., 2006). Consequently, whereas the “public” is not able to meet certain needs, for financial resources constraints or/and lack of capabilities, the “private” may find new solutions to social problems and look for new business opportunities.

Proposition 2: open social innovation can occur from collaborative relationships between several actors of different nature, as public, private, NGOs and customers, through inbound, outbound and coupled processes.

CONCLUSIONS

Summarizing, in line with the cues and propositions, this paper aims at contextualizing the range of open social innovation and stimulating future research on this field both from the perspective of organizations who seek for social change as primary purpose (Chesbrough and Di Minin, 2014) and private organizations who achieve indirectly social change through business innovations (Porter and Kramer, 2011).

Current social challenges call for open and collaborative actions between different stakeholders, cutting across sectorial boundaries. Public, private and civil society sectors can share resources and competencies in order to increase the innovative potential for all areas of civic and social life.

Nevertheless, very few efforts have been done so far in linking open innovation practices to social challenges. Thus, we theoretically suggest that openness in the social sector can contribute with higher efficiency, higher likelihood of transformative change exploiting new technological solutions, ensuring financial sustainability and overcoming the barriers associated with social innovation development process.

From this point of view, more case studies at open social innovation single-project level would help to build a theoretical base and a conceptual framework around it, analyzing the phenomenon from different point of view such as governance, IPR management, and technology and knowledge transfer between different parties.

Of course, this paper has several limitations. The most relevant regards the lack of empirical evidence. This is due to the fact that, being only at the beginning of its development, the open social innovation topic does not have a theoretical foundation.

THE HALAL CERTIFICATE IN THE CONTEXT OF NATIONAL BRANDING

Sărăcin, Valentin-Cosmin ; Vasile, Adrian

The Bucharest University of Economic Studies, Romania

ABSTRACT

Although the literature is increasing considerably regarding the brand concept, Halal brand is still not well-known, both in non-Muslim countries, and worldwide. This exploratory study presents the perception that consumers have over Halal businesses from around the world, focusing on consumer perception on Halal brand in a non-Muslim country compared to a Muslim country. This research identified a global need to regulate and to stabilize the Halal brand so that it can have the same success as the organic brand products, even in light of the fact that a certified product, also organic, Halal and Kosher lead to a premium product with the highest added value in the global market.

Keywords: *Halal, Muslim, non-Muslim, branding, Halal certification*

INTRODUCTION

The particular literature about Islamic Branding continues to be growing quickly although analysis interest about Muslim client viewpoint about Halal branding is scarce. The particular Marketing literature about branding is abundant and checked out distinct viewpoints. Keller (Keller, 1998) defines Branding as labelling items as well as offering significance, where by brand names established are able to obtain a specific higher level of recognition as well as create an attachment together with shoppers. Brand is defined in a lot more illustrative means seeing that “a name, term, sign, symbol or design or a combination of them, intended to identify the goods or services of one seller or group of sellers to differentiate them from those of the competitors” (Kotler *et al*, 2007). People see Branding as a way to generate differentiation and preference within the thoughts of shoppers (Xie & Boggs, 2006). Out of this academic perspective “Halal” is like a symbolic representation absolutely qualified to be thought as a brand that may identify a product coming from non-Halal choices and also to generate inclination and attachment with consumers’ mind as the best option they will choose to utilize. Nevertheless, taking purchaser psychology in mind,

advertising strategists need to have additional insight into the use of 'Halal' like a brand symbol representation for creating purchaser attachment and tastes for any sustainable competitive advantage inside the market segment.

Malaysia popularized the Halal notion along with a number of practical efforts with the government and private sectors. The political environment has strengthened with government policies by introducing Halal certification. This measure was taken for making Malaysia a Halal Food Center for processing Halal food, for local and global market segments. These pursuits are shown inside the appearance involving high percentage Malaysia-based Halal trademarks to certify items and companies as distributors of Halal items. Strangely enough, these kind of Halal trademarks aren't uniform enough to represent uniqueness of the items to be regarded as completely different from non-Halal qualified products.

Figure 1. *Malaysia Halal Logo*

Australia, on the other hand, incorporates a tiny Muslim group (estimation only close to 1.5% of the population) but its export to international Muslim markets in the world is actually approximated for a worth close to 8 billion dollars per year. Based on Food Safety Australia report, you can find at the least 15 corporations at the state and national wide ranges as well as Australian Halal Food Services Trust, Halal Certification Authority Australia, Australian Federation of Islamic Council, Islamic Co-coordinating Council of Victoria and Perth Mosque (Western Australia) which could certify a corporation as Halal. Halal certification is licensed by the National Federal government through the Australian Quarantine and Inspection Service (AQIS).

Figure 2. *Australia Halal Logo*

Interestingly enough, Halal logos are not just unique regarding different certifying organizations. "Halal" as a brand claimed to be created by some Muslims that came in contact to "Kosher" brand in America, and worked well in 1970s to ascertain some sort of controlling system about the legal Islamic food and diet. Perhaps surprisingly, during our research, we found only a few listed Halal certifying enterprises for the state levels and none has been plainly found to be national select body inside its birth place. Minimal exploration along with anecdotal research recommends rising purchaser awareness of Halal branding. However, inconsistent use of the Halal logo confuses quite a few and impacts positive perception.

Besides this kind of confusion over the Halal logo, many Muslim buyers often have different perceptions involving Halal wherever Halal certification is not considered just a qualifying measure intended for picking suitable solutions intended for usage. As an example, country of origin along with lack of 'haram' elements within the product are thought as additional ways of implementing solutions that may please individuals' idea of Halal usage. For a lot of Muslims in the world, Halal is usually a part of a belief system and moral code of conduct, which is crucial in the everyday life connected with Muslim community (Wilson and Liu, 2010). From that point of view, the understanding of Halal is the core of every Muslim's belief and it is thought to be referred as necessity, and it is based upon the typical rule regarding Islamic jurisprudence which in turn keeps every little thing as Halal unless stated otherwise. These kinds of viewpoints could have an effect on the recognition and usage of Halal branded products, or legitimate Islamic or even inbound Islamic brands and also traditional Islamic brands. However, thus far no study has looked into consumer belief on this with rigor.

THE HALAL BRANDING

Islamic Marketing as an area of study remains with curdles and the literature on Islamic Branding remains rare. A research on 'Islamic Branding' along with 'Halal Branding' listed only a small number of scholarly journal articles or blog posts (Alserhan, 2010; Wilson along with Liu, 2010) and mostly inside the new Journal of Islamic Marketing. An additional handful seminar papers (Nooh *et. al*, 2007; Danish *et. al*, 2010) addressed 'Halal Branding' from customer and also marketing points of views. While each of the scholarly record posts usually is conceptual in nature, this discussion forms noted customer understanding upon Halal goods in Malaysia. In addition to these kinds of limited scholarly posts, some chats on Islamic/Halal branding also can be found in Halal Journal, Business press and a few Islamic webpages.

The regular perspective on the literature is that the idea of 'Islamic Branding' puts its appeal firmly on Shariah guidelines, the impression connected with purity, welfare and human race connected with Islamic brand are also focus of some writers (Abdullah, 2010; Temporal, 2010). It is specified that Islamic branding is like a brand that is based on life values connected with Islam (Abdullah, 2010). Certainly that conveys towards the Muslim and the community which the brand offers adheres to the particular unique codes and principles of Islam, and in so doing associating with the brand would benefit these people with regard to doing a 'good deed' (Alserhan, 2010a).

The idea of "Halal" is central in the Islamic Branding, where Halal throughout Arabic means appropriate or permissible in Islam plus it is true of every area of Islamic life instead of merely limited to food and beverages. Inside various other phrases, Halal is the portion of a belief system and moral code of conduct associated with and carryout throughout Islam, which can be vital in day to day life in Muslim group (Wilson and Liu, 2010). So Muslims customers would hunt for Halal lifestyle for rewards of accomplishing good deeds and also avoid haram (non-permissible or prohibited) in order to avoid carrying out sin and punishment (Alserhan, 2010). When it comes to use of items, products and services, Halal accreditation assists Muslim buyers to help easily distinguish the acceptability of a product from the list of alternative products already in the market with that target in mind.

The term “Halal” in Arabic is usually a symbol or a sign that is utilized in many products to communicate Shariah conformity with the product. Even so, many authors of these studies notice HALAL linked to clean, much healthier or tastier (Al-Harran and Low, 2008) and little by little they end up to be suitable for a consumer life-style choice over and above religious practices and foodstuff, and as well within finance, non-food goods, logistics, refreshments, makeup products, prescription, hotel and cosmetics (Power, 2008; Knott, 2009).

The socio-political and also financial environment of some of the Muslim nations has added towards the progress of local businesses to cater for the local and worldwide needs regarding Shariah compliant products and services. Financial progress has led to the considerable progress of client areas in those nations and become part of the globalized costumers. They share the similar features of their developed nation counterparts together with their dedication to the spiritual obligations involving adherence to the Islamic way of existence.

This original consumption has brought the public and personal initiatives to be able to accomplish the development of organizational setup for certification of Shariah compliant production, storage, vehicles and supply of products and services by locally expanded business plus the development of true Islamic brands by classification (Alserhan, 2010).

An article released in the Journal of Islamic Marketing researched the impact involving religiosity on customer new product or service adoption (Rehman and Shabbir, 2010). Although the study model purely looked at the impact of various dimensions of religiosity of a buyer about his/her new brand adoption behaviour, the model provides a merit to be helpful to describe Muslim consumers’ adoption of HALAL products and various types of Islamic brands especially. As the research endeavours to explore the Muslim buyer perceptions as a result of exploratory qualitative approaches where no a-priori analysis expectation is unwarranted, the next general statements have been in mind for that variation of Rehman and Shabbir’s model on this study: “The greater the religiosity of the consumer, the higher the adoption of true Islamic brands” and “The greater the religiosity of the consumer, the lesser the adoption of traditional and inbound Islamic brands”.

METHODOLOGY, DESIGN AND RESEARCH

The on-going investigation is conducted in order to find out the consciousness and notion of Halal brand among Muslim buyers in a non-Muslim state (Australia) and also in a mainly Muslim state (Malaysia) at initial stage. Since the research dilemma of this investigation attempts to touch a new recently unexplored place for the understanding Muslim consumers' notion of diverse families of Halal brands, an exploratory investigation approach is proper. Even so, the study furthermore needs to check a model to look into the actual effect connected with religiosity on buyer usage of unique types of Halal product where a causal investigation approach is acceptable. As a result, a new merged technique investigation approach has been acquired to recognize buyer point of view of Halal being a brand among Muslim consumers.

The qualitative strategy has been used with the first cycle of the research in order to clearly understand purchaser point of view on Halal brands and define the research issue better when it comes to creating the study model for empirical assessment as a result of quantitative research.

A qualitative method involving data selection by means of in-depth interview and focus group interview encourages greater understanding of consumers' attitude and belief. As a result, in-depth one-on-one interviews were set up in the beginning to recognize the problem at hand coming from scholars. The initial interview had been with an Islamic scholar and Director of Islamic Studies of a college in Brisbane, Australia.

The next interview was with a scholar of Islamic Banking and Finance from the same college in Brisbane (Australia) that had been arranged to comprehend his professional understanding on usage of Shariah compliant goods in general as well as Islamic Finance. The third interview with a Marketing expert in Malaysia supplied the necessary understanding of purchaser belief regarding Halal branding within Malaysia.

Each one of these interviews took close to one hour. The initial interview in particular was targeted at understanding the particular Shariah rules of Halal and haram throughout Islamic life style, intricacy in the consumption circumstances for Muslim customers within a non-Muslim land including Australia, Halal certification throughout Australia, and looking for his expert thoughts and opinions on a preliminary study instrument for the next step in the study.

CONCLUSIONS

The initial interview with the Islamic academic offered an interesting understanding in the concept of Islamic means of existence in a Multicultural community of Australia in which Muslims from diverse socio-cultural circumstances interact with the normal Australia culture in addition to a blended Muslim community.

On such basis as his regular interaction with the leading Islamic bodies throughout Australia, political figures at the Federal, State and national levels, Australian local community at large along with the Muslim local community throughout Brisbane as an Imam inside a local mosque, he supplied a very balanced approach to the framework of implementing Halal branded services and products in the Australian community. Like most individuals interviewed in one-on-one and focus group interviews in Australia, this individual raised the problem concerning the authenticity involving a number of the Halal certifying organizations.

They agreed that variation of custom and practices in different Muslim nations help with the different meaning of Shariah guidelines relating to Halal and formation of unique certifying institutions within Australia. He pointed out that this Australian National Imam Council (ANIC) might have been keeping track of the Halal certifying organizations but ANIC has no personal and financial strength to perform this kind of supervising role. They pointed their satisfaction with Halal certified goods of some International institutions located in a number of Muslim nations as opposed to just all goods produced by the same company in other states. They stressed out the importance of purity and the humanitarian aspect rather than simply Halal official certifications that he imagines as “commercialization of Islam” by means of large businesses.

The interview with another college academic from Brisbane confirmed some of the Halal associated troubles stated by Islamic academic. This immigrant from South Africa staying in Brisbane for more than two decades mentioned that he always favours Halal merchandise. However, simply Halal certifications through any kind of institution really does not fulfil his Halal necessity and also isn't going to assume that any kind of product or service from a Muslim nation could be Halal unless licensed by a reliable certifying institution. He likes examining for ingredients in the goods rather than depending upon

Halal certification because a few institutions misuse Halal certification and he pointed out his reservation with the Halal certification used by a few International organizations in their conformity involving appropriate Shariah qualification.

The interview with a marketing professor in Malaysia exposed a different point of view on Halal certification. This extremely practicing Malaysian Muslim sees the locally manufactured Halal goods authorized by JAKIM as real and trustworthy. However, she isn't going to believe that all goods manufactured in Malaysia or other Muslim places are generally Halal unless certified. She isn't going to count only upon Halal qualifications of a diner unless owned by Muslim. She portrayed her reliance upon renowned Multinational brands which have been Halal certified and also manufactured in Muslim states. To her, Halal certification is sufficient in the event that the product comes from a store having solely Halal goods and she doesn't trouble to verify the ingredients of the goods.

Every second practicing Muslim men additionally depicted their own wish for Halal way of life; each of them knew the different Halal brands connected of foods, pharmaceutical drugs, health-related and beauty items and they preferred to buy those goods. Nevertheless, their standards of taking Halal product or service weren't that stringent and stated their acceptance of a product so long as it has a Halal logo of any certifying institution. They even stated their acclaim of International brands that are targeted to Muslim marketplaces or even merchandise that focus on purity and humanity even if not Halal certified. Additionally, they prefer examining the ingredients listed on the product instead of believing Halal logo and they also have smaller reservations about any Halal certified goods produced in non-Muslim states. They also believe that nearly all items produced in Muslim nations are Halal and they prefer purchasing those items from ethnic grocery stores.

Being at an early point, results are tentative and need additional testing in future studies along with other cross-country reports. It will increase our familiarity with Islamic Marketing and branding for the advantage of growing consumption requirements of Muslim community within this globalized market economy. Findings include realistic benefits pertaining to entrepreneurs as well as Islamic councils/bodies around the world to be aware of the importance of standardizing the Halal logo and supervising its use by entrepreneurs continually. To be able to win the approval of cross-section of Muslim consumers international firms should commit more of their resources on understanding Muslim

customer perception and also integrate Shariah compliance within their attempt to target this rising market.

AN INVESTIGATION ON THE DEVELOPMENT OF THE ROMANIAN AGRO-TOURISTIC SECTOR DURING 2005-2015

Sărăcin, Valentin-Cosmin

Bucharest University of Economic Studies, Romania

ABSTRACT

Tourism is one of the most important sectors of every country that has an extraordinary richness in natural resources. More and more tourists choose to spend their holiday in a rural, isolated, natural and clean environment. Every day, their preferences tend to diversify: under the social stress of urban areas, tourists are opting for less crowded and wild locations.

Despite the opportunities and natural tourism resources in Romania, the rural tourism hasn't reached its peak potential yet. However, it provides to their guests both the chance to relax in nature, away from congested and polluted areas, and the opportunity to participate in various cultural, historical or agricultural activities. In light of these opportunities, the rural tourism has recorded an increasing rate of development. Local and foreign tourist started to appreciate and take advantage of cost efficient benefits of organic food produced *a la carte*, locally by the host.

The study analyses growth of agro-tourism in Romania during the last decade (2005-2015), based on official collected data processed and interpreted with statistical approaches.

A significant conclusion shows that the rural tourism and agro tourism benefit from a major expansion in Romania, due to the increasing motivation and skills of the locals, the increasing number of tourism housing units, and the diversified options put together for the benefit of the tourist.

Keywords: *Rural tourism, Agro tourism, Agro touristic, Accommodation, Romania*

INTRODUCTION

Romania is one of the richest countries in Central and Eastern Europe in terms of natural resources and tourism. Most experts believe that through professional management and marketing, considering the touristic potential of our country, Romania can excel and compete with the biggest countries in the world, which by default will have direct effect on the entire economic sector. Romania excels in terms of natural wealth, with a high touristic potential, thereby supporting the entire economic sector of this country (Andrei et al, 2012).

Rural tourism is a much broader concept that includes agro tourism. Although these two concepts are different in literature, most authors consider them identical. An important aspect to note is that agro tourism is different due to the specific characteristics they offer tourists (Branzan, 2006). One of these features is represented by the fact that tourists are welcomed into the local's household. Another important feature is the fact that tourists are allowed to participate in different activities such as livestock farming, cultivation of different types of plants or trees. The third important feature is that tourists eat food and natural products grown and obtained predominantly in the household. Agro tourism is in addition to agriculture one of the most important factors of development in rural areas, thanks to the diversification of agricultural activities, profit driven activities and creating new jobs opportunities.

Nowadays, the human tendency is to return to the quiet of the countryside and nature, away from the hustle and pollution in urban areas, in order to bring everything that is natural, pure and unadulterated closer (Jarkko, 2006).

THE CONCEPT OF AGRO-TOURISM

Agro tourism or 'green tourism' can be defined as a form of tourism found in rural, natural, unpolluted, picturesque areas that relies on the provision of accommodation, meals, entertainment, interaction with the socio-natural environment and others that put value on the natural and anthropogenic resources of villages, representing a plus in development and living standards of the rural population (Ciugudean, 2009).

Figure 1. *Agro-tourism specific landscape in Romania*

Agro tourism seeks to harness the rural areas with tourism, agricultural and techno-economic potential, presenting in this respect a number of features that sets it apart from standard tourism: tourism demand, takes place in rural areas where essentials are: the originality of tourism products, knowledge of the natural, human and cultural environment, quality of reception; authenticity of the tourism offer, its multiple diversity and the fact that it is run by the villagers; It is not an alternative or replacement of farming, but it is a complementary economic activity to it; low-income population the opportunity to enjoy rest, recuperation, to spend time in a rural, scenic, cultural environment with educational values and specific hospitality; infrastructure, superstructure or other tourist facilities do not require very high profile investments; the avoiding the congested seaside, mountain or health resorts (Dobre, 2006).

Agro tourism in Romania was always implemented sporadically and, randomly, mostly unorganized in the 20s-30s. It represents an important way of attracting tourism and is represented by a varied and wide range of: folk music, weaving, pottery, painting on glass and wood, sculpture, traditional costumes, decorative fabrics, and also traditional food.

Romania accounts for a wide range of cultural and historical values like: folklore, ethnography, traditions, historical artefacts, folk art. All this adds more value to the Romanian rural tourism (Glavan, 2003).

Figure 2. *Traditional artefacts in agro-tourism sector in Romania*

In 1972 the Ministry of Tourism has selected 118 rural settlements representative of Romania to be promoted in tourism, thus putting the foundations of agro tourism. A total of 14 rural settlements were declared "tourism villages" in 10 counties of Romania: Poiana Sarata (Bacau), Recas (Timis), Tismania (Gorj) Vaideeni (Valcea), Bogdan Voda (Maramures), Fundata and Sirnea (Brasov) Sibiel (Sibiu), Vatra Moldovitei (Suceava), by the Minister of Tourism legal act no. 744/16 in July 1973.

In Romania there are numerous agro touristic products submitted to tourists that can lead to obtainable benefits and facilities: the opportunity for tourists to participate, attend a variety of traditional activities in the household, the advantage of preparing food by tourists from traditional, Innovation, Entrepreneurship and Digital Ecosystems

organic, fresh products obtained in the nearby villages and specific households, participation in shows, fairs and traditional village dances (Fîntîneru, 2005).

MATERIALS, METHODOLOGY AND RESEARCH

The information underlying this article comes from different sources in agro tourism field. The main source is the National Institute of Statistics, NIS, from which we get statistical data from the period 2005-2015 relating to structures of tourist reception that include tourist accommodation in different types of structures, namely: the number of tourist attractions in Romania like inns, tourist inns capacity accommodation, number of tourist lodges, chalets tourist accommodation capacity, the number of agro tourism pensions, the capacity of agro tourism pensions accommodations, the total number of units of accommodation options in Romania and their accommodation capacity. Other sources underlying this research are: Ministry of Agriculture and Rural Development MARD, where we processed the data on agro tourism in Romania, on the agricultural economy and on rural tourism; The National Association for Rural, Ecological and cultural A.N.T.R.E.C, founded in 1994 with a role in rural tourism; The literature in the field of tourism, about which we can say that Romania is not very thorough, having only general studies.

RESULTS

Romanian tourism focuses on nature, landscape and its rich history, indicating a significant contribution to the economic development of the country. Tourism is the second important economic branch of Romania after commerce, being dynamic, with a fairly fast development and great potential for expansion. According to studies, in 2006 domestic and international tourism has secured 4.8% of GDP, about half a million jobs, which means 5.8% of total employment in Romania. Romania has a yearly increasing potential in this sector of about 8% from 2007 until 2016. If in 2002 the tourists number accounted about 4.8 million, in 2005, the investments in the field got over 400 million Euros. Famous during the past times, the Black Sea has register in 2010 only 1.8 million tourists, 15% fewer than in 2009. In 2009 Romania had 1.27 million foreign tourists and in 2010 had an increase of up to 1.34 million. In Romania and in other countries there are many travel agencies that contribute to the influx of foreign tourists. They can make bookings at pensions, hotels, hostels, tourist lodges and motels directly on their websites. Romanian tourism brings currently less than 1% of GDP, i.e. \$ 1.8 billion annually, from 1.9 million of foreign tourists.

Year	Inns		Chalets		Agro Pensions touristic		Units with accommodation structures (hotels, hostels, motels, inns, cottages, villas, houses)	
	Nr.	Housing capacity	Nr.	Housing capacity	Nr.	Housing capacity	Nr.	Housing capacity

Table 1. The evolution of agro tourism sector during the period 2005-2015 by type of tourist accommodation structures and their housing ability in Romania

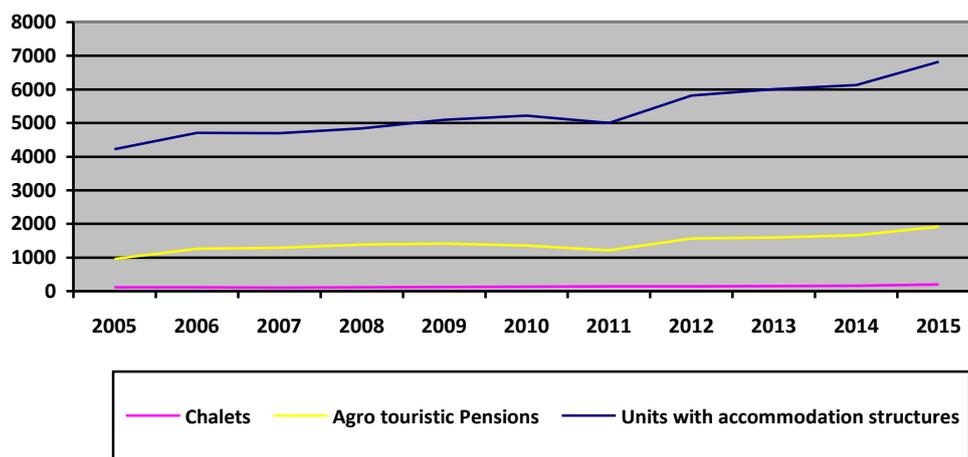

Figure 3. The evolution of agro tourism sector during the period 2005-2015 by type of tourist accommodation structures and their housing ability in Romania

As shown in the table 1 and in figure 1, the number of tourist inns in Romania in 2005-2013 significantly decreased by 72.72% in 2013 to 2014 was an increase of 66.67%, following that in 2014 to 2015 to fall by 40%. Analysing the tourist accommodation capacity existing within tourist inns from 2005 until 2011 we can say that it was recorded a decrease of 73.63% during 2011-2012 following that a slight increase of 5.2% occurred. During 2012-2013 the number of accommodation decreased by 24.69% and 2013-2014 increased significantly; by 134.43%, so that in 2014-2015 to register a decrease of 55.94%.

The number of tourist chalets in Romania registered an increase of 2.6% in 2005-2006, in 2006-2007 the number dropped by 6.89% and in 2007-2008 the number increased by 7.41%. During 2008-2011 the

number of tourist lodges experienced a significant increase of approximately 26.73%, following that in the next period 2011 to 2012 having a slight decrease, by 0.68%. From 2012 until 2015 was a significant increase, by 34.25%.

The housing at tourist lodges during 2005-2008 has decreased by 12.64%, so that in 2008-2009 to grow by 13.06%. Their capacity in 2009-2010 decreased by 3.73% and in 2010-2011 had an increase of 4.61%. During 2011-2014 a fluctuation in the number of beds existing in tourist chalets was recorded, namely: in 2011-2012 the number decreased by 13.12% in 2012-2013 there was a slight increase, by 0.64% and in 2013-2014 there was a drop in the number of seats of 1.06%. During 2014-2015 can be seen an increase of 14.59%.

Figures in table 1 show that the number of agro touristic pensions in Romania in 2005-2015 recorded a significant evolution: during 2005-2009 an increase of 47.7% was recorded, with 2009-2011 showing a decrease in agro touristic pensions of 14.3% and in 2011 to 2015 another significant increases of 58.52%. Analysing the accommodation capacity of agro touristic pensions in Romania during 2005-2015, a considerable increase is outlined, in the number of housing places of agro touristic pensions by 215.56%.

The total number of all units in Romania with accommodation options including hotels, hostels, motels, inns, villas, chalets, bungalows, holiday villages, camp sites, tourist stops, tourist cabins, student camps, youth hostels etc. grew in 2005-2006 by 11.46%, so that in 2006-2007 to decline by 0.34%. During 2007 to 2010 had an increase of 11.25% and in 2010 to 2011 had a decrease by 4.19%. From 2011 until 2015 the number of units of accommodation options in Romania was continuously growing, up to 36.34%.

Year	Inns	Chalets	Agro touristic Pensions	Units with accommodation structures (hotels, hostels, motels, inns, cottages, villas, houses, etc.)
2005	4.084	64.480	170.164	5.805.096
2006	5.502	71.167	217.020	6.216.028
2007	5.456	92.117	288.508	6.971.925
2008	1.877	107.110	357.617	7.125.307
2009	914	86.961	325.686	6.141.135
2010	638	73.992	289.923	6.072.757
2011	611	80.479	360.696	7.031.606
2012	823	86.322	447.113	7.686.489
2013	643	94.888	501.746	7.943.153
2014	1.336	94.049	549.302	8.465.909

Table 2. *The evolution of the number of tourists during 2005-2014, in tourist housing structures with tourist housing functions, in Romania*

The accommodation capacity of all units with specific structure of Romania in 2005-2006 saw a slight increase of 1.4%, in 2006 to 2007 a decline by 1.2%. From 2007 until 2010 the number of accommodation units with housing structure increased by 9.87%, so that in 2010-2011 to drop by 10.65%. Between 2011 and 2015 the number of accommodations had a continuous growth, up to 17.89%.

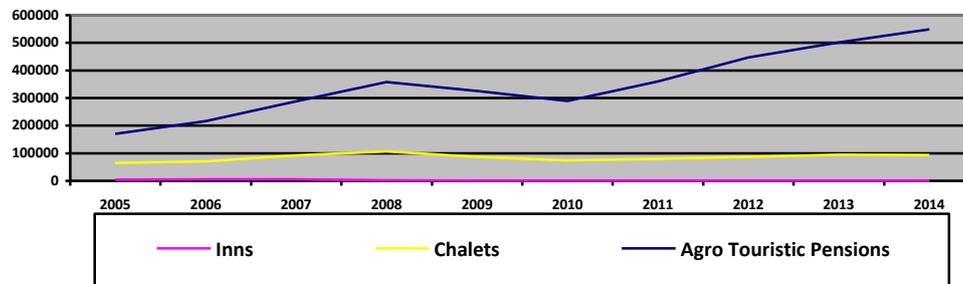

Figure 4. *The evolution of the number of tourists during 2005-2014, in tourist housing structures with tourist housing functions, in Romania*

The second table and the second figure of this research outline the number of tourists that spent their holidays in Romania, during 2005-2014, by touristic housing; figures delineate a significant evolution. The number of tourists recorded in accommodation units of tourist inn type in 2005-2006 increased by 34.72%, so that during 2006-2011 to drop substantially by 88.89%. From 2011 until 2012 there was a slight increase of 34.7% and between 2012 and 2013 the number of tourists dropped by 21.87%, so that in 2013-2014 to register a significant increase of 107.78%.

The number of tourist accommodation in chalets, between 2005 and 2008, recorded a considerable increase of 66.12%, and in the next period from 2008 to 2010 recorded a decrease of 30.92%. Between 2010 and 2013, the number of tourists recorded in tourist chalets increased by 17.91%, and between 2013 and 2014 fell by 0.88%.

Regarding the agro tourism housing structure, the number of registered tourists during 2005-2008 has seen a significant increase of 110.16% and from 2008 until 2010 there was a decrease in the number of tourists of 18.93%. During 2010-2014 the number of tourists in agro touristic accommodation units increased significantly by 89.47% compared to previous years. Analysing the number of tourists registered in all tourist accommodation units with touristic housing structure of Romania, we noted that during 2005-2008 it increased by 22.75% and in 2008-2010 dropped by 14.77%. Between the years 2010 and 2015 was recorded an increase of 39.41%.

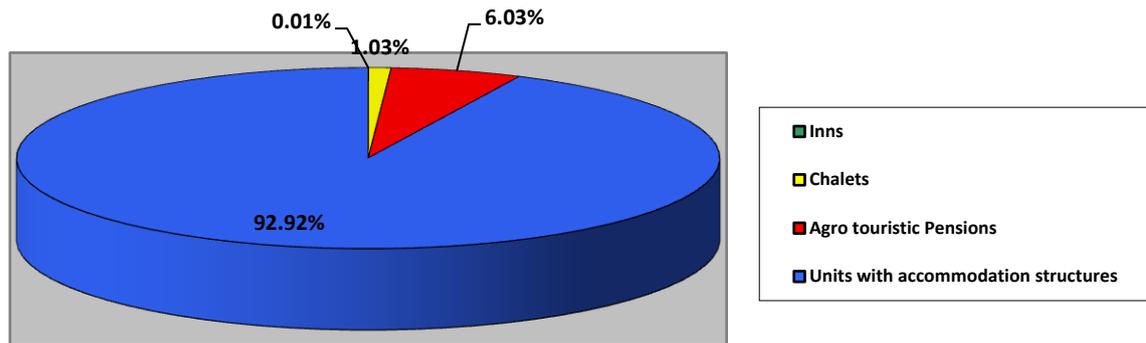

Figure 5. *The number of tourists in tourist housing structures with tourist housing functions, in Romania, 2014*

CONCLUSIONS

The conclusions are made based on the analysis of agro tourism development in Romania during 2005-2015, namely the number of agro touristic pensions, where we have seen a significant increase in units and accommodation capacity in tourist housing structures that serve the function of agro touristic interactive accommodation.

Analysing the number of tourists recorded during 2005-2014 in agro tourism we conclude that there has been a considerable increase among this type of tourism structures, which is an advantage for Romania's rural economy.

It has also been found a significantly increase of tourism in Romania after the analysis regarding the evolution of the number of units of accommodation including hotels, hostels, motels, inns, villas, chalets, bungalows, holiday villages, camping, travel plazas, houses tourist camps, students camps, youth hostels etc. and their accommodation capacity. Analysing the number of tourists of these units during 2005-2014 we notice a high increase that helps Romania's tourism economy greatly.

Based on this analysis of agro tourism we can say that tourists have a number of reasons for choosing agro touristic pensions, including the stay price, peace and quiet, naturalness of country life, the warmth with which they are met, the authenticity, knowledge of nature, traditional and ecological food, the advantage of self-cooked meals and participation in a wide range of traditional activities.

ATTAINING INNOVATION OUTCOMES THROUGH MANAGEMENT CONTROL

Saunila, Minna

School of Business and Management, Lappeenranta University of Technology, Lahti, Finland

ABSTRACT

This research investigates the mechanisms of innovation control in attaining outcomes at different organisational levels (divided into people-related outcomes, organisational outcomes, and financial outcomes). The current literature contains scant studies about integrating innovation control for outcomes at different levels. The empirical evidence is based on insights from a media company located in southern Finland. The data includes 15 semi-structured interviews with results showing that emphasis on innovation control should occur in the early phases of the innovation process and concentrate on finding best practices that support it. These early stages generate the most people-related outcomes, building the basis for organisational and financial outcomes.

Keywords: *innovation, innovation control, management control, people-related outcomes, organisational outcomes, financial outcomes, exploration, exploitation.*

INTRODUCTION

Firms require innovation control in order to turn their innovation potential into value creation (through products and/or services). They need to measure and manage innovation projects and processes in an efficient and goal-oriented manner (Adams et al., 2006). Because organisations involve work, control mechanisms heavily influence individuals' environments. To stimulate creativity, the use of innovation control is often characterised by a strong ambidexterity between the strict application of measurement procedures and a high degree of freedom. Thus, organisational aspects of innovation control seem to be a promising area of research. Greater emphasis should be placed on creating innovation control processes related to the individual and the collective, with an additional focus on holistic organisational needs. The innovation literature broadly accepts three essential levels of analysis—individual, group, and organisational. However, relatively little is known about organisations' managerial means to actively develop these three levels of innovation control in practice.

Understanding how innovation delivers outcomes is paramount to managing firm innovation. The relationship between innovation control and outcomes remains challenging. Studies on innovation

control and outcomes have mainly been theoretical or survey-based, lacking an in-depth understanding of how the different methods operate in real-life contexts. This gap in the literature has resulted in a new generation of research that studies the effect of innovation on firm performance by focusing on the complexities of the innovation process as well as the channels through which innovation input is transformed into better performance (Hashi and Stojic, 2013). Management control, especially related to innovation, can act as a tool to assist the transformation of innovation into desired outcomes. The current literature contains scant studies about integrating innovation control for outcomes at different levels. This research aims to address this research gap by investigating the mechanisms of innovation control in attaining outcomes at different levels (divided into people-related outcomes, organisational outcomes, and financial outcomes).

The paper begins with a literature review presenting prior research. The following paragraphs describe a case study built upon the theories of innovation and management control outlined in the literature review. Next, the results are presented in terms of how innovation control can assist in attaining outcomes at different levels. The final section presents conclusions for research and practice as well as limitations and suggestions for future studies.

LITERATURE REVIEW

Innovation and outcomes

A number of studies have found a positive relationship between outcomes and innovation, defined based on the degree of innovation or the scope of innovation. Historically, research on innovation types has followed a technological imperative (Damanpour et al., 2009). However, to improve performance and increase a firm's value, it is also imperative to encourage organisational innovations, defined as the introduction of new organisational methods for business management in the workplace and/or in the relationship between firms and external agents (Lloréns Montes et al., 2005; Bowen et al. 2010; Camisón and Villar-López, 2014). Laforet (2011; 2013) has found that organisational innovations result in increased productivity, profit margins, market share, market leadership, company image, and reputation; meanwhile, it also improves the working environment, employee satisfaction, and ability to operate outside the core competency. Armbruster et al. (2008) have shown that organisational innovations act as prerequisites and facilitators of efficient use of technical products and process innovations, therefore serving as sources of competitive advantage. Organisational innovations themselves impact business performance in terms of productivity, lead times, quality, and flexibility (Armbruster et al., 2008). According to Chapman (2006), innovations strongly affect financial success. The study found a strong link between collaboration and financial performance – organisations using

external sources achieve higher revenue growth than others. Klomp and Van Leeuwen (2001) discovered that innovations and innovativeness impact sales performance and productivity (measured sales/employees). On the other hand, Varadarajan (2009) points out that not only radical innovations but also incremental innovations are critical for organisations' survival, growth, and profitability. Simpson et al. (2006) have studied innovation orientation, suggesting that positive consequences of an innovation orientation relate to the following: the type, speed, number, and quality of innovations; market advantages (referring to competition and customer-related aspects); employee advantages (referring to recruitment, job satisfaction, performance, and retention); and operational excellence. However, negative consequences may also exist, including the following: producing unprofitable innovations; operating beyond a firm's core competency; taking unnecessary risks; allowing followers to copy an idea; and promoting negative employee attitudes that lead to job stress, dissatisfaction, increased turnover, and costs.

Innovation and control

Management control can be understood as systems, rules, practices, values, and other activities that company management puts into place in order to direct employee behaviour (Malmi and Brown, 2008). When these controls focus on developing innovation activities, they are called innovation control. Many prior studies have found a connection between innovation and control activities (cf., Cardinal, 2001; Chiesa et al., 2009; Chenhall et al., 2011; Bisbe and Malagueño, 2015). Chenhall et al. (2011) used a typology of controls comprised of social networking, organic innovative culture, and formal controls. They found that organic innovative culture and formal controls created direct paths to innovation, while social networking formed an indirect path to innovation through organic innovative culture. Labitzke et al. (2014) distinguished between formal and informal control mechanisms and found a positive effect of informal control mechanisms on innovation activity. However, the researchers found no significant relationship between formal control and innovation activity. Poskela and Martinsuo (2009) showed that input control is necessary for strategic renewal at the front end of innovation.

Another definition makes a distinction between diagnostic and interactive control systems. Research has found interactive control systems to be positively associated with creativity in both conservative and entrepreneurial firms (Bisbe and Malagueño, 2015). Bedford (2015) found that the effectiveness of flexible and interactive control structures depends on the particular mode of innovation pursued by the firm: they enhance performance in firms that engage in exploratory innovation, but not in exploitative innovations. Lopez-Valeiras et al. (2015) found a positive connection between interactive control systems and organisational innovations. However, they did not find interactive systems to play a moderating role enhancing the impact of organisational innovations on financial performance.

Prior research has also suggested that different types of controls are needed in different phases of the innovation process (cf., Chiesa et al., 2009; Revellino and Mouritsen, 2009). According to Chiesa et al. (2009), social controls are more diffused in the early stages, while diagnostic controls become easier to introduce and adopt as the concept crystallises, and the project moves towards commercialisation. Input, behaviour, and output controls are important for radical innovation, and the input and output controls are essential for incremental innovation (Cardinal, 2001). The characteristics of control systems may also differ between service innovation and product innovation (Aas, 2011).

RESEARCH METHODOLOGY

Empirical research setting

A medium-sized media company located in southern Finland constitutes the empirical setting. This company has several business units performing different roles in the organisation with shared and independent functions. The services and products provided include several printed newspapers; Internet services and radio; traditional supportive units, such as printing and distribution; and functions, such as IT and administration. Altogether, the company has around 270 employees. Similar to its competitors in the media business, the case company struggles with common challenges in the industry's changing business environment. The company understands that both exploitative and explorative innovations are needed for renewal and future business success; cutting costs is no longer enough to ensure survival. In this company, it is difficult to distinguish innovation activities from other types of activities, as the company does not clearly distinguish between product and service development and innovation. At the operative level, the focus and support related to innovation is strongly focused on idea generation.

Data

The data consists of semi-structured face-to-face interviews with a total of 15 persons who have different roles and responsibilities. The interviewees were selected on the basis of having group or department responsibilities related to innovation and development. Their managers were also interviewed. Table 1 presents detailed information about the interviewees. Interview questions were decided on in advance; however, the themes were discussed quite informally during the interviews and were facilitated through supporting questions and researcher comments. Three researchers carried out the interviews, taking notes and making observations. Interviews were chosen, because by interviews it is possible to gain a deeper view of the topic. Validity was ensured by grounding the interview questions on a strong theoretical basis. The interviewees were selected carefully based on particular criteria. In addition, other researchers besides the author have been involved in data analysis. All of the

interviews were recorded and transcribed to enable in-depth analysis. The interviews focused on the interviewees' perceptions concerning innovation and idea generation processes as well as the organisation's measurement of these processes. Without any prompting regarding the types of outcomes attributable to innovation control, respondents used their experiences to identify both positive and negative outcomes that could arise.

	Role in the company	No. of interviews and interviewees
Case company	Unit 1 (Paper)	3 interviews, employee + 2 managers
	Unit 2 (Paper)	2 interviews, employee + manager
	Unit 3 (Paper)	2 interviews, employee + manager
	Unit 4 (Radio)	2 interviews, employee + manager
	Unit 5 (Web service)	2 interviews, employee + manager
	Unit 6 (Sales)	4 interviews, 2 employees + 2 managers

Table 4. *Background information on the interviewees*

FINDINGS AND DISCUSSION

This research has investigated innovation control, meaning the systems, rules, practices, values, and other activities that company management puts into place in order to direct innovation activity. The study also considered its outcomes using the empirical setting of a media business company. The outcomes are analysed at three levels: people-related outcomes, organisational outcomes, and financial outcomes. Table 2 provides a summary of the findings with examples of innovation control actions in the case company and a summary of the outcomes (both negative and positive) that innovation control could generate. The following chapters discusses and elaborates upon these findings.

Based on the interviews, it became clear that no control actions should be introduced unless they have the potential to lower costs and improve future profitability. The potential for new business was also recognised as an output of systematic innovation control. On the other hand, interviewees viewed the potential for extra costs as a negative consequence of innovation control. Almost all interviewees highlighted the fact that innovation control should be systematic: the same actions should be introduced to all units and employees in order to gain positive benefits. Participants viewed innovation control as an important means to increasing sales. According to the individuals interviewed, promoting sales of current services and generating sales from new services were important determinants in attaining goals.

Examples of innovation control actions in the case company		
Creating interaction platforms for acquiring and sharing cross-functional information		
Involving all units in idea refinement		
Forming cross-functional teams linked to organisational strategy		
Prescribing available resources between units and functions		
Gathering user/customer feedback for all levels		
Communicating innovation efforts internally before external actions		
Defining measures that cover the innovation process		
Enabling learning throughout the company through responsible individuals		
Outcomes		
People-related outcomes	Organisational outcomes	Financial outcomes
Role clarity	Improved work atmosphere	Cost savings
Activity	Improved functioning of internal processes	Expenses
Motivation	Cooperation (internal or external)	Profits
Know-how development	New service, product, or project	Sales
	Customer satisfaction	Profitability
		Effectiveness

Table 5. *Summary of the findings*

Financial outcomes are a necessity, but result from other outcomes, and thus can be affected indirectly by innovation control. This finding aligns with previous studies that indicate that outcomes may not directly relate to financial measures (cf., Armbruster et al., 2008). Armbruster et al. (2008) showed that organisational innovations act as prerequisites and facilitators of efficient use of technical products and process innovations, making them sources of competitive advantage.

The benefits of innovation control cannot be tracked simply by measuring financial outcomes. A wider set of innovation outcome measures should be adopted, mainly reflecting organisational outcomes. The majority of innovation control activities in the case company related to attaining organisational outcomes. Outcomes also represent better processes of doing something. Thus, interviewees saw an improved work atmosphere and better functioning of internal processes as outcomes. Increased cooperation, either internally or externally, was one of the desired outcomes of innovation control. Because the customer eventually determines the success of the innovation efforts, customer satisfaction was seen as an important outcome of managing the innovation process efficiently. In the interviews, goal orientation was highlighted, because successful outcomes, such as new services, products, or projects, do not become ready for commercialisation overnight. They need to undergo multiple phases and threshold points before being delivered to customers.

Interviewees viewed people-related outcomes as the most challenging from the perspective of innovation control; they found it challenging to find the right combination of strict management procedures and freedom to stimulate creativity. People-related outcomes were seen as strongly dependent on employees' personalities and attitudes towards innovation. At best, innovation control can increase activity and motivation to create innovation through clearer practices. If innovation is

emphasised by adopting innovation control, it can motivate employees not only to ideate but also to develop their own know-how. The interviews demonstrated that innovation control can affect employees' role clarity by encouraging them to participate and by assisting them in recognising that innovation is everyone's task in the company.

Due to the nature of the media business, both explorative and exploitative innovation should be adopted in order to adjust to the rapidly-changing business environment. This situation creates challenges in innovation control mechanisms, because different issues are emphasised when focusing on exploitation or exploration. This finding is in line with prior research suggesting that various types of controls are needed during different phases of the innovation process (cf., Chiesa et al., 2009; Revellino and Mouritsen, 2009). When supporting exploration, freedom should be allowed in order to stimulate creativity. By comparison, in exploitative innovations, more formal mechanisms must function, as also demonstrated in Bedford (2015). He found that the effectiveness of flexible and interactive control structures depends on the particular mode of innovation pursued by the firm. In essence, such structures enhance performance in firms that engage in exploratory innovation, but not in exploitative innovation. In this research, it also becomes apparent that innovation control should be emphasised during the early phases of the innovation process while concentrating on finding the best practices to support it. The early stages generate most people-related outcomes, building the basis for organisational and financial outcomes.

CONCLUSIONS

This research has investigated the mechanisms of innovation control in attaining outcomes at different organisational levels. By examining multiple levels of outcomes – people-related outcomes, organisational outcomes, and financial outcomes – this study reveals how innovation control assists in generating outcomes.

Research implications

People-related outcomes are the most difficult to predict, because of the difficulty in finding the right combination of strict management procedures and freedom in order to stimulate creativity. Based on case study, innovation control should be emphasised in the early phases of the innovation process while concentrating on finding the best practices to support it. The early stages generate the most people-related outcomes, building the basis for organisational and financial outcomes. Financial outcomes are necessary, but participants viewed them as resulting from other outcomes, thus only indirectly affected by innovation control.

From a practical point of view, the findings suggest that the balance between exploration and exploitation in the innovation process is heavily assisted by innovation control. The avenues from fostering ideas to finished products/services must be clear; they should represent efficient and seamless paths that fit the organisation's current form and operational activities. The goals and desired outcomes can thus be more easily attained if control mechanisms are clear and aligned with the objectives.

Limitations and further research

Due to the nature of the data, there are some limitations that should be acknowledged. The research was conducted at a company operating in the media business. This specific context could limit the applicability of the results; research with a larger sample is needed to validate the results. The results are based on a single company and more research is needed to ensure the generalisation of the results. The study also faces limitations because the data comes from a single country. Country-specific characteristics should be taken into account when applying the results to practice or further studies. Despite these limitations, this research contains some interesting findings that could provide a solid starting point for further studies. In-depth case studies could be conducted to provide more insights into how innovation control is used as part of management practices at different levels. Further qualitative studies are also needed to understand the mechanisms between innovation controls at different levels.

THE GROWTH OF FOREIGN TOURISTS TO ISRAEL AND THEIR IMPACT ON ISRAEL'S GDP

Schein, Andrew

Business School, Netanya Academic College, Netanya, Israel

ABSTRACT

This paper reviews the number of foreign tourists coming to the land of Israel starting from the 19th century until 2014, and presents an analysis of the impact of tourists on Israel's economic from 1950-2014. In this review, we show that with regard to the period from 1948-2014, the years of the State of Israel under study, the greatest increases in the annual number of tourists was from 1950 through 1973. Afterwards the growth rate of tourists coming to Israel was much lower even though the fall of the Soviet Union in 1991 led to a large supply of potential tourists to Israel. In 2013, the tourist industry in Israel measured by expenditures of tourists per capita was an average tourist sector in comparison to tourist sectors in other countries in the world. However, measured by the number of tourists per capita, then Israel's tourist sector was little below the average of tourist sectors in other countries in the world. With regard to the effect of tourist arrivals on Israel's GDP, the direct effect was around 2% in 2013, and a regression analysis of the number of tourist arrivals to Israel and Israel's GDP indicates that the indirect effect of tourists on Israel's GDP was more significant for the years 1990-2014 than for the years 1950-1990. This study show that if Israel is unable to greatly increase the number of tourist arrivals, then the tourist industry is unlikely to have a large impact on Israel's GDP in the future.

Keywords: *Tourism, history of tourism, the Holy Land, Palestine, Economic growth, and number of tourists.*

INTRODUCTION

The impact of tourism on a country's economic growth is an important question for policy makers and has recently been examined by various scholars. Oh (2005) studied this question with regard to South Korea, and found that there was no long term relationship between tourism in South Korea and South Korea's GDP. However, Oh noted that other studies, as for example Balaguer and Cantavella-Jorda (2002) with regard to Spain, have found that tourism does positively impact on GDP. To explain these different results, Oh suggested that possibly the existence of such a relationship depends on the size of the tourism industry, that only in countries where tourism is large part of GDP, as in Spain, does it

generate economic growth. Massidda and Mattana (2013) studied this impact of tourism on Italy's GDP and they found a dual relationship that the growth of Italy's GDP causes tourism to Italy to increase, and the increase in tourist arrivals to Italy causes Italy's GDP to increase. This positive relationship could accord with Oh's suggestion that the economic impact of tourism is dependent of the size of the tourism industry since Italy's tourist industry is a large sector in Italy's economy. In a more recent study, Du, Lew and Ng (2016) note that other studies have found a positive relationship between tourism and economic growth, but in their study of 109 countries they did not find that investments in tourism causes economic growth. Accordingly, this question of the impact of tourism on economic growth remains unresolved and to the best of my knowledge, this question has not been investigated from a country specific perspective with regard to Israel's tourist industry.

In this paper, I will examine the relationship between tourist arrivals to Israel and Israel's GDP. I start with a brief historical review of the number of tourists who came to the land in the 19th century and the first half of the 20th century. Afterwards I will provide a detailed analysis of the number of foreign tourists who have come to Israel since the founding of the state in 1948. I will compare the growth of tourist arrivals to Israel from a worldwide perspective and present a regression analysis of the relationship between the number of arrivals of foreign tourists in Israel to Israel's GDP.

THE TOURIST INDUSTRY IN THE 19TH AND THE FIRST HALF OF THE 20TH CENTURY

Due to the numerous religious sites in the country, throughout history the land of Israel has been a desired location for tourists and pilgrims of various religious faiths. However, for many years until the 19th century, there was only a trickle of tourists. Yehoshua Ben-Arieh (2007) noted that in the beginning of the 19th century there was a rediscovery of the land of Israel, and the pace of foreign travelers arriving in the land began to pick up. In the beginning of the century, various individual travelers such as Edward Clarke (1801), Ulrich Jasper Seetzen (1806/1807), John Lewis Burchhardt (1812) came to explore the biblical sites of the land. In the 1830s, when the land of Israel was temporarily ruled by Egypt (1832-1840), groups of pilgrims began to come. According to one estimate, in the 1830s there were between 5,000 to 10,000 annual visitors (Shamir 1984), and Edward Robinson and his assistant Eli Smith who visited the country in 1838 noted that due to all the visitors around Easter (1856, p. 428), "the annual Easter fair of Jerusalem is relatively not much less important, than those of Leipzig and Frankfort."

After the Crimean War (1853-1856), large number of pilgrims from Russia began to travel to the land of Israel. Bertha Spafford Vester who lived in the country from 1881-1968, provides a vivid description of these visitors (1988, pp. 86,87):

Enormous crowds of Russian pilgrims trekked through Palestine in those days and up until WWI. They began to gather in Jerusalem at Christmastime and by Easter there would be between fifteen and twenty thousand. They came on foot in large caravans... The pilgrims had little money individually, but because of their vast numbers they contributed the major part of the support of the Greek Orthodox Covenant and the Holy Sepulcher in Jerusalem and the hospices. They created a demand for all kinds of trinkets, and many kinds of industries in the manufacture of souvenirs gave occupation to the inhabitants of Jerusalem and Bethlehem. Candle-dippers worked the year round to have a supply equal to the demands of the thousands of Russian, Greek, Armenian, Coptic and Macedonian pilgrims who attended the annual celebrations of the Holy Fire.... The Russian pilgrimages that were part of life in Palestine and supported so many families ceased with WWI and the Russian Revolution.

In 1869, the same year when the Suez Canal was completed, Thomas Cook began offering his first grand tour of the Middle East, which included the land of Israel, and it is estimated that from 1869 through 1882, 4,200 tourists visited the land of Israel on tours with Cook (Hunter, 2004). In 1892, the first rail line in the country was inaugurated running from Jaffa to Jerusalem, which assisted tourists who came to the main port in Jaffa and wanted to travel to Jerusalem (Eliav, 1997, p. 266). Ruppin (1918, pp. 79,80) provides a detailed report of the economy in the lands that would become Israel, Jordan, Lebanon, and Syria prior to WWI, and he estimated that the annual value of tourists in all four areas combined was around 10,000,000 francs. Furthermore, he estimated that prior to WWI, annually around 6,000 to 7,000 European and American tourists visited Syria and the land of Israel, and based on the number of passengers on Jaffa-Jerusalem train line, he believed that around 20,000 Christian pilgrims came annually to the land of Israel.

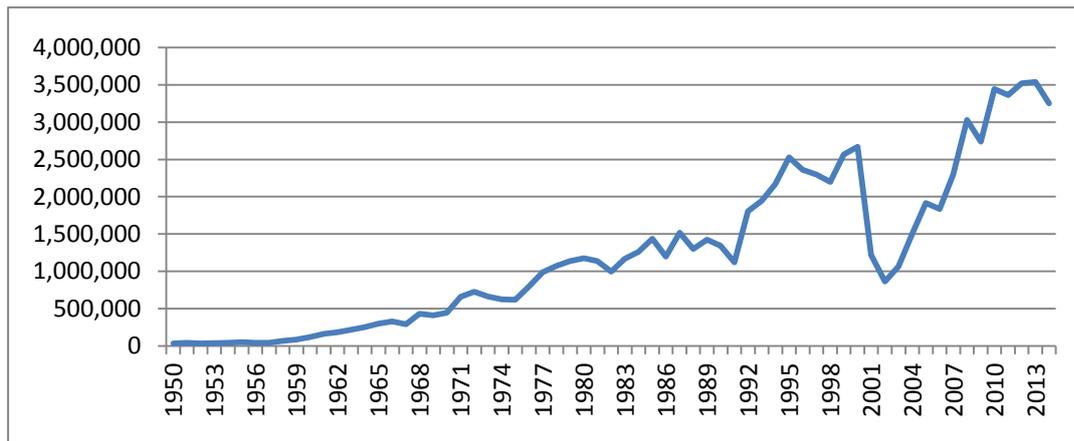

In WWI, the British captured the land of Israel, and from 1917/1918 -1948 they ruled the country. They significantly improved the infrastructure of the country by fixing up the train lines, building new roads (from 450 km of all weather roads in 1922 to 2,640 km in 1944), a new port in Haifa (1933) and the first civilian airport in the country Lod (1937/38, renamed Ben Gurion airport in 1973). In the 1920s, the tourist industry, which had declined significantly due to the cessation of Russian pilgrims, rebounded. In 1926, there were 52,000 tourists, and it was estimated that they contributed more than £ 1,000,000 to the economy (Goldwater, 1928, pp.1,2, and Report by His Britannic Majesty's Government for the year 1926, pp. 1,2). The tourist industry stopped growing with the Great Depression and the Arab revolt (1936-1939), but it also did not decline that much as it is estimated that from February 1937 to January 1938, 50,100 foreign tourists came to the land of Israel and their expenditures were around £ 500,000 (Gaathon, 1978, p. 196).

TOURISM IN THE STATE OF ISRAEL, 1948-2014

In 1948, the State of Israel was founded, and the government agency, Israel's Central Bureau of Statistics (CBS, 2016) provides annual data for the number of tourists from 1948 onwards (data for all years in Table 1, and below Table 1 is a graph of the data). The date includes all tourists who came to Israel, even if they stayed for just one day and/ or came on cruise ships.

Table 1.		Number of tourists coming to Israel			
Year	Tourists	Percentage change	Year	Tourists	Percentage change
1948	4,533		1982	997,510	-12.27
1949	22,208	389.92	1983	1,166,820	16.97
1950	33,122	49.14	1984	1,259,228	7.92
1951	39,398	18.95	1985	1,436,374	14.07
1952	34,311	-12.91	1986	1,195,909	-16.74
1953	37,085	8.08	1987	1,517,575	26.90
1954	39,390	6.22	1988	1,298,944	-14.41
1955	49,899	26.68	1989	1,424,524	9.67
1956	42,615	-14.60	1990	1,341,719	-5.81
1957	42,342	-0.64	1991	1,118,025	-16.67
1958	68,100	60.83	1992	1,805,201	61.46
1959	85,104	24.97	1993	1,945,999	7.80
1960	117,662	38.26	1994	2,168,488	11.43
1961	159,624	35.66	1995	2,530,619	16.70
1962	183,701	15.08	1996	2,360,791	-6.71
1963	218,460	18.92	1997	2,295,434	-2.77
1964	251,624	15.18	1998	2,200,002	-4.16
1965	296,493	17.83	1999	2,565,953	16.63
1966	328,077	10.65	2000	2,671,957	4.13
1967	291,168	-11.25	2001	1,218,800	-54.39
1968	431,966	48.36	2002	862,200	-29.26
1969	408,974	-5.32	2003	1,063,400	23.34
1970	441,294	7.90	2004	1,505,700	41.59
1971	656,756	48.83	2005	1,916,000	27.25
1972	727,532	10.78	2006	1,833,851	-4.29
1973	661,651	-9.06	2007	2,295,600	25.18
1974	624,727	-5.58	2008	3,028,000	31.90
1975	619,554	-0.83	2009	2,738,300	-9.57
1976	796,598	28.58	2010	3,443,900	25.77
1977	986,534	23.84	2011	3,362,000	-2.38
1978	1,070,813	8.54	2012	3,520,400	4.71
1979	1,138,622	6.33	2013	3,539,700	0.55
1980	1,175,819	3.27	2014	3,251,100	-8.15
1981	1,137,066	-3.30			

Graph of the number of incoming tourists to Israel 1950 – 2014

In 1948 there were 4,533 tourists and in 1950 the number increased to 33,122. By 1955, the number returned to the pre-WWII level, 50,000 and then in both 1956 and 1957, there was a fall in tourists which probably was due to the 1956 war (October and November) in the Sinai between Israel and Egypt. In 1958, the number of tourists increased 61%, the second largest increase for all the years from 1950-2014, and for the following eight years, 1959-1966, the number of tourists increased every year by more than ten percent. In the midst of this growth, in 1960, the number of tourists passed the one hundred thousand mark, 117,662, and in 1961, the country's national air carrier, ELAL, began to offer non-stop flight from New York to Tel Aviv (Lod airport).

In June 1967, there was the Six Day War between Israel, Egypt, Jordan and Syria, and the number of tourists for the year declined by 11%. The aftermath of the war was that new and old city of Jerusalem was re-united and the religious sites in the old city of Jerusalem came under Israeli rule. Possibly due to this reason and Israel's success in the war, tourism jumped in the five years after the war from 291,169 in 1967 to 727,532 tourists in 1972, an annual increase of 20%.

From the founding of the state of Israel until 1972, the Israeli economy had one of the best growth rates in the world, with its per capita GDP growing at an annual rate of 5.67% for the years from 1950-1972, the seventh highest growth rate in the world (Schein, 2007). This all came to an end with the Yom Kippur War in October 1973. After the war the Israeli economy entered a period of low growth, as from 1972 to 1989, per capita GDP only increased at an annual rate of 1.41%. In the period afterwards, 1990-2014, there was some improvement in the growth rate, as per capita GDP increased at an annual rate of 1.93%, but after the Yom Kippur War, the Israeli economy never grew like it had prior to the war. This same pattern by the economy was also true of tourist arrivals to Israel.

In the first few years after the Yom Kippur War, 1973, 1974, and 1975 the number of tourists declined in each year. This trend was reversed in 1976. From 1976 through 1980, the rate of tourists increased each year, and in 1977, the number of tourists passed the one million mark 1,070, 813. In the decade of

the 1980s, the number of tourists increased some years (1983, 1984, 1985, 1987, and 1989) but declined in the other years, and by the end of the decade in 1989, there were 1,424,524 tourists.

There were two years of declines in the rate of tourists in 1990 and 1991. Most likely, the decline in 1991 was due to the Gulf war in January and February 1991, when Iraq attacked Israel with missiles. 1992 was a very positive year for tourists in Israel, as the year had the highest increase in tourists, 61.5%, for the years 1950-2014. Tourist arrivals continued to grow in the ensuing three years and passed the two million mark in 1995 (2,530,619). In the following three years, 1996, 1997 and 1998 the number of tourists declined each year. In 1999 and 2000, there were two years of growth, and then very large falls in 2001 (-54%) and 2002 (a further decline of 29%). By 2002, the number of tourists had fallen to 862,200, the lowest level since 1976. These gyrations from 1996-2002 were due to the changing prospects for peace between Israel and the Palestinians. When the peace process was looking positive there were increases in tourism, and when the prognosis for peace was declining, then so too were the number of tourists (Schein, 2003). Thus, the large fall in tourists in 2001 and 2002 was during the *intifada* when there were a large number of terrorist attacks in Israel. Along with the drop in tourists, the *intifada* also caused Israel to enter a recession.

In the middle of 2002, the *intifada* slowly began to wind down, and the Israeli economy began to recover. Tourists also returned, and initially there was excellent growth as part a "catch-up" from the years of the *intifada*. In 2003, the number of tourists increased 23%, in 2004, another 42%, and in 2005 another 27%. In 2006, the rate of tourists declined 4%, which most likely was because there was a war between Israel and Hezbollah in the summer.

In 2007, there was a change in way that tourists were recorded by the CBS. Starting in 2007 due to change in visa regulations, the CBS started to publish data on tourists in three categories, tourists for more than a day, tourists who only stay for a day but not on a cruise ship and tourists who come for a day on a cruise ship. Based on the total of the three categories, all tourists, 2007 and 2008 were good years for the tourism sector as in 2007, the number of tourists increased 25% and in 2008, another 32%. In 2008, the number of tourists passed the 3 million mark, 3,028,000. In 2009, due to the worldwide recession because of the collapse of Lehman Brothers in September 2008, the number of tourists coming to Israel declined by 10%. This was just was a temporary blip, as 2010 was another strong year for tourism in Israel with a 26% increase in tourists, but then in 2011 there was a small decline of 2%. In 2012 and 2013 there were small increases, 5% and 1% respectively, and then in 2014 there was a decline of 8%, due to the war between Israel and Hamas in the summer of 2014.

Overall, the annual growth in tourists from 1949 to 2014 was 7.97%, and from 1955, when the number of tourists returned to the pre-WWII numbers, to 2014 the growth rate was 7.34%. With regard to the various decades: In the 1950s, the annual growth rate of tourist arrivals was 14%, in the 1960s, 17%, in

the 1970s, 11%, in the 1980s, 2.3%, in the 1990s, 6%, in the 2000s, 0.7% and the first half of the 2010s, 3.5%. We see that the best growth in tourism was from 1950-1979 (14% annual growth), while for the period from 1979-2014 (3% annual growth), the rate of growth fell significantly. If we divide the years to before and after the Yom Kippur War, then the distinction is very similar, as from 1950-1973, the annual growth of tourists to Israel was 14%, while from 1973-2014, the annual growth was 4%.

In addition to the change in growth rates, there was also a change in the composition of tourists partly due to the fall of the Soviet Union in 1991, which enabled numerous tourists to come to Israel from Russia and other countries that had been under Soviet control and who had been unable to travel to Israel before the break-up of the Soviet Union. In 1970, the largest source of tourists was from the United States, 39% of tourists, followed by France, 11%, the UK, 9%, and then Germany and Canada with 4% each. In 1990, the US was still the largest source of tourists but its percentage had fallen to 23%. The percentage of tourists from Canada also declined (3%), while the percentage of tourists from France (11%), the UK (11%) and Germany (9%) stayed even and even increased a little bit. By 2014, only 19% of tourists were from the US, 9% were from France, 5% were from the United Kingdom, 5% were from Germany, and 2% were from Canada. These reductions in percentages were because in 2014, tourists from Russia constituted 17.5% of the tourists, from the Ukraine another 4.2% and Poland 2.4%. These numbers indicate a return in some sense to the situation in the 19th century when Russian pilgrims were the majority of tourists in the land of Israel.

A COMPARISON OF ISRAEL'S TOURIST INDUSTRY FROM AN INTERNATIONAL PERSPECTIVE

The World Bank (www.worldbank.org) presents data on incoming tourists for most countries of the world from 1995 to 2013. Their data for Israel excludes day visitors, which means that their numbers differ from the numbers in table one, which includes these tourists. According to the World Bank's data, as of 2013 Israel still had not passed the three million level, and 2013 was the year with the most tourists (2,962,000).

We can compare the growth rate of tourists in Israel and the rest of the world with the World Bank data. According to the World Bank data the annual growth rate of tourists in Israel for the years 1995-2013 was 1.63%. (According to the CBS data, the growth rate of tourists coming to Israel was 1.9% for the period.) This rate was well below the world growth rate of 4.05% for the period. Of the 153 countries for whom the World Bank provides data for the years 1995 and 2013, 126 had greater increases in the number of tourists than in Israel, and only 26 had a lower growth rate than Israel.

The World Bank divides countries into several different categories based on their income levels. For the period 1995-2013, the rate of growth of tourists to low income countries was 7.58%, to lower

middle income countries, 8.42%, to upper middle income countries, 5.69% and to high income countries, 3.10%. According to the World Bank, Israel is classified as a high income country, and its growth rate of tourists, 1.63%, was lower than the average for its category.

If we narrow the years of comparison to the last five years of the data, 2008-2013, when the level of Israel's tourists had recovered from the *intifada* (2,416,800 tourists in 2000 vs. 2,559,600 in 2008, World Bank data), then Israel's growth in comparison to the world improves slightly to 2.86% annually. This still was less than the growth rate in the world, 3.19% for the period, but it was practically equal to the growth rate of tourists in high income countries, 2.88%.

We can also compare the number of tourists on a per capita basis, that is how many tourists does a country have in comparison to the country's population. This figure gives some measure of the relative importance of tourism to the country's economy. Based on the World Bank data (for number of tourists and population), in 1995, Israel's per capita level of tourists was 39.9%. This number was higher than the ratio for high income countries (33%), higher than for 118 countries and lower than only 56 countries. For the period from 1995-2013 there was a slight decline in Israel's tourists per capita as in 2013, the ratio decreased to 36.8%. Furthermore, in 2013 Israel's ratio of per capita tourists fell below the level for high income countries (51%), and there were more countries in the world (93) with a higher ratio than Israel than countries with a lower ratio (85) than Israel. This decline in per capita tourists might indicate that despite benefiting from a new group of tourists from the former Soviet Union, still relatively Israel's tourist industry developed less than many countries in the world for the period 1995-2013. However since Israel has a relatively high rate of population growth, then this decline of per capita tourists could just be indicative of the faster population growth.

A different way to measure the importance of the tourist sector to an economy is not by tourist arrivals but by expenditures by tourists. The World Bank provides data on international tourism receipts in current USD for the years 1995-2013, and if we divide the figure by a country's population, then we have per capita receipts from tourists per country. For Israel, this figure was \$630 in 1995 and it increased to \$801 in 2013. In 2013, this number was a little higher than the average for the high income countries (\$732), was higher than for 121 countries, but less than the figure for 56 countries. This indicates that in 2013 Israel's tourist industry in comparison to its economy was roughly similar to economies in its income bracket, and in the top third of countries in the world. Based on the data from 2013, this measure improves Israel's tourist industry's standing in comparison to the tourist industry in other countries in the world relative to the measure of per capita tourists, where Israel's tourist sector fared poorer in comparison to other countries.

REGRESSION ANALYSIS OF TOURIST ARRIVALS IN ISRAEL AND ISRAEL'S GDP

The tourist sector can impact an economy in two different ways. One, there is the direct measure through the spending of tourists, which counts as exports in the GDP accounting. The second method is the indirect effect of tourism on other sectors in the economy, such as construction and manufacturing. This indirect effect is harder to measure but potentially more important since if these indirect effects exist then the tourist sector can function as a driver to the economy as a whole in addition to impacting on industries that sell directly to tourists. We will review Israel's tourist receipts, and then offer some econometric evidence as to the indirect effect of tourism in Israel.

The World Bank calculates the receipts from tourists as a percentage of exports for the years 2005-2013 for most countries in the world. In 2005, the receipts from tourists to Israel were 6% of Israel's exports and according to Israel's CBS (2015), exports were 34.9% of GDP, which together implies that spending by tourists contributed to around 2.1% of Israel's GDP in 2005. In 2013, the receipts from tourists to Israel as a percentage of Israel's exports had risen slightly to 6.6%, and exports had fallen slightly to 34.5% of Israel's GDP, which together mean that spending by tourists' contribution to Israel's GDP rose slightly to 2.3%. This suggests that Israel's tourist sector has a small role in its economy. In reference to the world, in 2013 Israel's ratio of receipts from tourists as a percentage of exports was a little higher than the average of high income countries (6.2%), was higher than for 63 countries, but lower than for 89 countries. This indicates that the importance of Israel's tourists relative to its exports is roughly average in the world.

We now present econometric evidence of the importance or lack thereof of Israel's tourist sector on its GDP and here the goal is to get some indication of the indirect effect of Israel's tourist sector on its economy. I ran simple OLS regressions using SPSS for various time periods: 1950 – 2014, the complete data from the founding of the State of Israel to the latest available data, and then divided the data into three smaller periods based on different periods of growth in Israel's economy, 1950-1973, 1973-1990, and 1990-2014. The regression equation is

$$GDP_t = \alpha + \beta (AR_t) + \varepsilon_t$$

GDP is the annual percentage change in GDP (prices 2010) from CBS data (2015) and the independent variable, AR, is the annual percent change in total number of tourist arrivals to Israel. This data is also from the CBS and is in Table One. (I also ran a second set of regressions where the independent variable was tourists for more than one day, but the results were very similar to the regression with the total number of tourists, AR, so they are not presented here.) Table Two below presents the results from the different regressions:

Table 2	Econometric results				
	Dependent variable: Percentage change in GDP				
Years in regression	Independent variable (not including constant)	Coefficient on the independent variable	Standard error of the coefficient	t value of the coefficient	Adjusted R squared of the regression
1950-2014	All tourists	0.076	0.029	2.619	0.085
1950-1973	All tourists	0.075	0.066	1.137	0.013
1973-1990	All tourists	-0.023	0.028	-0.833	-0.018
1990-2014	All tourists	0.042	0.019	2.267	0.147

DISCUSSION OF REGRESSION RESULTS

In the all the regressions, the adjusted R- square is very low, which should be expected since there are many factors that influence the changes in GDP. However, the crucial issue is the significance of the coefficient, and here we see that significance was not consistent for the four different periods. For the overall data, the period from 1950-2014 the coefficient on the variable was significant and the correct sign. The coefficient itself is also small. Altogether, this implies that the number of tourists coming to Israel have a small but significant effect on Israel's economy. However, for the periods 1950-1973 and 1973-1990, the coefficient was very insignificant, and for the period from 1973-1990, it was even the incorrect sign. Only in the last period of 1990-2014, was the coefficient significant and also the correct sign.

These results imply that the tourist arrivals in Israel had their most significant impact on Israel's GDP in the most recent period of 1990-2014. This result is somewhat surprising since, as discussed above, the period of 1950-1973 had the greatest growth in tourists. Yet, in the period from 1950-1973, the growth of Israel's GDP was much greater than from 1990-2014, and then the lower rate of tourist arrivals had a greater impact on the lower growth rate of GDP. In any event, the changes in the significance of the number of tourist arrivals in the four regressions means that the regression results are not robust, and calls into question even the strong significance of the coefficient in the first and last regressions. Following Oh's suggestion (discussed above), it could be that the number of tourists only impact on a country's GDP when there is a certain threshold level of tourists, and maybe Israel only reached this level in the most recent period of its history. Or, maybe the regression results of the first and last regressions are just indicating a correlation between tourist arrivals in Israel and Israel's GDP with no causality. This is a question for further research to examine and to better identify the relationship between the number of tourists coming to Israel and their effect on Israel's GDP.

CONCLUSION

This paper has reviewed the growth in the number of tourists coming to the land of Israel from the 19th century to the present. The number of tourists have grown during the entire period, but the best rate of increase was the period from 1950-1973. Afterwards, from 1973-2014, the trend was positive, but the growth was uneven, and overall the growth rate of tourist arrivals declined. During this period of lower growth, from 1995-2013, the growth rate of tourists coming to Israel was also less than the growth rates for most countries in the world. In 2013, based on expenditures by tourists per capita Israel's tourist sector was roughly average to tourists sectors in other countries, but based on tourists per capita, the sector was on the weaker side in the world. Finally with regard to the impact of the number of tourists on Israel's GDP, the direct effect of tourist arrivals in Israel was around 2% of Israel's GDP in 2005-2013. The indirect effect as measured by the regression results are somewhat contradictory as overall from 1950-2014 there appears to be a positive relationship, but when the data is broken down into smaller periods, then only in the period from 1990-2014 is there a positive relationship between tourist arrivals and Israel's GDP.

The review here indicates that there is potential for Israel to increase its tourist sector by attracting more tourists if it can return to its growth rate of tourist arrivals from before 1972. If Israel could return this level of growth of tourist arrivals, then this would likely add a little bit to Israel's economic growth. Yet, as noted in our review of tourism in Israel, in many years there were decreases in tourists due to wars and the *intifada*, which means that it will be a difficult task for Israel to significantly increase the number of tourists as long as the security situation in Israel is uncertain. One can only hope that some peace agreement between Israel, the Palestinians and the surrounding Arab nations can be reached, and then one would expect a large increase in the number of tourists coming to Israel. If this does not happen, then it is unlikely that the number of tourists will grow significantly, and in turn the economic impact of the tourists will be relatively minor to Israel's economic growth.

WHAT IS RESPONSIBLE – WHAT IS IRRESPONSIBLE LEADERSHIP IN LUXEMBOURG?

Schinzel, Ursula

EVAtraining Luxembourg

ABSTRACT

The purpose of this study is to determine first what is responsible, second what is irresponsible leadership in Luxembourg, and third what is typical for Luxembourg? 51 semi-structured interviews were conducted in English, French, German, Luxembourgish, and Italian among four different categories, notably: 1) Lux.Nat. (Luxembourgers with Luxembourgish Nationality), 2) Lux.Foreigner (foreigners who reside in Luxembourg), 3) cross-borderers (people who come to work to Luxembourg every day from Germany, France, and Belgium), and 4) the rest of the world (World). The following results were found: Responses from all four categories were similar on the one hand and quite contradicting on the other. Respondents showed sound knowledge of the subject, and mentioned how Responsible leadership spans three areas: first the ecological, second the social and human, and third the economic/business area, and are long- or short-term oriented. Irresponsible leadership is exactly the contrary: lack of respect, abuse of people, bullying, degrading the environment, etc. Typical for Luxembourg is the multicultural, multilingual and diverse people, the beautiful countryside in the middle of Europe, the trilingual education system, but also its limitations in resources given its small size and its nepotism. Some interview citations and one case study are reprinted. Conclusion, discussion, implication, limitations and future research follow.

Keywords: *Responsible leadership, cross-cultural management, education, international business, Hofstede, multiculturalism, trilingual education system, management and language, Luxembourg*

1 INTRODUCTION

The purpose of this research is to discover what is responsible and what is irresponsible leadership in Luxembourg? 51 semi-structured interviews were performed among four categories, notably: 1) Lux.Nat. (Luxembourgers with Luxembourgish Nationality), 2) Lux.Foreigner (foreigners who reside in Luxembourg), 3) cross-borderers (people who come to work to Luxembourg every day from

Germany, France, and Belgium), and 4) the rest of the world (World). Respondents were asked 1) What is responsible leadership in Luxembourg? 2) Please name some examples, 3) What is irresponsible leadership in Luxembourg? 4) Please name some examples, and 5) What is typical for Luxembourg?

Following this introduction, this paper will first briefly review the extant literature on Responsible Leadership, and then describe Luxembourg's linguistic and cultural peculiarities, and presenting with a hypothesis. Chapter 2 will describe the applied method: semi-structured interviews. Chapter 3 will present the results from the four different categories of respondents, some interviews will be reprinted entirely, some partially, and one case study will be completely represented. Chapter 4 is for conclusion, discussion, and implication, research limitations and further research opportunities. References will conclude this research.

1.1 RESPONSIBLE LEADERSHIP

"There is only one irrefutable definition of a leader: someone people follow. Therefore, leadership is a relationship between the leader and the led. Unlike management, the leadership relationship cannot be delegated or automated" (Maccoby, 2011).

Responsible leadership is defined as being "about making business decisions that, next to the interests of the shareholders, also takes into account all the other stakeholders such as workers, clients, suppliers, the environment, the community and future generations" (The Financial Times, 2015).

Stückelberger and Mugambi (2007) split 'Responsible Business Leadership' into 5 aspects: 1) in general, 2) economically, 3) socially, 4) politically and 5) environmentally.

Responsible leadership has increasingly been a topic of interest in recent years, looking into topics like 'organizational culture' (Schein 2009, 2010), 'strategic intelligence' (Maccoby, 2015), 'raising performance through uplifting leadership' (Hargreaves et al, 2014), 'stakeholders' (Maak, 2007; Maak and Pless, 2006), and 'narcissistic leaders: who succeeds and who fails' (Maccoby, 2007). Northouse (addresses the subject through different types of approaches: the trait approach, skills approach, style approach, situational approach, contingency theory, path-goal theory, leader-member exchange theory, transformational leadership, servant leadership, authentic leadership, team leadership, psychodynamic approach, women and leadership, culture and leadership, and leadership ethics.

Here some questions responsible leaders might wish to consider (Financial Times, 2015): "1. Are your business activities sustainable and are not polluting the surrounding environment?

2. Do you identify systemic risks that your activities might contribute to, or do you take short term risks for quick profits that could endanger the reputation of your company?

3. Do you care about the welfare of your workforce?

4. Have you checked that your subcontractors do not use child labour?", or: to ask with the words of Alan Murray (2010): "What makes a great leader?"

This will be examined in the following chapters.

1.2 LUXEMBOURG

Luxembourg is a parliamentary democracy and a constitutional monarchy, it is the only remaining Grand Duchy in the world. As of 1st of January 2015, Luxembourg's total population consisted of 563,000 inhabitants of whom 304,300 (54.05%) were Luxembourgers and 258,700 (45.95%) were foreigners (statec, 2015), these included 92,100 Portuguese, 39,400 French, 19,500 Italians, 18,800 Belgians, and 12,800 Germans, see <http://www.statistiques.public.lu/stat/TableViewer/tableView.aspx>. The cross-borderers are typical for Luxembourg's employment situation. Domestic employment was at 395,200, comprising 164,900 cross-borders (41.73%): 81,300 from France, 41,900 from Belgium, and 41,700 from Germany. Luxembourg's motto is: '*Mir wëlle bleiwe, wat mir sin'* [*We want to remain what we are*'] Luxembourg is one of the smallest countries in Europe with a total size of only 2,586 km². It is 82 km long and 57 km wide and has borders with Germany (138 km), with France (73 km), and with Belgium (148 km) (The World Factbook). The language situation is anchored deeply in the country's history (Schinzel, 2013): there are three official administrative languages: French, German, Luxembourgish (statec, 2015); Luxembourgish being the national language (Lëtzebuergesch). The public education system is tri-lingual: the instruction language in Kindergarten is Luxembourgish, being replaced by German as language of instruction in primary school and then gradually replaced by French in secondary school (Kraemer, 1995; Schinzel, 2014a; 2014b; Weber and Horner, 2008). Citizenship is only awarded to those who speak Lëtzebuergesch (Spizzo, 1995).

The language defines the in-group (Briley et al. 2005) and the out-group. Those who speak Luxembourgish are part of the in-group and those who do not speak the language are part of the out-group (Schinzel, 2014).

The author replicated Geert Hofstede's cultural dimensions' study in Luxembourg and compared the findings with Hofstede's estimates. Luxembourg's specific cultural environment is characterized by low Power Distance (PDI=29), high Uncertainty Avoidance (UAI=95), low Individualism = high Collectivism (IDV=34) (COL=66), medium Masculinity (MAS=54), high Long-Term Orientation (LTO=65), medium Indulgence versus Restraint (IVR=55), and low Monumentalism (MON=24).

Table 1 (Schinzel, 2015; 2015a) shows Hofstede's (2001) and Hofstede et al. (2010) cultural dimensions of Lux.Nat. and Lux.All., Hofstede's estimates on Luxembourg, his data for France, Germany, the UK, Belgium FR, Belgium NL, Italy, the Netherlands, China, the USA, and Japan, where the cultural differences become clear.

Table 1 Cultural Comparisons: The author's Luxembourg, Lux.Nat. in comparison with Hofstede's UK – Belgium FR – Belgium NL – Italy – the Netherlands NL – China –USA – Japan (on a scale from 1-100, 1 being the lowest and 100 the highest score)

	The author's Lux.Nat.	The author's Lux.All.	Hofstede's estimates on Luxbg	Hofstede's France	Hofstede's Germany	UK	Belgium FR	Belgium NL	Italy	NL	China	USA	Japan

MON	24	10	-	16.5	9.9	35.4	-	-	35.2	11.9	0	57.2	4.0

The author makes the following hypothesis:

What is 'Responsible leadership' depends mainly on the respondent's cultural dimensions and his/her value system.

2 METHODS

Semi-structured interviews were carried out during summer and fall 2015. Respondents were from the four categories: Lux.Nat. (19), Lux.Foreigners (15), Cross-Borderers (6) and the rest of the World (11). Interviews were carried out in Luxembourgish, English, French, German, and Italian. They were in person, by phone, via skype or email exchange and lasted between 15 minutes and 2 hours. For confidentiality reasons, interviews were not taped, nor recorded or filmed. In-depth notes were taken during the interviews. After the interviews, the respondents were presented the summary of the interview and their consent was asked. Interviews in Luxembourgish, French, German, Italian or Spanish were translated into English.

3 RESULTS

The author performed a total of 51 semi-structured interviews with business men and women in companies in the four categories 1) Lux.Nat., 2) Luxembourg Foreigners, 3) Cross-Borderers, and 4) the rest of the world were interviewed. The language of the interviews was Luxembourgish, German, French, Italian and English. Interviews were held in person, on the telephone, via skype and via email conversation, and lasted between a maximum of two hours and a minimum of 15 minutes. In the following, the author analyzes the data from the 51 interviews. This total of 51 semi-structured interviews can be divided into the four categories as follows: 19 Luxembourgers with Luxembourgish

nationality (Lux.Nat.), 15 foreigners living in Luxembourg, 6 Cross-Borderers, and 11 respondents from the rest of the world. Among the 15 foreigners living in Luxembourg were 6 French, 5 Italians, 2 Germans, 1 Portuguese, 1 Dutch, 1 Belgian. The Cross-Borderers live in the neighboring Germany, France and Belgium and come from Germany (4), the UK (1), and the Netherlands (1). The rest of the world comprises diverse countries such as Germany (3), the UK (2), Italy (1), Poland (1), Israel (1), Bosnia (1), Russia (1), USA (2), Australia (1), NZ (1), Sweden (1) and Bulgaria (1). Four people have double nationality: French + Dutch, German + Dutch, German + Luxembourgish, and German + Bosnian.

The 51 respondents have the following native languages: Luxembourgish (18), French (11), English (6), Italian (5), German (5), Portuguese (2), Dutch (2), Russian (1), Hebrew (1), Bosnian (1), Bulgarian (1), Swedish (1), and Polish (1).

Out of the 51 respondents, 5 people have 2 mother tongues: French + English (2), French + Dutch (1), French + German (1), Swedish + Bulgarian (1). 1 respondent speaks seven languages, 2 speak 6 languages, 8 speak 5 languages, 17 speak 4 languages, 14 speak 3 languages, 5 speak 2 languages, and only 4 respondents speak just one language (1 French, and 3 English).

As a summary of the language analyses, it could be said: most Lux.Nat. speak Luxembourgish, German, and French; unfortunately English is a bit neglected. Most French speak just French, some with some English. The Portuguese living in Luxembourg are multilingual, speaking Portuguese, Luxembourgish, German, French, and some English. In general, respondents from the English speaking world only speak English, without any foreign language knowledge.

In total, the 51 respondents come from 15 different countries and speak 19 different languages. The migration background can be described as follows: there is a migration stream from the rest of the world to Luxembourg, especially from Europe and more precisely from the neighboring countries Germany, France and Belgium. Apart from this migration, these populations also represent the category of the Cross-Borderers.

The respondents' age categories are as follows: age 0-19 (0), age 20-24 (0), age 25-29 (3), age 30-34 (4), age 35-39 (8), age 40-49 (11), age 50-59 (19), and over age 60 (6).

Concerning gender: 25 of the respondents were males (49%), 26 females (51%).

The education level of the respondents is as follows: A-level (1), professional education (3), undergraduate degree (4), master's degree (18), the French Bac+5 (2), doctorate (12).

The industry sector of the respondents is: Bank+Finance (12), Education (12), Tourism (5), Food industry (5), Medicine (4), Law (3), Publication+Journalism (3), Construction (2), Civil Servant (2), Human Resources (2), Petrol industry (1), Politics (1), and Telecom (1).

3.1 RESULTS INTERVIEWS: Category Lux.Nat.:

3.1.1 The question: “What is responsible leadership in Luxembourg” was answered by Lux.Nat. as follows:

“Responsible leadership for us is divided in three categories:

- 1) ecological responsibility
- 2) social and human responsibility
- 3) economical and business responsibility.

We have our values, also to be found on our website. Ecological: We invest in nature and environment, by buying forests and planting trees. We instruct children where milk comes from and re-implant bees. We educate the children of this country to guarantee the continuity of the Grand Duchy. We invest in renewable energy, our products are not thrown away, but recycled or given away to charity, Red Cross and sports clubs, other clubs and/or associations. We support different associations and clubs with sponsorship. We invest in local companies, in local producers, in local people, in our local environment. And we preserve our nature.”

“We have an ‘environment certificate’ (www.petro-center.lu). Our waste is collected separately, coffee pads, paper, batteries, used oil, even chewing gum in a separate container and treated by specialized companies. Environment friendliness is key with us and all of our subsidiaries are upgraded to our standards, especially when we overtake another site.”

A responsible leader knows his/her business, his/her profession, his/her job. He/she has knowledge of his/her job and is capable of transmitting his/her knowledge, and motivating his/her people.

A responsible leader works a lot, he/she is interested in his/her people, their work and their persons, he/she helps always in every situation, he supports his/her people always.

A responsible leader is a person that we can trust in, on whom we can count, in every moment.

A responsible leader treats his staff in a fair way: he puts his employees in the foreground.

Social and human responsibility:

He/she pays his people well. But a good salary is not everything.

He/she provides best possible work conditions; adaptable working hours; care for workers’ children and their education; language courses for his/her employees; education/training for his/her employees; financial participation in the company’s profits.

Mutual trust and respect is key.

There is a work environment of ‘mutual respect’ towards colleagues, customers,... basically everybody.

He/she provides good work; asks their opinion about problems; assistance in every situation; is always in good mood; preserves the national interests of the country and the people; transmits his/her knowledge to his people to educate the future leaders the country needs. "I was first in internship here, then offered a full contract, this is responsible leadership for me, to educate the future specialists the country needs to guaranty the continuity of our company and of our Grand Duchy".

"Responsible leadership is, in my view, a leadership that preserves the national interests of the country and its people, places itself in the tradition and historic continuity of Luxembourg, acts internationally in a way to assure and enhance the security and economic welfare of the country, preserves and strengthens national sovereignty and insists on the preservation of high moral and ethical standard in all political fields, including scientific and technical progress."

Ecological responsibility: He/she is an example for the protection of environment; He/she supports energy conscious production; He/she promotes of alternative energy sources; He/she promotes minimization of waste.

Security responsibility: He/she emphasizes security in the company: he/she provides security training; He/she reduces accidents / the probability of accidents.

Economical / business responsibility: Profit is not key; Of course: a company's objective is to make profit. But profit is not everything. In difficult times, profit could be reduced and employees' satisfaction emphasized, without layoffs.

Citation from a dentist:

"13 years ago, one of my assistants got an offer from another dentist, offering her a 50% salary increase. I explained to her that I am not willing to increase her salary to make her stay, especially because of the way I am working: 1 chair and on average 1 patient every 20-25 minutes. But I understood that she had to quit for such a tempting offer. About 1 ½ years (and one pregnancy) later: she was back! Too much stress, as the other dentist works at 5 chairs in parallel, unhappy employees, and a weekly work amount of 50 hours, having to stay late until 9pm. For her family life this was not ideal. Result: she came back to me, and she still works for me happily, because I give her time off when her child is out of school, on some days of the week, of course she has to renounce the high salary, but compensates this loss with a better life quality."

Responsible leadership consists of two aspects:

- 1) a time aspect: long-term orientation or short-term orientation
- 2) a multi-orientation aspect: not only monetary profitability but also other aspects: social, human, environment, reputational, of the country in general.

3.1.2 The following examples for responsible leaders were given by Lux.Nat.:

“Me, I hope”; “My partner/colleague”; “My boss”; “I cannot think of anybody”; Barack Obama; Pope Franziskus; www.cactus.lu; www.luxlait.lu; www.luxair.lu; www.petro-center.lu; Gaston Vogel, lawyer who dares telling the truth; Firma Heinen in Bech-Maacher at the Mosel.

Former Prime Minister Pierre Werner: “One of those responsible leaders was former Prime Minister Pierre Werner who established the financial center in the 70s, bringing the number of banks from 30 to 168 in the 90s as well as launching the first SES satellite making Luxembourg one of the most important TV programs provider in the world. The space occupied in the cosmos by Luxembourg exceeds by far the surface of our territory on Earth.”

Former Grand-Duchess Charlotte: “An outstanding example of a responsible leader remains Grand-Duchess Charlotte, who took the wise decision to leave her country and go into exile when Germany invaded Luxembourg in 1940. This was of paramount importance for maintaining the existence of a sovereign Luxembourg.”

“I cannot name you anybody, because I cannot copy any leadership, because my leadership depends on my personality. I am myself. There are leaders who are natural leaders, and there are people who will never be leaders, whatever they try. Either you are captain or you aren’t.”

3.1.3 The question: “What is irresponsible leadership in Luxembourg” was answered by Lux.Nat. as follows:

Irresponsible leadership is exactly the contrary of what was said under the point ‘responsible leadership’. It is irresponsible when somebody is not interested in his people, always arrives late, leaves earlier, and when he/she doesn’t speak the languages, is egoistic, tyrannises his/her people, is bullying his/her people, praising one, but denigrating all the others.

“Irresponsible leadership would be an abandonment of our national sovereignty, a sinister plan that was revoked by a 78,02% NO vote by our people on June 7 2015.”

“A leadership that tries to split or weaken the national community for purely ideological reasons is to be considered irresponsible. National solidarity and cultural identity have been among the pillars of our capacity to survive as a nation and a state through the centuries. A responsible leadership also has to increase our economic strength and competitiveness to assure national income and the ability for the state to act in the interest of social justice.”

“I am tired of paying exaggerated taxes.”

3.1.4 The following examples for irresponsible leaders were given by Lux.Nat.:

“There are too many irresponsible leaders in Luxembourg! I cannot name them all!”

“Then it is not irresponsible leadership but the wrong person at the job!”

“Then this is not a guide who shows you the way, but a manipulator.”

The current government under Xavier Bettel. “The current left-wing Government under Prime Minister Bettel acts in a completely irresponsible way. Their idea to grant voting rights in national elections to foreign citizens would have, if accepted, put an end to the very existence of a Luxembourgish nation. Their ongoing fight against unborn children and the traditional families, the introduction of homosexual “wedding” and their adherence to gender-ideology, their continued struggle against the Catholic Church, their inability to manage crisis situations and their meddling around with public finance are but a few examples of the clear irresponsibility of the left-wing government and the Democratic, Socialist and Green political parties.”

Former Prime Minister Gaston Thorn: “Former Prime Minister Gaston Thorn was one of that kind during the period of between 1974 and 1979. He wanted to build an atomic power plant at Remerschen at the Luxembourgish border river, the Moselle, during his legislature. More and more people were against, but Thorn did not respect his people. A national congress of the coalition government party LSAP, (the socialists) decided on a moratorium of the construction so that the plan was politically shot down. This made Thorn angry in a way that only a couple days later he ran to his homologue Alain de Guirongot, (he was not a French Prime Minister, but the Energy Minister under the Prime Minister Jacques Chirac and the President Valéry Giscard d'Estaing) in Paris where he signed the agreement by Luxembourg to an atomic power plant in Cattenom. The agreement was never confirmed by any parliament, but morally the damage was done, and we suffer from it for more than 30 years now and long beyond many generations. DIRTY THORN!”

All the politicians in general: they navigate without any vision. Their impact on our future generations is disastrous: see the discussions about the financing of our pensions, the construction of new buildings and streets...

Ryanair. Arcelor Mittal and Mr. Mittal. Banks that lay off staff for their own profit. The Lux-Leaks affair. VW. Nestlé. The financial sector in Luxembourg in general. Mr. Jean-Marie Le Pen, he preaches populist ideas. Mr. Donald Trump in his electoral campaign, where he promises unrealistic projects. The dictators in North-African countries or any other dictator.

“Your next research should be: What is the correlation between the irresponsibility of the company and the number of lawyers employed. My hypothesis is that there is a correlation!”

3.1.5 What is typical for Luxembourg? was answered by Lux.Nat. as followed:

Peaceful country. High standard of life. Multilingual. Multicultural. Diversity. Cross-borderers, coming to work from the 3 neighbouring countries, without speaking all the languages.

The small size, and therefore small projects and limitations: "The limited resources and possibilities of a small nation-state need to be fully recognized and be properly taken into account, especially in our foreign policy."

The tri-lingual public education system: Luxembourgish, German and French as instruction language in this order, while neglecting English.

Sport clubs, associations, teams

"Luxembourg always had to struggle for its independence and was very often disrespected, but saved into the present by either the capacity of being able to satisfy itself for its daily needs due to the iron-ores in the southern part of Luxembourg in the 19th century as well as the different political views of our big neighbors in the past, namely at the congress of Vienna where France wanted to englobe Luxembourg in its territory, but the Prussians were against and voted for a neutral territory. Thus, we should celebrate 2015 our bicentennial of Independence....

Today, we can save our sovereignty in the frame of the EU. As a small country we took part to the creation of NATO, the UN and our aid to development has reached the 1% of our GDP, more than the 0,7% required by the UN.

As Luxembourg lies at the crossroad between French and German cultures, our country is multilingual, most Luxembourgers can speak 4 languages, Luxembourgish, German, French and English. This makes Luxembourg a favorable place for foreign investors which again is kind of a fight against poverty."

"Luxembourg's reputation on the international scene is bad, because many neighboring countries are jealous, they use every occasion to denigrate the country, which has to be more Catholic than the Pope."

Bullying in companies. A lot of nepotism, because everybody knows everybody. Easy, fast, simple contact. The high real estate prizes. Tourism, especially fuel tourism. The beautiful countryside and Luxembourg City. Schouberfourer. Les Casemates. People's emphasis on luxury and their habits: always the same procedure, at the same place, the same time, the same hotel, their comfort, and their nice objects. Good social security. Everything is regulated, there are rules everywhere. Rules and law. Good infrastructure: airport, trains, highways. The only thing we are missing here is the sea, and good weather.

"Concerning responsible leadership, there are no specificities for Luxembourg or any other location on earth: either a person is responsible or he/she isn't, independently of the location, it doesn't matter if he/she is in Germany, in France, in Luxembourg, or anywhere else."

3.2 RESULTS INTERVIEWS: Category Lux. Foreigners:

3.2.1 The question: “What is responsible leadership in Luxembourg” was answered by Lux.

Foreigners as follows:

One Italian said: “Ministers, prime minister, government, police, and especially citizens.”

“Based on the definition of Responsible leadership, by the Financial Times (<http://lexicon.ft.com/Term?term=responsible-leadership>), “Responsible leadership is about making business decisions that, next to the interests of the shareholders, also takes into account all the other stakeholders, such as workers, clients, suppliers, the environment, the community and future generations.” This definition applies to me for Luxembourg as well.”

A responsible leader has ecological, social and human, economical responsibility

A responsible leader knows how to motivate his/her people. He/she is a hard worker. He/she is somebody who cares for the collective well-being of citizens and the country. He/she helps employees achieving their goals. He/she maintains a good environment among colleagues. He/she is efficient. He/she listens. He/she helps his employees. He/she organizes social, sport events.

“I just came back from the ‘Letz go local market’ at the Rotondes. This, for me, is responsible leadership for Luxembourg. For example, one of my colleagues started knitting together with some elderly women. Her work was discovered and started being liked by a company, who ordered many knitted products from her. Now, my colleague has nearly too much work. She doesn’t know anymore how to satisfy the huge demand. She has to find more women to knit the pieces. This is a success story.”

“Responsible leadership is leadership that takes into account the complexity of the social and human relations, especially the interaction with the local community and the local environment.”

3.2.2 The following examples for responsible leaders were given by Lux.Foreigners:

“Me, us, I hope. Because I/we do everything to be it.

One Italian living in Luxembourg said: “Luxembourgish ministers, the Luxembourgish prime minister, government, police, labor representatives and especially citizens.”

“Bill Gates, since he knew how to use and increase the potential of others and hand it back to society. For example a friend of mine got a scholarship fund for his chair in informatics in order to do his research; he needed to present the results afterwards. This was a win-win situation for both parties (Microsoft and the University of Saarland).”

Barack Obama. Pope Franziscus.

3.2.3 The question: “What is irresponsible leadership in Luxembourg” was answered by Lux.Foreigners as follows:

One Italian said: “Citizens not respecting laws and civic rules and leaders not respecting peoples’ rights.”

“One of my colleagues told me, that she is working for 3 people. In her team of 3, she is the only one working. One colleague is sick because of the huge amount of workload. The other colleague is absolutely incompetent. He is the wrong person on the job. My colleague told the boss about the incompetency of the colleague. The boss replied: I do not want to fire this person, because then we will have to go through the ‘hiring procedure’. This means: the boss prefers keeping an incompetent person, because he wants to avoid going through the hiring process, a long process in our company.”

“Irresponsible leadership is short-term oriented, profit oriented use of employees with just one specific task in mind or for a limited period of time. This is high turnover leadership.”

“Irresponsible leadership is: Either the decision is aimed to serve and please the company’s family & friends, or it takes into account international actors and objectives and does not necessarily match with the shareholders based in Luxembourg.”

Bullying. Work overload. Lack of respect with regard to employees, colleagues, clients, and suppliers. Nepotism. Not caring for the well-being of the country, but following selfish interests of power.

3.2.4 The following examples for irresponsible leaders were given by Lux.Foreigners:

Real estate agents in Luxembourg, as prices are far too high. Bankers, banks, as money is not ‘clean’. Citation: “I don’t have a specific person’s name in mind. As a general example, I can refer to the banks middle and small managers who are mostly chosen to lead a team and make sure the job’s done. But they don’t necessarily have the mandate, the competencies, the personality, the training or even the vision to become a (responsible) leader.”

Irresponsible are those people in the education system, judging children of foreigners. Irresponsible are those people who insist on making the Luxembourgish language a distinctive element for nationality and national identity. Asport, a sports article shop, because for achieving their financial profit they disrespect people. Luxair. Cactus. Irresponsible are those companies which are not providing free drinking water to their employees.

“Roland Koch. He was helping to privatize two university hospitals (Marburg and Gießen which became the Rhön Kliniken) because of the short term profits, without trying to use and encourage the potential of the personnel working there. Also, he mismanaged Bilfinger and in the end, causing high

losses at this company, he insisted on getting paid until February 2016, whilst he resigned as a manager on 8 August 2014. His personal interest was higher than that in the people that he led.”

Companies which proclaim magic formulas, their employees knowing that they cannot fulfill these promises, but still having to offer these products. Because the job market is difficult. There are companies which open just for a few months, offering unrealistic prices and products, only to shut down a few weeks later. Dictators in North Korea, China, Russia, Syria. “One example for irresponsible leadership is Mauritius, where I spent my vacation. They live from exports of sugar cane. They export their entire sugar cane production, with the result that they are obliged to import the sugar for their own consumption. I think it’s the same for the rice.”

3.2.5 What is typical for Luxembourg was answered by Lux.Foreigners as followed:

Multilingual; Multicultural: the cultural mix; The Cross-Borderers; The diversity.

“It is specific for Luxembourg that a lot of different cultures and backgrounds are gathered in one little country and since it is a melting pot, no one can be aware of all steps and studies that a person has taken until arriving here. A lot of potential can therefore get lost.

Here is the example of a colleague who studied French literature, is now working in marketing, but back in the eighties did also start to do studies as an artist.”

“For small and middle Luxembourgish companies: In a small national market with few competitors; where clients are mostly “family and friends” (from the same schools or club co-members), decision-taking is biased and based on consensus, not on real and rational business objectives.

For bigger and international organizations: decisions are taken and monitored from abroad (e.g. from HQs based outside Luxembourg) and don’t take into account Luxembourg’s interest.”

Schouberfourer; Braderie.; Octave; Festival des migrations, des cultures et de la citoyenneté ; Bazar International; La Fête Nationale; Tourism.

3.3 RESULTS INTERVIEWS: Category Cross-Borderers:

3.3.1 The question: “What is responsible leadership in Luxembourg” was answered by Cross-Borderers as follows:

“My opinion has been succinctly explained in the HBR article on HR management, but I think it can apply to responsible leadership in Luxembourg and around the world. <https://hbr.org/2015/08/what-separates-great-hr-leaders-from-the-rest>

The 16 Key Leadership Skills:

Great outcomes are connected to 16 leadership competencies that span five categories: **Character:** 1. Displays honesty and Integrity; **Personal Capabilities:** 2. Exhibits technical/professional expertise; 3. Solves problems and analyzes issues; 4. Innovates; 5. Practices self-development; **Getting Results:** 6. Focuses on results; 7. Establishes stretch goals; 8. Takes initiative; **Interpersonal skills:** 9. Communicates powerfully and broadly; 10. Inspires and motivates others; 11. Builds relationships; 12. Develops others; 13. Collaborates and fosters teamwork; **Leading change:** 14. Develops strategic perspective; 15. Champions change; 16. Connects the group to the outside world"; **Taking decisions:** Be able to listen. Respect for the team. Trust .

A responsible leader is an expert in his/her domain. Responsible leadership depends on the level in the hierarchy. On different levels, there are different expectations. The Grand Duke and the Grand Ducal Family, the politicians and associations in Luxembourg.

3.3.2 The following examples for responsible leaders were given by Cross-Borderers:

The Grand Duke and the Grand Ducal Family. My father. My boss. Jean-Claude Juncker, he had the talent and skills but has lost his way. Cactus. Luxlait. Goodyear. Delphi [by hiring locally but also expatriates, contributing to an ideal mixture and diversity]. Politicians. Associations.

3.3.3 The question: "What is irresponsible leadership in Luxembourg" was answered by Cross-Borderers as follows:

Missing team-work. Missing motivation. Tyrannical behavior. Bullying. Threatening people. False friending. False talking. False promises.

"Luxembourg has been very irresponsible with the education of its youth, in my honest opinion. There is no reason why Luxembourg should be in the bottom half of the PISA scores, for example. Plus, the multi-cultural and -linguistic aspect has not been exploited to its maximum. The PISA scores: I think the teachers should step down from being civil servants. They are being very obstinate so far. They should stop worrying about their jobs and start worrying about the greater success of the country. They are civil servants. The whole Luxembourg state should review the whole civil servants status. If you worked in France in a public school, you wouldn't want this job. The teachers are highly underestimated. As the kids come to school in cars worth your annual salary, then you reflect on that and your career. They are overpaid, anyhow the whole education system should be completely reviewed. They should better educate their teachers."

3.3.4 The following examples for irresponsible leaders were given by Cross-Borderers:

Arcelor Mittal: Citation: "As Indian, he invested in Luxembourg and in France, promising to keep the employees, but then he didn't stick to his promises and laid off the people, or closed the entire factory (Florange, etc.). He is only looking at his own profit, not the profit of the country (Luxembourg, France) or of their people (every person's dignity)."

Jean-Claude Juncker. Citation: "Given that JCJ was Prime Minister over 3 decades, he should shoulder much of the blame."

Lucien Schneider. Other members of the former JCJ government. The current government and Prime Minister. The civil servant status of teachers / and in general.

"An irresponsible leader is somebody who becomes manager without having any clue of people management (most of the managers unfortunately, or too young managers), as people management is not given to everybody. Not everybody can be a good manager."

3.3.5 What is typical for Luxembourg was answered by Cross-Borderers as followed:

It's a great place to live and work in. Multilingual. Multicultural. Cross-cultural management. The Cross-Borderers. The financial advantages, less taxes, higher salaries. EU presidency 07/2015-12/2015. European Institutions in Luxembourg. A lot of banks, funds and investment companies and headquarters are located in Luxembourg because of its business-friendly tax laws.

The good working conditions in general, where forecasts are met by reality (not the case in my home country).

"The difference in legislation applying for people working together, as different laws apply for Lux.Nat., Lux.Foreigners, civil servants, Cross-Borderers: i.e. different school vacation times, different salaries, different National Holidays (Fête Nationale), that leaders need to take into account."

3.4 RESULTS INTERVIEWS: Category World:

3.4.1 The question: "What is responsible leadership in Luxembourg" was answered by 'the rest of the world' as follows:

Taking care of the followers more than taking care of self. Covering short as well as long term objectives. Employing the highest standards of ethical behavior.

"Knowing little about Luxembourg other than it's a good country in which to bank if you have a lot of money, I don't have any information upon which to make judgements. What is "responsible" appears to be culturally determined, see, e.g.:

Witt, M. A., & Stahl, G. K. (2015). Foundations of Responsible Leadership: Asian Versus Western Executive Responsibility Orientations Toward Key Stakeholders. *Journal of Business Ethics*, 1-16.

Greenberg, D. (2015). Review: Globally Responsible Leadership: Managing According to the UN Global Compact. *Academy of Management Learning & Education*, 14(1), 1-15.

Stahl, G. K., & de Luque, M. S. (2014). Antecedents of responsible leader behavior: A research synthesis, conceptual framework, and agenda for future research. *The Academy of Management Perspectives*, 28(3)

Security. Respect. Fairness. Reliability. Doing not talking. Commitment. Compassion. Hold to your promises.

“Responsible leadership is leading your business in a way that benefits the community. A responsible leader will make ethical decisions and encourage a culture of responsibility in the wider company, with an equal eye on profits, long term success and the environment and community.”

Corporate Social Responsibility (CSR): Citation: “Ethical, cross-culturally competent, socially responsible (CSR), inspiring and leading to a real breakthrough, able to make difficult decisions and taking into account their long-term impact on stakeholders.”

What is ‘responsible’ in one country, is not automatically ‘responsible’ in another country. This is a cultural issue. ‘Responsible’ in Bulgaria might not be ‘responsible’ in Germany, or in Saudi Arabia, or in Scandinavia. Different countries have different standards and interpretations, different rules, also in regard of women’s rights.

3.4.2 The following examples for responsible leaders were given by ‘the rest of the world’:

Ghandi. The CEO of Costco – taking 10 times the salary of the lowest paid in his company (about \$400K). Dr Angela Merkel. Barack Obama. Martin Luther King; Bill Gates –Steve Jobs. Warren Buffet, Gian-Luca Buffon. Mr. Rossmann (Germany).

3.4.3 The question: “What is irresponsible leadership in Luxembourg” was answered by ‘the rest of the world’ as follows:

Making promises one does not intend to keep.

“In general terms, irresponsible leadership is going after profits as a priority and not taking into consideration employee well-being, a short term focus for the organization, not taking into account the wishes of people in the community with regards to expansion or environmental concerns, and not providing any value to the community, perhaps in terms of training local people who could work for the business.”

“For me, the worst combination is ‘incompetence’ coupled with ‘lack of sense of responsibility’, notably regarding people in companies, these two should never come together, that’s absolutely the worst scenario.”

3.4.4 The following examples for irresponsible leaders were given by 'the rest of the world':

You may count 98% of the current leaders. Nearly all politicians: they mainly care about being re-elected. The leaders of BP (the oil spill). Hitler. Tony Abbot (Australian Prime Minister). Citation: "Very self-focused, doesn't believe he needs to properly address the concerns of the majority of the voting citizens in Australia, very backward in embracing new sustainable technologies, preferring coal to wind farms etc..."

Steve Jobs: the infamous factories in China. Another example: USA prisons. Mr. Alexis Tsipras in Greece. Mr. Vladimir Putin in Russia etc., Mr. Assad in Syria.

3.4.4 What is typical for Luxembourg was answered by 'the rest of the world' as follows:

I know nothing or very little about Luxembourg. Where is Luxembourg? It is extremely rich, with one of the highest GDPs in the world. Beautiful countryside.

4 CONCLUSION, DISCUSSION AND IMPLICATION

The purpose of this research was to discover what is responsible and what is irresponsible leadership not only in general, but specifically in Luxembourg. Even though the findings from the 51 interviews confirm the literature, new knowledge is added to the existing knowledge about responsible leadership regarding Luxembourg.

In conclusion, the author's hypothesis was confirmed: *What is 'Responsible leadership' - depends mainly on the respondent's cultural dimensions and his/her value system.*

5 FUTURE RESEARCH

Future research could focus first on civil servants, second on linguistic and cultural issues combined with responsible leadership in Luxembourg, third on expatriates and global mobility. Furthermore, in addition to the interviews, collecting more data via questionnaires could allow for more sophisticated methods.

USERS GENERATED IDEAS VIA SOCIAL MEDIA NETWORKS: BASED ON THE OI MODEL

Scuotto, Veronica¹; Santoro, Gabriele²; Papa, Armando³; Carayannis, Elias⁴

¹School of Business and Enterprise, University of the West of Scotland

²Department of Management, University of Turin, Italy

³Department of Economics, Management, Institutions, University of Naples Federico II, Italy

⁴Department of Information System & Technology Management, George Washington University, Washington DC, USA

ABSTRACT

Leveraging on the keep-going growth of the use of social media networks (SMNs) within organizational environments, the relationship of these digital tools with the open innovation (OI) model was quantitatively explored in order to bridge the current gap in the literature review. Here, since the lack of knowledge of the use of OI model through SMNs in the service industry, this research seeks to evaluate the OI model through the use of SMNs by 374 small medium enterprises operating in the service industry in UK. This open approach involves the concept of online customers' co-creation which called for user-generated ideas. Empirically, the relationships among user-generated ideas, the use of social media networks, the adoption of OI model, and SMEs' innovation performance are estimated by the structural equation modelling. Findings and discussion are argued based on the lens of OI model. Finally, academic and managerial implications were provided along limits and further research.

Keywords: open service innovation, user-engagement, users' generated ideas, social media networks.

INTRODUCTION

The world-developed economies are increasingly based on service economy. In fact, services contribute more than 70% of aggregate gross domestic product (GDP) and employment in the Organization for Economic Cooperation and Development countries (OECD, 2015). In addition, empirical evidences in literature indicate that service firms are innovative at least as much as the manufacturing firms (Metcalf and Miles, 2000) and also are considered the main source of the current growth in the international economies (Love et al., 2010). In this context, current technological opportunities and challenges are stimulating service firms' innovation process with strong emphasis on external collaboration and open innovation (Chesbrough, 2011; Cusumano et al., 2015). The open innovation paradigm assumes that firms should interact with the eco-system in order to facilitate innovation process acquiring and absorbing external knowledge (Chesbrough, 2006). Alongside this, Innovation, Entrepreneurship and Digital Ecosystems

literature on innovation in service industry highlights the key role of online customers in the development of new ideas and knowledge which can be translated in incremental or radical innovation services (Tether, 2005; Schumpeter, 1939). However, despite some theoretical arguments that point out the relevance to adopt an open innovation approach in the service industry (Chesbrough, 2011), scholars are still focused on the embeddedness of the open innovation (OI) in the manufacturing industry. Therefore, we reckon that the open service innovation deserves more attention from different points of view. For instance, there is a scarcity referring to open service innovation in small and medium enterprises (SMEs), even though literature underlines that smaller are adopting an increasing open approach to innovation (Brunswick and Vanhaverbeke, 2015), and they are recognized as a strong source of growth in the world economies (European Commission, 2013).

The paper seeks to contribute to the literature review from two points of view. First of all, it sheds light on open service innovation highlighting the strategic role of users in create new services via social media networks. In doing so, we also fill a gap already mentioned by Mina et al. (2014), when they called for more research on the relationship between openness in service firms and performance, investigating on if there is a positive or negative relationship between these factors. In order to analyse these aspects, an empirical analysis is conducted on 374 SMEs operating in the service industry in the United Kingdom (UK). A primary research has been carried out for one year and the data obtained were measured via the Structural Equation Modelling (SEM).

Therefore, the paper is structured as follow. First, a theoretical framework based on open service innovation and social media networks was argued. And then leveraging on this theoretical base, hypotheses were formulated and measured through an empirical research. It was conducted on 374 small medium enterprises operating in the service industry in UK. Via Structural Equation Modelling the findings were evaluated. Finally academic and managerial implications were provided along limits and further research.

THEORETICAL FRAMEWORK

Open service innovation

Developing and commercialising products and services usually involve risk and uncertainty due to the high competitive market since the market (Bresciani, 2010). Consequently, firms tend to adopt an open innovation strategy based on collaborations with their eco-system. The scope is to reduce and share costs and risks of an innovation process, and also to optimise time to market (Vanhaverbeke et al., 2008). In line with this, more and more scholars have been studying the Open Innovation (OI) model in the last few years. This model was defined by Chesbrough as “the use of purposive inflows

and outflows of knowledge to accelerate internal innovation, and expand the markets for external use of innovation, respectively. Open innovation is a paradigm that assumes that firms can and should use external ideas, as well as internal ideas, and external and internal paths to market, as they look to advance to technology" (2006c, pp.1). Several studies tend to describe openness in terms of openness variety considering the number of external sources involved in the innovation process and partner intensity assessing the depth of the relationship between the focal firm and the external source (Laursen and Salter, 2006; Mina et al., 2014; Aloini et al. 2015).

So far, mainstream studies on open innovation focused mainly on large and multinational enterprises (Chesbrough and Crowther, 2006; West and Gallagher, 2006; Mortara and Minshall, 2014) even if a recent attention has been aimed at small medium enterprises (SMEs) (Brunswick and Vanhaverbeke, 2015; Santoro et al., 2016). In fact, some empirical studies highlight that SMEs are adopting an increasing open approach to innovation, even higher than larger enterprises (Spithoven et al., 2013). Despite that, the lack of knowledge on the OI model is still related to the service industry as well as SMEs. This is caused partly to the slow adoption of systematic and effective processes for innovation with low investments in R&D activities (Tether, 2003; Nesse, 2008). However some studies show the predominant use of the OI model in the service industry (Leiponen, 2005; Tether, 2005; Cainelli et al., 2006; Scuotto and Shukla, 2015) makes a positive effect on firms' performance (Love et al., 2010). In turn, the need of shorten time to market, lower costs, new technological opportunities, and sector integrations are achieved (Metcalf and Miles, 2000; Cusumano et al., 2015). Notwithstanding, the open service innovation process is quite different to product innovation, because there is not a physical and linear process in transforming an invention to an innovation (Mina et al. 2014). In fact, the formal stage-gate processes used in many large manufacturing companies to advance new product development from inception to the market likely are not used in the service industry. But the service innovation process is likely to embrace a co-creation process that can involve customers and/or other business (Prahalad and Ramaswamy, 2004).

As a consequence, while manufacturing firms are more likely to innovate relying on internal R&D efforts, service firms are more likely to collaborate with customers and suppliers (Tether, 2005), employing lower internal R&D investments (Kanerva et al, 2006).

Thus, the interactive and relational nature of service industry indicates that service SMEs should adopt an open innovation strategy (Adu and Singh, 1998), based of informal exchanges, exploiting networks and communities, and achieving un-codified know-how (Mina et al., 2014). Engaging with market-based partners such as users can help SMEs in identifying market requirements and needs, developing new solutions and ideas (Adu and Singh, 1998; Mention, 2011). E-collaborations tools are employed to foster information and communications flows (Chen et al., 2012; Scuotto and Morellato,

2013; Del Giudice et al., 2014). In fact, theoretical contributions stress that on-line interaction with customers through is the most powerful channel of knowledge transfer supporting open service innovation (Chesbrough, 2011). Actually costumers are playing a significant role in encouraging the service sector to be more innovative (Boschma 2005; Love et al., 2010). In turn, firms are more customer centric orientation with a predominant focus on the online environment (Love et al., 2011).

Therefore, we declare that

Hp. 1: openness in service sector is positively associated to SMEs' innovation performance

Hp. 2: openness in service sector is positively associated to enhancing the relationships with customers.

Open Service Innovation and User-Generated Ideas

With a growing interest in collaborations, networking, and open innovation from firms, most of scholars' attention has been paid to a main external source of knowledge, namely as the user. In fact, many firms exploit users' ideas to create new innovations (Franke and Piller, 2003). User-generated ideas are related to the engagement stage where firms tend to establish active, creative, and social collaborations (Roser et al., 2009). Therefore, SMEs should adopt an OI user engagement strategy focusing on the type of interaction with users such as sharing information, peer-to-peer recommendations, and searching (Piller et al., 2010; Diener and Piller, 2010; Piller et al., 2010). This is beneficial for mainly smaller firms since they have fewer human and financial resources (van de Vrande et al., 2009; Brunswicker and Vanhaverbeke, 2015).

Hence, SMEs become more customer-oriented, offering personalized services with a better quality and consequently improving customers' satisfaction by building a relational link (Hartline et al., 2000; Slater and Narver, 1998; Chesbrough, 2011; Weinberg and Pehlivan, 2011). For instance, Alam (2002) suggest that managers should be more proactive in developing long-term relationships with customers as co-partners based on online interactions. This collaboration is fundamentally beneficial in the early stage of the innovation process even in the post- launch stage where customers' recommendations are becoming increasingly significant in generating incremental innovation (Neale and Corkindale, 1998; Gales and Mansour-Cole, 1991). Users' engagement is typically a form of external linkage that involves lower costs compared to other open innovation practices, ensuring flexibility, which in turn guarantee SMEs superior responsiveness to market-needs (Sivadas and Dwyer 2000). Thus, user represents the main external source of new ideas for innovation also for SMEs, and user – generated ideas positively affects SMEs' performance (Adu and Singh, 1998).

Therefore, we state that

Hp. 3: user - generated ides is positively associated to users' engagement.

Hp. 4: user generated ideas is positively associated to the SMEs' innovation performance

Social Media Networks

Concerning the users' engagement, firms can use a range of activities spanning from the traditional questionnaire or market research to a deep involvement in the innovation process whereby users play an active role in the generation of new ideas (von Hippel, 1998; Alam, 2002). Alam (2002) identifies six main user engagement modes such as face-to-face interviews, user visit and meetings, brainstorming, users' feedback; phone calls, fax and emails, and focus group discussion. In turn, technological tools as well as social media networks (SMNs) are centrally part of this process (Bughin et al., 2011). Users generated new ideas via SMNs which are interactive platforms where people as part of the eco-system share, co-create, discuss, and modify user-generated content (Kaplan and Haenlein, 2010). SMNs rely on digital platforms such as blogs, microblogging, forums, professional networking platforms, and social networks (Cortizo et al., 2011). Thus, firms can increase the use of social media networks. These tools have a twofold objective. On one hand, they foster marketing, advertising and branding activities in order to increase sales (Culnan et al., 2010). Increasing sales can be seen as a variable of user-firms engagement evaluation (Love et al., 2011). On the other, firms are increasingly conscious that SMNs can be used as strategic platforms to engage users in the idea generation (Fuller and Matzler, 2007). For instance, LinkedIn, Facebook, and Youtube facilitate the relationship between SMEs and users thanks to the strong networks they allow, connecting millions of users by establishing user communities and enabling communications among communities and firms without cost (Piller et al. 2012). Thus, increasing both the use of social media networks by firms (Moital et al., 2009; Leung et al., 2015), the use of social media by users (Dijkmans et al., 2015), and in turn the perceived reputation and commitment in social media networks (Wetzels et al., 1998; Marchiori et al., 2013) is recognized as a driver for the generation of new ideas which in turn can be translated in innovative services, in new innovative business model, and increasing in sales indicators such as ROS (Love et al., 2011; Chesbrough, 2011).

Therefore, we declare that

Hp. 5: SMNs mediate the relationship between user-engagement and user generated ideas.

Hp. 6: SMNs positively influence SMEs' innovation performance.

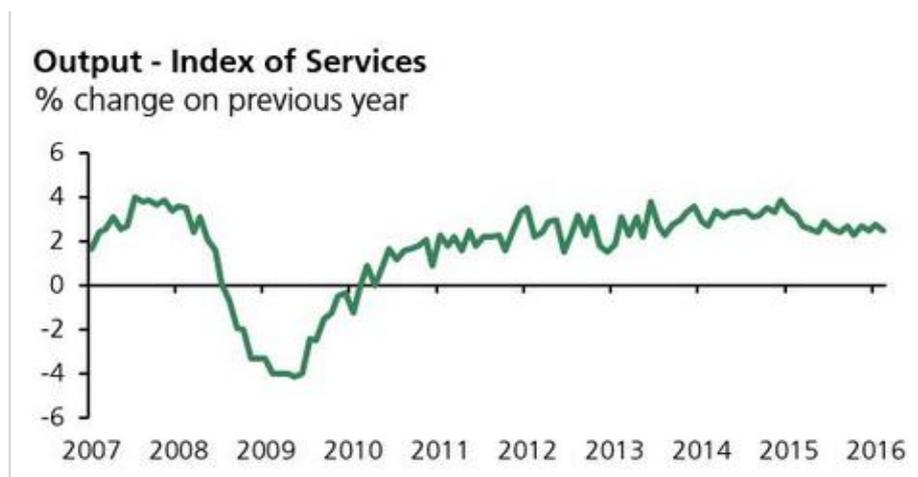

METHODOLOGY

Research Context

Looking into UK market 2015, firms operating in UK were in the region of 5,4 million, where 99% are Small Medium Enterprises (SMEs). The service industry has been growing faster and efficiently since the last few years, accounted for 80% of the Gross Value Added (GVA) accounted for 83% of jobs in September 2015 (Markit/CIPS, UK Services PMI, 2016). This industry is composed by a diverse set of sectors such as retail, financial sector, public sector, business administration, and cultural activities.

The growth has been mainly pushed from the new technological changes that stimulate firms to be proactive and innovative. In turn, customers become more and more active and stand for firms' innovation. Fundamentally the innovation ideas are more and more developed in joint with customers, differently to the past where customers' trust and receptiveness was considered a barrier to innovation (CBI/QinetiQ, 2008). In line with this market overview, the paper seeks to investigate if firms are improving the innovation performance collaborating with customers via social media networks (SMNs) and consequently adopting the OI model.

In UK a total number of 4.0 million firms are based on the service industry where professional, scientific, and technical sector accounted for 15% of firms, while retail sector for 10%. Instead of manufacturing sector relies on just 5% of all firms.

Research Design and Sample

Leveraging on a strong literature review grounded of more 30 research articles, a strong empirical analysis was conducted on 374 UK SMEs, selected by following three drivers that can easily be considered as proxy of open innovation growth path. In particular, the variables:

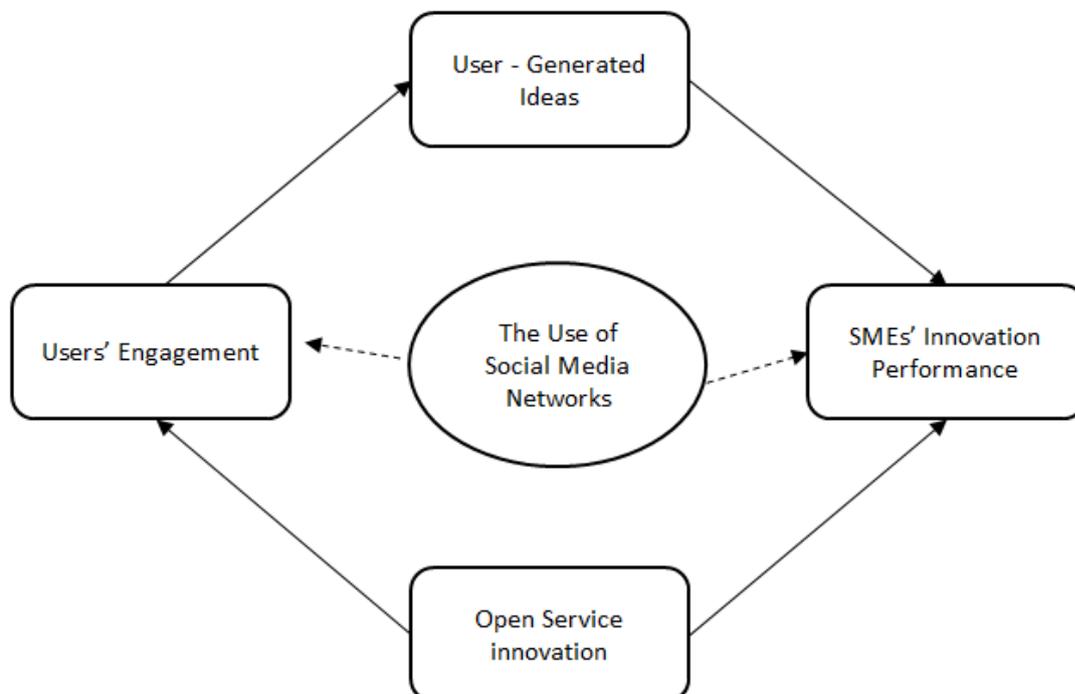

- **Progress in innovation;**
- **Adoption of social media networks;**
- **Belonged to the service industry.**

The sample was built up in four months, starting from a population of 784 SMEs (European Commission, 2009). The stage took more than ours expectations since some information on the above selection criteria were missed. Therefore, SMEs were contacted by email as the first instance and in the case of no response another contact was made by phone. Completing this stage, the collection data were carried out by an online survey. The survey was filled out by managers of R&D development and costumers' service. At least, they were two for each SMEs and occasionally just one participant who was in charge of both roles.

The scope of this empirical research was to investigate diverse aspects such as the adoption of OI model, the development of innovative ideas in joint with customers, the use of SMNs to generate these ideas. The survey was built up on 15 close questions with a brief statement on the research purpose.

Questions were structured out using a funnelling technique (Breiman et., 1984). So initially questions on basic firm's information such as sector; number of employees; job position, among others were outlined, followed to specific one rely on in five main aspects such as open service innovation, users' engagement, users-generated ideas, service innovation performance, and the use of SMNs. Each aspect was investigated on return on sales; sale growth; interaction between consumers and SMEs; stages of innovation process; degree of collaboration; use of SMNs by SMEs, intensity use of SMNs by users; Relational/behavioural dimension; Partner Intensity; E-collaboration digital tools; and openness variety. For instance, some of the questions were: Q5. How much you agree with statement – Users' engagement improve innovation performance; Q9._How much you agree with statement – user-generated ideas are fundamental in an early stage of innovation process Q10. How much you agree with statement – a lack of an open approach can decrease innovation process; Q12. How much you agree with statement – SMEs are innovative in the service sector; Q13. How much you agree with statement – a customer is a partner for your firm; Q15. How much you agree with statement – social media networks improves your relationship with customers. So based on these questions, each respondents was asked to choose a statement value on a range of 1 as disagree strongly and of 5 as agree strongly (Likert, 1932).

Fig. 4: The Design Model

The data collection ended up after 8 months thanks to the big effort made by all authors. Subsequently the data were examined and split up in the five topics identified as five latent variables such as open Innovation, Entrepreneurship and Digital Ecosystems

service innovation, users' engagement, users-generated ideas, service innovation performance, and the use of SMNs (figure 3), and then measured via Structural Equation Modelling (SEM). In line with previous research that declared the significance of data measurement (Hooper et al., 2008), we reckon that this method fits our research.

As showed to the design model five latent variables were analysed accounted for 15 items. To each latent variable were associated three items or manifest variables as indicated in the following table.

Table 1. Dimensions and Items

Dimensions	Items	References
SMEs' performance	Service innovation stem from external environment	Love et al. 2011; Chesbrough 2011
	Service business model innovation	Love et al. 2011; Chesbrough 2011
	Return on Sales	Love et al. 2011; Chesbrough 2011
OI users engagement	Type of interaction (e.g. sharing information, peer-to-peer recommendations; and searching, among others).	Piller et al. 2010
	Innovation process stage	Diener and Piller, 2010; Piller et al. 2010
	Relational/behavioral dimension	Diener and Piller, 2010; Piller et al. 2010; Weinberg and Pehlivan, 2011
Social Media Networks	Use of SMNs by SMEs	Moital et al. 2009; Leung et al. 2015
	Intensity Use of SMNs by users	Dijkmans et al. 2015
	Perceived reputation and commitment in SMNs	Wetzels et al. 1998; Marchiori et al. 2013
Open service innovation	Partner Intensity	Laursen and Salter 2006; Mina et al. 2014; Aloini et al. 2015
	Openness variety	Mina et al. 2014; Aloini et al. 2015
	E-collaboration digital tools	Chen et al. 2012

ANALYSIS AND RESULTS

Examining the data, the adoption of the OI model relies on costumers' collaboration via SMNs was translated into mainly sales performance. In fact, 75% of respondents indicate "agree strongly" to the questions: OI model is enhancing your sale performance; the use of SMNs is positively connected to more satisfied customers; the increasing of costumers' satisfaction is positively linked up to higher earnings; the co-creation approach allows you to work on more projects with lower investment.

Furthermore, the results showed that the SMEs are likely to be more efficient and successful when sharing knowledge and ideas with the external environment. Regardless of that, this approach tends to rule out the internal innovation but dedicate more energy to the external one as declared from some respondents (around 7%). While just 3% of the respondents have just started recently to use SMNs and adopt an open approach with their customers.

Structural Equation Modelling via IBM SPSS Amos

Via structural equation modelling (SEM) the connection between the five latent variables were measured (Jöreskog and Wold, 1982). The analysis was divided in measurements, i.e. outer model and structural one.

Outer Model

Applying the outer model the relationship between each manifest variables and the relative latent variable was evaluated (Chin & Newsted, 1999, p.322), emerging that the score is 78. The manifest variable are the “*reflection*” of their *latent variables* (Tenenhaus *et al.*, 2010) to which the reliability was estimated by Cronbach's alpha (Cronbach, 1951). The Cronbach's alpha of each relationships emerged to be positive with a value of ≥ 0.7 (Hair *et al.*, 2010). Moreover the reliability was also confirmed, evaluating the internal consistency which its scale was above .3 (Henson 2001).

Table 2. Reliability Test

Reliability Statistics		
Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.78	.79	374

The Structural Model

Consequently the predictive relevance of the model was evaluated calculating R-squared for endogenous latent variables (Chin and Newsted, 1999). The R-Squared for Users-generated ideas is rated by 0.64, the use of SMNs is .81, users' engagement was scored 0.64, and SMEs' performance via (1) Via User-Generated Ideas is .57 and (2) via Open Service Innovation is 0.78.

Table 3. R²

	User-Gen.Ideas	UseSM Ns	UsersEng.	SMEsInnovP erf (1)*	SMEsInnovP erf (2)*
R ²	.64	.81	.67	.57	.78

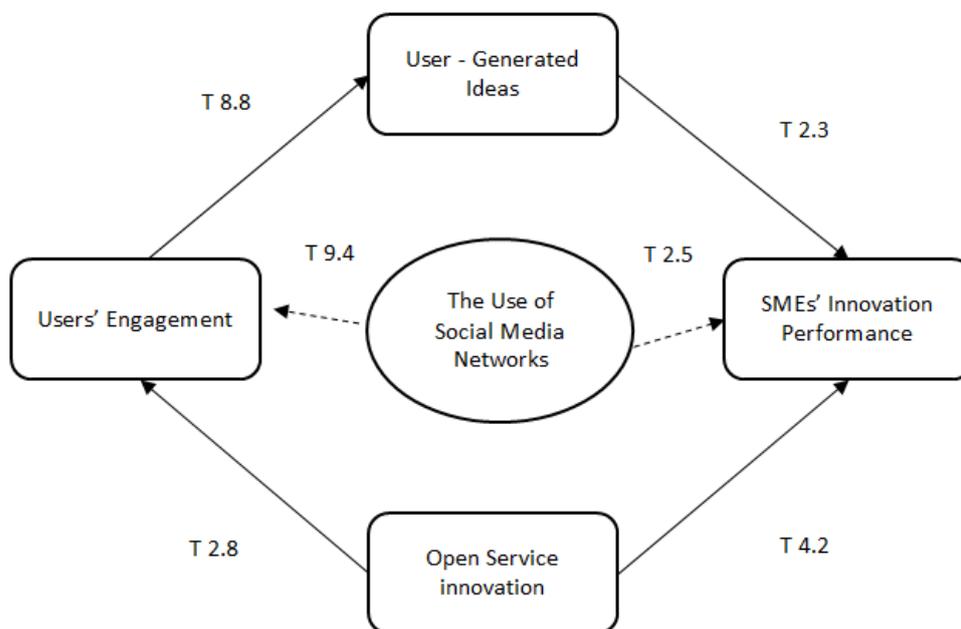

(1) Via User-Generated Ideas

(2) Via Open Service Innovation

Finally the relationships between all manifest endogenous and exogenous variables were measure via a path analysis and bootstrap approach (Anderson and Gerbing, 1988; Chin, 1998) as well as the hypotheses were tested. Therefore looking at the Table 5 the scores of unstandardized coefficients, standardized coefficients, T-statistic and corresponding p-values were indicated.

Referring to H1 – openness in service sector results to be positively connected to SMEs' innovation performance ($T=4.2$, $p<0.001$). Therefore H1 is confirmed. Regarding to H2, there is a positive relationship between openness and the enhancement in relationships between SMEs and customers ($T=2.8$, $p<0.001$). Also in this case the H2 is supported. Considering H3 which regards to the use of SMNs and is focus on the relationship between user-generated ideas and user's engagement which is resulted positive ($T=8.8$, $p<0.001$). So H3 is supported. In turn, H4 based on the relationship between user-generated ideas and SMEs' innovation performance is slightly significant ($T= 2.3$; $p<0.001$). Thus, H4 is supported. Finally, evaluating H5 refers to the role of SMNs as a mediator between users' engagement and user-generated ideas ($T=9.4$, $p<0.001$), H5 is clearly positive. Moreover, concerning H6, the relationship between SMNs and SMEs innovation performance is slightly positive ($T=2.5$, $p<0.001$). Overall all hypotheses are confirmed as reported in the figure 5.

Figure 5. The hypotheses tested via bootstrap approach

DISCUSSION

The purpose of the research was to evaluate the impact of User-Generated Idea on SMEs' innovation performance through a holistic view of open service innovation approach (Chesbrough, 2011). This approach relies on the virtual market where social media networks are the predominant venues to Innovation, Entrepreneurship and Digital Ecosystems

share information and exchange knowledge. By according our empirical findings, we currently are able to comment there is a strong correlation between SMEs' innovation and SMNs generated content. The research suggests that UGC are growing about the possibility of co-creating value with "social network customers", which assume a pro-active role in ideating, producing or testing innovation, by interacting them with each other (i.e. testing prototypes, supporting design, suggesting references or additional services, etc.), by according the principle of open innovation approach (Chesbrough, 2003, 2011; Prahalad & Ramaswamy, 2004).

In a service-dominant approach (Lusch & Vargo, 2008), the creation of innovation, then of value, is the core purpose and central process of economic exchange, especially if we consider the interaction-revolution of the economic system, produced by advances in information technologies and the growth of a knowledge-based service economy (Vargo et al., 2008; Del Giudice & Straub, 2011). Open innovation are transforming the basis of technological innovation and global corporate competition, especially if we consider small business world which is affected, both strategically is financially, from greater challenges and higher risks in managing technology-push innovation process, due to a shortage of managerial and financial resources as a results of the smaller size.

In this regard, as confirmed by our hypotheses (especially HP4 and HP5), UGC through SMNs can enabling SMEs to produce innovation "market pull" interacting with the eco-system of customer-users as well as by facilitating acquisition and absorption of external knowledge and big data. Moreover the OI model directly reflects on revenues and capital efficiency, then the performance, confirmed by HP6, which feeds a spiral of growth sustained by a knowledge competitive advantage increasingly considered as the main source of the capacity of enterprise to create value and survive in long-term (Leonard, 2000; Teece, 2007; Golinelli, 2010; Del Giudice et al. 2013, Scuotto et al, 2016). Consequently the adoption of an open approach triggers off different innovation forms – more incremental than radical ones. Obviously, this is not that easy as theorized about but for sure the majority of small and micro firms present in UK, with relatively low educational level, familiar in working with "geolocalized" consumers can facilitate the process of transferring data and information, useful in producing users' engagement and ideas. Overcoming traditional communicative logics, SMNs emphasize the development of a direct and iterative customer-producer relationship through interaction and exchange of ideas. Over large companies, even SMEs are seeing important challenges in percent revenue derived from technologies facilities. The need for service innovations to fuel economic growth and to raise the quality and productivity levels of services may represent a greater opportunity in a global competitive arena especially for supporting business performance of knowledge intensive services firms.

The potentiality of SMEs in managing service innovation through UGC is represented by the multilateral nature of open service innovation which integrate technology, business, social and customer-driven skills (Spohrer & Maglio, 2009).

According this, the empirical analysis relied on practical application of service open-innovation and R&D customer-based product development should challenge at least the open mindness of entrepreneurs in order to reconsider their strategy in a co-creative manner by considering directly to engage users in product and innovation development. Without detracting the importance of brand-equity for customers, our empirical analysis shows that participants are mostly interested in making part of contribution of new development and seeing it more adherences with their specific needs. At the same time, our findings (Table 2 and Table 3) also suggest that the use of open innovation tools promotes customer's loyalty and satisfaction by reducing the costs of consumer's participation and retention.

The user-innovators, in fact, have various non-financial motives in making up collaborations with firms such as fame, fun, altruism, and brand affinity. Moreover, users who seek to increase their "digital fame" often spend time and efforts recommending others to join the network in the hope of increasing the audience of community, then creating a wide pool of user co-creators. This appears to be an imperative for business middle class-size, particularly since on intangible and competitive advantages offered by both codified and tacit knowledge and the customer's experience linked with a service innovative furniture product.

Adopting an OI approach, SMEs tend to be more flexible in managing their business in the long-term. In this way, we have consider open service innovation as the envelope of a number of "organizational moment" (Table 1) regarding strategy, knowledge-based innovation processes, networking, technology and know-how transfer, and ICT issues.

In this regard, the present study has tried to hypothesize the contribution of OI and UGI can give on innovation firm performance of SMEs by acting through with customer relationship management as well as leveraging on customers expectation.

In particular, as showed on the design model (Figure 4), the multidimensional relationship built up on SMNs between users and enterprises seems to create an "innovation customer-driven circuit", in which informations and ideas circulate voluntary and specifically within the network. In this context, at one side, firms are able to manage innovation development by reducing information redundancy; at other side, SMNs assuming the role of filter, by interpreting right informations in order to overcome idea stickiness.

In particular, as showed on the design model (Figure 4), the multidimensional relationship built up on SMNs between users and enterprises shows an interweaved path of the open innovation cycle,

driven by four dimensions such as: SMEs' performance, which attests the financial level of relationship between Service business model innovation and profitability of OI architecture expressed by Return on Sales; OI users engagement which represents the behavioral dimension, emphasizing the type of interaction and the stage of development of the process; Social Media Networks may represent the social dimension of the relationship. It represents a virtual place where users and firms interact simultaneously according to the reputation of enterprises, the commitment and the social benefits for consumers. Finally, Open Service Innovation represents the organizational level of collaboration used to measure the degrees of intensity and openness of the main relationship. Therefore the virtual environmental complexity and the consequent need to simplify and reduce the amount of information and data coming from the users constitute the main challenge of the strategic decision-making process, especially if we consider the insights and individual side of single specific needs. Anyhow, Social Networks now exist and can offer a real chance to firms to review market dynamics and technological challenges through a cognitive process of service and product innovation development, by offering an integrated business approach from an entrepreneurial viewpoint of consumers.

Moreover, our findings have more academic implication and act as trailblazer evaluating the effect of open innovation on competitiveness of SMEs.

Notwithstanding, actually, it can be a very complex task to evaluate this relationship then, it will be necessary to be more specific because, there are certain dimensions that need to be approached from multiple angles that blend knowledge from different perspectives and claim the answers to specific research questions. In this way, by managerial side openness up the borders of an organization and the innovation process infers a type of "post managerial environment", where conventional managerial mechanisms are no longer applicable, because we reverse traditional theoretical paradigms. Even if OI scholars in management have produced widely an amount of research by investigating various aspects of open innovation, OI remains constantly tied to technological and engineering aspects. To be fair, although some important managerial implications have been identified in literature, they are underdeveloped on the field of open innovation management. Furthermore, some of the most important issues are still unexplored, especially when we consider the small business segment. Most of the identified challenges arose in testing empirical analysis (the choice of dimension, the items and the literature background) affected the organizational perspective of the SMEs performance, engaged in OI. From a managerial perspective of OI collaborations, the degree of openness of the firm involved in the process suggests a further dimension of complexity related to the contextual challenges and opportunities, which is not valuable a priori. About managerial implications, we can argue that previous research often emphasized the value of legal and ownership aspect of relationship, by stipulating agreements in order to protect intellectual property

rights. From a collaborative perspective of OI, we are able to acknowledge the complex situation of how SMEs have to turn in “social” their organization and management structure, never forgetting the scarcity of financial and strategical resources. In this regard, a first implication comes from diversity management because the generation of Idea from OI project involved people from diverse perspective both organizational is social, with different cultures and benefits. Another implication for SMEs comes from co-creating strategy of user engagement, particularly how managers are able to engage the partners in innovation because the “social collaboration” via SMNs appears more complex than traditional one because the relationship is more fragile and contingent since it linked to intangible aspect such as trustiness, customers’ loyalty and firms’ reputation. In this regard, the communication and interaction is no guarantee for development of trust, especially in situations where the participants in the collaboration have very different perspectives (Newell & Swan, 2000). Finally, the difficult to realize oOpen service innovation for SMEs is associated with e-collaboration. We can determine users as heartless and faceless then implying a quite degree of emotional control and coordination, as well as a strong belief in rationality in human behavior. This creates the condition of equality between parts involved in the relationship, guided by principles of reciprocity which impose flexibility and caution in the collaboration by requiring firms a collaborative and non-hierarchical approach in order to prevent negative spill-over (Han et al., 2012).

CONCLUSION, LIMITS AND FUTURE RESEARCH PERSPECTIVES

Co-creation and familiarization with the open innovation model can provide strong competitive advantages to SMEs, especially for those less innovative which suffer of a gap in competitiveness on the market, drastically reduced due to globalization and hyper competition (D’Aveni, 2010). The article seeks to describe one of the first efforts made by authors to create a new value-added strategic framework which emphasizes the relevance in adapting OI for small and medium firms operating the service industry in UK. It appears that open innovation and more precisely service open innovation constitutes new way road to survival for manufacturing middle class. Innovation performance can be considered the outcome of an open-innovation approach. In a nutshell, the OI has accelerated the evolution dynamic of the stages of business development that does not always (and not more) proceeds by respecting incremental steps but, otherwise, for technological leaps. This is particularly true when the innovation process is evaluated, developed and sustained by lead user (Booz, Allen & Hamilton, 1982). Theoretically, we prove that OI practices have an effect on all four dimensions outcomes on conceptual framework (Table 1). SMEs performance, OI users engagement, Social Media Networks and Open service Innovation was seen that have an effect directly on the learning perspective and indirectly on innovation performance, as result of the relationship with user-

consumers. In this regard, should be read the principle academic implication of this interest research which redefining the boundaries of innovation management for a long time considered linked by a dyadic relation with technology development. Alternately, this research has shown that innovation in addition to R&D management is positively affecting by other business performance parameters also represent internal process perspective and customer satisfaction as well. In particular, by evoking relevant contributions on the main field of research, we are able to identified three items for each dimension adopts to represent the main research question. Currently, very few contribute in this regard is able to find out a multi-lateral correlation between OI paradigms and Innovation performance of SMEs. The framework developed strongly supports the idea that the use of OI practices influences directly the strategy highlighting that SMEs are increasing open approach to innovation, more than larger enterprises (Spithoven et al., 2013). In this regard, with a robust test, statistically, we demonstrate the impact of OI model on the business performance between all manifest endogenous and exogenous variables (Anderson and Gerbing, 1988; Chin, 1998). According this, SMEs must foster increased innovation flows both within and between the stakeholders, especially customers. This concept opens an opportunity for further research development, by proposing for instance the revisitation of theoretical framework enlightening the Quadruple and Quintuple Helix Models (Carayannis & Campell, 2011; Carayannis et al., 2012) or, alternatively, by extending empirically the relationship with other stakeholders. Alternatively, recognizing its importance, the analyses of the knowledge management process via SMNs which has not been argued from us may be a part of the further research development. Moreover, other future avenues for research could include improving the evaluation framework by extending dimension and items considered so that it can be applied to companies operating in different contexts. Bias linked to the evaluation framework could be reduced if the evaluation is carried out by recognizing a pro-active role also for firm's actions in engaging user-customers via SMNs.

Obviously, the present work is not exempt of limitations. Mainly, the first concern regards the appropriateness of research question. In particular, we have to consider if open innovation be completely developed in the virtual and ubiquitous environment or, cause of technological progress, open innovation can consider on first stage? In effect, meanwhile a new generating idea evolves, the management of open innovation becomes increasingly more knowledgeable but more difficult as well. In this regard, the middle business class continuously lacks of capability, knowledge and skills, preventing the OI model application.

Subsequently, we need to consider a theoretical limitation because underline literature contributions is not the only reference to the open innovation theory. In particular, we focus our attention on small

and medium enterprises then the theoretical background suffers of an exhaustive comprehension of the entire field of research.

A second limit of this inquiry is linked to empirical development. The evaluation model is composed of 12 items which we believed be the most representative OI mechanisms applicable to business of small and medium size. Since this we are testing the significance of the analysis, we examining the association between the latent and manifest variables, evaluating the significance of bootstrapping.

Another limitation which should not be overlooked when investigating innovative entrepreneurship is the lack of consideration of a multidisciplinary approach. In particular psychological traits, individual characteristics and environmental features have been ignored. It is important to include the perspectives from cultural theory, consumer sociology and political economy when trying to understand the essence of generating user content. It seems obvious that say the main relationship need more than singular disciplinary theories to help us understand the intricate relationship between OI and social and technological performance. Anyhow, the present research, due to our background, should be widespread among entrepreneurial scholars. Conceptually and methodologically, in this article, we have argued for the articulation of OI practices as a complex concept involving not for his cultural role as a facilitator of civic engagement and participation, but only for his economic meaning as a creator and consumer of new innovation. Indeed, from a different perspective, this limitation might represent strength to leverage on. Hopefully, by proposing new contributions about this topic, academics could include other perspectives for enriching future analyses and forthcoming researches. Finally, open innovation models are seldom met in empirical literature. A deeper knowledge about the mechanisms and practices of OI model could be gained by investigating a number of different case studies in the field. Although holistic, our sample considers OI practices starts from SMEs then there might be interesting to extend the research model to the large ones or alternatively differentiate empirical findings by sectors or by country of Origin.

INFRASTRUCTURE AS A DETERMINANT OF ENTERPRISE DEVELOPMENT WITHIN THE ACADEMIC ENVIRONMENT IN POLAND

Siemieniuk, Łukasz

University of Białystok, Faculty of Economics and Management, Białystok, Poland

ABSTRACT

The aim of the study is to analyze the impact of infrastructure on the development of entrepreneurship within the academic community in Poland. Transfer of innovative knowledge and the practical application of research results within the economy which at the same time present opportunities for companies facilitating rapid growth are the most important tasks of the academic community of Poland. Infrastructure it is one of the primary determinants of the development of academic entrepreneurship in Poland. Appropriate infrastructural facilities satisfying the needs of representatives of both science and business are the basis on the development of entrepreneurship within the academic community in Poland.

Keywords: *infrastructure, academic entrepreneurship, Academic Business Incubators, Poland*

INTRODUCTION

In Poland academic entrepreneurship is a relatively new phenomenon which is rarely used for the development of economic activity. Literature on the subject points to a number of barriers limiting and often preventing economic activity of the scientific community. These include in particular: the inadequacy of formal and legal arrangements, limited access to financial resources and the assistance of highly qualified executives. Other obstacles encompass risks associated with the specific character of the intellectual property market, problems with the estimated value of a product, the formal description of the market as well as the clarity of property rights. Development of academic entrepreneurship is dependent on many factors. This applies in particular to problems connected to the science, research and education sectors which are sources of research and development and which provide a skilled workforce, training opportunities and potential entrepreneurs from among staff and students. Development of the local environment for innovation and entrepreneurship consisting of small and medium-sized enterprises, entities offering specialized business services, and potential customers for the products and services being offered also plays an important role. A support system, including institutions, organizations and various assistance programs such as science parks, technology transfer centers, technology parks and incubators of academic entrepreneurship, gains a

Innovation, Entrepreneurship and Digital Ecosystems

particular importance in this respect. One of the entities which enables the connection of business with universities are Academic Business Incubators whose mission is to support economic activity of the academia - students, doctoral students, staff and graduates of universities, combating unemployment and the commercialization of tangible and intellectual goods. The aim of this paper is to discuss the essence of academic entrepreneurship and present issues faced by Academic Business Incubators functioning as an institutional form of the development of academic entrepreneurship in Poland.

The aim of the study is to analyze the impact of infrastructure on the development of entrepreneurship within the academic community in Poland. Transfer of innovative knowledge and the practical application of research results within the economy which at the same time present opportunities for companies facilitating rapid growth are the most important tasks of the academic community of Poland. Infrastructure it is one of the primary determinants of the development of academic entrepreneurship in Poland. Appropriate infrastructural facilities satisfying the needs of representatives of both science and business are the basis on the development of entrepreneurship within the academic community in Poland.

THE ESSENCE OF ACADEMIC ENTREPRENEURSHIP

In literature academic entrepreneurship is defined in various ways. Some characteristic terms which are used include: *technology entrepreneurship*, *innovative entrepreneurship* or *intellectual entrepreneurship*.

Several examples of the definition of academic entrepreneurship are stated below:

- any kind of involvement of research institutions, academics, PhD students and students in economic activity (Plawgo, 2011).
- a new attractive mechanism for the commercialization of scientific know-how, allowing the multiplication of benefits derived by the researcher (explorer) and other research and business partners (the university, equity investors) (Banerski et al., 2009).
- activity within the sphere of transferring technology to business practice and the operation of businesses established on the basis of knowledge as well as research programs realized by students, graduate students and researchers (Ćwiek, 2012).
- business activity of people professionally connected with the school (academics) and those for whom an affiliation with the university is a stage in life, students or doctoral students, including the promotion of entrepreneurship, education concerning entrepreneurship and the activation of entrepreneurship (Banerski et al., 2009).

Academic entrepreneurship can therefore be understood in two ways. Firstly, it may be considered as the entrepreneurship of the university itself, as a separate well-managed and properly organized

entity. Secondly, academic entrepreneurship can be understood as entrepreneurial people associated with the university, such as researchers, academics, auxiliary and administration workers as well as students and graduates of doctoral, graduate and undergraduate programs. The university should, therefore, not only be regarded as an institution training future cadres for the economy but should also create conditions which could be used as practical knowledge by students, graduates and academics. Academic centers of the USA, a place where, after World War II, Stanford University and the Massachusetts Institute of Technology (MIT) initiated cooperation on scientific research with business, were precursors of this type of activity. Within the European Union a country that is a good example of creating academic enterprise using policies to encourage start-ups is Finland. Policies supporting the formation of academic companies in Finland are based on extensive cooperation between institutions supporting technology transfer to investors. Excellent examples of Finnish companies created on the basis of academic entrepreneurship are those dealing with the field of nanotechnology such as GENANO, KSV instruments or NanoLab Systems. Further examples of cooperation of academic centers with business practice of economic life include the University of Philadelphia (USA), British Cambridge University, the Heriott-Watt in Edinburgh, the University of Stuttgart, the Mining Academy in Aachen, the Technical University of Berlin and the University of Lund (Sweden).

Academic entrepreneurship was defined within the legal system in Poland in 2005. Principles of governing academic entrepreneurship of public and private universities are defined by the law concerning higher education. The Act of 2005 dealing with Higher Education contains provisions specifying universities as institutions which collaborate with the environment and spread the idea of entrepreneurship throughout the academic community. Academic entrepreneurship is a new way of thinking which shows that attempts to commercialize research results do not contradict the principles of research work and the attitude of the scientific community.

To take advantage of its intellectual and technical potential and the transfer of results of research and development to the economy universities can establish and maintain academic business incubators and technology transfer centers. These projects are implemented in the form of an interdepartmental entity, a foundation or a commercial company. Technology transfer centers are created in order to sell or transfer free of charge results of development work. In order to commercialize the results of research and development an institution should set up a special purpose company whose main task is holding shares of companies or creating companies with share capital dealing with the implementation of research results and development activities at the university. As a result, although SPVs and academic business incubators as well as technology transfer centers are meant to sell the results of development work, the tasks of the SPV are narrower, more specialized in nature. Hence,

taking into account the parallel enforcement of these regulations, creation of special purpose entities whenever the university intends to commercialize the results of research and development performed at the State Research Unit is recommended (Barszcz, 2013).

The development of academic entrepreneurship is conditioned on a number of determinants. The primary determinant is the growing importance of "knowledge" as a production factor. The experience of other countries from within the European Union confirms that the current model of a scientific institution, including the university, is being supplemented to include preparation for entrepreneurial activity and developing of active and independent labor market behaviors. The academic community should get closer to business practice. Firstly, the general direction of the development of scientific institutions is to collaborate with the widely understood business world, mainly with local small business. Secondly, educational and scientific institutions should also be focused on building entrepreneurial attitudes and entrepreneurial skills among their own teaching and research staff as well as students and graduates.

A number of literary sources display interest in issues concerning entrepreneurship in the academic community (Matusiak et al., 2005):

- the "inventor-entrepreneur" model allowing current implementation of new solutions within the sphere of market and consumer expectations seems to be particularly effective for activities relating to the commercialization of new ideas from science to the economy;
- the increasing pressure to innovate leads to the reduction of time in the process of transforming a product from idea to market deployment (faster is better) which requires that business and scientific institutions as well as university scientists and entrepreneurs work closer together. Innovation is increasingly becoming a product of the environment in which the entrepreneur operates (innovative environment);
- the intensified search for new forms of increasing income of universities and research institutions by opening channels of communication and cooperation with business and, consequently, the sale of technology and research services.

External success factors of academic entrepreneurship which include differences in national legislation along with issues regarding the ownership of the discovery can also be very important. In most countries, including Poland, these rights are the property of the institution employing the creator. There are, however, countries in which the so-called professor's privilege places all the rights to the invention in the hands of its creator (some countries in which this occurs include Sweden, Greece, Italy, Finland, Romania). Other external success factors are the availability of government funding and private financing of innovation, raising public spending on research, creation of tax incentives for inventors, institutions and investors, encouraging entrepreneurship, the manner of functioning of

institutions within the sphere of a business environment including government agencies and programs, consulting firms, science parks and technology incubators which can provide new businesses with additional assistance at their early stage of development (Guliński and Zasiadły, 2005).

The development of academic entrepreneurship also includes the need to deal with a number of barriers localized both within the organization and in its surroundings. Obstacles to the development of academic entrepreneurship involve, among others, organizational barriers within the university, mental, cultural, psychological, social, financial, structural or information barriers. Listed among obstacles to the creation of business stemming from academia are: imperfect procedural solutions, limited access to financial resources and highly qualified managerial staff and the lack of sufficient awareness within the academic community, especially of university management. At the same time this activity is fraught with considerable risk because it is difficult to predict if the proposed product will meet market demands and whether those qualitative and quantitative parameters, demand limitations, which have been foreseen for the technology being developed, can be met (Plawgo 2011).

Other limitations to the development of academic development mentioned in literature include perpetuating negative attitudes to risk-taking, negative attitudes of the scientific community to commercial activities as well as a lack of encouragement from university authorities to initiate business activity. Research conducted in 2009 by the Polish Agency for Enterprise Development shows that the main reasons that students taking part in the study were not interested in any form of business was satisfaction with their current job (57%) and fear of risk and lack of appropriate predispositions (24%). Exactly the same reasons were given by academic staff showing no intention to engage in entrepreneurship. 76% of scientists pointed to job satisfaction, and 10% to the lack of the necessary predispositions. A major problem in the development of academic entrepreneurship is the conviction of respondents that it would be difficult to reconcile it with their scientific work. This view was presented by 63% of respondents and, at the same time, 40% of them were of the opinion that they would have a problem with overcoming this barrier (Zbaraszewski, 2009).

Entrepreneurship within the academic community in Poland has to overcome, therefore, numerous obstacles to function at all. This is primarily due to the current legal system and to organizational constraints, both within the economic sphere and of mentality. Overcoming limitations can promote the creation of channels of technology transfer and innovation between universities and the economy. According to Berkhout, an entrepreneur is seen as an entity bearing the risk arising from uncertainty. However, in order to reduce the uncertainty of income from self-employment, it is more and more associated with the regular part-time work (Berkhout et. al., 2010).

J. Baumol argues that the allocation of entrepreneurship resources is a mechanism for transferring institutional impulse into the economy (Baumol, 1990)

The development of an entrepreneurial attitude is always a very individual matter, but in the economy there are a number of divisions and types of entrepreneurship. The external and internal entrepreneurship can be distinguished. The external entrepreneurship is addressed to our environment, we have to deal with it when we are developing our own commercial venture. The internal entrepreneurship occurs when we use our characteristics and skills needed by the company, a team of people we work with.

Gibb, on the other hand, recognizes the role of small and medium-sized enterprises in supporting the process of maintaining management of entrepreneurial attributes of young people by providing standards, role models and insight into independent business processes (Gibb, 1987).

According to S. El Harbi Sana A. and R. Anderson, the establishment of appropriate institutions produces beneficial effects in the form of dynamic effectiveness of the economy. This reinforces attitudes that are conducive to progress. Therefore, there should be adequate economic infrastructure built, supporting good entrepreneurship and associated innovation (Harbi and Anderson, 2010).

THE IMPACT OF INFRASTRUCTURE ON THE DEVELOPMENT OF ACADEMIC ENTREPRENEURSHIP IN POLAND

Infrastructure is one of the key factors affecting the development of economic activity of the academic environment in Poland. Proper infrastructural facilities satisfying the needs of the scientific world as well as of business are the foundation of innovative development of the nation.

Science and technology parks as well as centers of academic entrepreneurship are very important elements of infrastructure. These institutions have at their disposal tools which facilitate and support cooperation of business with research centers. They are therefore conducive to stimulating innovative development of the economy.

Science and technology parks can, therefore, be perceived as innovation systems which may be scaled down but which are very functional and essential to a modern economy. They are a place of creating and perfecting innovative solutions and they enable genuine cooperation of science and business. Business incubators are, in turn, organized economic complexes possessing the necessary facilities for the development of innovation as well as the technological and intellectual capital. Their activity is aimed at supporting start-ups and concerns two main areas - access to office space and to business services. Recently in Poland, business incubators have become the domain of research centers – they are established by universities, both public and private, in the form of centers for entrepreneurship. Academic Business Incubators (AIPs), created through the use of university and EU funds constitute a

nationwide network of support and development of entrepreneurship for students, alumni and faculty (Wierzyński, 2012).

The International Association of Science Parks (IASP) in November of 2002 adopted a definition of a technology park (scientific, research, etc.) as an organization which is managed by qualified professionals and whose aim is to improve the well-being of the community in which it operates through promoting innovation, competition among entrepreneurs and knowledge-based institutions (Bąkowski and Mazewska, 2012).

42 technology parks operated in Poland in 2014. Most parks were located in the provinces of Wielkopolska, Silesia (6 each) and Lower Silesia (5). Technology parks are usually located in cities or in their proximity.

International experience confirms that one of the success factors of technology parks is their closeness to a university which is active in the area of academic entrepreneurship and effective multi-level networking contacts with the scientific community. They facilitate the development of cooperation between the academic environment and business which favors the merger of a market-oriented offer of representatives of science and expectations of business. Parks should therefore support the commercialization of research results.

Transfer of knowledge from a university to a business is one of the functions of science and technology parks mentioned in literature. These parks are most often established by universities or sustain other strong links with them - some conduct workshops or maintain whole university managed entities on their premises. Now-a-days typical services of these kinds of parks include access to the infrastructure of developmental projects as well as technology testing based on the results of research from universities (the function of "technology incubation"), brokerage and organizational support for R & D projects ordered by or as part of cooperation with enterprises, cooperation with university technology transfer centers or, at times, even fulfillment of the role of such a center, incubation of spin-out companies which originate from universities and supporting their development. According to experts the future integration of the park with the university will be even stronger and will influence both partners. Parks can support universities in their educational functions by conducting classes on entrepreneurship, "sharing" their employees as lecturers, transferring knowledge related to the practical aspects of the functioning of a given field that is being developed in the park, allowing access to research infrastructure for educational purposes, conducting practical classes and participation in the exchange of internships with park tenants and customers as well as affecting the curriculum (based on their knowledge of market needs gained from their customers) (Matusiak, 2011).

Key processes supported by the parks include: the ability of tenants to utilize the park's infrastructure, flexible modification of the park's offers to fit the needs of their tenants, building of active networks of cooperation, obtaining of financing and the effective support of commercialization. On the other hand, key assets held by the parks consist of their infrastructure including offices as well as laboratories or spaces for test or prototype production, a qualified work force fulfilling the role of innovation brokers, and supplementary processes connected to security, maintenance or IT services (Bialek-Jaworska and Gabryelczyk, 2014).

Another element of technical infrastructure effecting the development of entrepreneurship are Academic Business Incubators (AIP). Most often they function as interdepartmental facilities directly subordinate to the Rector or Vice- Rector and are part of the institutional structure of the entrepreneurial model of the university.

Activity of academic business incubators usually is initiated by the academic community. Their aim is to assist the preparation of the establishment of a company and the initial assessment of its chances for achieving market success. The incubators carry out their statutory tasks within the fields of education and promotion of entrepreneurship and support efforts to commercialize new products and technologies. The goal of supporting academic entrepreneurship requires their active involvement in the educational processes through the use of tools such as (Bąkowski and Mazewska , 2012).

- promotional events related to entrepreneurship,
- university competitions for development of business plans for students, graduate students and young science lawyers,
- organization of training and consulting for potential academic entrepreneurs,
- creation and development of centers of academic creativity,
- creation of a wide network of external contacts of risk investors, alumni associations and other business support institutions.

Academic incubators generate many benefits for the university by using tools such as (Bąkowski and Mazewska , 2012).

- making the educational offer of the university more attractive and improving the image of the university,
- improving relations with society and local businesses,
- increasing revenues from collaboration and technology transfer to companies established by graduates,
- increasing orders and research sponsorship,
- obtaining additional funds from programs supporting technological entrepreneurship,

- providing additional income opportunities for students and research, engineering and technical employees.

The Academic Incubators of Entrepreneurship is a network of 50 incubators in various cities of Poland.

City (Number of incubators)	Brief characteristics
WARSAW (7)	<p>AIP Incubator of the Warsaw Agricultural University - since 2004 it has helped more than 1,000 startups and currently supports more than 200 of them. It enables business from any industry.</p> <ul style="list-style-type: none"> - AIP Incubator of the Warsaw Agricultural University - one of the first business incubators in the country has been in operation for more than eight years and includes more than 500 companies. - AIP Incubator of the UW, Department of Economics is located in the very center of Warsaw and combines expertise from more than 50 departments of the largest academic center in Poland. - The Warsaw University of Technology AIP Business Incubator is also located close to the center of Warsaw. It helps to transform technological projects into well-functioning companies. - AIP Incubator of the Lazarski University in Warsaw - the only incubator in Warsaw which is fully adapted for disabled people. It offers up to date computer equipment and a conference room for 12 people. The office is available 7 days a week, 24 hours a day. - AIP Incubator of the Vistula Academy of Finance in Warsaw - AIP Incubator of the University of Social Sciences and Humanities in Warsaw - AIP Incubator of the Warsaw University - Faculty of Management
BYDGOSZCZ (4)	<ul style="list-style-type: none"> - AIP Incubator of the University of Economy in Bydgoszcz –the incubator is located in the city center. Its strengths are convenient location and a large surface area (111 m²). - AIP Incubator of the University of Technology and Life Sciences in Bydgoszcz - there is a coworking space for startups and a big hall which can be turned into a place of training or a photography studio. - AIP Incubator of the University of Bydgoszcz - AIP Incubator of the Collegium Medicum UMK in Bydgoszcz
LODZ (3)	<ul style="list-style-type: none"> - AIP Incubator of the University of Lodz. The incubator stands out because of its large work space. Its conference room can accommodate up to 30 people allowing the organization of training and mini-conferences. The coworking area has 6 fully-equipped work spaces. Additionally, free parking is available in front of the building. - AIP Incubator of the Social Academy of Sciences. It has an intimate conference room and three coworking spaces - AIP Incubator at the Higher School of Computer Science and Skills
GDANSK (3)	<ul style="list-style-type: none"> - AIP Incubator of the Gdansk University - the oldest incubator in Tri-City Area, - AIP Incubator of the Gdansk University of Technology – has been in operation since December of 2013. Training, mentoring or loose networking meetings occur at the incubator every day. -AIP Incubator of the AWFIS - Poland's only incubator operating at a university with a sports profile. It specializes in startups which promote a healthy lifestyle.
BIALYSTOK (3)	<p>Three incubators located near universities and municipal offices function in the city.</p> <ul style="list-style-type: none"> - AIP Incubator of the WSFiZ in Bialystok – The AIP Incubator is located at the School of Finance and Management. The location is very popular with start-ups confirmed by the fact that so far access cards for this office have been used 20 565 times. Startups have at their disposal a coworking space consisting of 6 capsules with all the necessary equipment to work effectively and use of the conference room. -AIP Incubator of the University of Bialystok – The Incubator is located in the students' dormitory. Available to startups is a coworking space consisting of 3

	capsules and a conference room. -Another AIP incubator was created at the City Hall of Bialystok
LUBLIN (2)	- AIP Incubator WSPiAin Lublin – is equipped with 5 independent work spaces equipped with computers, internet access and a laser printer. At companies' disposal is also a small conference and training room for 8-10 people equipped with an LCD TV, a camera for video conferencing, a multimedia projector and an array of glass boards to draw up business concepts. - AIP Incubator at KUL - offers 4 computer stations equipped with computers and a conference and training room for up to 6 people equipped with an LSC TV and a flipchart.
RZESZOW (2)	- AIP Incubator of the University of Rzeszow – over 60 companies are active within the incubator - AIP Incubator of the UiTM in Rzeszow
KATOWICE (2)	- AIP Incubator of the University of Silesia in Katowice – in terms of area it is the largest incubator in Silesia and one of the largest in Poland (its surface area is 120 m2). Operates as part of the largest academic center in the region. - AIP Incubator of the Gen. J. Ziętka Silesian School of Management.
WROCLAW (2)	- Wroclaw AIP Incubator at Bank Zachodni WBK - the largest incubator within the network of incubators – with an area of 200 m2. The incubator has a large coworking Space, a meeting room for 4-6 persons equipped with a TV, a training room equipped with a projector and multifunctional device. - AIP Incubator of the University of Economics in Wroclaw - consists of 6 coworking stations equipped with computers and a meeting room for 8 people equipped with a TV, a projector and whiteboard.
POZNAN (2)	- AIP Incubator of the Poznan University of Economics. There are 5 workstations in its coworking space and a conference room for 6 people. -AIP Incubator of the Adam Mickiewicz University in Poznan. Its coworking space consists of 5 workstations, and a conference room which will fit from 6 to 16 people.
SZCZECIN (2)	- AIP Incubator of the University of Szczecin - AIP Incubator of the Pomeranian Medical University

Table 1. Selected Academic Incubators of Entrepreneurship in Poland

Source: <https://inkubatory.pl/> (accessed 10 February 2016).

A significant aspect for working toward the creation of academic entrepreneurship in Poland is the project being realized by the Academic Incubators of Entrepreneurship titled "the Road to an Enterprising Poland". The goal of the project is to build and implement a combined system for the creation of academic entrepreneurship in Poland consisting of institutions such as the Academic Incubators of Entrepreneurship and the Academic Incubators of Entrepreneurship Business Links, which cooperate with one another. The main goal of the project is the creation of a pre-incubation – incubation system offering services promoting innovation for people starting businesses and testing their ideas within the framework provided by the Academic Incubators of Entrepreneurship as well as incubation services for new businesses, especially technology companies, which have completed their pre-incubation phase, took advantage of the Academic Incubators of Entrepreneurship and, in a natural way, can move on to the incubation stage and obtain support of Business Links incubators. Also important is the fact that the "Road to an Enterprising Poland" project is mainly directed at

people connected to the academic environment who have not officially registered a business as well as those who have and seek an opportunity to utilize the support of an incubator.

The "Road to an Enterprising Poland" project, financed through funds obtained from the European Union, has been developed by the Academic Incubators of Entrepreneurship Foundation and has as its aim the development of modern, promoting innovation services for SMB sector as well as supporting the implementation of innovative organizational, technical and IT solutions. Activities mentioned above are being realized through the creation of a pre-incubation system whose framework supported the creation and operation of over fifty incubators and incubations which in turn have resulted in the establishment of nine AIP Business Links. The realization of this project, possible through EU funds, brought about the achievement of effects which in their scale are, so far, unprecedented in Poland and have resulted in the establishment and rapid development of new, innovative businesses all over Poland. It should be stressed that the realization of the "Road to an Enterprising Poland" project has been based on the analysis of foreign experience gained during study visits (in places such as the Silicon Valley, China, India or Israel) as well as through consultations conducted with Polish and foreign experts and authorities on the subject of entrepreneurship. Aims of the project include the modernization and development of the potential of the business environment providing services promoting innovation for start-ups through the activation of 50 modern Academic Incubators of Entrepreneurship, which fulfill the role of AIP pre-incubators, and 9 Business Links or so called AIP BL enterprise centers.

Two ecosystems of innovation promoting services for AIP as well as for AIP BL have been created within the project, ecosystems which have been integrated and implemented through the use of a specialized IT system. The "Road to an Enterprising Poland" project is part of initiatives inspired by the European Innovation Action Plan which has as its aim the stimulation and development of entrepreneurial attitudes in Europe. The total worth of the project, which in its initial phase gained approximately 25 million PLN in funding, was expanded to 65 million PLN. The realization of the project consists of the creation of a modern network of Academic Incubators of Entrepreneurship and groups of technologically advanced centers of entrepreneurship or AIP Business Links.

SUMMARY

In conclusion it can be stated that academic entrepreneurship based on innovation is an essential element of the innovation policy of the state. It, therefore, requires the development of appropriate legislation and the creation of appropriate regulations. Reorientation of universities to cooperate with the business community is a long-term process that requires changes in the mentality of the academic community and relevant internal regulations of schools. The transfer of knowledge from science to

business will be more efficient when support is provided both at the national as well as the regional level. Factors listed in literature which have a favorable effect on the efficient cooperation between businesses and universities along with direct financial support, technology transfer, and business contacts are all a part of appropriate infrastructure.

Growth of academic entrepreneurship in Poland is difficult to imagine without necessary infrastructure. Both the process of pre-incubation as well as the establishment of a technology transfer center at a University requires office space which has been adequately equipped with telecommunication devices, software and furniture. Especially important for these processes was the 1.3.SPO WKP28 (2004-2006) Initiative which provided funds for consulting services, promotion of, construction of academic incubators and, its most important aspect, investment into academic incubators. It turned out, however, that schools could not apply for those funds and that they were reserved for science and technology, industrial and technological parks. Nevertheless, in some cases funding for the construction of technological incubators were granted to science and technology parks connected to universities, including the Wroclaw University of Technology, the Adam Mickiewicz University in Poznan and the University of Lodz and the academic incubators functioning within the framework of those universities also benefited. As a result the year 2006 saw the creation of the first in Poland technological incubators. Other facilities were established with funds guaranteed for this type of investment in subsequent periods of the program. The possibility to gain additional funding for the operation of technology transfer centers from the structural funds (ZPORR29 2004–2006, initiative 2.6.) spurred some universities to intensify the activity of existing or about to be established new academic technology transfer centers (like those from the Warsaw University, the Jagiellonian University, the Adam Mickiewicz University in Poznan or the Wroclaw University of Technology). Thanks to the funding identified above incubators gained computer equipment, furniture and operational resources. It is foreseen that within the next few years the structural funds of the EU will not lack funds for the continuation of activities connected to the operation of Academic Incubators of Entrepreneurship (Gulinski and Zasiadly, 2005).

Technology, space, computer and multimedia equipment as well as communication and IT systems supporting the development of centers backing entrepreneurship in Poland stimulate all types of business activity. Infrastructure plays a significant role in the growth of a given entity (country, region or university). It is a factor of development. It can be ascertained that the correct development of infrastructure leads to the development of entities like universities, countries or regions providing foundations for the growth of economic activity in Poland.

Our analysis has shown that the Academic Incubators of Entrepreneurship significantly influence the infrastructure level of centers supporting the development of economic activity in Poland stimulating

various types of economic enterprise which, in turn, affects the growth of entrepreneurship of Polish society in regards to investing into their own businesses. The "Road to an Enterprising Poland" project, financed with EU funds and developed as well as realized by the Academic Incubators of Entrepreneurship Foundation, is an example of such activity.

ABSTRACT

This research aimed to study the role of indigenous knowledge on climate change and disaster resilience of local communities living in Surkhet and Dailekh districts of Nepal. The importance of including indigenous/local knowledge (IK) in the programming of DRR and CCA has been recently internationally recognized, because of the growing attention around the concept of resilience and its focus on what is already in place, instead of what is missing from an affected community. The principal objective of this thesis has been to understand the main characteristics of IK in the studied communities and analyse its role in the disasters and climate change resilience. The investigation started with a literature review of the main disciplines related to disasters and climate change, in order to build up a theoretical framework that would have entailed a comprehensive overview of the IK applied to community resilience. Through the FGDs and transect walks a field study of two weeks has been conducted, in order to collect primary data information and apply the theoretical framework designed. The analysis of the findings lead to the conclusion that the sampled communities living in Surkhet and Dailekh have an extensive awareness of the reasons behind the occurrence of natural disasters and climate changes, while preserving their beliefs and local practices to cope with the natural challenges. Nevertheless, the indigenous coping mechanisms and adaptation practices proved to be not resilient; the practices that might have worked in the past are not effective anymore, and the few indigenous coping mechanisms are too weak to be a reliable help when a disaster strike. Similarly, the changes in the climate are too structured for the IK of the studied communities to be strongly effective. In conclusion, while the IK for disasters and climate change plays an important role for the communities living in Surkhet and Dailekh, the lack of physical and economical resources keeps them very vulnerable and impede them to be fully resilient.

Keywords: *Climate change, environment, agricultural, focus group, Nepal.*

INTRODUCTION

The above statement comes from an analysis made by O'Brien et al. (2006), who define the meaning of resilience in such a way that it comprehends the main debates around the concept and its applicability in the humanitarian world. It is important to emphasize the distinction that O'Brien et al. (2006) make between what is missing in a crisis and what is in place, in terms of resources and adaptive capacities. The key revolution around the concept of resilience relates to a focus on what is actually already in place, and build on that to enhance the capacity of coping with natural disasters or climate change consequences of a certain community (Elasha et al. 2005). The basic concept of resilience thus entails a focus on adaptive capacities: resources with dynamic attributes. These attributes are considered dynamic because they are likely to change when faced with a certain disturbance or shock, which triggers the adaptation capacity (Norris et al. 2008). This shift from reducing vulnerability to increasing the adaptive capacity is not new in literature (Dekens 2007). Recent studies on resilience have recognized the importance of local knowledge and practices to cope with natural hazards (Kelman et al. 2008) and adapt to climate change (Berrell & Phillips 2013). Indigenous/local knowledge is a type of knowledge that is part of a communities' behaviour and lifestyle, which is passed through generations and internalized by people through a process of socialization (SAARC 1999). The importance of indigenous/local knowledge when it comes to Disaster Risk Reduction (DRR) and Climate Change Adaptation (CCA) has recently been recognized internationally and several efforts are made to understand if a permutation between them would improve the effectiveness of disaster risk preparedness and climate change adaptation and mitigation. For what concerns indigenous knowledge in disasters preparedness, it refers mainly to building techniques for disaster-resistant houses, interpreting the signs in the environment to anticipate a natural hazard, understanding unusual appearance and movement of wildlife, using local legends/proverbs to raise awareness on climate-related problems and relying on social networks of a community to cope with disasters effects (ISDR 2008). Regarding the IK for climate change, the main features that characterize it are the awareness of the changes in the climate, comparing the weather patterns between 10 or 20 years ago and now, using climate-resilient agricultural local practices, noticing the changes in biodiversity and in the ecosystem and preserving natural resources (Nakashima, D.J., Galloway McLean, K., Thulstrup, H.D., Ramos Castillo, A. and Rubis 2012; Chhetri et al. 2012; Chaudhary et al. 2011).

The goal of this research is to study the use of indigenous knowledge (IK) for disaster preparedness and climate change, and investigate what their leverage is in community resilience. In other words, the research aims to understand the IK on disasters and climate change of a given community, to see what their local practices and beliefs are, and how these contribute to their resilience. In order to study

the application of this concept in practice, a field research was conducted. The districts of Surkhet and Dailekh in the Mid-Western region of Nepal have been selected as the field setting. Nepal has been selected because of its long experience with natural disasters (Aryal 2012; Jones et al. 2013) and because similar studies have been conducted in the country (Chaudhary et al. 2011; K.C. 2013). However, no research has focused on IK applied to both natural disasters and climate change specifically. Another reason for choosing Nepal is that it is a country where hazards triggered by the climate change are constantly increasing, and therefore the link between the climate change and disasters is already embedded in the weather patterns. This research focuses on investigating what the role of indigenous/local knowledge of the communities in Surkhet and Dailekh is on disasters preparedness and response, as well as on climate change adaptation, focusing on the communities' self-vulnerability assessment, as well as their awareness and coping mechanisms.

AIM AND METHODOLOGY OF THE STUDY

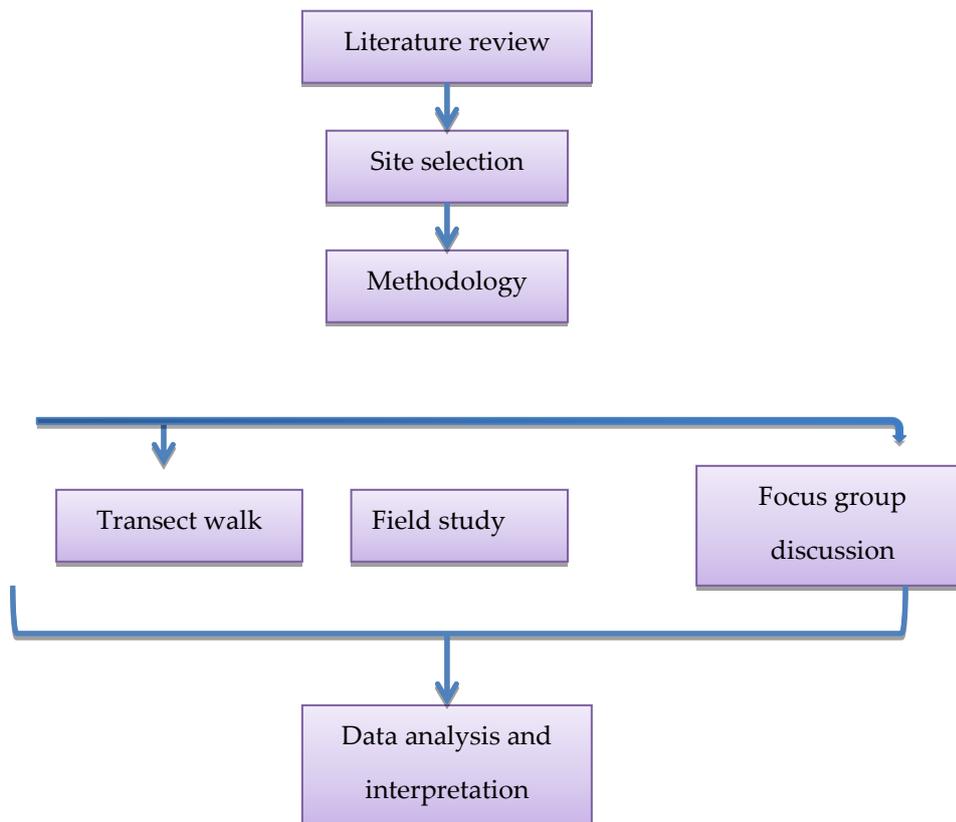

The principal objective of this research is to identify the role of indigenous/local knowledge in the resilience to climate change and natural disasters in two districts of Nepal. In doing so, it will become clear through the methods chosen for this research where these two disciplines could merge and to what extent IK could play an important role in the coping mechanisms and adaptation measures towards natural disasters and climate changes. The consequent scope is to understand if the IK of the studied communities still constitutes an important tool for the resilience of rural communities, and two different districts (Surkhet and Dailekh, in the Mid-Western region of Nepal) have been chosen, in order to make a comparison and strengthen the outcomes of the research.

The specific objectives, that would aim to achieve the overall objective, are:

1. Identify the importance of the combination of DRR and CCA and study the role of indigenous/local knowledge in this combination
2. Identify the indigenous/local knowledge on DRR and CCA in two VDCs in two districts of Nepal. I will make a comparison between a VDC which is located in a flat and cultivated area (Surkhet), where the temperatures are quite high in comparison with another mid-hilly area, where the environment is slightly different (Dailekh). The analysis will be mainly focused on the different type of indigenous knowledge assessed, rather than on the physical context of the two districts.
3. Identify the state of knowledge, both in terms of awareness and adaptation measures, towards natural disasters and climate changes of the selected communities, and see the similarities and the differences of the two case studies.

4. Finally, to see as a whole how the IK of the selected local communities is contributing to the resilience to disasters and climate change, trying to understand where the limitations and challenges are, and where some lessons learned can be built. The discussion will be built around the concept of resilience and, under an IK perspective, the adaptation level of the studied communities will be analysed.

The conduction of this research has been done through the use of various tools, triangulating the focus group discussion (FGD) and transect walk. The reason of the use of FGD is given by the fact that the topic of IK in disasters and climate change is not easy to grasp.

We started this research through an extensive literature review that lasted for several months, as I added sources along with my data collection and analysis, and I then decided where to base my research, in Nepal. Once in Nepal we developed an schedule design (the FGD) together with secondary data collection of the most important Nepalese developments in terms of policies and researches. In this regard, the informal meetings with important stakeholders in the field of DRR and CCA in Nepal significantly helped us to frame this research in a very context-specific manner. After framing my data collection tool, we went to the field and we performed the research. Back in Europe we started with the writing, and especially the data analysis and discussion. While analysing the data and discussing the findings, we went back to my literature to consolidate what I discovered in the field with already existing studies. This strategy helped us to make the research more scientific, and

knowing the limitation of this study given the methods and the small-scale character of the research itself.

FOCUS GROUP DISCUSSION

The FGD structure follows in principle the same outline of the survey, but without going into too much details about the potential answers of the respondents. Considering that the questionnaire is very much structured, because even if there are some open ended questions, the majority of the questions are closed and with very specific answers, with the FGD we decided to have a general skeleton through which direct the questions and leave the floor to open interpretations and added value that could come out only with a very open structure. This decision comes from the fact that assessing IK for disaster and climate change is extremely difficult, especially because it is context-specific, most of the time orally transmitted and probably hard to measure in areas where the impact and risk of disasters/climate change is low, as it is the case for the VDCs of Surkhet and Dailekh. The questions we have chosen for the questionnaire are as much as possible close to what we expected to find in these two VDCs, according to other studies in the area or Nepal in general (Singh et al. 2011; Gum et al. 2009; Chaudhary et al. 2011), but it is with the FGD that it is really conceivable to grasp in deep the fundamental indigenous/local knowledge of the communities interviewed, as the goal of it was to let them speak and contribute to the topic, rather than me suggesting how to respond.

In order to have a clear idea on how the FGD was structured, a clarification must be done. As it is widely affirmed in the literature (Krueger 2002), it is very important, when designing a FGD, to have all the possible categories in terms of age and gender represented. For this reason, I decided to perform 10 FGDs¹ in total and divide them per category in the following way:

- 4 FGDs with women only.
- 2 FGDs with men only.
- 2 FGDs with mixed people (both men and women).
- 2 FGDs with children in two different schools.

This division refers to the total number of FGDs for both VDCs, which means that for each VDC I performed 5 FGDs and divided them per category accordingly. We performed more FGDs with women mostly because of two reasons: in our field visits the majority of people available for an interview were women, and this is due to the fact that men were either at work or outside the country to earn money for the HHs (with the last being the main reason for their absence). The second

reason is that the two NGOs that helped me with the data collection had performed various women empowerment training sessions with the communities we visited, which strengthened their relationship and therefore women were more favourite to be selected as respondents.

As a general consideration, it must be noted that we slightly adjusted the FGD structure after the first two focus groups we performed, which served as a pilot and gave me useful inputs to ameliorate the FGDs to come. The final structure chosen has been the following:

FIRST PART: DESCRIPTION OF THE PARTICIPANTS

1. Description of the facilitator and the importance of this study.
2. Describe yourself (age and educational level included) and what is your occupation and how many people you are living with.

SECOND PART: QUESTIONS RELATED TO DISASTERS

3. What is a risk for you?
4. Why do you think natural hazards occur?
5. Have you experienced any flood/landslide/drought or any other hazard in the recent years and which were the consequences?
6. Think about a flood/landslide/drought etc. that occurred in your area and explain how you AND YOUR COMMUNITY REACTED TO IT.

THIRD PART: QUESTIONS RELATED TO CLIMATE

7. What kind of changes have you noticed in the environment in the last 10 years, regarding temperatures and rainfalls?

FOURTH PART: COMMUNICATION OF IK

8. Please tell us the proverbs/songs/legends that have been transmitted in your household for generations that helped you to be more aware of risks and climate pattern. Any kind of community ceremony?

9. What have your grandparents/parents/relatives taught to you in relation to adaptation to climate, awareness and coping mechanisms related to disasters? (i.e: how to build houses, what kind of crops use, how to interpret the changes in the weather)
10. How the social network within your community influenced the way you respond when a natural hazard occurs?
11. Do you have any evacuation system put in place within your community, in case a hazard strikes?

RESULTS

In order to have a consistent outcome of the FGDs, the analysis will be done at an aggregate level, putting together the results all the four FGDs and seeing what patterns could be drawn. The following are the FGDs conducted in Surkhet, summarized per category of people and details about the participants:

Table 1: Focus group discussion overview

Focus group discussion overview	
Surkhet	
Day 1 – women participants	Gender: Female Number of participants: 11 Age: from 24 to 56, mostly young adults Education: Most of them got school education (very heterogeneous sample as it varied from grade 2 to grade 10) Occupation: Mainly agriculture, plus private shops HH average size: From 4 to 6
Day 2 – mixed participants	Gender: Mixed (5 men and 8 women) Number of participants: 13 Age: from 25 to 57, mostly young adults Education: Mostly illiterate, some received informal education, only 3 of them have school education (grade 6-7-8) Occupation: Crop production, agriculture and HH care HH average size: 5 people
Day 2 – women participants	Gender: Mixed (5 men and 8 women) Number of participants: 11 Age: from 25 to 50, mostly around 40 Education: Mostly from grade 5 to 9, some of them got informal education Occupation: Agriculture, retail shop, poultry and goat production, small hotel HH average size: 8 people (from 3 to 11)
Day 3 – male participants	Gender: Men Number of participants: 8 Age: from 24 to 70, mostly around 40 Education: Various school educational level (from 5 to 9), some got informal education and one is doing a bachelor Occupation: Small shop, agriculture and one student HH average size: Around 6-7

After the roundtable of sharing of information within the participants, which allowed to have a clear picture of the composition of the FGDs, the discussion started with some general questions regarding concepts such as risk, disasters, vulnerability and secondly the respondents have been asked to share their experiences related to natural hazards and describe what kind of impacts affected them. What it was important to see is their definition of risk, their idea on why natural hazards occur and the experiences they had in relation to that.

DEFINITION OF RISK

The answers across the FGDs conducted are quite similar in terms of what is the most common definition of risk, and how the concept of risk is associated with natural disasters. The main trends are the following:

1. Natural hazards: the most selected options to answer the question of what is risk for the respondents has been related to a mere list of natural hazards that occurred in the communities. Those are especially floods, landslides, heavy storm, strong wind, earthquakes.
2. Sudden incidents: the second most given answer is that risk is everything that happen all at sudden and for which there is very little to do about, in order to retain the consequences. In terms of sudden incidents the majority of respondents indicated sudden diseases, the death of livestock for unexpected reasons, physical incidents that undermine the normal functionality of the HH.
3. Consequences of climate change/disasters: The last trend of the definition of risk is related with the consequences of climate change and disasters, meaning that a risk for some of the respondents is the destruction of crops by floods, destruction of houses by landslides/floods, low crop production due to poor rain and long drought, financial crises related to all the losses.

NATURE OF NATURAL HAZARDS

Same for the definition of risk, the respondents have been ask to define why they think natural hazards occur, in order to see what is the level of awareness of the communities sampled. The main answers for the four FGDs have been the following:

1. Causal effect – wrong actions bring bad changes in the environment: many of the respondents surprisingly, for a researcher perspective, knew about the changes in the environment and what actually causes climate change negative effects and natural disaster. The communities sampled mostly affirmed that problems they are facing in their

livelihoods are due to bad habits of people and wrong actions. The ones that are mostly cited are:

- a. Deforestation causes drying up of water sources and scarcity of rainfalls, which will cause landslides and tougher drought and therefore less productivity and HH damages.
 - b. High urbanization causes bad waste management and use of materials that are not degradable, irresponsibly thrown in the nature. High urbanization also makes that the building of more houses destroys the forests and the high pollution causes negative climate effects.
 - c. Massive use of chemical pesticides deteriorate the soil quality, and therefore cause low crop production.
 - d. Open defecation causes diseases.
2. Poverty: a good quantity of the respondents pointed out the poverty and the inability of buy the necessary materials to cope with disasters and negative climate change effects as the main reason why disasters actually hit their communities. Examples given connected to the scarcity of financial resources were mainly the consequence of low education and therefore low awareness on the changes, bad materials to build houses that are less resilient to shocks, the high cost of river barriers that would prevent floods, inability to buy toilets and avoid open defecation and the use of traditional crops that are no more adaptable to the new changes in the environment. This last point will be further discussed later in the analysis.
 3. No awareness and bad coping mechanisms: some of the respondents are not aware of the reasons for the occurrence of natural hazards, and some of them mentioned that only the people who listen to the radio are aware of these changes.

DISASTER EXPERIENCE

The last question of the section regarding natural hazards aimed to know what kind of hazards the communities interviewed experienced in their lives (and not just recently), and especially to know the consequences of them and the coping mechanisms they put in action. The answers given by the respondent kind of followed the same trend as the responses in the questionnaire, but added important details on the consequences of such hazards.

The respondents indicated, at an aggregate level, the main hazards that hit their communities, in the past and nowadays. The hazards identified are the following (in order of frequency):

- Strong storm

- Drought
- Lightening
- Landslides
- Heavy rainfalls
- Earthquakes
- Diseases
- Everyday accidents that have little to do with natural disasters (incidents, broken bones, people dying).

These are the most given answers in relation to hazards experience (mostly natural and climate hazards), from which three very interesting features came out. Kokishara, 49 years old, resumed in a sentence the main issues she is facing:

“We always suffer from drought, wilting of plants, they do not get water. There is a high presence of pests and dropping of flowers, we usually grow vegetable seed, so we should provide sufficient water but in the dry season the plant do not get enough water and the flower will fall. So in a Doku (basket) we bring the water from Bheri river and we bring it where the crops are” (Kokishara, 49 years old).

As a matter of facts, the respondents have several times underlined the fact that their coping mechanisms to handle the natural hazards abovementioned are too poor to be considered resilient, because of lack of financial resources and their local knowledge is not anymore sufficient to cope with the new changes in the climate, that jeopardize the already difficult daily situation of these communities. It became very clear from this question that these communities responded passively to their disaster experiences, many times losing relatives, livestock, crop productions, and general goods.

KNOWLEDGE ON CLIMATE CHANGE

The strong feature of this section lies on the use of an improved seasonal calendar, that would not only look into the changes in the way crop plantation is carried out throughout the year now and 10 years ago, but also to changes in the temperature and precipitations within the same timeframe. In order to do so, given the nature of this research, the communities have been asked to particularly focus on inputs regarding precipitation and temperature, and within that give some information on how their agricultural habits changed during the time. As a result of the merge between the various answers for Surkhet, this is the outcome table:

Table 2: Climate change patterns

Climate change	10 years ago	Now
Precipitations	<p>Pre monsoon: April/May¹/June (there could be some drought in May)</p> <p>Monsoon: May/June/July</p> <p>Post-monsoon: October/November</p> <p>Cultivation:</p> <ul style="list-style-type: none"> - We cultivated the corn in April-May - Nursery plantation of rice in May/June, in monsoon planted in a bigger field (June/July) - Wheat in October/November/December <p>Rainfalls:</p> <ul style="list-style-type: none"> - More rainfalls, and well distributed over the year (monsoon/winter seasons) - Winter rain started in November/December - Forests, green vegetation, so no erosion or landslides. - Some snowfalls 	<p>Pre monsoon: No pre-monsoon – there is only late monsoon, which is the reason of late plantation</p> <p>Monsoon: June/July-August (only here the rainfall starts)</p> <p>Cultivation:</p> <ul style="list-style-type: none"> - Corn in June/July - Without irrigation canals they would see the rice only in August (with canals in July) - Wheat in December/January (low production – very low that coping mechanisms are buying wheat and rice, or migrate to India) - Short crops of weed in winter times <p>Rainfalls:</p> <ul style="list-style-type: none"> - Less rainfall, - No trees, no green vegetables, more disasters - More variable rainfalls - No rainfalls in winter months (December/January) - No snowfalls
Temperature	<p>Summer: Summer was colder and shorter (April to July)</p> <p>Winter:</p> <ul style="list-style-type: none"> - There was some frost but it could be mild - It was milder 	<p>Summer:</p> <ul style="list-style-type: none"> - Extremely hot and longer (end of March to September) - Longer drought period <p>Winter:</p> <ul style="list-style-type: none"> - Extremely cold - Frost more frequent (dangerous for the cultivations) - Less sunshine

In the above table all the most important information regarding precipitations, temperature, seasons and crops plantation are clearly displayed, comparing what was the situation 10 years ago and what is the situation at the moment. What is clear from it is that in the past the weather was much more reliable, there were fixed patterns for the seasonal plantations and the temperatures were milder in summer and in winter. On the other hand, the unpredictability of the rainfalls and weather patterns in general nowadays has a significant impact on the livelihoods of the communities involved, especially for what concerns their main source of living, which is the agriculture. The rainfalls are more rare, but at the same time heavy destroying rainfalls are more frequent and causes a lot of damages, and also because of the longer droughts and the absence of a pre-monsoon season, the quality/quantity of crops are worse than in the past and it is becoming very difficult for the communities to cope with these radical changes. As a matter of facts, temperatures also changed their pattern as the respondents indicated more extreme temperatures nowadays rather than in the past, both for summer and winter

¹ In red, the most given answers.

(summers extremely hot and longer, and winters extremely cold with less sunshine). An interesting example of IK to resist to coldness has been given by Chandrakala:

“In extreme cold situation we feed the animals with supply feed, we boil some water in a large container and we mix the water with small seeds. We put salt in there so we manage to keep the animal warm” (Chandrakala, 74 years old).

EXPERIENCE OF NATURAL HAZARDS

For this questions the respondents have shared approximately the same answers of the respondents in Surkhet, as the type of hazards have been demonstrated to be very similar. The experiences of natural hazards of the communities in Dailekh ranged from very recent disasters that challenged their actual livelihood, to other events that happened 30-40 years ago but for which the people still have a vivid image on. The examples given where the following, in order of mentioning:

Heavy rain/Landslide: the respondents talked about landslides (mostly caused by heavy rain) that destroyed houses, livestock and fields. The problem connected with the landslide is that the respondents affirmed that they did not have any money to recover from the event, and rebuild what has been destroyed, which triggered many unfortunate circumstances, such as the husbands going to India for work. A quote from Tila displays the difficulties encountered by the communities in terms of livelihood whenever a hazard strikes: “In June this year one buffalo and two oxen died because of the landslide, even though we had a small hut for them, the landslide killed them. A buffalo is a very costly and a it gave me a lot of money before, but buying a new one would cost 50000 rupies, too much. It is very difficult for me to continue living, because my husband is getting very old, and the oxen are too old and I am asking help to the villagers but I cannot pay back. It’s difficult because if we don’t have anything nobody will give help because they know we can’t pay back” (Tila, 29 years old).

Another aspect that came out from this section is that nowadays they would build some walls with wire nets, to prevent landslides, but given the fact that they use the stones from the river to build the walls, and that most of the time they do not have money to buy a wire, the walls they build are not resilient enough and rarely contain a big landslide. In this regard, most of the communities shared the frustration of not being able to prevent something they know is going to happen, because of lack of money and resources.

Heavy rain/Floods: Here in Dailekh the link between heavy rains and floods is also very strong. The respondents addresses the heavy rain as being the main cause of floods, which have been and are very dangerous for the HH cause they destroy the cultivated fields, fish ponds, houses that are very next to the river. An example has been given by Narisarah:

“Because of the flood in the river in my place I experienced damages in the hill and some field was destroyed, and this happened this year. The field was fully destroyed, we have planted seeds and we could not do anything because everything was destroyed. Half hectare of the land was destroyed. We can’t do anything, all the stones and mud are there and we would need a lot of money to repair it. If we would have money we would dig a canal, so the next time the flood will go to the canal instead of damaging the land” (Narisarah, 42 years old).

- Heavy wind that blown away the iron roofs.
- Systematic drought every dry season since recent years.
- Earthquake: Although not many earthquakes happened in the area in old times and recent years, many of the respondents affirmed that 30 years ago there was a strong earthquake that had a great impact on the lives of the communities. Here also, the main damages were to houses and fields.

As a general consideration, the respondents affirmed that they do not get any help, especially not from the chairperson of the VDC, because there is no money available to repair and restore houses, or general proprieties. One interesting thing mentioned is that it is not possible to receive help from the government if it the damage is only for one HH, and not the whole village.

CONCLUSION

This paper aimed to understand the role of indigenous knowledge in the natural disasters and climate change resilience of local communities living in Surkhet and Dailekh districts of Nepal. The field visit, both in Surkhet and Dailekh, proved to be very useful to get a wider idea on the local knowledge of the communities in relation to climate change and disasters issues. The main findings, both in Surkhet and Dailekh were the following:

- The communities are well aware of the reasons that trigger natural hazards, identifying the source of them in deforestation, pollution, heavy rains and urbanization.
- The main coping mechanism towards natural hazards is the use of social networks within a community: while their anticipation and response capacity is minimal, on the other hand, considering their IK, they highly depend on the mutual help that they would give to each other in case a hazard strikes.
- There are some practices in use in IK that might help the communities to prevent natural hazards to strike but the resources they use for them are not sufficient and not resistant enough. Here is where the low economical capacity demonstrates to be the main obstacle to their resilience.

- In the communities' perspective, weather nowadays is much more extreme comparing to the past: if in the past summers were hot but bearable and winters not too cold, now the communities feel that summers are extremely hot and winters are much colder than before.
- The precipitations have also changed a lot, as the communities were experiencing a much more regular rain in the past, they knew exactly when the monsoon period would start and finish and they were having winter rainfalls. Nowadays, they feel like the starting of the monsoon period has been anticipated (around March they already feel the hotness of the summer days and they get some rainfalls) and that the weather is so unpredictable that they do not know anymore how much is going to rain in a specific year and they do not know when the monsoon would actually finish.
- Regarding the productivity of the crops, the communities have experienced a radical change on the way they used to plant crops in the past and how they do it now. As the weather is more and more unpredictable, some communities that have been part of awareness programs try to use pesticides and new specific crops that were not in use in the past; some other communities just rely on their own local knowledge that is proving to be less and less efficient, probably due to the climate change and their poverty situation.
- Especially for the communities that have not been part of any program run by the NGOs, the general feeling is that even if they have a good knowledge on the climate change, also mentioning the reasons why they think there are such changes in the environment (for example many of them said that it is probably due to deforestation and pollution), there is a lack of knowledge within the community on the new technologies in use for cultivation, which makes them less resilient comparing to the past and comparing to other communities that received such information.

As a general consideration, the communities showed to have an extensive awareness of the changes in the climate, as they experienced throughout these recent years some radical variations in the weather that contributed to an adjustment of the way they use to plant in their land fields. The majority of the people interviewed work as farmers and they have their private or shared plantations, which is the reason why they have such a knowledge on the weather changes, as their livelihood well-being depends on the productivity of their crops, hence on rainfall patterns and temperature. Besides their awareness on climate change, as a result of the unpredictability of the weather these communities faced – and they are still very much facing – many natural hazards that in some cases drastically changed the lives of the people affected. Depending on the areas visited, the problematic related to the

environment differs, but on average the main issues are related with drought in the dry season, heavy rainfall and high wind in monsoon season, and landslides.

With the use of scientific research methods (FGDs) the communities interviewed shared their experiences with natural hazards that challenged their lives and the way they try to cope with those. As briefly introduced previously, a distinction can be made between the communities that did not receive any help from the VDCs nor from NGOs or other private enterprises to face their yearly recurrent problem of drought and landslides, and the ones that have actually been part of capacity building programs. For the communities that have to manage by themselves, following the practices in use in their IK, the coping mechanisms and adaptation measures seem to be not resilient anymore as for what concerns natural hazards the only effective coping mechanism is the reliability of the communities on their community's members, who would help each other to reduce the negative effects of a given hazard. The proverbs, songs and local beliefs are still in use to anticipate the coming of hazards, but their practical efficacy is very limited, because there is still a lack of resources that impede them to combine their IK with the new technologies. In regards to climate change, the communities that did not receive any external help still rely on their IK practices, which proved to be not resilient anymore to the changes in the climate. If on one side their IK helped them to be well aware of the weather patterns and changes, on the other side the farming practices that were working in the past did not adapt to what is the weather and ecosystem nowadays, which puts in serious danger the livelihoods of these communities.

The communities that have been part of some capacity building programs managed to get to know the new technologies for the agricultural plantations, they have been taught how to use the radio to listen to a women empowerment program and they learned how to organize a seasonal calendar. In fact, these communities demonstrated to have rather good coping mechanisms to face problems related with climate change, as now they know more about the diversification of crop plantation, the importance of cultivating vegetables and the usefulness of having livestock to diversify their livelihood income and sustainability. This example shows how external help can constitute a major benefit for communities that do not cope anymore only using their IK. It must be said though that this causal relationship is probably poorly demonstrable just via focus groups and observations, but there were certainly many signs of correlation between receiving the help of some NGO and have a better awareness and coping mechanisms towards environmental changes. This being said, although the general livelihood situation for the communities that received external help is better than the ones that did not receive it, it cannot be said that these communities are resilient to natural disasters and climate

change, because they are still very much vulnerable to natural disasters and the new technologies to increase productivity do not always work.

Even if it was not in the intentions of the research, a comparison between the outcomes in Surkhet and Dailekh can also be done. In Surkhet the main difficulty faced by the communities has been defined as to be drought during the dry season, to which the communities are more and more challenged every year. The scarce quality of the soil, maybe caused by pollution and other factors, is also constituting an alarming issue for the communities in Surkhet, that cannot manage to have the same productivity as they had in the past, putting in danger their livelihood sustainability. In Dailekh, even if some communities still agreed on the fact that drought is also a problem, the main issue is mostly related with landslides and storm wind – and in some cases floods – that especially this year destroyed part of the cultivation fields of many of the people interviewed. The perception obtained in the three days of visit in Dailekh was that the population there is living with the fear of the next landslide, as most of them live in slope areas, and other natural hazards as floods, for the people living downhill, and storm wind; all these put in serious danger their cultivation fields, which are the main source of their livelihood, but also their houses, properties and livestock. Their coping mechanisms are very poor and most of the time, if a hazard strikes, they are relying mostly on their social networks within the community to get some help and try to rebuild, if it is possible, what has been destroyed. Another curious aspect that differentiates the two districts is the grade with which the communities rely on their local knowledge, rather than the external one. If in Surkhet some communities showed a good understanding of the causes of the climate change and the best coping mechanisms to face it, in Dailekh the majority of the people interviewed had little knowledge about it and the way they cope has much to do with what they learned in the past through their generations and through the help of the community itself. It must be said though that in both districts the communities proved to have a strong social network that help them to face natural hazards and to cope with the low productivity, for instance with the creation of a loan system in case a household needs money for its sustenance.

To conclude, the communities in Surkhet and Dailekh demonstrated that their IK most of the time is not resilient to natural disasters and climate change, where for those that received an external help the combination of the two improves their livelihoods, but still not reaching acceptable levels of resilience. The main reasons for that are the significant lack of physical and economical resources, that would allow the communities to be more proactive and less vulnerable. The IK, through songs, proverbs, beliefs and practices could still be a useful tool in order to mitigate the damages, but it does not constitute anymore a reliable instrument to successfully face natural disasters and climate change.

Future researches on this topic should probably be conducted in more remote areas, where the use of IK might be even more present, and in communities where natural hazards are more keen to strike. Although it has been demonstrated that the communities in Surkhet and Dailekh are often targeted by natural hazards, the overall level of danger in relation to natural hazards in the districts of Surkhet and Dailekh is quite low, comparing to other areas in Nepal, or other countries in the South-East Asia and Pacific. Similarly, a deeper study into the topic, with more resources and an actual comparison between the indigenous knowledge and scientific findings, to prove their reliability, is highly suggested.

AN EMPIRICAL ANALYSIS OF FIRM PERFORMANCE UNDER ISO 9000 CERTIFICATION

Siougle, Efrosini¹; Economidou, Claire²; Dimelis, Sophia¹

¹Department of Informatics, Athens University of Economics and Business, Greece

²Department of Economics, University of Piraeus, Greece

ABSTRACT

This study investigates the effect of the ISO 9000 certification on the performance of firms listed on the Athens Stock Exchange. The ISO 9000 certified firms are classified into two groups: the group of firms that hold the certification for all the years that are listed (*always*) and the group of firms that initiate the certification at some point after entering the stock market (*starters*). The effect of the ISO 9000 certification on firm performance is estimated by comparing the financial performance of both certified groups to the financial performance of a control group of non-certified firms using a difference-in-differences econometric approach. The ISO 9000 certification effect is further examined by comparing the financial performance between the two certified subgroups (*always vs starters*). The empirical findings indicate that the ISO 9000 certified firms significantly outperform the non-certified firms. Furthermore, the findings reveal that firms initiating the ISO 9000 certification after entering the stock market (*starters*) are more benefited from the certification in comparison to firms that are certified for all the years that are listed (*always*).

Keywords: *ISO 9000 certification; Quality; Firm performance; Difference-in-differences econometric approach*

INTRODUCTION

The popularity of the ISO 9000 Quality Management Standard, since its introduction in the late 1980's by the International Organization of Standardization (ISO), has been exposed to an unprecedented increase. The number of firms seeking to become certified every year, after demonstrating the necessary conformance to the requirements of the ISO 9000 standard so as to receive the relevant certification, is growing over time. According to the survey provided by the International Organization of Standardization, in 2013 alone over one million ISO 9000 certificates were issued across 187 countries (ISO, 2015). This phenomenon provides an indication that firms perceive the adoption of the ISO 9000 certification as a beneficial business asset, taking into account the high cost and considerable effort related to the certification process.

The remarkable adoption of the ISO 9000 certification has motivated researchers to explore whether benefits derive from the relevant certification. However, existing literature yields conflicting results regarding the impact of the ISO 9000 certification on the performance of adopting firms. A number of studies find that the effect of the ISO 9000 certification on firm's financial performance is positive (e.g. Heras et al., 2002a; Chow-Chua et al., 2003; Sharma, 2005; Terlaak and King, 2006; Benner and Veloso, 2008; Lafuente et al., 2009, Starke et al., 2012; Chatzoglou et al., 2015), while other studies find that such an effect is weak or negative (e.g. Lima et al., 2000; Singels et al., 2001; Rahman, 2001; Heras et al., 2002b; Wayhan et al., 2002; Tsekouras et al., 2002; Martinez-Costa and Martinez-Lorente, 2007). The rapid diffusion of the ISO 9000 certification in combination with the conflicting results reported by existing literature allows additional investigation on the association between the ISO 9000 certification and firm performance.

The aim of this study is to explore whether financial performance benefits are gained due to the ISO 9000 certification. In doing so, the study examines the effect of the ISO 9000 certification on the financial performance of publicly traded firms by accessing financial performance differences between certified (treated) and control (non-certified) firms using a difference-in-differences methodological approach. The ISO 9000 certification effect is further examined by comparing the financial performance within the two certified subgroups (*always vs starters*). The financial performance measures used in this study are return on equity (ROE) and return on assets (ROA).

The study contributes to existing literature by employing a sample consisting of all firms listed in a less mature stock exchange as compared to European peers. Furthermore, the analysis is based on detailed data derived from the financial reports of firms listed in the Athens Stock Exchange from 1992 to 2013, which allows accounting for the impact of measurable factors such as financial performance variables. Additionally, a novel methodological approach is followed by classifying the certified firms into two groups according to the time period that they adopted the ISO 9000 certification. The first group consists of the firms that are certified for all the years that are listing during the sample period (*always*) and the second group consists of the firms that initiated the ISO 9000 certification at some point after entering the stock exchange and are certified from that point onwards (*starters*). The control group of non-certified firms comprises those listed firms that have never obtained an ISO 9000 certification.

The findings indicate that the ISO 9000 certified firms show significantly higher financial performance in comparison to the non-certified firms. Also, the findings reveal that there are differences between the two certified subgroups in firm's financial performance due to the ISO 9000 certification.

The rest of the study is organized as follows: Section 2 presents the literature review and hypothesis development. Section 3 describes the sample and the data. Section 4 discusses the research design.

Section 5 presents the empirical results. Section 6 concludes the study and section 7 discusses the findings of the study.

LITERATURE REVIEW AND HYPOTHESIS DEVELOPMENT

Existing literature discusses the effect on firm's financial performance due to the adoption of the ISO 9000 certification.

A number of studies report the weak or non-existent role of the ISO 9000 certification on firm's performance. The studies of Terziovski et al. (1997) and Dick (2000) find that the ISO 9000 certification is not associated with any financial performance benefits. Similarly, the study of Singels et al. (2001) finds that the performance of ISO 9000 certified firms is not better than the performance of non-certified firms. Also, the study of Lima et al. (2000), finds that there is no difference regarding the financial performance between the ISO 9000 certified firms and a control group of non-certified firms. In the same vein, the research of Tsekouras et al. (2002), finds no effect of the ISO 9000 certification on firm performance. Furthermore, the research of Wayhan et al. (2002), reports that the impact of ISO 9000 certification on the firm's financial performance, measured by ROA, is very limited. Also, the study of Heras et al. (2002b) shows that the ISO 9000 certified firms are not benefited from the certification as the certification does not lead to an increase in their profitability. Additionally, the study of Martinez-Costa and Martinez-Lorente (2007) reports that the impact of the ISO 9000 certification on company performance is negative as certified firms gain less earnings and ROA in the post certification period.

On the other hand, a number of studies show a strong and positive association between ISO 9000 certification and firm performance. The study of Heras et al. (2002a) reports that ISO 9000 certified firms are more profitable in terms of ROA in comparison to non-certified firms for a period of four years after certification. In the same line, the studies of Chow-Chua et al. (2003) and Sharma (2005) find that the financial performance of the ISO 9000 certified firms is significantly greater in comparison to the financial performance of non-certified firms. Similarly, the study of Terlaak and King (2006) finds the ISO 9000 certified plants show greater increase in production volume in comparison to non-certified plants. Additionally, the study of Benner and Veloso (2008), finds that performance advantages of the ISO 9000 certification are higher for early adopters. Also, the study of Starke et al. (2012) finds that the ISO 9000 certification is associated with an increase in sales revenues and asset turnover ratios and a decrease in cost of goods sold/sales revenues of certified firms. Moreover, the study of Chatzoglou et al. (2015) finds that the ISO 9000 certification is highly associated with overall financial performance improvements.

The conflicting results of existing literature indicate that the issue of the association between the ISO 9000 certification and firm's financial performance calls for further investigation. Therefore, the first hypothesis of the study is formulated as follows:

Hypothesis H1. The listed ISO 9000 certified firms do not experience higher financial performance in comparison to the listed non-certified firms.

As the methodological approach of the study introduces the classification of the certified firms into the two subgroups of *always* and *starters*, hypothesis H1 is further explored by stating the following two hypotheses H1a and H1b:

Hypothesis H1a. Firms that are ISO 9000 certified for all the years that are listed (*always*) do not experience higher financial performance in comparison to the listed non-certified firms.

Hypothesis H1b. Firms that initiate the ISO 9000 certification at any point after entering the stock market (*starters*) do not experience higher financial performance in comparison to the listed non-certified firms.

Furthermore, this study investigates the effect of the ISO 9000 certification within the population of the certified firms. As the certified firms are classified into the *always* and *starters*, the second hypothesis is stated as follows:

Hypothesis H2. Firms that are certified for all the years that are listed (*always*) and firms that initiate the certification at any point after entering the stock market (*starters*) are equally benefited from the ISO 9000 certification.

SAMPLE DESCRIPTION AND DATA

The study sample consists of all firms traded in the Athens Stock Exchange from 1992 to 2013. Data regarding the ISO 9000 certification were manually collected from various publicly available sources such as the websites of listed firms, the web sites of certification agencies, ISO 9000 certification announcements and information in printed media, direct contacts with the firms as well as from library archives for the older firms. Data for the financial performance measures were collected from the DataStream database.

After excluding firms not having available financial performance data as well as financial firms and firms with negative book value of equity (Fama and French, 1992), the sample size comprises 183 listed firms, 127 of which are ISO 9000 certified.

The certified firms of the sample are partitioned into two subgroups: the group of firms that are certified during the total sample years—*always*— and the group of firms that firstly initiate the ISO certification at a given point during the sample period – *starters*. The listed firms that have never acquired an ISO 9000 certification constitute the control group of non-certified firms. Based on the

above classification, the *always* group constitutes the 25,7% (47 firms), the *starters* group the 43,7% (80 firms) and the non-certified group the 30,6% (56 firms) of the sample.

Return on equity (ROE) and return on assets (ROA) are employed as measures of a firm's financial performance. Return on equity provides a measure of profitability attributable to shareholders and return on assets provides a measure of profitability related to the firm's total assets. ROE is calculated as net income in year t divided by common equity in year $t-1$ and ROA as operating income in year t divided by total assets in year $t-1$.

Control variables are included in the analysis in year $t-1$, in order to control for the effect of those variables on firm performance. The control variables used are: the size of the firm (SIZE) measured by the logarithm of total assets, the firm's debt financing measured by the total debt to common equity ratio (DEBT/EQUITY), the firm's growth opportunities i.e. the book to market ratio (BV/MV) and prior year's profitability (EPS) calculated as net income divided by the number of shares in year $t-1$. The descriptive statistics of all the variables included in the analysis are presented in Table 1.

Variables	Mean	Median	St Dev	Min	Max
ISO	0.593	1	0.491	0	1
ROE	0.054	0.042	0.192	-0.561	0.894
ROA	0.042	0.033	0.082	-0.181	0.350
SIZE	11.566	11.460	1.425	8.563	15.792
DEBT/EQUITY	0.886	0.599	1.058	0	6.475
BV/MV	1.400	0.883	1.559	0.055	9.447
EPS	0.179	0.093	0.484	-1.041	2.490
Notes. N=2.651 total firm year observations.					
Table 1. Descriptive Statistics					

RESEARCH DESIGN

This section presents the methodology and models used. The study is based on unbalanced panel data. Firms are included in the sample from the year that enter the Athens Stock Exchange (ASE) and afterwards in the period from 1992 to 2013.

A difference-in-differences econometric approach is employed to examine financial performance differences between the ISO 9000 certified and non-certified firms. In doing so, treated and control firms are included in the same regression to estimate the effect of the ISO 9000 certification on firm performance. Year dummy variables and industry-specific fixed effects are included in all regressions to control for time effects and common shocks among industries.

To test the first hypothesis H1, stating that the listed ISO 9000 certified firms do not experience higher financial performance in comparison to the non-certified firms, the following regression equation (1) is estimated:

$$y_{it} = a_1 ISO_ALL_{it} + a_k Controls_{it-1} + \sum_{t=1}^{20} \delta_t year_t + \zeta_i + e_{it} \quad (1)$$

where y_{it} is the financial performance measure of firm i in year t i.e. return on equity and (ROE) and return on assets (ROA). The dummy variable ISO_ALL_{it} indicates the ISO 9000 certification for each certified group relative to the control group of non-certified firms. It takes the value of one for the firms of the *always* group, the value of zero for the non-certified firms and for the firms belonging to the *starters* group the value of one in the initial certification year and the subsequent years and zero in the years prior to the initial certification. The control variables ($Controls_{it-1}$) include lag levels in year $t-1$ of firm size (SIZE), total debt to common equity ratio (DEBT/EQUITY), book to market ratio (BV/MV) and earnings per share (EPS). The full set of year dummies is represented by the term $\sum_{t=1}^{20} \delta_t year_t$ and ζ_i denotes the industry-specific fixed effects.

To test the more specific hypothesis H1a, stating that the *always* do not experience higher financial performance in comparison to the non-certified firms, the following regression equation (2) is estimated:

$$y_{it} = \beta_1 ISO_ALWAYS_{it} + \beta_k Controls_{it-1} + \sum_{t=1}^{20} \delta_t year_t + \zeta_i + e_{it} \quad (2)$$

where y_{it} is the financial performance measure of firm i in year t i.e. ROE; ROA. The dummy variable ISO_ALWAYS_{it} takes the value of one for the *always* firms and the value of zero for the non-certified firms. The other variables are as explained in equation (1).

Furthermore, to test the more specific hypothesis H1b, stating that the *starters* do not experience higher financial performance in comparison to the non-certified firms, the following regression equation (3) is estimated:

$$y_{it} = \gamma_1 ISO_STARTERS_{it} + \gamma_k Controls_{it-1} + \sum_{t=1}^{20} \delta_t year_t + \zeta_i + e_{it} \quad (3)$$

where y_{it} is the financial performance measure used of firm i in year t . The certification dummy $ISO_STARTERS_{it}$ takes the value of one in the year that each *starter* firm obtains its initial ISO certification and the years following the initial certification, and zero in the years prior to the initial certification year. Also it takes the value of zero for non-certified firms. The other variables are as explained in equation (1).

Coefficient α_1 of equation (1) captures any performance difference between the total certified firms and the control group of non-certified firms. Coefficients β_1 and γ_1 of equations (2) and (3) capture any performance differences between the *always* and *starters* groups when compared to the non-certified firms respectively.

Furthermore, to test hypothesis H2, stating that the *always* and *starters* are equally benefited from the ISO 9000 certification, the following regression equation (4) is estimated:

$$y_{it} = \varepsilon_1 ISO_CERT_{it} + \varepsilon_2 ISO_CERT \times STARTERS_{it} + \varepsilon_k Controls_{it-1} + \sum_{t=1}^{20} \delta_t year_t + \zeta_i + e_{it} \quad (4)$$

where y_{it} is the financial performance measure of firm i in year t . The dummy ISO_CERT_{it} indicates the ISO 9000 certification for the *always* and *starters* groups. The variable $ISO_CERT \times STARTERS_{it}$ is an

interaction between the dummies ISO_CERT_{it} and STARTERS. The STARTERS dummy takes the value of one for each *starter* firm and zero otherwise. The coefficient of interest is coefficient ε_2 of the interaction term, which captures any performance differences between the two certified subgroups.

Panel A: All_CertifiedNever

Table 2. Performance comparison across groups		

EMPIRICAL RESULTS

Performance comparison across groups

Panel A of Table 2 contains the estimates from the performance comparison between the full sample of ISO 9000 certified firms and the control group of non-certified firms. The results reveal a positive and statistically significant association between the ISO 9000 certification and firm's financial performance as measured by either the return on equity (ROE) or the return on assets (ROA). Panel B of Table 2 presents the estimates from the comparison of the *always* certified group of firms relative to the control group. The findings suggest a positive and statistically significant effect of the ISO 9000 certification on both ROE and ROA. Furthermore, Panel C of Table 2 contains the estimates from the *starters*

certified group when compared to the non-certified group. The evidence indicates the same positive and statistically significant association between the ISO 9000 certification and both return on equity and return on assets for the *starters*.

Overall, the above findings indicate that the ISO 9000 certified firms achieve higher financial performance in terms of return on equity and return on assets in comparison to the non-certified firms.

Performance comparison within the certified subgroups

Table 3 contains the estimates from the performance comparison between the two certified groups of the study (*always vs starters*). The findings suggest that the *starters* group is more benefited from the ISO 9000 certification than the *always* group in terms of return on equity (ROE). There is no difference in terms of ROA. Therefore, firms that initiate the ISO 9000 certification after entering the stock market (*starters*) exhibit better financial performance, in terms of ROE, in comparison to the *always* certified firms. The performance benefits deriving from the ISO 9000 certification have been realized earlier for the *always* firms whereas for the *starters* this takes place at later years.

	ROE	ROA
ISO certification	-0.0183 (0.109) ^a (-1.60) ^b	0.0103 (0.070) (1.81)
ISO certification x STARTERS	0.0183** (0.014) (2.47)	-0.0046 (0.169) (-1.37)
R2	0.42	0.47
Notes: a The first brackets contain t-statistics: *significant at 10%; **significant at 5%; ***significant at 1%. b The second brackets contain standard error. Year dummies, industry fixed effects and the control variables SIZE, DEBT/EQUITY, BV/MV and EPS are included in every regression.		
Table 3. Performance comparison within the certified subgroups - StartersAlways		

CONCLUSION

This study examines the effect of the ISO 9000 certification on the financial performance of publicly traded firms by accessing financial performance differences between certified groups and a control group of non-certified firms using a difference-in-differences methodological approach. The ISO 9000 certification effect is further examined by accessing performance differences between the two certified groups. The findings of the study reveal a positive and statistically significant association between the Innovation, Entrepreneurship and Digital Ecosystems

ISO 9000 certification and firm's financial performance as measured by either the return on equity (ROE) or the return on assets (ROA). Furthermore, the findings indicate that the group of firms initiating the ISO 9000 certification after entering the stock market (*starters*) is more benefited from the certification, in terms of ROE, than the group of firms that are certified for all the years that are listed (*always*).

This study contributes to existing literature by distinguishing the certified firms of the sample according to the time period that they adopted the ISO 9000 certification into the *always* and *starters* groups. Additionally, the analysis is performed in an extended time period of 22 years. The data used in the study are compiled from financial reports rather than survey data. Differences in the empirical findings from previous evidence in the literature can be attributed to market characteristics, sample sizes and structures.

The policy implication of this study is that the acquisition of the ISO 9000 certification is beneficial to Greek listed certified firms as it creates better prospects for the firms that operate under a challenging economic environment.

DISCUSSION

The aim of this study is to examine the effect of the ISO 9000 certification on the financial performance of all firms listed on the Athens Stock Exchange from 1992 to 2013. The analysis is conducted by categorizing the firms into groups based on whether they hold an ISO 9000 certification (certified firms) or not (non-certified control firms) and by further categorizing the firms within the certified group to those that *always* hold an ISO 9000 certification and to *ISO starters*.

The effect of the ISO 9000 certification on firm performance is estimated by comparing the financial performance of both certified groups to the financial performance of the control group of non-certified firms employing a difference-in-differences econometric approach. Prior literature is also extended by comparing the performance within the two certified subgroups of the study. To control for other financial characteristics that may or may not affect financial performance, the econometric models of the study are estimated by adding control variables (i.e. size effect, leverage and growth opportunities). By controlling for the effect of those variables the fit of the models is substantially improved (R-squared of the models are from 36% to 47%).

The findings suggest that the ISO 9000 certified firms exhibit significantly higher financial performance in comparison to the firms that have never obtained an ISO 9000 certification. The results presented in Table 2 suggest a positive and statistically significant association between ISO 9000 certification and both financial performance measures employed in the study i.e. return on equity

(ROE) and return on assets (ROA), for all the group comparisons of the certified firms relative to the control non-certified firms.

For the full sample, the total certified firms outperform the non-certified firms by 0.0201 in ROE (coefficient in second column of Table 2 Panel A) and 0.0132 in ROA (coefficient in third column of Table 2 Panel A). ROE and ROA are statistically significant at the 1% level of significance.

For the *always* firms, ROE is 0.0256 (coefficient in second column of Table 2 Panel B) and ROA is 0.0201 (coefficient in third column of Table 2 Panel B) higher for the certified firms relative to the non-certified firms. ROE is statistically significant at the 5% level of significance and ROA at the 1% level.

Also, for the *starters* when compared to the non-certified firms, ROE is 0.0252 (coefficient in second column of Table 2 Panel C) and ROA is 0.0123 (coefficient in third column of Table 2 Panel C) higher for the certified group. ROE and ROA are statistically significant at the 1% level of significance.

Furthermore, the evidence suggests that the certified firms belonging to the *starters* group are more benefited from the ISO 9000 certification in terms of ROE than the *always* firms. As presented in Table 3, the *starters* group exhibits 0.0183 higher ROE in comparison to the *always* group (coefficient of the interaction term in second column of Table 3). ROE is statistically significant at the 5% level of significance.

The findings of this study follow the stream of existing literature about the performance benefits gained due to the ISO 9000 certification (e.g. Starke et al. 2012; Terlaak and King 2006).

WHAT DRIVES PRICE DISPERSION IN EUROPEAN E-COMMERCE INDUSTRY?

Sobolewski, Maciej; Gyódi, Kristóf; Ziemiński, Michał

Faculty of Economic Sciences and Digital Economy Lab, University of Warsaw, Warsaw, Poland

ABSTRACT

This paper reports results of a study dedicated to measurement of price dispersion in European e-commerce industry. Using custom made web scraping tool we have collected pricing data of 182 branded products sold on-line across the EU, representing the most popular categories: clothing, consumer electronics, gaming and software and cosmetics. The novelty of our approach lies in targeting all major price comparisons sites in 26 EU member states, which enabled us to collect pricing signals from thousands of retail shops operating on-line. We find considerable dispersion of both pre and post-vat prices ranging from 20% to 40% depending on product category as measured with 10-90 interquartile range. Pattern of price dispersion is determined by the level of per capita income and capital costs.

Our results suggest that the observed dispersion of prices is driven by both cost differences and strategic price discrimination based on income heterogeneity. We argue that under the above circumstances policy interventions aiming to reduce fragmentation of Digital Single Market across national borders will decrease prices in high income countries and likely increase prices in low income countries introducing adverse welfare changes of a-priori unknown net effect.

Keywords: *price dispersion, price discrimination, e-commerce, web-scraping, price comparison service.*

INTRODUCTION

Single market theory assumes the far-reaching integration among the countries. European Union (EU) is the only economic union whose objective is completing the single market. Among many legal initiatives the great part of them is focused on the price differences. If markets are integrated, there should be no significant difference in prices according to standard theories such as the Law of One Price. However, this is not what is observed in the EU. According to the Eurostat (2016), between 2004 and 2008 prices converged in the EU28, but afterwards this process stopped or even reversed. On the other hand, in the EU15 the level of price dispersion is fairly stable. European Commission (EC) undertakes many legal initiatives to reduce price dispersion, even though there is still lack of understanding of all factors behind it. Our papers aims to shed more light on this phenomenon. Our study offers value added in two respects. First, we use a novel approach – the web-scraped price data

from the price comparison services. Web-scraping is an innovative technique used to analyze the price dynamics e.g. by Cavallo (2015). It offers a possibility to collect tons of individual price signals from virtually all shops selling particular item in each country. This allows us to measure the price dispersion in EU in a robust way. According to our assessment, it reaches on average 29,8% for the whole sample. This figure varies substantially depending on product category. Second, we study the pattern of the observed price dispersion and show that it depends among other factors on per capita income.

We analyze three broad groups of factors which influence the magnitude of the price dispersion: (i) supply side factors; (ii) demand side factors and (iii) institutional factors. Wrong targeting of the policy intervention can result in the adverse effects on the economy. For example, if price dispersion is a result of a strategic price discrimination on producer and/or distributor level, then any policy intervention reducing trade barriers would essentially bring adverse distributional effects on customer and producer welfare in the particular member states. As economic literature suggests, a-priori there is no conviction that the net effect is guaranteed to be positive (Malueg et al., 1994). Therefore, understanding sources of the price dispersion is crucial. We find that at least some part of the observed price dispersion is induced by the strategic price discrimination between different country markets within the EU.

Our paper is organized as follows: section 2 provides literature review, section 3 describes data collection technique and summarizes the data, section 4 sheds light on the price dispersion pattern, while section 5 summarizes and concludes.

LITERATURE REVIEW

Economic integration should lead to the convergence of economies in the long run. Neoclassical models, like the Solow growth model, or the Heckscher-Ohlin trade model show that economic integration of factors would eventually result in the convergence of income (Kim, 1998). Our era of globalisation provides many opportunities to test this conclusion. Kim (1998) shows that US regional convergence in the second half of the 20th century was driven by the greater mobility of factor endowments, which led to the convergence of capital-labour ratios, hence to the convergence of wages and per capita income. There are numerous empirical analyses in the context of European integration. Among others, Barry (2003) analyses the convergence of EU cohesion countries (Ireland, Greece, Spain and Portugal) to the rest of the EU, Massmann et al. (2003) examine the convergence of business-cycles of EU15 countries, while Halmai et al. (2010) present the convergence of the New Member States to the EU15. On general, the empirical works confirm the convergence of the EU member states (income, interest rates) to each other.

An important aspect of economic convergence is the decrease of price dispersion (the difference between prices for identical products). If markets are integrated, there should be no significant difference in prices according to standard theories such as the Law of One Price. However, this is not what consumers and economists observe in the EU. According to the Eurostat (2016), prices converged between 2004 and 2008 in the EU28, however, this process stopped ever since and even reversed, with increasing price dispersion. In the EU15, the level of price dispersion is fairly stable.

Online shopping is becoming an important channel of purchases besides the traditional offline retail. According to Eurostat data, the share of e-commerce in total turnover (without the financial sector) has already reached 15% in EU15, and in countries like Great Britain comprises more than 20%. The European Commission, aware of the fundamental meaning of digital economy, made the completion of the Digital Single Market (DSM) one of its priorities. The aim of the DSM is to ensure the cross-border access of online activities under conditions of fair competition in the entire EU (EC, 2015). A potential impact of the stronger integration of digital markets between EU member states is the decrease in the price dispersion across countries in online prices.

E-commerce is also becoming a major source of data on prices. This potential of online trade is harnessed by the Billion Price Project at MIT, which provides macroeconomic research using data collected from the Internet (scraped data). From this branch of research, Cavallo (2015) shows that prices collected from the Internet can be used to analyze inflation and changes in the real economy. Furthermore, scraped data has many advantages over traditional sources of micro-price data (no delays, free from common measurement errors).

The observed cross-country differences in prices may be caused by international price discrimination of the producers (differences in mark-ups) or by differences in costs (Verboven, 1996). Mark-ups may be influenced by differences in consumer income and taste, while costs by transportation, service wages etc. Additionally, structural causes, like market structure or differences in taxes (VAT) may cause prices to differ (Internal Market Directorate General, 2002).

Price dispersion has been widely analyzed in the car market, due to the huge price differences between EU15 countries. Verboven (1996) shows that international price discrimination, measured by cross-country differences in relative wholesale mark-ups, is among the drivers of price-differences. Interestingly, car producers seem to charge a higher mark-up for their domestic market, than at the foreign markets. An analysis of price convergence in the car market is also provided by Goldberg et. al (2005), who find evidence on convergence to the Law of One Price between 1970-2000.

Alessandria et al. (2007) show that income per capita explains half of the aggregate price dispersion across countries. Using a wide sample of US export data, the authors suggest that mark-ups account for 40% of this relationship and that costumers in low income countries are more price sensitive. Crucini et

al. (2013) analyze the determinants of price dispersion using a panel of retail prices from 79 countries in the period 1990-2005. The authors find that service-sector wage differences almost entirely explain price dispersion at the PPP level. When analyzing price dispersion at the level of individual goods and services, wage differences explain around one third of dispersion, with an equal impact of trade related costs. However, the authors are aware of the fact that the prices of tradable goods are affected by non-tradable elements, therefore it is difficult to distinguish between costs and mark-ups. Simonovska (2015) is tackling this issue analyzing the relationship between the price of online tradable goods and per capita income. The author is using a dataset of prices on apparel products produced by a Spanish manufacturer, which are sold in 29 various countries (23 EU member states). The examined products are only available online, furthermore they are manufactured and shipped from a single place, therefore destination-specific non-tradable price contributions (such as wages) can be suppressed. The author finds that per-capita income differences account for one third, while shipping costs explain up to a third of cross-country differences in prices. More specifically, doubling the per capita income of the buyer's country leads to an 18% rise in the price level of apparel and footwear. Additionally, the author finds that Eurozone membership decreases price dispersion relative to Spain.

The literature has been divided in the evaluation of the impact of the euro on price dispersion. Allington et al. (2004) finds that price convergence accelerated due to the euro, while others, including Parsley and Wei (2008) or Fischer (2012) did not find such causal effect. Ogrokhina (2015) examines the impact of the common market and the EMU on price convergence and finds that while the Single European Act decreased price differences in the examined 120 traded goods by 5%, the single currency increased by 2%. However, the euro had different impact considering product categories- price convergence had been observed for cars, while divergence for food and tobacco.

To sum up, the literature suggests that price differences are indeed influenced by both mark-ups and costs. International price discrimination can be classified as third degree price discrimination, in which the seller discriminates (charges different prices for a unit of the same product) among different groups of consumers based on observable heterogeneities (for example, the geographical location of the consumer or income). Theoretical literature shows that third degree price discrimination might increase or decrease overall social welfare compared to uniform pricing. For the analysis of monopoly market, see Armstrong (2008), Cowan (2008), Aguirre et al. (2010), Galera et. al (2014), while for duopoly markets refer to Corts (1998), Stole (2003) and Adachi et al. (2011). Malueg et al. (1994) shows the necessary conditions for price discrimination to increase the welfare of an economic union, which refer to the convexity of respective demand functions and the overall size of weak and strong markets. Therefore, we cannot state that price discrimination is necessarily harming consumers. The fact that producers segment the internal market and charge different prices in the member states does not have a

clear impact on the overall welfare of the EU. Moreover, theoretical analysis shows that welfare effects of reducing price discrimination will have opposite signs in case of low and high priced markets, hence even if the net effect would be positive for the EU, some compensation mechanism should be in place.

SCOPE OF PRICE DISPERSION

Web-scraping technique and advantages and disadvantages of Scrapped-data

Cavallo (2015) introduces Scraped Data as a new source of micro-price information to measure price stickiness. It is only one of the examples of usage of the web-scraping techniques, which are getting attention as the new approach to analyze behavior of prices. Lunnemann and Wintr (2011), Gorodnichenko and Talavera (2014), and Gorodnichenko, Sheremirov, and Talavera (2014) find that online prices tend to be more flexible and have smaller price changes than offline prices. However current research was mainly focused on the price dynamics and their patterns. However, to the authors' best knowledge, there is still a gap in the empirical literature using the web-scraping and investigating the price dispersion between countries. To fill this gap we investigated the price differences in online retail in European Union.

There are a few advantages of using on-line rather than off-line prices. Firstly, collecting data remotely is much cheaper option than the survey based methods, especially in case of cross-country setting. Secondly, it is possible to include large number of retailers. This huge advantage is important, as the result won't be affected by the price strategies of the particular company or retail chain. However, in case of increasing the number of retailers, it would be necessary to design the web-scraping tool for every retailer separately, if they are using different web-page designs. To address this issue we run our web-scraping tool on the data provided by the price comparisons services¹. It allows us to limit significantly web-scraping tool complexity significantly with keeping the diversity of on-line retailers. Thirdly, we are able to collect many observation for one product, which should improve the quality of price information in our database. It is connected with one disadvantage – as the automated tool is collecting all information provided by the price comparison service, we observe “heterogeneity” bias² extending tails of price distribution. To address this we use medians of the prices for every country-product level in our analysis.

Our approach is similar to one presented in Cavallo (2015). As we are not intend to analyze the dynamic of prices we are collecting our data in one point of time. Precisely our procedure works in

¹ The list of the price comparisons services is available upon request.

² As “heterogeneity” bias we refer to the situation when the price comparison service asked about the price of the particular product provides us with price information of the most similar products in case of not having proper data. Even though we use restrictive cleaning techniques to fully address this concern we use the medians of the prices in further analysis.

three steps. Firstly, we collect information about most popular products searched in price comparisons services and we choose only those, which have the most “unified” names across countries (i.e. the name of the product is the same in at least 9 countries). Secondly, we design dedicated tool to visit price comparison service webpages and to collect information about the product, price and price information provider (i.e. online shop which is included in the price comparison service database). Our program is designed to read the webpage code, recognized proper tags defined separately for every price information provider¹ and store the data. Finally, we run our program in two different modes – using its own IP or using the external server placed in particular country. The last step is designed to ensure that we are getting the same price information as the local consumer on particular market.

Data set and results

We collect the data about five of the most popular categories in on-line retail, in particular: fashion (clothing and footwear), cosmetics and healthcare (cosmetics and perfumes), computer games and software, electronics and computer hardware, and household appliances. The full list of products contains 657 different product names divided into categories, which results in 143,490 observations. The full split of the sample by products and by observations is presented in Table 1.

To ensure that, as we mentioned above, we are collecting valid price information, we apply few rigorous filters on our data, e.g. every word from the product name (further called “product query”) is included in the description of our price record. Those procedures limit the number of products to 382 and the number of observations to 32,116. Finally we keep only the products, which are recorded in at least 9 countries in our sample. The final impact on the number of products after each step and in every category is presented in details in Table 1. As it can be seen the cleaning procedure impacted the data significantly - finally we keep only around 19.1% of final sample. In case of working with scrapped data we face a trade-off between the number of data providers (price comparison services, online retailers’ webpages) and code complexity. In particular if we want to extend the number of the data providers we need to define proper tag structure of every new one. Using the price comparison services data we can address this problem, however we need to pay more attention to its quality.

¹ For more details about markup languages and their tag structure please see Coombs et al. (1987)

Category	# of products		
	scrapped	after cleaning	in final sample
Fashion	362	154	33
Cosmetics&Healthcare	87	33	24
Households Appliances	58	56	35
Electronics and Computer Hardware	84	75	43
Computer Games and Software	66	64	47
Total	657	382	182

Category	# of observations		
	scrapped	after cleaning	in final sample
Fashion	58 410	7 713	4 272
Cosmetics&Healthcare	25 472	5 419	4 736
Households Appliances	11 643	3 955	3 181
Electronics and Computer Hardware	23 697	7 503	6 666
Computer Games and Software	24 268	7 526	6 547
Total	143 490	32 116	25 402

Table 1. *The number of products and observations in each product category*

Even though at the beginning of data collecting we were trying to ensure that the data are equally distributed between countries after all cleaning procedures we observe that for some of them total number of observations remains low. Total number of products and observations for each country is presented in Table 2. It has to be noted that only for two countries the numbers remains low (Belgium and Portugal), while for others we get satisfying sample size.

Country	# of products	# of observations	Country	# of products	# of observations
Austria	143	1 183	Italy	131	910
Belgium	16	37	Latvia	115	2 447
Bulgaria	101	678	Lithuania	92	494
Croatia	91	340	Netherlands	39	380
Czech Republic	144	2 427	Poland	137	1 805
Denmark	127	844	Portugal	36	158
Estonia	58	763	Romania	141	1 152
Finland	73	346	Slovakia	152	1 963
France	92	766	Slovenia	91	469
Germany	70	989	Spain	72	386
Greece	130	1 359	Sweden	144	2 177
Hungary	149	1 482	United Kingdom	131	1 342
Ireland	76	505	Average	102,0	1 016,1

Table 2. *The number of products and observations for EU countries*

We observe significant price dispersion in European Union. We calculate average price dispersion in three steps. Firstly, as mentioned before, we calculate the median price on country-product level (for every product and for every country separately). It cleans our data from outliers and “heterogeneity” bias issue. Secondly, we compute the mean of the median prices for every product. It gives us the

average price of the product in European Union. Finally, we calculate the difference between median price and the product average price and scale it by the product average price. The results are presented in first column of Table 3. The absolute price deviation in EU on average is (+/-) 11.2%. In similar way we calculate different dispersion statistics, every time starting from median price on country-product level as proxy of the price in respective country for particular product. Price dispersion in the whole product sample, measured by interquartile range of median (post-tax) relative price distribution, amounts to 16% for 75-25 percentile interval. While this is rather conservative measure, the figure almost doubles (30%) for 90-10 percentile range. Analyzing the variation of the price differences we see that both approaches – one based on quantiles and one based on the moments, show us that the possibilities for price arbitrage exist. In most extreme situations they can reach even more than 160 EUR as in case Laptops and PCs category or more than 87 EUR for software, measured by quantile price dispersion (the difference between 90% quantile and 10% quantile).

Category	Subcategory	Average absolute price dispersion	Average # of observation per product	Quantile coefficient of dispersion (0.9-0.1)	Quantile price dispersion (0.9-0.1) [EUR]	Quantile coefficient of dispersion (0.75-0.25)	Quantile price dispersion (0.75-0.25) [EUR]	Coefficient of variation (mean)	Coefficient of variation (median)
Fashion	Clothing	13,9%	9,91	39,3%	27,65	18,3%	12,03	0,35	0,34
Fashion	Footwear	12,3%	12,36	31,1%	27,91	18,0%	16,08	0,25	0,26
Fashion	Accessories	9,9%	7,92	26,4%	21,16	12,1%	10,52	0,54	0,49
Cosmetics&Healthcare	Cosmetics	12,9%	12,72	36,2%	11,93	19,4%	4,28	1,16	1,53
Cosmetics&Healthcare	Perfumes	12,5%	12,53	35,3%	22,91	20,5%	13,2	0,38	0,39
Households Appliances	House	9,6%	6,65	20,9%	12,05	8,7%	5,04	0,35	0,34
Households Appliances	House (>100EUR)	10,4%	7,02	21,1%	58,85	11,3%	30,42	0,78	1,31
Households Appliances	Kitchen	11,4%	7,06	35,5%	64,32	18,4%	35,05	0,78	0,91
Households Appliances	Beauty	13,1%	5,51	31,8%	17,24	17,8%	10,1	0,51	0,5
Electronics and Computer Hardware	Accessories	10,7%	10,05	31,6%	14,98	19,5%	9,78	0,51	0,5
Electronics and Computer Hardware	Laptops and PCs	11,4%	8,67	28,8%	162,74	16,3%	94,61	0,55	0,84
Electronics and Computer Hardware	Monitors	7,8%	9,18	20,6%	39,54	11,5%	19,81	0,95	1,46
Electronics and Computer Hardware	Tablets and E-readers	9,6%	7,36	24,1%	73,57	14,0%	43,34	0,55	0,59
Electronics and Computer Hardware	Consoles	9,6%	10,09	24,0%	67,89	11,7%	32,18	0,4	0,4
Computer Games and Software	Software	11,7%	9,11	32,4%	87,89	18,6%	55,35	0,7	0,81
Computer Games and Software	PC games	12,3%	7,46	35,5%	13,29	21,4%	8,09	0,39	0,36
Computer Games and Software	Console games	10,7%	7,44	31,7%	14,74	18,2%	8,5	0,26	0,25
Total		11,2%	8,93	29,8%		16,2%		0,55	0,66

Table 3. *The price dispersion in European E-commerce industry*

As results presented above show significant price dispersion in on-line retail, we confront our data with Eurostat price levels data (precisely we use `prc_ppp_ind` variable from Eurostat database for year 2014). We expect the significant difference between our and Eurostat levels due to the differences in the products included in the sample (see Figure 1). However, in terms of magnitude, we see that the range of scale dispersion is similar in both datasets. This shows that the analyzed phenomenon is not exclusive for on-line retail.

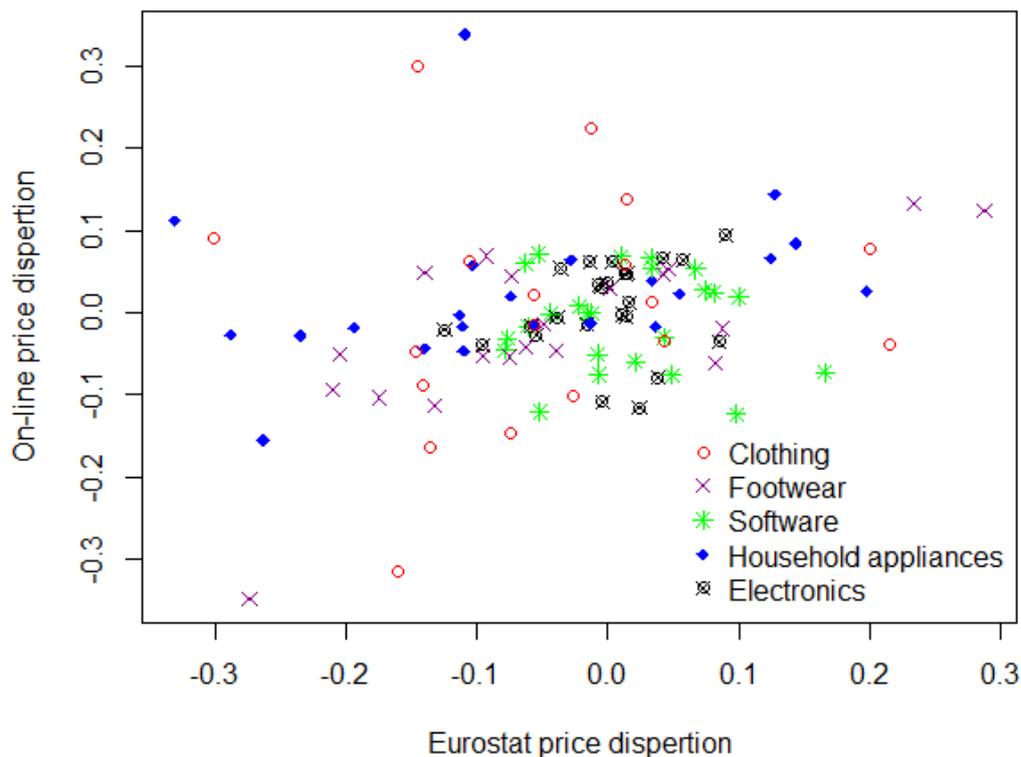

Figure 1. *Price dispersion in European E-commerce industry compared with Eurostat data.*

Our data confirms significant price dispersion in European e-commerce industry. Dispersion of prices was previously confirmed in economic literature as is shown in section 2. Also Eurostat provides comprehensive data confirming the phenomenon. As we can argue that in case of the off-line transaction making the cross-border transactions is connected with high transaction costs, for on-line retail they are mostly limited. Therefore, to answer the question about the main factors behind price dispersion, usage of the on-line price data seems to be more appropriate.

PRICE DISPERSION PATTERN

Economic literature discussed in section two suggests at least three broad groups of factors which influence the magnitude of price dispersion: (i) supply side factors like the cost of manufacturing, sales and distribution of goods; (ii) demand side factors such preferences and more importantly purchasing power of consumers and (iii) institutional factors such as differences in the level of competition in the market or taxation. It should be noted that although in most instances items are produced in developing countries, and imported to the EU, factor prices in particular member states will still affect economic conditions of pursuing activity of on-line shops as sale, distribution and marketing generate bulk of costs which are born domestically. Moreover there is large scope of differences among EU member states with respect to contractual law regarding for example seller liability or scope of consumer protection which will be most likely reflected in prices.

In this section we verify to what extent supply and demand side factors influence systematically on-line price dispersion among EU states. We start this analysis by looking at various factor prices available in the Eurostat, such as unit labor cost, unit cost of energy and fuels or capital costs. We expect that this supply side variables could affect prices in an obvious way. On top of it two demand side variables are considered: annual net salary in the private service sector and GDP *per capita*. We also include standard VAT rates which generally apply to the product categories which we analyze.¹

The scale of differences in all these variables among the Member States of the European Union is given in Table 4.

Variable	average	median	min	max	standard deviation
Unit cost of labour [EUR/h]	18.96	15.60	3.80	40.30	11.87
Average annual net salary [EUR/full time]	13455	11960	2668	28583	7973
Electric energy price [EUR/kwh]	0.18	0.17	0.09	0.30	0.06
Euro95 petrol price [EUR/litre]	1.31	1.34	1.10	1.57	0.14
Diesel fuel price [EUR/litre]	1.24	1.23	1.05	1.54	0.11
Cost of capital – interest rate [%] (a)	1.80	1.26	0.31	7.81	1.57
Standard VAT rate [%] (b)	21.61	21.00	17.00	27.00	2.35

Table 4. *Descriptive statistics of price dispersion determinants in the EU countries.*

Source: Eurostat, average annual data (2014) except for (a) ECB (status as at 31/10/2015), (b) DG TAXUD (status as at 1/09/2015).

At present in the EU we can still observe considerable differentiation with regards to the factors presented in Table x1. To assess in statistically meaningful way which of those factors have the

¹ Although VAT rules are not harmonized across the EU, reduced rates apply usually to books and baby clothing and equipment – all of which have not been considered in our study.

strongest influence on dispersion of on-line prices in the EU countries, we have conducted linear regression analysis. As a dependent variable we took relative price deviation, which is closely related to interquartile price dispersion but takes both negative and positive values around the average from median prices calculated for the countries where a given product was supplied. More specifically we have estimated the following model:

$$PD_{i,j} = f(SS_{i,j}, DS_{i,j}, IE_{i,j}, PC_k)$$

Where $PD_{i,j}$ is percent deviation of median price of product i in country j from the average of median prices for all countries where the product was offered on-line. SS and SD are vectors of supply and demand side factors, IE are institutional environment variables and PC are product subcategories. Detailed list of variables is provided in Table 5 below.

Name of variable in the model	Variable description
PD: [percent_deviation]	Percentage deviation of the median of product prices in a given country from the average of medians for all countries based on the web scraping study of results from price comparison websites
DS.: [GDP_pc]	Real GDP per capita in EUR thousands, at the end of 2014.
DS: [net_earnings]	Average annual net salary in 2014
IE: [NMS]	Variable indicating a new member state of the European Union
SS: [pop_density]	Population density – proxy for transportation costs
IE: [vat_stdrate]	Current level of standard VAT rate
SS: [ele_cost]	Unit cost of electric energy, average annual value in 2014.
SS: [E95_price]	Euro95 petrol price, average annual value in 2014.
SS: [diesel_price]	Diesel oil price, average annual value in 2014.
SS: [unit_lab_cost]	Unit cost of labour, average annual value in 2014.
SS: [interest_rate]	Current interest rate on 10-year Treasury bonds in the secondary market–capital price index
PC: [Games for PC], [Games for consoles], [Consoles], [Cosmetics], [Laptops and computers], [Small household appliances for the home < EUR 100], [Small household appliances for the home > EUR 100], [Small household appliances for the kitchen], [Monitors], [Footwear], [Perfumes], [Software], [Tablets and e-book readers], [Clothing], [Body care appliances] – Binary variables for subcategories of products.	

Table 5. List of variables used in regression analysis.

Prior to estimation we inspected collinearity of independent variables. Based on variance inflation factor test we had to eliminate from the model, net earnings and unit labor cost due to high collinearity with GDP *per capita*. For the same reason a dummy variable NMS denoting new member states had to be ruled out from analysis. As a consequence we could not further treat *per capita* income as a purely demand side factor, but can still expect that the sign of coefficient for this variable will be positive. Final model has been estimated with the OLS regression and passes bunch of standard diagnostic tests.¹ Coefficients of the final model are presented in Table 6.

¹ Error terms are distributed iid normal. Model has no omitted variables.

MODEL	Parameter	Std. Error	t value	Pr(> t)
(Intercept)	-0.1258	0.0493	-2.55	0.0108

Table 6. Results of linear regression for the 'percent_deviation' variable

Regression results shed light into the pattern of observed price dispersion among the EU countries. Its magnitude is conditional first of all on two factors: cost of capital ('interest_rate' variable) and the level of GDP *per capita* ('GDP_pc' variable). Estimations of parameters for both variables follow the expected

direction: along with the increase in cost of capital in a given country by 1 percentage point, the deviation of median price from the average level for EU rises by 0.4 percentage point for the whole product sample. In turn, increase in GDP *per capita* by EUR thousand is connected with increase in deviation of the price in the given country from the median of prices in the EU by 0.22 percentage point. The influence of the GDP variable can be illustrated on the example of Poland and United Kingdom, whose GDP levels are, respectively, EUR 11 thousand and 41 thousand. Based on the model results, prices in Poland will be, due to the differences in income, on average 6.6 percentage point lower than in the United Kingdom. The model also shows systematic differences in the magnitude of price deviation between few product categories. For example, the positive coefficient for 'Perfumes' variable means that, other things being equal, prices of perfume products deviate by 3 percentage points more from the average level than all other products in the sample.

Interesting observations can be drawn from the results showing which variables proved to be statistically insignificant. First and foremost, these are the VAT rate and fuel and energy costs. VAT rates are established by individual countries in accordance to the needs and objectives of their fiscal policy and not the level of income. As for electricity costs, they are often larger in less developed countries due to greater share of fossil fuels in their energy mixes and also less efficient production capacities. Besides share of fuel and energy in sales and distribution costs remains relatively low.

SUMMARY AND CONCLUSIONS

This paper provides a new way of collecting price data and applies it to measure price dispersion across the EU for a broad variety of homogeneous commodities. We have obtained a unique snapshot picture of price dispersion based on data from price comparison sites using web-scraping technique. The main advantage of this approach is that it offers a possibility to collect tons of individual price signals from virtually all shops selling particular item in each country. This great benefit comes at a relatively small effort of scraping reasonably small number of web sites that integrate information. We have also analyzed the pattern of observed price dispersion with selected economic characteristics of member states to gain better insights into factors which determine on-line prices. Our study brings two main results.

First, price dispersion in the whole product sample, measured by interquartile range of median (post-tax) relative price distribution, amounts to 16% for 75-25 percentile interval. While this is rather conservative measure, the figure almost doubles (30%) for 90-10 percentile range. We note that both figures show average price dispersion for the whole product sample. The sample itself is composed of large variety of branded items representing all main product categories. We believe that this large heterogeneity adds to the robustness of our results. The magnitudes of price dispersion differ quite a lot

between product categories and subcategories, ranging from roughly 20% for electrical household appliances to 40% for clothing.

Secondly, price levels grow with GDP *per capita* and costs of capital. According to results of regression analysis an increase in real GDP *per capita* by one thousand EUR increases deviation of median price by 0.22 percentage point relative to the average level for the EU. In turn, an increase of interest rate of treasury bonds by 1 percentage point increases price by 0.44 percentage point. We note that the observed link between *per capita* income and price dispersion might be consistently explained with at least two through mechanisms. The first is classical third degree price discrimination based on differences in demand elasticity induced by income levels. The second is supply side mechanism related to labor costs. Unfortunately, lacking data on quantities, we could not isolate both effects.¹ Nevertheless we argue that it is reasonable to assume that both mechanisms are likely in force. Consequently at least part of observed price dispersion is induced by strategic price discrimination between country markets within the EU. This has important bearing for new policy interventions aiming to reduce price dispersion in the Digital Single Market.

While price dispersion between EU countries is unavoidable because of objective differences in taxes, wages and capital costs, as well as lack of harmonization of contract laws, the main policy question remains whether its scope is not too large and how can be effectively reduced? Some policy interventions are now being debated within the EC in response to public consultations on geographically based-restrictions initiated in September 2015. The Commission wants to address geo-blocking and other discriminations based on place of residency or nationality with a new regulation. The new regulation will reinforce equal treatment of cross-border consumers with so called 'shop like a local' principle - and perhaps will go even further and impose an obligation to serve customers across the EU giving the trader the right to charge extra delivery costs. What would be the effects of such regulation?

Lowering barriers for cross border trade will lower high costs of arbitrage for consumers and as a result ability to exercise price discrimination by distributors on the European level. It is however unlikely that equal treatment principle would have any effect on non-strategic component of price dispersion, because on-line retailers act in competitive environments and hence all existing differences in operational costs between countries will be passed on retail prices. On the other hand the situation of large distributors and producers is very different. Considerable income differences affect price elasticity and encourage distributors to price discriminate between national markets. On the EU level strategic price discrimination leads to greater rent extraction from customers. Hence the effects of new

¹ Lacking sales data makes it impossible to account for market competition which is also an important determinant for price dispersion. There is some evidence that market power of merchants from off-line channel is often transmitted to e-commerce.

regulation will crucially depend on whether it can limit the room for uncompetitive practices of large distributors and producers such as vertical trade restraints so that consumers can actually buy cross border. Besides competition law enforcement major change in arbitrage costs could happen if the delivery prices were lower, however EC does not plan to undertake any action in this respect.

EC interventions to lowering barriers for cross-border trade such as reducing geo-blocking restrictions or liberalizing parcel delivery market would most likely decrease price dispersion due to reduction of incentives for strategic price discrimination on the wholesale level. This would eventually decrease prices in high income countries bringing positive welfare effects for customers. On the other hand prices in lower income countries are expected to increase, because in this way traders can reduce potential benefits from arbitrage to customers. Hence welfare effect for customers from lower income countries will most likely be negative. Producers' surpluses are expected to change in the opposite directions.

The major conclusion from this discussion is that if price dispersion is a result of strategic price discrimination on producer and/or distributor level, then any policy intervention reducing trade barriers, would essentially bring adverse distributional effects on customer and producer welfare in particular member states. As economic literature suggests, a-priori there is no conviction that the net effect is guaranteed to be positive (Malueg et al., 1994). Therefore we argue that any policy interventions targeting price dispersion in the Digital Single Market in an administrative manner should be carried out very carefully.

BUNDLING OR UNBUNDLING? ANALYSIS OF PROFIT GAINS FROM BUNDLING

Sobolewski, Maciej; Miernik, Ireneusz; Kopczewski, Tomasz

Faculty of Economic Sciences, University of Warsaw, Poland.

Abstract

Bundling literature has mainly focused on profit dominance in a weak sense. However, this classical perspective has little practical applicability, as it does not tell under which conditions mixed bundling can be expected to outperform the two remaining sales formats strictly and by how much. Therefore, in this paper, we shift to a different perspective and look at the magnitude of profit gains from mixed bundling in a particular, albeit tractable demand setting. We propose a single parameter joint density function of reservation prices for two goods which has two convenient properties: (i) marginal distributions are uniform yielding linear market demands for both component products and (ii) correlation coefficient between reservation prices has a closed-form. Our analysis of bundling gains is carried out for the whole possible range of marginal costs and degree of correlation of valuations of bundle components. Our results in principle show that bundling is rarely better enough. It can generate over 10% profit gains only for specific combinations of low marginal cost and sufficient negative correlation of valuations. In this way, our results conform with practical observations that bundling is applicable mainly to low marginal costs industries like information goods or ICT services.

Keywords: *correlated reservation prices, mixed bundling, pure bundling, uniform marginal distribution*

1. INTRODUCTION

The question about conditions for optimality of bundling is a long studied issue in pricing literature. The problem has been posted since the seminal works of Stigler (1963) and Adams and Yellen (1976) and still has not received a definite answer. In their famous study, Adams and Yellen have shown on discrete examples that monopolist will earn extra profit from bundling, compared to independent sales of products, if a distribution of reservation prices for the package has reduced variance compared to valuations of each component. Their more general conclusion was that

profitability of bundling depends crucially on the level of costs and distribution of consumers in reservation price space.¹

Since then continuous attempts has been made to derive conditions under which bundling generates more profit for possibly the least restrictive assumptions about consumer demand space and costs. Venkatesh and Mahajan (2009) provide an excellent overview of those efforts undertaken throughout more than three decades. They conclude that although mixed bundling is expected to outperform weakly pure components, the conditions for strict profit dominance are unknown except for several particular cases.

Existing research identified at least several demand and supply side elements which determine the profitability of bundling, such as (non) additivity and correlation in reservation prices and (non) additivity of unit costs. Schmalensee (1984) argues that pure bundling works through reduced heterogeneity in reservation prices across consumers, thus facilitating the capture of greater part of consumer surplus. On the other hand, mixed bundling is essentially a price discriminating tool and might yield an even higher profit if marginal production costs are substantial.² The idea of reduced heterogeneity of reservation prices for a bundle is linked to the issue of negative correlation of component reservation prices. McAfee et al. (1989) establish general sufficient condition for mixed bundling to dominate separate sales for any atomless joint distribution of reservation prices and show that it also holds for independently distributed reservation prices. Their condition partially corresponds to but does not imply, a negative correlation property of reservation prices. More recently, Chen and Riordan (2013) utilized copula approach to restate sufficient and necessary conditions of McAfee et al. (1989) for bundles of a size larger than two. Their conditions use broader concepts of negative dependence or tail dependence which are properties of copula functions (Nelsen, 1999). However, bundling can be profitable also when reservation prices for two products are positively correlated, at least for specific distributions of individual demands such as bivariate normal (Schmalensee, 1984).

All these studies have adopted local analysis approach, looking at the improvement of profits when shifting to mixed bundling, from introducing package price with infinitesimal small discount. Our study takes a different approach. We focus on by how much (mixed) bundling outperforms unbundling. It requires switching from local improvement analysis towards searching for global optima. Despite its obvious practical relevance, the problem of (global) profit gains magnitude has not

¹ Under pure bundling, monopolist sells only the package, while with mixed bundling customers may choose to buy either a package (for the price that is different from the sum of single-good prices) or any of the component goods separately.

² Mixed bundling enables monopolist to sell a bundle to a large mass of customers with at least moderate valuations for both goods and at the same time capture higher mark-up from consumers, who are mainly interested in one of the goods.

received much attention in literature so far. Some existing studies conducted global optima analysis for specified stylizations of components reservation prices and dependency pattern, sometimes with the supportive use of simulation techniques.¹ Eckalbar (2010) explores optimality of bundling under a uniform distribution of reservation prices and gives analytical mixed and pure bundling solutions, but only for the three special cases: independence and perfect positive or negative correlation.² He also reflects on the profit gains issue and claims that mixed bundling offers up to 10% larger profits than separate sales while the gains from pure bundling do not exceed 8.8% - both results holding only for independence case and zero marginal costs. Despite this result, hardly anything can be found about how the magnitude of profit gains from bundling is affected by costs and correlation of valuations.

This paper aims to shed some light on this issue. To progress with analysis of profit gains, we introduce a new bivariate distribution of reservation prices which possesses advantages of both previously indicated. On one hand it has analytically tractable demand and profit functions for pure bundling and pure components strategies and on the other hand, it allows to capture underlying correlation with a single parameter.

Our contribution to existing research is twofold. First, we propose joint density function of reservation prices for two goods f^a , with a single parameter controlling for the shape of demand space. We show that this joint distribution has two convenient properties for the analysis of bundling problem: (i) marginal distributions derived from f^a are always uniform in the whole parameter space and (ii) correlation coefficient between marginal distributions is a closed-form function of distribution's parameter and can take any value in the whole range $[-1,+1]$. Under our formulation of reservation price space, we can analytically model pure bundling problem for any degree of correlation. Although closed-form solutions for mixed bundling do exist in proposed setting, our treatment of mixed bundling relies on simulations, as this case has too many subcases that need to be considered analytically. Second, for the introduced joint density function we analyze optimality and profit gains from shifting to monopoly pure and mixed bundling strategies for a full range of correlation and marginal costs. Our results are valid for the specific type of distribution we have adopted, but nevertheless, they support an astonishing conclusion that while bundling is never worse than unbundling, it is rarely better enough for practical implementation. This finding holds even for high negative correlation between reservation prices, pointing to the critical role of costs in bundling

¹ For continuous case, the most frequently used families of distributions are uniform and normal. Gaussian demand is analytically intractable, but on the other hand, bivariate normal distribution captures underlying correlation through a single parameter.

² Uniform distribution yields linear demand curve which is convenient for analytical profit maximization, especially for pure components strategy. So far there have been no attempts to analytically model partial correlation between uniformly distributed valuations, perhaps in consent with a view expressed by Venkatesh and Mahajan (2009, p.236): *"This form is analytically quite tractable, can capture complementarity and substitutability, but is not convenient for modeling correlation (except perfect positive/negative correlation)"*.

analysis. We assess bundling gains with arbitrary assumption that 10% markup over operating surplus from pure components is sufficient to cover implementation costs.¹ The fact that mixed bundling rarely exceeds this rather modest threshold is the most astonishing finding from our study.

The paper is organized as follows. In section 2 we describe the general structure of bundling problem and set out our analytical framework. More specifically we introduce bivariate density function with 'belt-shaped' domain to describe reservation price space and derive a formula for correlation of reservation prices. In section 3 we provide solutions to bundling problem within our framework and determine profit gains from pure and mixed bundling for different degrees of correlation and marginal costs. The last section provides summary and conclusions.

2. MODEL OF COMMODITY BUNDLING

The focus of this section is on a mathematical model of commodity bundling. Let \mathbb{R} denote the ordinary real line $(-\infty, \infty)$, \mathbb{R}^2 denote the real plane $\mathbb{R} \times \mathbb{R}$, and $\overline{\mathbb{R}}$ denote the extended real line $[-\infty, \infty]$, $\overline{\mathbb{R}}^2$ denote the extended real plane $\overline{\mathbb{R}} \times \overline{\mathbb{R}}$. We also let $Domf$ and $Ranf$ denote the domain and the range of the f function. There are two goods in our model. We will use the capital letters \mathbb{X} and \mathbb{Y} to represent these goods and lowercase letters x, y to represent their reservation prices. Valuations of \mathbb{X} and \mathbb{Y} goods by consumers will be represented in our model by joint bivariate reservation price density function.

Definition 1

The bivariate reservation price density function for goods \mathbb{X} and \mathbb{Y} is a real function f with the following properties:

1. $Domf = [0, \bar{x}] \times [0, \bar{y}] \subset \overline{\mathbb{R}}^2$ is the Cartesian product of two closed intervals, where $\bar{x} \in \overline{\mathbb{R}}$, $\bar{y} \in \overline{\mathbb{R}}$ and $\bar{x} \geq \bar{y} > 0$,
2. $Ranf \subset \mathbb{R}$ and $f(x, y) \geq 0$ for all (x, y) in $[0, \bar{x}] \times [0, \bar{y}]$,
3. $\iint_{[0, \bar{x}] \times [0, \bar{y}]} f(x, y) dy dx = 1$.

Note that for all $x_1, x_2 \in [0, \bar{x}]$, $x_1 \leq x_2$ and for all $y_1, y_2 \in [0, \bar{y}]$, $y_1 \leq y_2$ in $Domf$

$$0 \leq \int_{x_1}^{x_2} dx \int_{y_1}^{y_2} f(x, y) dy \leq 1$$

is the fraction of a population of consumers with the reservation prices for good \mathbb{X} and \mathbb{Y} falling within rectangle $[x_1, x_2] \times [y_1, y_2]$

Definition 2

¹ In reality, there are always some additional fixed and variable implementation costs, which are usually ignored in bundling models as a consequence of simplifying assumptions about additivity of constant marginal costs.

The univariate reservation price density function for good \mathbb{X} is a real function f_x with the following properties:

1. $Domf_x = [0, \bar{x}] \subset \overline{\mathbb{R}}$ is the closed interval in $\overline{\mathbb{R}}$,
2. $Ranf_x \subset \mathbb{R}$ and $f_x(x) \geq 0$ for all x in $[0, \bar{x}]$,
3. $\int_0^{\bar{x}} f_x(x) dx = 1$.

Note that

$$f_x(x) = \int_0^{\bar{y}} f(x, y) dy$$

and for all $x_1, x_2 \in [0, \bar{x}]$, $x_1 \leq x_2$, in $Domf_x$

$$0 \leq \int_{x_1}^{x_2} f_x(x) dx \leq 1$$

is the fraction of a population of consumers with the reservation prices of good \mathbb{X} falling within interval $[x_1, x_2]$.

The following properties hold: $f_y(y) = \int_0^{\bar{x}} f(x, y) dx$, $Domf_y = [0, \bar{y}] \subset \overline{\mathbb{R}}$ and for every interval $[y_1, y_2]$, where $y_1, y_2 \in [0, \bar{y}]$, $y_1 \leq y_2$, in $Domf_y$ $0 \leq \int_{y_1}^{y_2} f_y(y) dy \leq 1$.

Univariate reservation price density function for good \mathbb{Y} is defined analogously. Following the framework of Adams and Yellen (1976) monopolist can choose between three following strategies:

1. Sell goods \mathbb{X} and \mathbb{Y} separately - **pure component** strategy (PC).
2. Offer goods \mathbb{X} and \mathbb{Y} for sale only in packages - **pure bundling** strategy (PB).
3. Combine PC and PB strategies by offering goods \mathbb{X} and \mathbb{Y} not only separately but also in a package. This is **mixed bundling** strategy (MB).

pure components strategy

A consumer with single demand will purchase a unit at price p if his reservation price of this good (weakly) exceeds this price. Therefore, the market demand for any good at price p is a fraction of consumers with the reservation prices greater than or equal to p . Hence, we can define the demand function of good \mathbb{X} for PC strategy as follows:

Definition 3

The demand function for good \mathbb{X} under pure components strategy is a real function d_x^{PC} with domain $[0, \bar{x}]$ given by:

$$d_x^{PC}(p) = 1 - \int_0^p f_x(x) dx = \int_p^{\bar{x}} f_x(x) dx$$

Demand function for good \mathbb{Y} is defined analogously.

pure bundling strategy

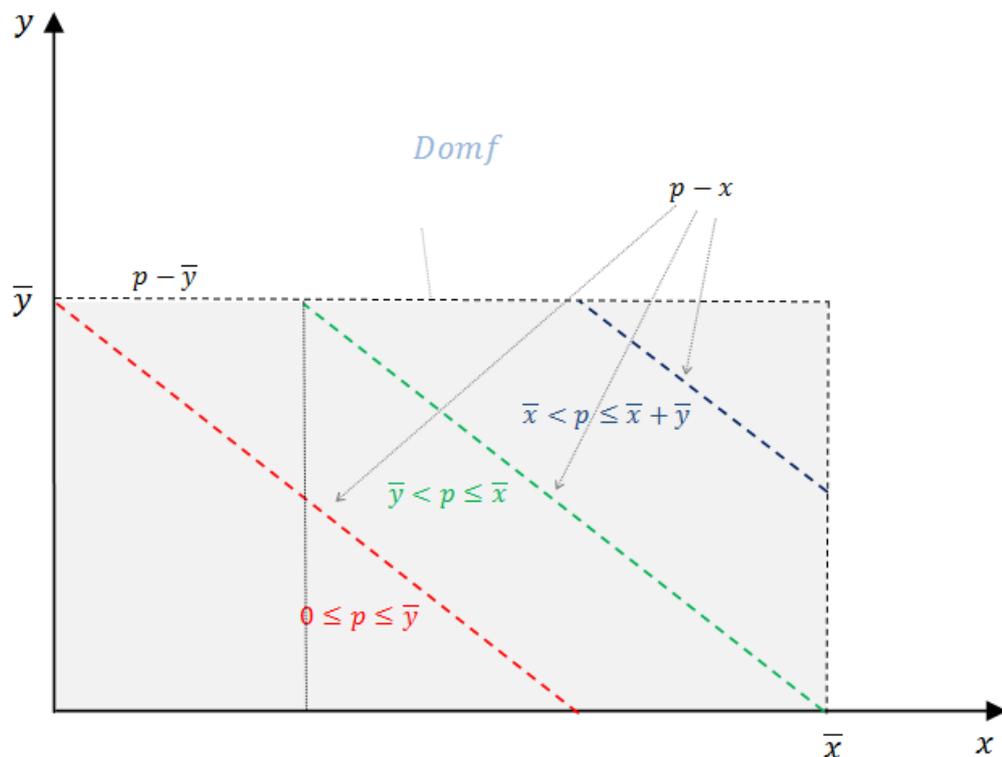

When a package consisting of the X and Y goods is offered at price p , a consumer will make a purchase if and only if the sum of his or her reservation prices for these goods will be greater than or equal to p . This additivity property is assumed in most studies and adopt it as well. Consumer space under pure bundling strategy is graphed in Figure 1. We need to define demand function for the bundle for three different intervals of a price p : $[0, \bar{y}]$, $(\bar{y}, \bar{x}]$, $(\bar{x}, \bar{x} + \bar{y}]$.

Definition 4

The demand function of the bundle the X and Y goods under pure bundling strategy is a real function d_b^{PB} with domain $[0, \bar{x} + \bar{y}]$ given by:

$$d_b^{PB}(p) = \begin{cases} 1 - \int_0^p dx \int_0^{p-x} f(x,y)dy, & 0 \leq p \leq \bar{y} \\ 1 - \int_0^{p-\bar{y}} dx \int_0^{\bar{y}} f(x,y)dy - \int_{p-\bar{y}}^p dx \int_0^{p-x} f(x,y)dy, & \text{where } \bar{y} < p \leq \bar{x} \\ 1 - \int_0^{p-\bar{y}} dx \int_0^{\bar{y}} f(x,y)dy - \int_{p-\bar{y}}^{\bar{x}} dx \int_0^{p-x} f(x,y)dy, & \bar{x} < p \leq \bar{x} + \bar{y} \end{cases}$$

Figure 1. Pure bundling strategy.

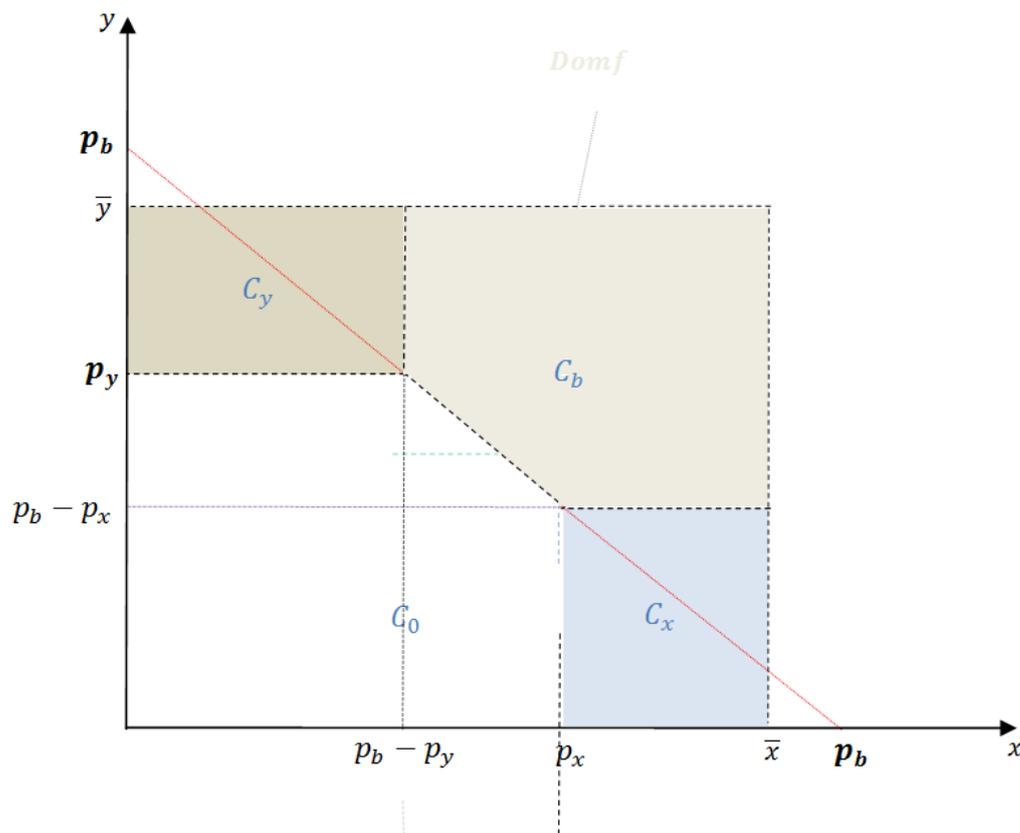

Note that for symmetric case: $\bar{x} = \bar{y} < +\infty$ demand for a bundle simplifies to:

$$d_b^{PB}(p) = \begin{cases} 1 - \int_0^p dx \int_0^{p-x} f(x,y)dy, & 0 \leq p \leq \bar{x} \\ 1 - \int_0^{p-\bar{x}} dx \int_0^{\bar{x}} f(x,y)dy - \int_{p-\bar{x}}^{\bar{x}} dx \int_0^{p-x} f(x,y)dy, & \bar{x} < p \leq 2\bar{x} \end{cases}$$

mixed bundling strategy

This is most interesting but also the most analytically demanding strategy, because a consumer can buy not only a package consisting of goods X and Y but also each good separately. Essentially mixed bundling strategy introduces discrimination between consumers who now have four options to choose from: buying only good X, buying only good Y, buying a package of both and at the end buying nothing. Consumer space under MB strategy is presented in Figure 2.

Figure 2. Mixed bundling strategy.

Under pure bundling monopolist needs to establish three different prices:

- p_x - a price for good X;
- p_y - a price for good Y;
- p_b - a price for the bundle consisting of X and Y.

Note that if monopolist offers goods \mathbb{X} and \mathbb{Y} separately at prices p_x and p_y then it makes sense to offer a bundle provided that its price includes a discount:

$$p_b < p_x + p_y.$$

Based on this inequality, we get two conditions for implicit prices for \mathbb{X} and \mathbb{Y} which must hold if monopolist wants to implement mixed bundling strategy effectively:

$$p_b - p_x < p_y \text{ and } p_b - p_y < p_x.$$

The interpretation of those conditions is simple: $p_b - p_x > 0$ is the implicit price of good \mathbb{Y} for a consumer who would buy only good \mathbb{X} at a price p_x and $p_b - p_y > 0$ is the implicit price of good \mathbb{X} for the consumer who would buy only good \mathbb{Y} at a price p_y . Implicit prices for \mathbb{X} and \mathbb{Y} are also bounded from the above by the price of a bundle or the maximal reservation price in the population - whichever is smaller. Thus for every p_x in $[0, \bar{x}]$, p_y in $[0, \bar{y}]$, p_b in $[0, \bar{x} + \bar{y}]$ we have the following restrictions on (p_y, p_x, p_b) :

$$0 < p_b - p_x < p_y < \min(p_b, \bar{y}),$$

and

$$0 < p_b - p_y < p_x < \min(p_b, \bar{x}).$$

In Figure 2, we can see the following four demand segments:

$$C_0 = \{(x, y) \in \text{Dom}f \mid x < p_x \text{ and } y < p_y \text{ and } x + y < p_b\}$$

is the area with consumers who buy nothing;

$$C_x = \{(x, y) \in \text{Dom}f \mid x \geq p_x \text{ and } y < p_b - p_x\}$$

is the area with consumers who buy only good \mathbb{X} ;

$$C_y = \{(x, y) \in \text{Dom}f \mid y \geq p_y \text{ and } x < p_b - p_y\}$$

is the area with consumers who buy only good \mathbb{Y} ;

$$C_b = \{(x, y) \in \text{Dom}f \mid x \geq p_b - p_y \text{ and } y \geq p_b - p_x \text{ and } x + y \geq p_b\}$$

is the area with consumers who buy only the bundle. Based on the above, for mixed bundling strategy we need to define:

- demand for good \mathbb{X} ,
- demand for good \mathbb{Y} ,
- demand for the bundle consisting of both goods.

Definition 5

The demand function for good \mathbb{X} under mixed bundling strategy is a real function d_x^{MB} with domain $(p_b - p_y, \min(p_b, \bar{x})) \times [0, \bar{x} + \bar{y}]$ given by

$$d_x^{MB}(p_x, p_b) = \int_0^{p_b - p_x} dy \int_{p_x}^{\bar{x}} f(x, y) dx.$$

Definition 6

The demand function for good Y under mixed bundling strategy is a real function d_y^{MB} with domain $(p_b - p_x, \min(p_b, \bar{y})) \times [0, \bar{x} + \bar{y}]$ given by

$$d_y^{MB}(p_y, p_b) = \int_0^{p_b - p_y} dx \int_{p_y}^{\bar{y}} f(x, y) dy.$$

Definition 7

The demand function for the bundle under mixed bundling strategy is a real function d_b^{MB} with domain $(p_b - p_y, \min(p_b, \bar{x})) \times (p_b - p_x, \min(p_b, \bar{y})) \times [0, \bar{x} + \bar{y}]$ given by

$d_b^{MB}(p_x, p_y, p_b) = \int_{p_b - p_y}^{p_x} dx \int_{p_b - x}^{\bar{y}} f(x, y) dy + \int_{p_b - p_x}^{\bar{y}} dy \int_{p_x}^{\bar{x}} f(x, y) dy$. independent uniform marginal densities

Now we apply the general structure of bundling problem to the case when reservation prices for both goods are independent and uniformly distributed. Under these assumptions bivariate joint reservation price distribution takes the form $f(x, y) = \frac{1}{\bar{x}\bar{y}}$ with $Domf = [0, \bar{x}] \times [0, \bar{y}] \subset \mathbb{R}^2$, where $\bar{x} \in \mathbb{R}$, $\bar{y} \in \mathbb{R}$ and $\bar{x} \geq \bar{y} > 0$, the demand functions evaluate to:

1. For PC strategy (Definition 3)

$$d_x^{PC}(p) = 1 - \frac{1}{\bar{x}}p, \quad d_y^{PC}(p) = 1 - \frac{1}{\bar{y}}p,$$

2. For PB strategy (Definition 4)

$$d_b^{PB}(p) = \begin{cases} 1 - \frac{1}{2\bar{x}\bar{y}}p^2, & 0 \leq p \leq \bar{y} \\ 1 - \frac{1}{2\bar{x}\bar{y}}(p^2 - (p - \bar{y})^2), & \text{for } \bar{y} < p \leq \bar{x} \\ 1 - \frac{1}{2\bar{x}\bar{y}}(p^2 - (p - \bar{x})^2 - (p - \bar{y})^2), & \bar{x} < p \leq \bar{x} + \bar{y} \end{cases}$$

3. For MB strategy (Definitions 5, 6 and 7)

$$d_x^{MB}(p_x, p_b) = \frac{1}{\bar{x}\bar{y}}(\bar{x} - p_x)(p_b - p_x), \quad d_y^{MB}(p_y, p_b) = \frac{1}{\bar{x}\bar{y}}(\bar{y} - p_y)(p_b - p_y),$$

$$d_b^{MB}(p_x, p_y, p_b) = 1 - \frac{1}{\bar{x}\bar{y}}(\bar{x}(p_b - p_x) + \bar{y}(p_b - p_y)) - \frac{1}{2\bar{x}\bar{y}}((p_x^2 + p_y^2) - p_b^2).$$

Eckalbar (2010) has analyzed bundling problem under the above assumptions. He shows that for all relevant values of marginal cost mixed bundling strategy generates the highest profits but reduces consumer surplus compared to separate sales of both goods. His second conclusion states that pure bundling will be inferior to pure components if marginal costs exceed a certain level. Our analysis extends Eckalbar's results beyond independence case.

Profit optimization

We can now formulate monopoly profit optimization. With the three strategies at hand, generic profit formula for monopolist is given by:

$$\Pi_{max} = \max_{(p_x^{PC}, p_y^{PC}, p_b^{PB}, p_x^{MB}, p_y^{MB}, p_b^{MB})} \{ \Pi^{PC}(p_x^{PC}, p_y^{PC}), \Pi^{PB}(p_b^{PB}), \Pi^{MB}(p_x^{MB}, p_y^{MB}, p_b^{MB}) \} \quad (1)$$

where:

- $\Pi^{PC}(p_x^{PC}, p_y^{PC})$ is profit from PC strategy,
- $\Pi^{PB}(p_b^{PB})$ is profit from PB strategy,
- $\Pi^{MB}(p_x^{MB}, p_y^{MB}, p_b^{MB})$ is profit from MB strategy,
- p_x^{PC}, p_y^{PC} are prices of the X and Y goods respectively for PC strategy,
- p_b^{PB} is price of the bundle for PB strategy,
- $p_x^{MB}, p_y^{MB}, p_b^{MB}$ are prices of the X, Y and the bundle both goods respectively for MB strategy.

To evaluate the expression (1) we need to specify the cost structure. We will follow the mainstream approach adopted in bundling literature and assume additive cost function with constant marginal costs and no fixed costs. It should be noted that this assumption rather disfavors bundling as it rules out economies of scale and scope which likely increase gains from selling a product in packages. Profit functions are now given by:

1. For PC strategy

$$\Pi^{PC}(p_x^{PC}, p_y^{PC}) = \Pi_x^{PC}(p_x^{PC}) + \Pi_y^{PC}(p_y^{PC}) \quad (3)$$

where:

- $\Pi_x^{PC}(p_x^{PC}) = d_x^{PC}(p_x^{PC})(p_x^{PC} - c_x)$ is profit from selling good X under PC,
- d_x^{PC} is demand function for good X under PC (Definition 3),
- c_x is marginal costs of good X.

Profit formula for good Y is analogous.

2. For PB strategy

$$\Pi^{PB}(p_b^{PB}) = d_b^{PB}(p_b^{PB})(p_b^{PB} - c_b) \quad (4)$$

where:

- d_b^{PB} is demand function of the bundle of X and Y goods under PB (definition 4)
- $c_b = c_x + c_y$ is the marginal cost of the bundle.

3. For MB strategy

$$\Pi^{MB}(p_x^{MB}, p_y^{MB}, p_b^{MB}) = \Pi_x^{MB}(p_x^{MB}, p_b^{MB}) + \Pi_y^{MB}(p_y^{MB}, p_b^{MB}) + \Pi_b^{MB}(p_x^{MB}, p_y^{MB}, p_b^{MB}) \quad (5)$$

where:

- $\Pi_x^{MB}(p_x^{MB}, p_b^{MB}) = d_x^{MB}(p_x^{MB}, p_b^{MB})(p_x^{MB} - c_x)$ is profit from selling X under MB,
- $\Pi_y^{MB}(p_y^{MB}, p_b^{MB}) = d_y^{MB}(p_y^{MB}, p_b^{MB})(p_y^{MB} - c_y)$ is profit from selling Y under MB,

- $\Pi_b^{MB}(p_x^{MB}, p_y^{MB}, p_b^{MB}) = d_b^{MB}(p_x^{MB}, p_y^{MB}, p_b^{MB})(p_b^{MB} - c_b)$ is profit from selling the bundle under MB,
- $d_x^{MB}, d_y^{MB}, d_b^{MB}$ are demand functions for goods \mathbb{X} , \mathbb{Y} and the bundle respectively, under MB (see, Definitions 5, 6, 7).

Setting the framework: joint density f^a

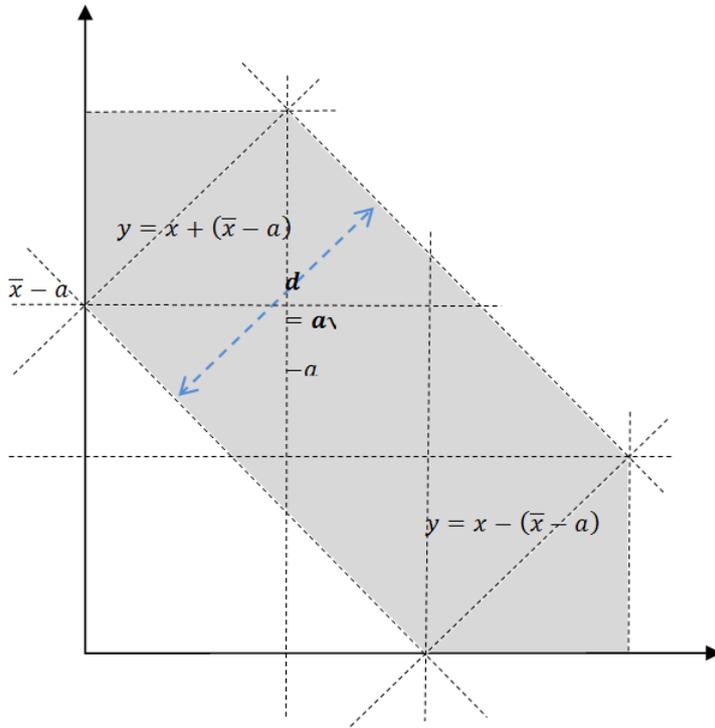

With a basic model at hand, we can introduce reservation price space which has desirable properties for analysis of bundling problem, namely uniform marginal densities and a closed-form formula for the correlation coefficient. Let f^a denote a joint bivariate density function of reservation prices for two goods, with a single shape parameter a . The domain of f^a where density is positive forms a 'belt', which is symmetric around the diagonal of square $[0, \bar{x}] \times [0, \bar{x}]$ as illustrated in Figure 3. Parameter a measures width of the 'belt', which in this case equals $d = a\sqrt{2}$. Depending on the value of a the 'belt' shrinks towards a diagonal line or expands to the whole square. The key feature of f^a is that density in both triangular areas is twice larger than in rectangular area Cooke (2009).¹ In what follows we show that f^a : (i) is indeed a proper density function; (ii) always has uniform margins and (iii) has a closed form expression for correlation coefficient which covers a full range of values in $[-1, +1]$.

We introduce two variants of f^a density. By f^{a-} we denote a function with belt-shaped domain directed towards top-left corner of $[0, \bar{x}] \times [0, \bar{x}]$ square and by f^{a+} a function with belt-shaped domain directed towards the top-right corner.² Both variants cover respectively positive and negative correlation of reservation prices for goods \mathbb{X} and \mathbb{Y} . In Figure 3, we show a negative belt: $Dom f^{a-}$ for $a \in \left(0, \frac{\bar{x}}{2}\right]$ and in Figure 4 for $a \in \left[\frac{\bar{x}}{2}, \bar{x}\right]$. We distinguish both subranges for parameter a because the definition of f^{a-} slightly differs in each case, as is shown in Propositions 1a and 1b.

¹ Andrew Cooke proposed this density in a short technical note outside bundling context. We credit him here.

² Throughout the text we use the following naming convention: we refer to the domain of f^{a-} as a negative belt and f^{a+} as a positive belt.

Figure 3. Negative belt: $Dom f^{a-}$ for $a \in (0, \frac{\bar{x}}{2}]$.

In the following two propositions, we formally define f^{a-} and prove uniformity of its margins.

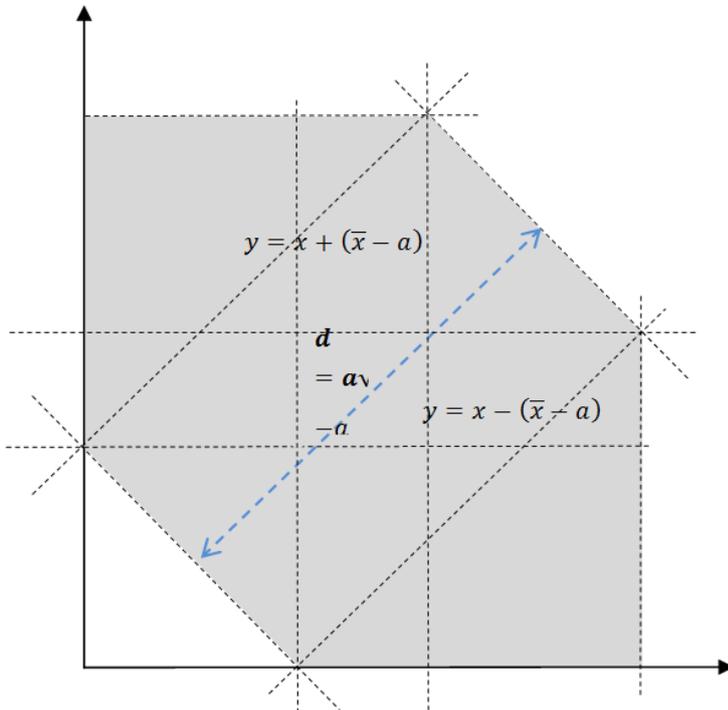

Proposition 1a. Function f^{a-} for $a \in (0, \frac{\bar{x}}{2}]$ given by:

$$\begin{aligned}
 \bigwedge_{0 \leq x \leq a} f^{a-}(x, y) &= \begin{cases} \frac{1}{a\bar{x}} & x + (\bar{x} - a) \leq y \leq \bar{x} \\ \frac{1}{2a\bar{x}} & -x + (\bar{x} + a) \leq y < x + (\bar{x} - a) \\ 0 & \text{otherwise} \end{cases} \\
 \bigwedge_{a < x \leq \bar{x} - a} f^{a-}(x, y) &= \begin{cases} \frac{1}{2a\bar{x}} & -x + (\bar{x} - a) \leq y \leq -x + (\bar{x} + a) \\ 0 & \text{otherwise} \end{cases} \quad (6) \\
 \bigwedge_{\bar{x} - a < x \leq \bar{x}} f^{a-}(x, y) &= \begin{cases} \frac{1}{2a\bar{x}} & x - (\bar{x} - a) < y \leq -x + (\bar{x} + a) \\ \frac{1}{a\bar{x}} & 0 \leq y \leq x - (\bar{x} - a) \\ 0 & \text{otherwise} \end{cases}
 \end{aligned}$$

is a reservation price joint density function for goods X and Y with uniform marginal densities.

For proof, see Appendix. Next proposition defines f^{a-} in a range $a \in (\frac{\bar{x}}{2}, \bar{x}]$.

Figure 4. Negative belt: $Dom f^{a-}$ for $a \in (\frac{\bar{x}}{2}, \bar{x}]$.

Proposition 1b. Function f^{a-} for $a \in (\frac{\bar{x}}{2}, \bar{x}]$ given by:

$$\begin{aligned}
 \bigwedge_{0 \leq x \leq \bar{x} - a} f^{a-}(x, y) &= \begin{cases} \frac{1}{a\bar{x}} & x + (\bar{x} - a) \leq y \leq \bar{x} \\ \frac{1}{2a\bar{x}} & -x + (\bar{x} + a) \leq y < x + (\bar{x} - a) \\ 0 & \text{otherwise} \end{cases} \\
 \bigwedge_{\bar{x} - a < x \leq a} f^{a-}(x, y) &= \begin{cases} \frac{1}{a\bar{x}} & 0 \leq y \leq x - (\bar{x} - a) \\ \frac{1}{2a\bar{x}} & x - (\bar{x} - a) \leq y \leq x + (\bar{x} - a) \\ \frac{1}{a\bar{x}} & x + (\bar{x} - a) \leq y \leq \bar{x} \end{cases} \quad (7) \\
 \bigwedge_{a < x \leq \bar{x}} f^{a-}(x, y) &= \begin{cases} \frac{1}{2a\bar{x}} & x - (\bar{x} - a) < y \leq -x + (\bar{x} + a) \\ \frac{1}{a\bar{x}} & 0 \leq y \leq x - (\bar{x} - a) \\ 0 & \text{otherwise} \end{cases}
 \end{aligned}$$

is a reservation price joint density function for goods \mathbb{X} and \mathbb{Y} with uniform marginal densities.

Proof of Proposition 1b is analogous to Proposition 1a and is therefore omitted. Having established negative belt density function for the whole range of parameter a , in Propositions 2a and 2b we introduce its positive belt variant.

Proposition 2a. Function f^{a+} for $a \in (0, \frac{\bar{x}}{2}]$ given by:

$$\bigwedge_{0 \leq x \leq a} f^{a+}(x, y) = \begin{cases} \frac{1}{a\bar{x}} & 0 \leq y < -x + a \\ \frac{1}{2a\bar{x}} & -x + a \leq y \leq x + a \\ 0 & \text{otherwise} \end{cases}$$

$$\begin{aligned}
 \bigwedge_{a < x \leq \bar{x} - a} f^{a+}(x, y) &= \begin{cases} \frac{1}{2a\bar{x}} & x - a \leq y \leq x + a \\ 0 & \text{otherwise} \end{cases} \quad (8) \\
 \bigwedge_{\bar{x} - a < x \leq \bar{x}} f^{a+}(x, y) &= \begin{cases} \frac{1}{2a\bar{x}} & x - a \leq y < -x + (2\bar{x} - a) \\ \frac{1}{a\bar{x}} & -x + (2\bar{x} - a) \leq y \leq \bar{x} \\ 0 & \text{otherwise} \end{cases}
 \end{aligned}$$

is a reservation price joint density function for goods \mathbb{X} and \mathbb{Y} with uniform marginal densities.

Proposition 2b. Function f^{a+} for $a \in (\frac{\bar{x}}{2}, \bar{x}]$ given by:

$$\begin{aligned}
 \bigwedge_{0 \leq x \leq \bar{x} - a} f^{a+}(x, y) &= \begin{cases} \frac{1}{a\bar{x}} & 0 \leq y \leq -x + a \\ \frac{1}{2a\bar{x}} & -x + a \leq y < x + a \\ 0 & \text{otherwise} \end{cases} \\
 \bigwedge_{\bar{x} - a < x \leq a} f^{a+}(x, y) &= \begin{cases} \frac{1}{a\bar{x}} & 0 \leq y \leq -x + a \\ \frac{1}{2a\bar{x}} & -x + a \leq y \leq -x + (2\bar{x} - a) \\ \frac{1}{a\bar{x}} & -x + (2\bar{x} - a) \leq y \leq \bar{x} \end{cases} \quad (9) \\
 \bigwedge_{a < x \leq \bar{x}} f^{a+}(x, y) &= \begin{cases} \frac{1}{2a\bar{x}} & x - a \leq y \leq -x + (2\bar{x} - a) \\ \frac{1}{a\bar{x}} & -x + (2\bar{x} - a) < y \leq \bar{x} \\ 0 & \text{otherwise} \end{cases}
 \end{aligned}$$

is a reservation price joint density function for goods \mathbb{X} and \mathbb{Y} with uniform marginal densities.

Proofs of Propositions 2a and 2b are analogous to Proposition 1a and hence are omitted. In Figure 5, we graph $Dom f^{a+}$ for $a \in (0, \frac{\bar{x}}{2}]$. We skip the illustration of a positive belt-shaped domain for $a \in (\frac{\bar{x}}{2}, \bar{x}]$.

The reason why f^a has uniform margins is that the joint density in both triangular areas is twice bigger than the density in the rectangular area. From managerial perspective heavier triangular corners represent explicit market segments of consumers having either diverging valuations for both goods - that is low for the first and high for the second (negative belt), or converging valuations - that is low or high reservation prices for both goods (positive belt). An interesting possibility follows from the construction of f^a . Using summation of $f^{a(\pm)}(x, y)$, one should be able to construct a joint density function over $Dom f^{a(\pm)} \cup Dom f^{b(\pm)}$ which also maintains uniformity of marginal distributions. Hence, our approach to bundling analysis can be applied to a wider class of demand structures. For example, one could model a situation where there are four segments of consumers having converging/diverging preferences for both goods \mathbb{X} or \mathbb{Y} or a preference for only one good, preserving linear demand functions for both components.

correlation of reservation prices under joint density f^a

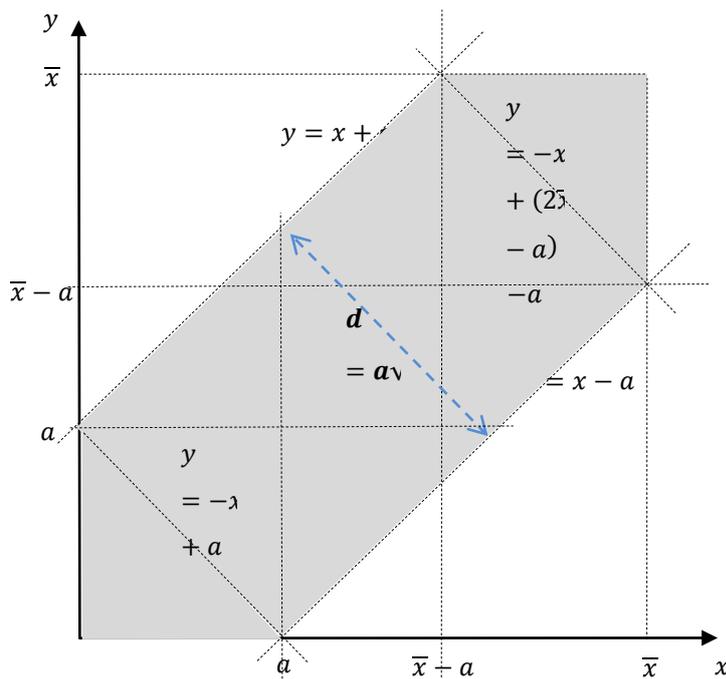

In the previous section, we have proven that $f^a(x,y)$ has uniform margins. In this section, we derive correlation coefficient between its marginal distributions.

Proposition 3a. For reservation price density function f^{a-} given by (6) the correlation coefficient between the consumer's reservation prices goods \mathbb{X} and \mathbb{Y} is given by the following formula:

$$\rho_{x,y} = -\frac{a^3 - 2a^2\bar{x} + \bar{x}^3}{\bar{x}^3} \quad (10)$$

For proof see Appendix. Note that for $a = 0$, we obtain perfect negative correlation $\rho_{x,y} = -1$ and for maximum value of parameter ($a = \bar{x}$) we obtain $\rho_{x,y} = 0$ (independence).

Figure 5. Positive belt: $Dom f^{a+}$ for $a \in (0, \frac{\bar{x}}{2}]$.

Proposition 3b. For the reservation prices density function f^{a+} given by (8) the correlation coefficient between the consumer's reservation prices goods \mathbb{X} and \mathbb{Y} is given by the following formula:

$$\rho_{x,y} = \frac{a^3 - 2a^2\bar{x} + \bar{x}^3}{\bar{x}^3} \quad (11)$$

Derivation of this formula is analogous to (10) so we leave it without proof. For positive belt, perfect positive correlation $\rho_{x,y} = 1$ holds for $a = 0$ and $\rho_{x,y} = 0$ for $a = \bar{x}$ (independence). For both variants of joint density with a belt-shaped domain, the absolute value of correlation between individual reservation prices is nonlinearly increasing in a . With formulas (10) and (11) we are equipped to analyze optimality of monopoly pure and mixed bundling strategies for the full range of correlation and marginal costs.

3. SOLUTION TO BUNDLING PROBLEM

3.1. Pure components strategy

For both reservation price density functions (f^{a-} and f^{a+}) marginal density functions of good X (f_x^{a-} and f_x^{a+}) and good Y (f_y^{a-} and f_y^{a+}) do not depend on parameter a and are given by:

$$\bigwedge_{0 \leq x \leq \bar{x}} f_x^{a-}(x) = f_x^{a+}(x) = f_y^{a-}(x) = f_y^{a+}(x) = \frac{1}{\bar{x}},$$

So, the demand functions for each good under pure components are given by:

$$d_x^{PCa-}(p) = d_x^{PCa+}(p) = d_y^{PCa-}(p) = d_y^{PCa+}(p) = 1 - \frac{1}{\bar{x}}p$$

and a profit of monopolist writes:

$$\Pi_x^{PCa-}(p) = \Pi_x^{PCa+}(p) = (p - c_x) \left(1 - \frac{1}{\bar{x}}p\right),$$

$$\Pi_y^{PCa-}(p) = \Pi_y^{PCa+}(p) = (p - c_y) \left(1 - \frac{1}{\bar{x}}p\right)$$

In this case first order condition are sufficient for derivation of optimal prices. Hence monopolist will choose the following prices and earn the following profits under PC strategy:

$$p_x^{PCa-} = p_x^{PCa+} = \frac{\bar{x} + c_x}{2}, \quad p_y^{PCa-} = p_y^{PCa+} = \frac{\bar{x} + c_y}{2}.$$

$$\Pi_x^{PCa-}(p_x^{PCa-}) = \Pi_x^{PCa+}(p_x^{PCa+}) = \frac{(\bar{x} - c_x)^2}{4\bar{x}}$$

$$\Pi_y^{PCa-}(p_y^{PCa-}) = \Pi_y^{PCa+}(p_y^{PCa+}) = \frac{(\bar{x} - c_y)^2}{4\bar{x}}$$

$$\Pi^{PCa-}(p_x^{PCa-}, p_y^{PCa-}) = \Pi^{PCa+}(p_x^{PCa+}, p_y^{PCa+}) = \frac{(\bar{x} - c_x)^2 + (\bar{x} - c_y)^2}{4\bar{x}}$$

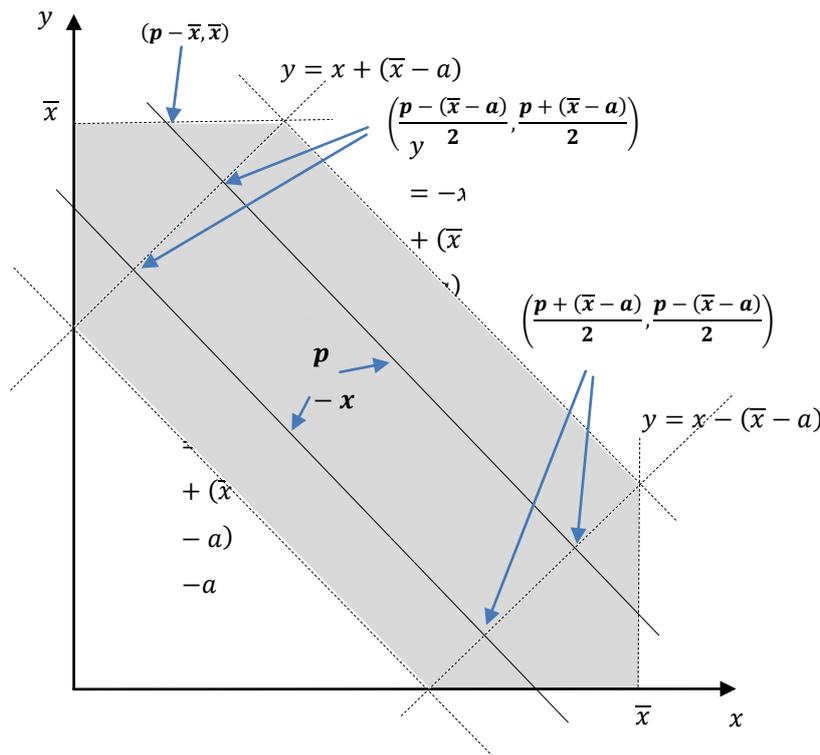

3.2. pure bundling

Profitability of pure bundling for both the cases of positive and negative correlation needs to be analyzed separately.

Negative correlation: f^{a-} joint density

The graph of the demand space f^{a-} under PB strategy is presented in Figure 7. Depending on the price for the bundle, monopolist might sell to all or only to a subset of consumers located in rectangular and triangular areas of the belt-shaped domain. Thus, several cases must be considered to locate buyers depending on the price.

Figure 7. PB strategy under negative belt: $Domf^{a-}$.

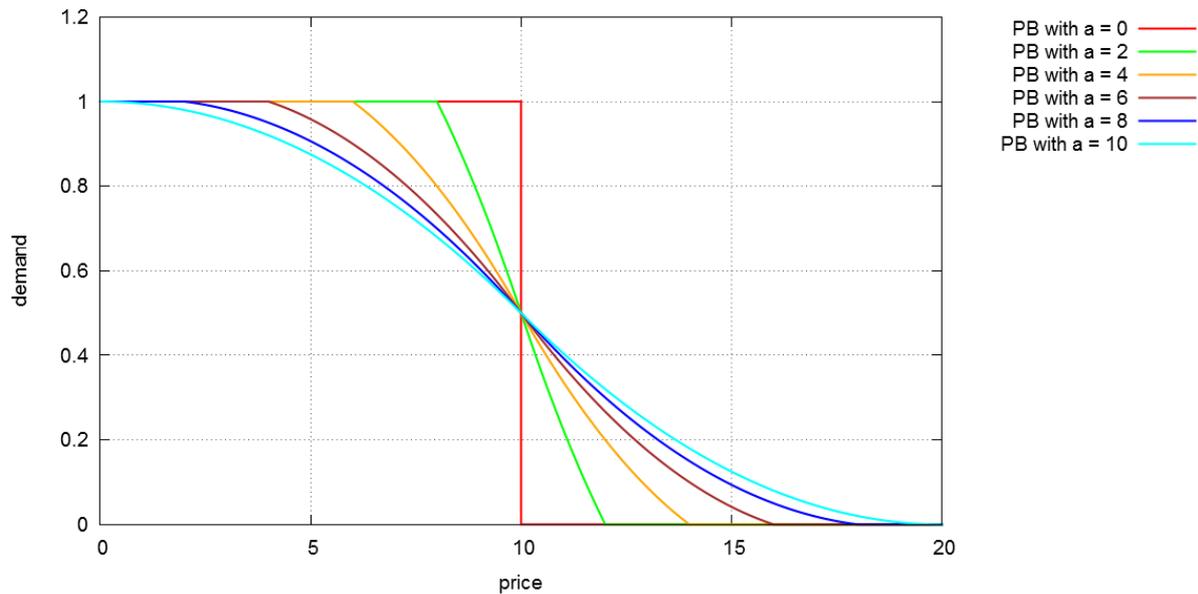

Demand function for the bundle d_b^{PBa-} is given by:

$$d_b^{PBa-}(p) = \begin{cases} 1 & 0 \leq p \leq \bar{x} - a \\ 1 - \frac{1}{2a\bar{x}}p(p - (\bar{x} - a)) & \bar{x} - a < p \leq \bar{x} \\ \frac{1}{2a\bar{x}}((\bar{x} + a) - p)(2\bar{x} - p) & \bar{x} < p \leq \bar{x} + a \\ 0 & p > \bar{x} + a \end{cases}$$

Demand for bundles is nonlinear in price. In Figure 8 we graph demand function for $\bar{x} = 10$ and different values of parameter $a \in (0,10)$.

Figure 8 shows that there is a high dependency between parameter a and curvature of demand function under pure bundling. For the case of perfect negative correlation ($a = 0$), the demand curve is inelastic, and monopolist can capture the whole consumer surplus. Consequently, for higher values of parameter a , demand becomes more elastic. All demand curves intersect at price $p = \bar{x}$ for which 50% consumers buy the bundle. This is a consequence of the symmetry of $Domf^{a-}$ over diagonal of the square $[0, \bar{x}] \times [0, \bar{x}]$.

Figure 8. Demand function under PB, d_b^{PBa-} for $\bar{x} = 10$ and $a \in (0, 10)$.

The profit for this demand function is given by:

$$\Pi^{PBa-}(p) = \begin{cases} (p - c_b) & 0 \leq p \leq \bar{x} - a \\ (p - c_b) \left(1 - \frac{1}{2a\bar{x}} p(p - (\bar{x} - a)) \right) & \bar{x} - a < p \leq \bar{x} \\ (p - c_b) \left(\frac{1}{2a\bar{x}} ((\bar{x} + a) - p)(2\bar{x} - p) \right) & \bar{x} < p \leq \bar{x} + a \\ 0 & p > \bar{x} + a \end{cases}$$

First order conditions yield a closed form expression for optimal price of monopolist under PB strategy:

$$p^{opt} = \frac{\sqrt{\bar{x}^2 + (4a - c_b)\bar{x} + c_b^2 + ac_b + a^2 + \bar{x} + c_b} - a}{3}$$

Optimal PB profit is given by:

$$\Pi^{PBa-}(p^{opt}) = (p^{opt} - c_b) \left(1 - \frac{1}{2a\bar{x}} p^{opt}(p^{opt} - (\bar{x} - a)) \right)$$

When consumer valuations are negatively correlated, monopolist using pure bundling always optimizes price on the same segment of a demand curve, but his profit obviously depends on the degree of correlation as marked by the parameter a . In Figure 9 we graph profit function Π^{PBa-} for $\bar{x} = 10, c_b = 0$ and different values of correlation parameter $a \in (0, 10)$. As can be seen there, profit function behaves in close correspondence with the demand function shown in Figure 8. Profit takes the highest value for $a = 0$ (perfect negative correlation) and the lowest for $a = \bar{x}$ (independence). Marginal costs of a bundle c_b also have a substantial impact on the profitability of pure bundling. When costs are positive, those customers who have a strong preference for only one good but buy a bundle are in fact subsidized to do so. Thus, pure components might generate higher profit than pure

bundling for a certain level of marginal costs. In Figure 10 below, we graph profit functions Π^{PBa^-} and Π^{PCa^-} for $\bar{x} = 10, a = 2$ and different values of cost parameter $c_b \in (0,8)$. Note that $a = 2$ corresponds to strong negative correlation $\rho_{x,y} = -0,92$. Two immediate observations follow: First, optimal prices (corresponding to maximal values of profit functions) are increasing with marginal costs of component goods and the bundle which apparently restricts total demand and reduces total profits of a monopolist. For low-cost levels $c_b = 0$ and $c_b = 2$ profit from pure bundling is greater than from pure components as shown by dashed red and green lines. However even for very high negative correlation (note that $a = 2$ corresponds to strong negative correlation $\rho_{x,y} = -0,92$), this relation becomes reversed for a sufficiently large marginal cost. Starting from $c_b = 4$ pure components strategy yields higher profit than pure bundling. Apparently subsidization becomes too costly and cannot be outweighed by the benefits from central segment of the demand function.

Later on, we show that for any degree of correlation, there exist marginal cost c_b^* for which both strategies generate the same level of profit. Moreover, this critical value of marginal costs for which monopolist is indifferent between both strategies is decreasing with parameter a . This means that the range of costs for which pure bundling outperforms pure components shrinks to zero with a correlation of consumer valuations. In fact, our model shows that for $\rho > 0.2$ bundling is never better than pure components, but still can be worse off if marginal costs are large enough.

Figure 9. Profit function under PB, Π^{PBa^-} for $\bar{x} = 10, c_b = 0$ and $\in (0, 10)$.

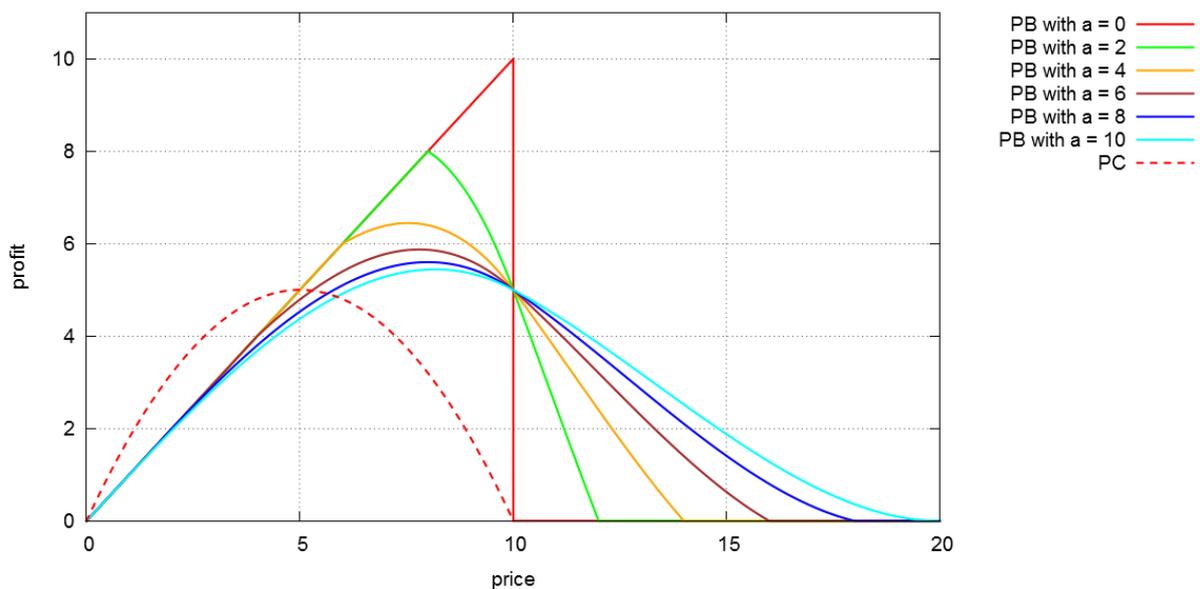

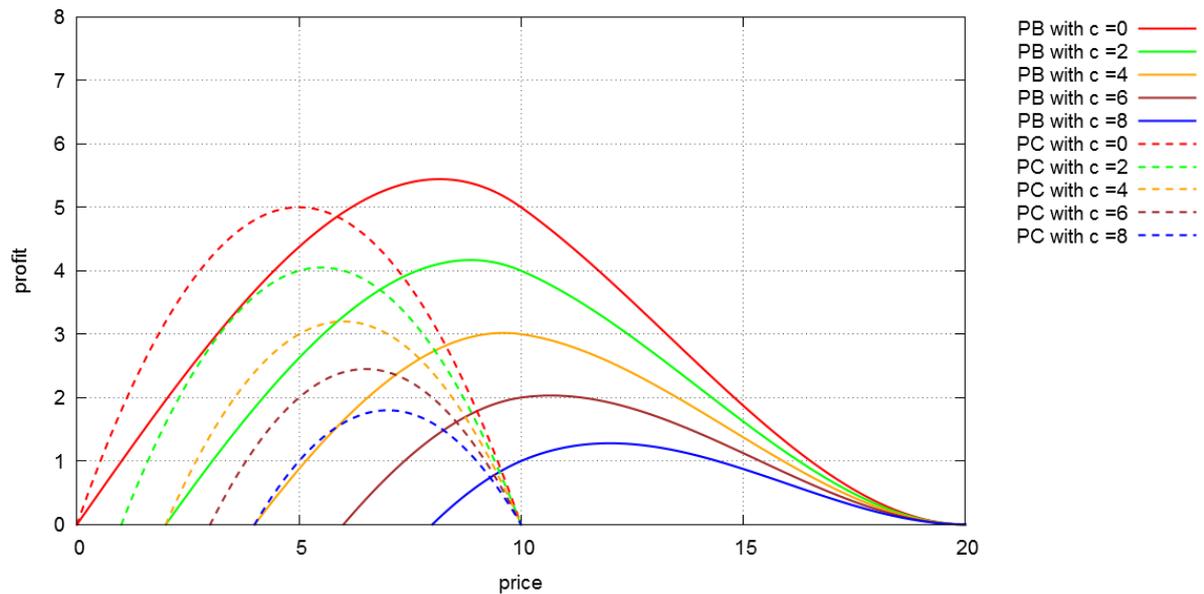

Figure 10. Profit functions Π^{PBa-}, Π^{PCa-} for $\bar{x} = 10, a = 2$ and $c_b \in (0, 8)$.

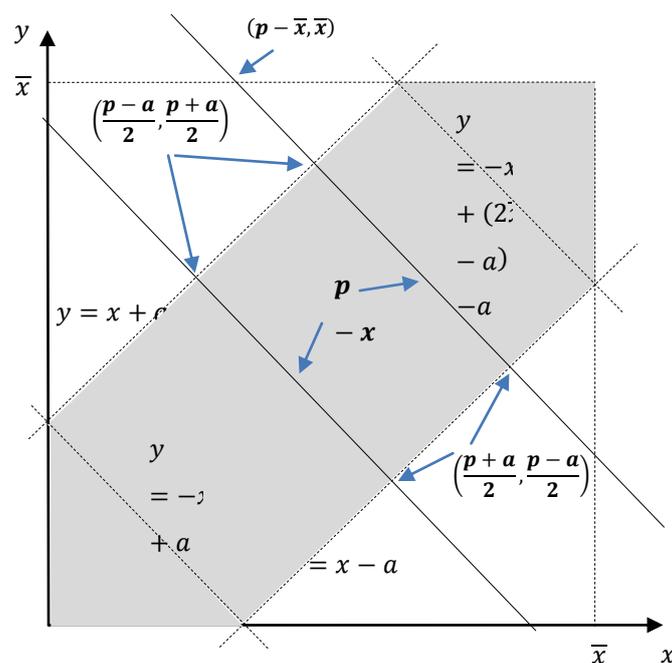

In the next subsection, we analyze a pattern of bundling optimality for the case of positively correlated demands.

Positive correlation: the f^{a+} joint density

The graph of the demand space f^{a+} under PB strategy is presented in Figure 11. Depending on the price for the bundle, monopolist might sell only to consumers located in the upper triangle or also to some or all consumers located in the rectangular area of the right belt-shaped domain. Eventually, if he sets a very low price, also customers from the lower triangle will buy.

Figure 11. PB strategy under left belt-shaped $Domf^{a+}$.

Thus, again several cases must be considered to locate buyers depending on the price. In this case the demand function of the bundle d_b^{PBa+} is given by:

$$d_b^{PBa+}(p) = \begin{cases} 1 - \frac{1}{2a\bar{x}}p^2 & 0 \leq p \leq a \\ 1 - \frac{1}{2a\bar{x}}ap & a < p \leq 2\bar{x} - a \\ \frac{1}{2a\bar{x}}(2\bar{x} - p)^2 & 2\bar{x} - a < p \leq 2\bar{x} \\ 0 & p > 2\bar{x} \end{cases}$$

For the right belt-shaped domain demand function is composed of 3 segments out of which the middle one is linear.

The profit function from pure bundling for positive belt: Π^{PBa+} is given by:

$$\Pi^{PBa+}(p) = \begin{cases} (p - c_b) \left(1 - \frac{1}{2a\bar{x}}p^2\right) & 0 \leq p \leq a \\ (p - c_b) \left(1 - \frac{1}{2a\bar{x}}ap\right) & a < p \leq 2\bar{x} - a \\ (p - c_b) \left(\frac{1}{2a\bar{x}}(2\bar{x} - p)^2\right) & 2\bar{x} - a < p \leq 2\bar{x} \\ 0 & p > 2\bar{x} \end{cases}$$

Analytical optimization for positive correlation case is more lengthy and hence will be avoided here.¹ Instead, we show graphically how optimal profits from both strategies behave in response to changes in the degree of correlation and level of marginal costs. In Figure 12 we draw profit function Π^{PBa+} for $\bar{x} = 10, c_b = 0$ and different values of parameter $a \in (0,10)$. As can be seen from there, monopolist maximizes profit from pure bundling always on the linear (least elastic) segment of a demand curve. The optimal profit takes the highest value for $a = \bar{x} = 10$ (independence) and then for $a < 8$ becomes irresponsive to a correlation of reservation prices. In the case of positive correlation our model predicts that pure bundling can hardly generate higher profits. Even for moderate levels of correlation pure components yield an equal profit as pure bundling.

¹ Note that depending on the value of correlation monopolist will optimize profits on the first or the second segment of the demand curve. The intuition behind this observation is that for sufficiently small correlation the width of the belt gets large enough, and monopolist will choose to set lower price sell to more customers including those from the more dense lower triangular area. However if the belt becomes narrower (or the costs increase) the seller will raise the price of the bundle and move to the linear segment, where optimal price does not depend on correlation (see Figure 12).

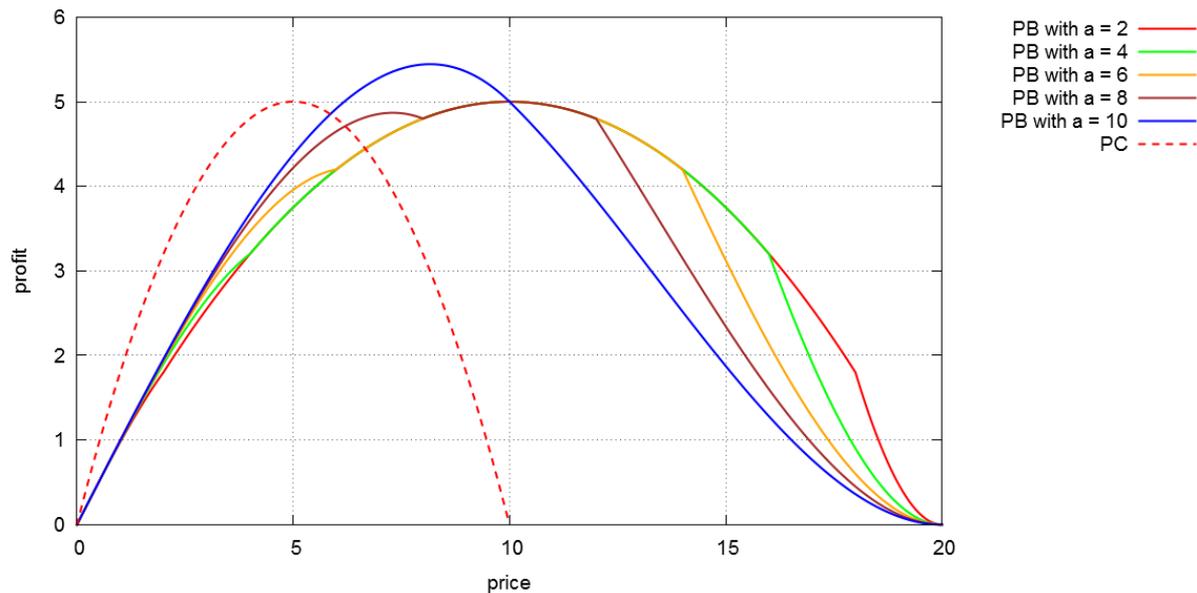

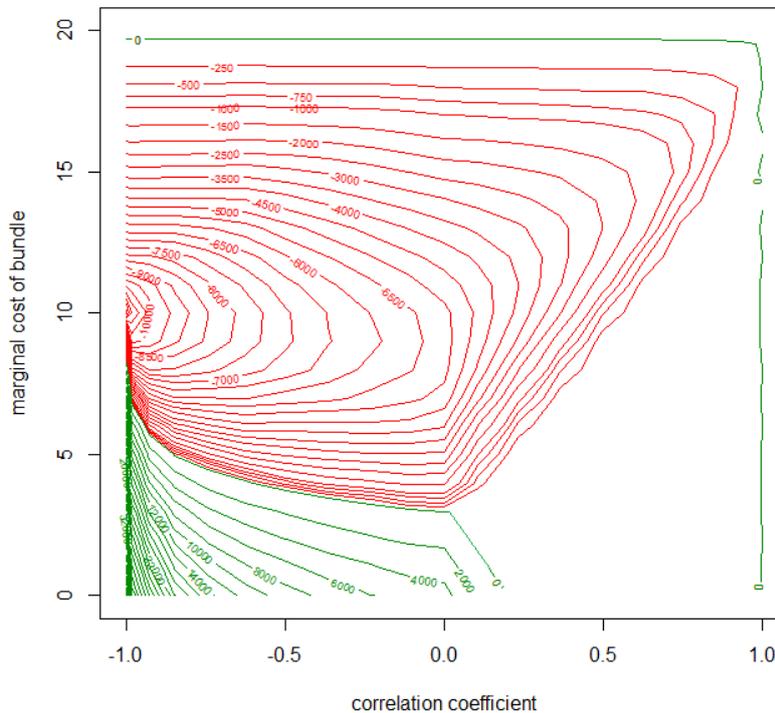

Figure 12. Profit function under PB, Π^{PBa+} for $\bar{x} = 10$, $c_b = 0$ and $\epsilon \in (0, 10)$.

Figure 13 which compares the performance of pure components and pure bundling using iso-difference curves of optimal profits ($\Pi^{PB} - \Pi^{PC}$) graphed in correlation-cost space. Full independence case is marked in the middle of the graph. The left part of Figure 13 confirms what has been already noted in the previous subsection for negative correlation case. Now we focus attention on the right part which represents positive belt: f^{a+} with $corr \in (0, 1]$. The zero difference curve marks correlation-cost combinations which yield equal profit from pure bundling and pure components. Red isocurves mark the area where pure bundling is profit-inferior to pure components. The green ones mark the space where pure bundling yields greater profits. For sufficiently positive correlation (approximately $\rho > 0.2$) pure bundling is indeed never better from separate sales and more importantly becomes strictly worse for high enough marginal costs. Intuition which stands behind this result is the following: With growing correlation the positive belt shrinks in width implying that individual demands become more and more homogeneous. As a result, monopolist stops benefitting from the package, because of limited possibility to reduce heterogeneity of consumer demands. On the other hand, if marginal costs are large enough, monopolist using pure bundling engages in implicit subsidization of consumers. Pure components can avoid this problem while reaching the same people from the profitable central segment of pure bundling demand curve. This explains why this strategy outperforms pure bundling.¹

¹ In a perfect correlation case, there is no subsidization at all. Hence, both strategies converge in profits for in the whole range of marginal costs

Figure 13. Iso-difference curves for optimal profits from PB and PC strategies in correlation-cost space.

3.3. Mixed bundling

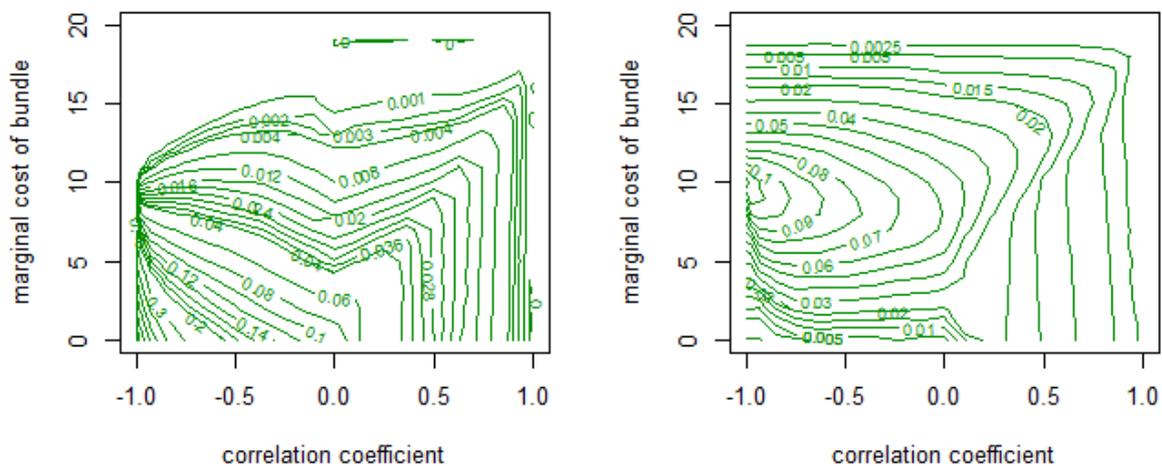

Unlike pure bundling, analytical derivation of demand and profit functions under f^a density is complicated due to a large number of cases which need to be considered for the three price parameters. For this reason, we switch to simulation techniques to obtain a complete picture.¹

We use the following algorithm. First, we generate a fixed sample of $k = 10000$ customers with uniformly distributed reservation prices: $r \sim U[0,10]$ for each product according to the joint density f^a . Then for each variant of width parameter $a \in [-10,10]$ and marginal cost $c \in [0,20]$ both taken with a step 1 we find optimal prices under MB and PB. We take a smaller search step for a price (0.1) to ensure sufficient level of precision – at the expense of considerable computation burden. For mixed bundling, our algorithm checks $100 \times 100 \times 200$ price combinations for each of 21×21 a, c variants in the sample of 10000 customers. We did robustness checks with regards to alternative parameters of simulation and are confident with the precision and reliability of results obtained for this set of parameters. In what follows, we present the profit performance of mixed bundling against pure bundling and pure components in relative terms (see Figure14) as well as compare simulated optimal prices with the use of iso-difference curves (in Figure 15).

¹ Simulations have been done in R. The code is available on request from the authors under CC-BY 4.0 license.

Figure 14 indicates mixed bundling weakly dominates both separate sales and pure bundling concerning profit levels. This result is expected because MB contains in itself the remaining two pricing instruments. Hence, with mixed bundling monopolist can always replicate any PC or PB strategy if it is optimal. What is remarkable and striking about Figure 14 is that mixed bundling offers minuscule profit gains as shown in relative terms in the left panel. Only in the bottom-left segment of the correlation-cost space advantage of mixed bundling can be considered attractive from a managerial perspective.¹ This segment marks either (i) a combination of high to medium negative correlation (between -1 and -0,5) and medium to low levels of marginal cost (between 50% and 25% of a mean bundle valuation) or (ii) a combination of medium to low negative correlation and costs close to zero (less than 25% of a mean bundle valuation). For close to independent or positively correlated reservation prices the profit gains from mixed bundling are close to zero regardless of the level of costs. The same is true for cost exceeding 50% of a mean valuation, regardless of the degree of correlation components valuations. Comparing optimal prices in mixed bundling and pure components which explain why the gains from mixed bundling diminish so rapidly.

Figure 14. Simulated isocurves for the relative difference in optimal profits in correlation-cost space. Left panel presents $(\Pi^{MB} - \Pi^{PC})/\Pi^{PC}$, the right panel presents $(\Pi^{MB} - \Pi^{PB})/\Pi^{PB}$.

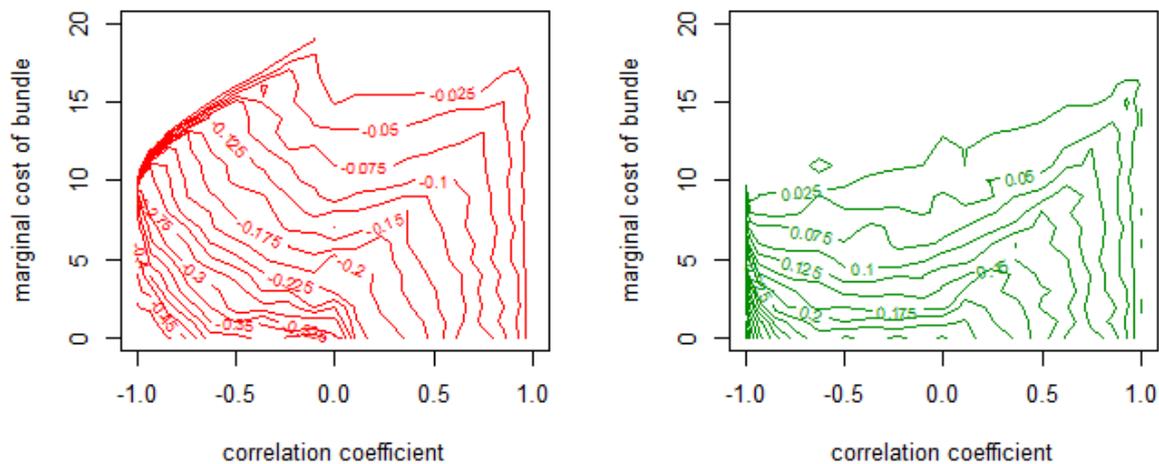

This insight is provided in Figure 15, which shows the magnitude of discount for buying a bundle offered by mixed bundling strategy (left panel) and also compares the sum of individual prices under mixed bundling and pure components (right panel).

¹ There is always a problem about what magnitude of gains is attractive. We acknowledge that there is no single answer to this question. The answer depends on differs across industries and depends on the level of additional fixed and variable costs resulting from implementation of bundling strategy. Therefore, we have arbitrarily set the threshold for attractive gains at rather modest 10% level relative to operating surplus from pure components.

Figure 15. Simulated isocurves for the relative difference in optimal prices in correlation-cost space.

Left panel presents $(p_b^{MB} - p_1^{MB} - p_2^{MB}) / (p_1^{MB} + p_2^{MB})$, right panel presents $(p_1^{MB} + p_2^{MB} - p_1^{PC} - p_2^{PC}) / (p_1^{PC} + p_2^{PC})$,

Two interesting observations follow from Figure 15. First, in the segment of greatest relative gains mixed bundling works through a classical pattern, namely a combination of higher prices for component products relative to pure components and considerable discount on price for the bundle. In this way, mixed bundling can capture a greater portion of a surplus from those customers who have largely heterogeneous valuations and at the same time realize profits from those clients who have moderate valuations for both goods. Second, if cost is sufficiently high or correlation coefficient is highly positive mixed bundling converges in prices to pure components.¹ Although in both cases convergence effectively drives profit gains from mixed bundling to zero it is governed by two distinct mechanisms. Under growing costs, selling a bundle at a discounted price will require implicit subsidization and monopolist will gradually increase the price for a bundle relative to component prices. Eventually, mixed bundling will converge to pure components, and monopolist will stop selling bundles at all. Interestingly this result holds even for large negative correlation of reservation prices stressing a critical role of costs in solving bundling problem. For example, for $\rho \rightarrow -1$ all consumer will value package for 10, so if costs exceed this level, monopolist starts to generate loss from selling a package. On the other hand, under large positive correlation, there are limited possibilities for reducing demand heterogeneity and hence the gains from selling bundle become very limited. Although monopolist can still earn extra profit from mixed bundling by extracting little bit more surplus from the most divergent customers at the expense of lower revenues from those buying

¹ We use the term convergence intuitively, meaning that individual prices are the same and a discount for buying a package is zero, which makes the price for the bundle ineffective.

a bundle, eventually for perfect positive correlation mixed bundling converges in prices to pure components.

We note two more things about mixed bundling from Figure 15. First, the zero difference isocurve in prices shown in the left panel indicates that monopolist will choose the same levels of individual prices under pure components and mixed bundling. However, naturally those prices will rise with costs as indicated by optimal prices formula for pure bundling (see Section 3.1). Second, for $\rho > 0$ the threshold level of costs for which gains from mixed bundling are zero increases with the degree of correlation. This happens because with growing ρ some customers are willing to pay a high price for the bundle and monopolist will be able to make positive (albeit small) profit thanks to the discriminatory power of mixed bundling strategy.

Taken as whole our results indicate that mixed bundling can rise profits maximum by 70% compared to pure components and by 11% compared to pure bundling. The distribution of gains in correlation-cost space reveals that the sufficient benefits from mixed bundling can be realized only for a specific combination of both very low marginal costs and relatively high negative correlation of valuations. In all other cases the gains from mixed bundling are negligible, undermining the rationale for implementation of this strategy. Our model also reveals the critical role of costs for bundling problem. This is best seen for large negative correlation, where profit gains from bundling are the most sensitive to cost increases because of the largest reduction in demand heterogeneity. We believe that both conclusions from our linear model are interesting from a managerial perspective as they indicate that bundling will better enough to justify its implementation only for low-cost services and only under a specific pattern of component demands dependency.

4. SUMMARY AND CONCLUSIONS

In this paper, we look at the magnitude of profit gains from mixed bundling. We introduce a model of reservation price space which yields linear market demands for both component goods. Our analysis of bundling gains is carried out for the whole possible range of marginal costs and degree of correlation of valuations of bundle components. Our results in principle show that bundling can generate sufficient gains only in low marginal cost industries provided that demands are sufficiently negatively correlated. In this way, our results conform with practical observations that bundling is applicable mainly to ICT services or more broadly to information goods.¹

¹ Fixed line services typically meet both criteria. Marginal costs of broadband and telephony are close to zero and market demand is segmented in a way which ensures negative correlation. Younger consumers do not value fixed line telephony as they use IP or mobile telephony. On the other hand, older customers are not interested in broadband but are attached to traditional telephony service.

Our study contributes to the bundling problem in two ways. First, we focus on profit gains rather than simply on profit dominance. We believe that this perspective is more insightful from a managerial standpoint. We argue that weakly dominance result has no practical importance for managers, as it does not tell under which conditions mixed bundling can be expected to outperform the two remaining sales formats strictly and by how much. Our perspective requires shifting from local improvement considerations towards global optimum search. Secondly, we propose an analytical framework that has some desired properties which enable us to carry out global analysis. More specifically, we introduce a joint reservation price space which on one hand preserves linearity of market demand for individual goods – a feature which often is assumed not only in theoretical models but serves as a starting point in practical analyzes. Our so called ‘belt shaped’ density function allows to capture underlying correlation with a single parameter and yields analytically tractable demand and profit functions under pure bundling strategy. Approaches that have been explored so far in normative bundling literature, like uniform and Gaussian densities of customer valuations, miss one or the other element. Our model of reservation price space encompasses several situations so far analyzed in literature as special cases, like perfect correlation or full independence of valuations.

Two results follow from our study. First, mixed bundling is weakly dominant in payoff over pure bundling and pure components for all levels of marginal costs and any degree of correlation of consumers’ reservation prices. This common sense result is just a confirmation of earlier findings. Moreover, we show that benefits from implementation of mixed bundling strategy vary significantly and are negligible for the wide range of correlation-cost combinations, as appears in our model. We assess bundling gains with arbitrary assumption that 10% markup over profits from pure components is sufficient to cover its implementation. The fact that mixed bundling rarely exceeds this rather modest threshold is the most astonishing finding from our study.

Our results point to the critical role of marginal costs for the optimality of bundling. Earlier bundling literature has argued that under high negative correlation, bundling reduces demand heterogeneity and makes market demand less elastic. We show that with growing marginal costs pure bundling sooner starts to generate losses because of homogeneity of bundling valuations.

Our results are not encouraging for implementation of bundling. Sufficient profit gains from mixed bundling can be expected only under a specific combination of both very low marginal costs and relatively high negative correlation of valuations. Given that usually firms have limited knowledge about the dependency of individual demands, they might choose to use a safer pure components strategy to avoid a risk of uncontrolled subsidization of its customers. Moreover, with incomplete information about the demand, it might be difficult to find an optimal vector of mixed bundling prices.

Our model is limited and could be extended several ways. By construction, our 'belt-shaped' reservation price space corresponds to market with two distinct segments (marked by triangular areas with double density) and also a mass of consumers in between. One can try to use mixtures of bivariate distributions to cover demand structures, which are closer to reality. Four segments of customers with divergent and convergent valuations for both goods would be an interesting case to study. Another limitation of the current study is that we have focused solely on profit gains and did not consider welfare changes. Our analysis is also restricted by the usual simplifying assumptions adopted in bundling models such as additivity of reservation prices and unit costs. Relaxing each of them would bring more in-depth insights about a potential of bundling in real market applications.

APPENDIX

Proof of Proposition 2a.

First, we check that function f^{a-} has properties of the reservation prices density function requested in

Definition 1:

1. $\text{Dom}f = [0, \bar{x}] \times [0, \bar{x}] \subset \bar{\mathbb{R}}^2$, where $\bar{x} > 0$,
2. $\text{Ran}f \subset \mathbb{R}$ and $f^{a-}(x, y) \geq 0$ for all (x, y) in $[0, \bar{x}] \times [0, \bar{x}]$,
3. $\iint_{[0, \bar{x}] \times [0, \bar{x}]} f(x, y) dy dx$ can be calculated in the following way:

$$\begin{aligned}
 &= \int_0^a dx \int_{-x+(\bar{x}-a)}^{x+(\bar{x}-a)} f^{a-}(x, y) dy + \int_0^a dx \int_{x+(\bar{x}-a)}^{\bar{x}} f^{a-}(x, y) dy + \\
 &+ \int_a^{\bar{x}-a} dx \int_{-x+(\bar{x}-a)}^{-x+(\bar{x}+a)} f^{a-}(x, y) dy + \int_a^{\bar{x}} dx \int_0^{x-(\bar{x}-a)} f^{a-}(x, y) dy + \\
 &\quad + \int_{\bar{x}-a}^{\bar{x}} dx \int_{x-(\bar{x}-a)}^{-x+(\bar{x}+a)} f^{a-}(x, y) dy = 1.
 \end{aligned}$$

Since f^{a-} is indeed a proper density function we calculate marginal densities. The reservation prices density function of good X: f_x^{a-} is given by:

$$\begin{aligned}
 \bigwedge_{0 \leq x \leq a} f_x^{a-}(x) &= \int_{-x+(\bar{x}-a)}^{x+(\bar{x}-a)} f^{a-}(x, y) dy + \int_{x+(\bar{x}-a)}^{\bar{x}} f^{a-}(x, y) dy = \frac{1}{\bar{x}} \\
 \bigwedge_{a < x \leq \bar{x}-a} f_x^{a-}(x) &= \int_{-x+(\bar{x}-a)}^{-x+(\bar{x}+a)} f^{a-}(x, y) dy = \frac{1}{\bar{x}} \\
 \bigwedge_{\bar{x}-a < x \leq \bar{x}} f_x^{a-}(x) &= \int_0^{x-(\bar{x}-a)} f^{a-}(x, y) dy + \int_{x-(\bar{x}-a)}^{-x+(\bar{x}+a)} f^{a-}(x, y) dy = \frac{1}{\bar{x}}
 \end{aligned}$$

The reservation prices density function of good Y: f_y^{a-} is given by:

$$\begin{aligned}
 \bigwedge_{0 \leq y \leq a} f_y^{a-}(y) &= \int_{-y+(\bar{x}-a)}^{y+(\bar{x}-a)} f^{a-}(x, y) dx + \int_{y+(\bar{x}-a)}^{\bar{x}} f^{a-}(x, y) dx = \frac{1}{\bar{x}} \\
 \bigwedge_{a < y \leq \bar{x}-a} f_y^{a-}(y) &= \int_{-y+(\bar{x}-a)}^{-y+(\bar{x}+a)} f^{a-}(x, y) dx = \frac{1}{\bar{x}} \\
 \bigwedge_{\bar{x}-a < y \leq \bar{x}} f_y^{a-}(y) &= \int_0^{y-(\bar{x}-a)} f^{a-}(x, y) dx + \int_{y-(\bar{x}-a)}^{-y+(\bar{x}+a)} f^{a-}(x, y) dx = \frac{1}{\bar{x}}
 \end{aligned}$$

Thus both marginal densities: f_x^{a-} and: f_y^{a-} are uniform for $a \in \left(0, \frac{\bar{x}}{2}\right]$.

Q.E.D

Proof of Proposition 3a.

For the case of only two random variables X, Y generic formula for correlation writes:

$$\rho(X, Y) = \frac{\text{COV}(X, Y)}{\text{VAR}(X) \cdot \text{VAR}(Y)} = \frac{E(XY) - E(X) \cdot E(Y)}{\text{VAR}(X) \cdot \text{VAR}(Y)} \quad (1a)$$

where the nominator of (1a) stands for covariance between variables and denominator denotes a product of their variances. Because $f_x^{a-}(x) = \frac{1}{x}$ for $x \in [0, \bar{x}]$

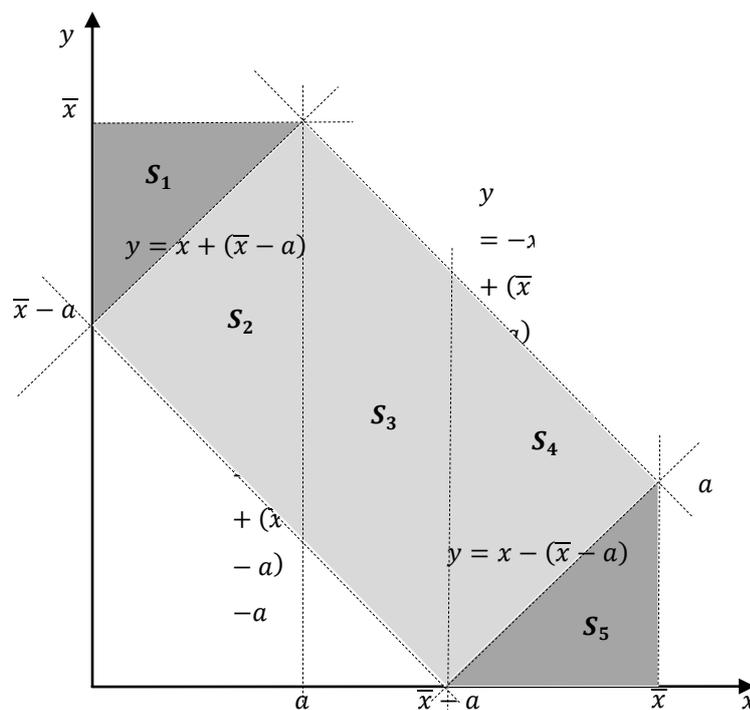

$$E(X) = E(Y) = \frac{\bar{x}}{2} \text{ and } \text{VAR}(X) = \text{VAR}(Y) = \frac{\bar{x}^2}{12}$$

So it remains to calculate $E(XY)$ which by definition is

$$E(XY) = \iint_{(x,y) \in \text{Dom}f^{a-}} xyf^{a-}(x, y) \, dx dy \quad (2a)$$

To conduct this integration we divided $\text{Dom}f^{a-}$ for $a \in (0, \frac{\bar{x}}{2}]$ as shown in Fig. A.1.

Figure A.1. Graph of the subsets of $\text{Dom}f^{a-}$ for $a \in (0, \frac{\bar{x}}{2}]$.

Where:

- $S_1 = \{(x, y) \in \text{Dom}f^{a-} | 0 \leq x \leq a \text{ and } x + (\bar{x} - a) \leq y \leq \bar{x}\}$
- $S_2 = \{(x, y) \in \text{Dom}f^{a-} | 0 \leq x \leq a \text{ and } -x + (\bar{x} - a) \leq y < +(\bar{x} - a)\}$
- $S_3 = \{(x, y) \in \text{Dom}f^{a-} | a < \leq \bar{x} - a \text{ and } -x + (\bar{x} - a) \leq y \leq -x + (\bar{x} + a)\}$
- $S_4 = \{(x, y) \in \text{Dom}f^{a-} | \bar{x} - a < \leq \bar{x} \text{ and } x - (\bar{x} - a) < \leq - + (\bar{x} + a)\}$
- $S_5 = \{(x, y) \in \text{Dom}f^{a-} | \bar{x} - a < \leq \bar{x} \text{ and } 0 \leq y \leq x - (\bar{x} - a)\}$

Expected value in (2a) is the sum of five integrals

$$E(XY) = \sum_{i=1}^5 \left[\int_{x \in S_i} x \left(\int_{y \in S_i} y f^{a^-}(x, y) dy \right) dx \right]$$

which can be easily evaluated for each S_i :

For $i = 1$

$$\int_0^a x \left(\int_{x+(\bar{x}-a)}^{\bar{x}} y \frac{1}{a\bar{x}} dy \right) dx = \frac{a^2(4\bar{x} - a)}{24\bar{x}}$$

For $i = 2$

$$\int_{x=0}^a x \left(\int_{-x+(\bar{x}-a)}^{x+(\bar{x}-a)} y \frac{1}{2a\bar{x}} dy \right) dx = \frac{a^2(\bar{x} - a)}{3\bar{x}}$$

For $i = 3$

$$\int_a^{\bar{x}-a} x \left(\int_{-x+(\bar{x}-a)}^{-x+(\bar{x}+a)} y \frac{1}{2a\bar{x}} dy \right) dx = \frac{4a^3 - 6a^2\bar{x} + \bar{x}^3}{6\bar{x}}$$

For $i = 4$

$$\int_{\bar{x}-a}^{\bar{x}} x \left(\int_{x-(\bar{x}-a)}^{-x+(\bar{x}+a)} y \frac{1}{2a\bar{x}} dy \right) dx = \frac{a^2(3\bar{x} - 2a)}{6\bar{x}}$$

For $i = 5$

$$\int_{\bar{x}-a}^R x \left(\int_0^{x-(\bar{x}-a)} y \frac{1}{a\bar{x}} dy \right) dx = \frac{a^2(4\bar{x} - a)}{24\bar{x}}$$

Finally, given $E(XY) = -\frac{a^3 - 2a^2\bar{x} - 2\bar{x}^3}{12\bar{x}}$ we obtain correlation coefficient as in formula (10) Q.E.D.

MENTOR IN EDUCATION AND BUSINESS – INTELLIGENCES AND COMPETENCIES

Solomon, Ionela Gabriela

Bucharest University of Economic Studies, Bucharest, Romania

ABSTRACT

Mentoring is one of the most effective tools at promoting professional development. In literature there is a subtle line between mentoring and coaching activity within organization.

This research aims to highlight the importance of intelligence in developing competencies for a mentor. In practice, we find mentors with different abilities and competencies according to the environment where they develop activity, in a private or public organization. Depending on situation, the mentor can make recommendation for training, provides continuing advice and assistance and evaluates progress of the mentee. For this occupation the article provide an analysis based on observation, for different professional or occupational standards, in countries as USA, Canada, UK. From this comparative analysis we can observe that the mentor does not operates only in education field, he can also influence the organizational culture at the workplace. A good mentor is defined by a strong emotional intelligence, social and interpersonal competencies and also skills.

Another aspect analysed in this paper is related to formal or informal mentoring. Practice activity shows that employees are getting benefits especially from informal mentoring relationships. Through this empirical research we try to identify new patterns of behaviour in mentor training and correlate them with organizational benefits of mentoring.

Keywords: *mentoring, education, leadership, management, organizational culture, mentor occupation, behavior model, emotional intelligence;*

INTRODUCTION

According to Martin et al., “the main concepts that characterize the mentorship are: (1) Mentoring, as a process of transferring information and creating skills from experienced persons to beginners; (2) The Mentor, as a person capable to offer guidance and to gradually help the other person to initiate in a professional area; (3) Mentoring relationships, as a collaboration on a limited period of time, between a person called mentor and a beneficiary, in this relationship the first supports the latter to follow the predefined objectives (Martin et al, 2011).

The paper goal is to explain the link between intelligences, competencies and mentoring activity. For this, it will be presented a short literature review on intelligences and would be identified a series of roles that a mentor might provide in his relationship with the mentees, but also will be given three examples of mentoring standard in different countries.

SHORT REVIEW REGARDING THE TYPES OF INTELLIGENCES

Even though at the beginning, the theory of multiple intelligences has been widely used in education with applications especially for pupils, Howard Gardner has shown interest in expanding its applications in the work place, so in working with adult people (Gardner, 2006). This is why, the Theory of Multiple Intelligences may become a very useful tool that may be incorporated in the mentoring activity.

In S. Covey's concept about the types of intelligence, the most popular and frequently analyzed are: 1- Thinking (IQ) - is the ability to analyze, rationalize and communicate; 2- Sense (EQ) - called "left brain" is self-awareness, self-knowledge, and represent empathy.

Robert Cooper (1997) argues that man has three brains (intelligence) in: the head area (what we call the brain usually); heart – the second brain; the intestines – the thord brain.

Reuven Bar-On (1997) groups the intelligence components as follows: • intrapersonal appearance (awareness of their own emotions, optimism, respect, self-fulfillment, independence); • interpersonal aspect (empathy, interpersonal relations, social responsibility); • adaptation (problem solving, reality testing, flexibility); • stress control (stress tolerance, the control of impulse); • general provision (happiness, optimism).

Daniel Goleman's vision (2006) regarding the components of emotional intelligence are: • self-awareness; • self-control; • motivation; • empathy; • social skills.

Brain works not only as a computer, the cognitive reasoning alone can not explain the complete human intelligence. Research on brain function must take into account the spiritual aspect, too.

Zohar and Marshall (1994) has described three aspects of intelligence. The first is the intellect or the rational intelligence (IQ), which would be the intelligence "to solve strategic or logic issues". The second intelligence is emotional intelligence (EQ), a "basic requirement for effective use of IQ." The third is spiritual intelligence (SQ), which is "necessary foundation for efficient operation both IQ and EQ".

The transforming power of spiritual intelligence differs from IQ and EQ, and in the same time integrates them. IQ solve logical problems first. EQ allows us to judge the situation in which we find ourselves and to behave appropriately. SQ allows us to ask whether we want to be in that situation and can motivate us to create a new one. SQ is not related to religion. Spiritual intelligence is related to the inner life of mind and spirit and its relationship with the concept of being in the world. Spiritual

intelligence gives a profound understanding of existential questions and insight into many levels of consciousness.

Multiple Intelligences in mentoring helps the process to become more personalized. Teachers become more aware of their intellectual competences and become able to personalize the teaching-learning process. (Constantinescu, 2014)

Morton-Cooper and Palmer (2000) identified numerous roles that mentors undertake while guiding and supporting students in the clinical setting. Some of the most important roles include the following:

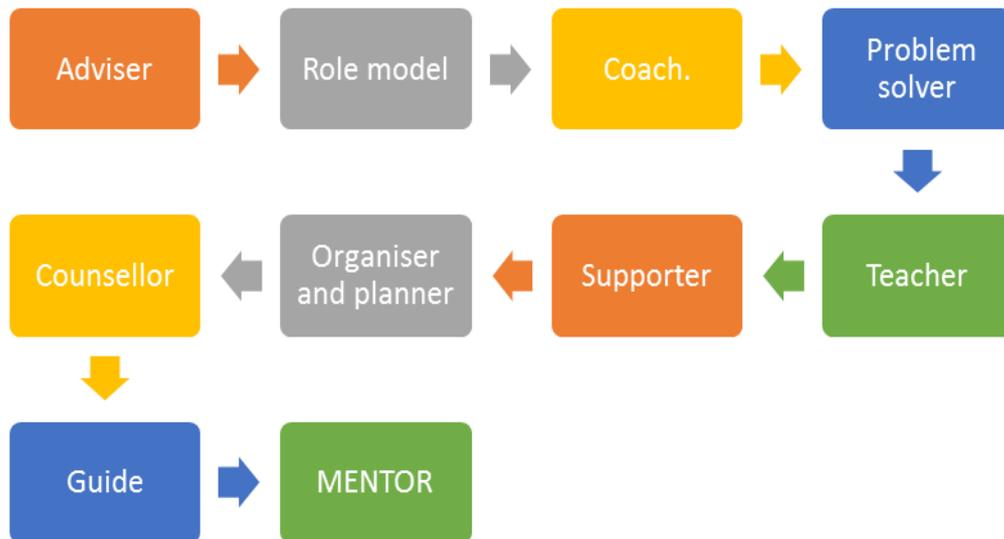

Figure 1. Roles of a mentor, personal approach on Morton-Cooper and Palmer (2000)

BEHAVIOR AND ATTITUDE IN MENTORSHIP

The behavior consists of attitude and action. Attitude can be manifested or unmanifested. When we talk of attitude manifested outwardly. (Bagozzi,1986)

As an alternative to the personality theories, behavioral theories were developed, which remain centered on person, but change the angle of its investigation.

Some authors equate the attitude and the way of thinking. From a managerial perspective, however, the attitude is a result of intra-psychic way of thinking.

The attitudinal manifestation can be made verbal, nonverbal and paraverbal. The attitude that does not show, is the result of perceptive way of thinking, a result seen as a finished product of the thinking. Attitude manifests intra-psychic, but not outside. It is actually an internal perception and perception is altered by errors, as selectivity, attention, etc.

For instance, Rudolf Carnap does not have a key aim in prohibiting the choice of an individual in terms of logical thinking. It is actually of making one explore the consequences of such choices. He states that logic has no moral principles. Everyone is free to build their own form of logic, i.e. as well as their particular language expressivity as they wish. (Nita, 2014 a). For Carnap, choosing the preferable language of expressivity is a pragmatic method (Restall, 2002).

INTELLIGENCES AND MENTORSHIP. INTEGRATION THROUGH TRANSDISCIPLINARITY

First of all, the human mind must **integrate** the truths (economic, legal, medical etc), more exactly the different perceptions of different persons with our own perception. By **harmonizing** them afterwards at an intrapsychic level, but also at the level of the individuals, we get to a result. The final step is to check whether the process has ensured or not the **Self-Coherence!**

When it comes to types of truth, we must keep in mind that truths are limited perceptions. To understand this better we inanimate introduction of a concept to harmonize these perceptions: transdisciplinarity.

Transdisciplinarity means the greatest degree of knowledge in relation to other concept sphere of interdisciplinary and multidisciplinary. It is the most complex form of communication between disciplines and aims at the understanding of the present world, seen from the perspective of all sciences existing that can integrate them underlines the common points of overlap in order to form a new discipline or reveal a complex truth about an studied object. (Nicolescu, 2002; Klein, 2004)

The three pillars of transdisciplinarity are: the levels of reality, the logic of the included third, and complexity.

Levels of reality refers to the study of a single perspective of an object, that by knowing they limited in terms of transdisciplinary, issue a theory assumed to be true that from another perspective, by observing on another level of reality, it can be considered false. Specifically, each study viewed in terms of a single domain have a specific application in one level of reality.

The merit for the development of the excluded third belongs to Stefan Lupaşcu who showed it's genuine, formalized, multivalent and non-contradictory logic. Stefan Lupaşcu was a pioneer and inspired the philosophy of discoveries made by quantum physics, but was not fully understood by his contemporaries in the same field, maybe because of the lack of expression "levels of reality" without which he couldn't very well be finalizing his idea (Nicolescu, 2008).

At birth a human being has no mental representation; the human body at birth has an energetic body attached, a bio field, and an energetic protecting shield against cosmic radiations belonging to our Solar System or outside it, even from the Universe itself. In time, the human body starts adapting through the receptive human sensory analyzers to a dualism of an external energetic environment (low and high vibrations). (Nita, 2013)

Improving attitude means refining capacity of synthesis and integration of different perceptions. In this regard, we need to integrate and harmonize perceptions of x, y, z, and form our attitude according to our personal way of thinking. Mind separates, compares, but forget to integrate. It separate, depending on the experience. Hence attitudes differ from individual to individ. Accumulations are theoretical logical-rational knowledge or emotions. Partial and incomplete truth results are depending on the level of accumulation of the individual.

Starting from the Product/Management-Image matrix (Nita, 2014 b), we can translate the work principle and obtain a behaviour matrix.

	Conscious attitude	Unconscious attitude
Conscious action	+/+	+/-
Unconscious action	-/+	-/-

Table 1. The action-attitude matrix, personal approach on Osho (2014)

In any human group, the mentor or leader, has the ability to influence the emotions of all. If emotions are channeled into enthusiasm, it will lead to performance.

When the mentor is channeling emotions in a positive direction, a phenomenon called resonance is born, and otherwise the phenomenon is called dissonance. Emotional intelligence is an important part of a mentor's ability to successfully contribute to development of an organization where he work or with the people he advise and counsell.

By intention we focus our attention to a point. Thus we acknowledge the attitude. Awareness is very important for a mentor. This helps him not to remain in an inertial behavior.

STANDARDIZATION OF MENTORING

For this part of the research, it will be provided an analysis based on observation of three occupational standard for mentor. These standards were created in different periods of time, for instance the mentor individuals standard in UK was approved in march 2012, in Romania it was approved in 1999, while in Canada it is applied since 2007.

	Occupational Standard in UK -Mentor individuals-	Occupational Standard in Romania - Mentor-	Occupational Standard in Canada - Mentor -
Purpose	- develop and maintain people performance	- responsibility to lead and coordinate students	- responsible of the planning profession
Competencies	- seek opportunities to improve performance - find practical ways to overcome obstacles - support others to make effective use of their abilities - give feedback to others to help them maintain and improve their performance - model behaviour that shows, and inspires others to show, respect, helpfulness and cooperation	- interactive communication - communication mentor – trainee - maintaining balance in the working group - develop capacities of teaching knowledge and training skills - guiding students in designing of the didactic project	- knowledge and skill in the structure and process of the mentoring relationship, - skill to cope with challenges arising within a mentoring - relationship, and understanding of the roles and responsibilities of a mentor, - recognition of dysfunction in a mentoring relationship
Skills and Abilities	- communicating, empathising, empowering, evaluating, influencing, information management, leading by example	- analysis and synthesis capacity, generalization and abstractization, distributive attention, interactive and interpersonal communication,	- demonstrated competence in the subject matter of their discipline or area of specialization, individual's emotional self-awareness and receptivity, capacity to communicate empathy, respect and compassion.

Table 2. Comparative analysis on mentoring

Source: (www.anc.edu.ro), (www.nos.ukces.org.uk), (www.esdc.gc.ca)

From the table above we can observe that mentoring activity it has broadened its coverage and become more complex, but is still related to formal or non-formal learning activities.

CONCLUSION

In order to speak about competencies and abilities, we need to take a look at intelligences type. As Gardner pointed out, multiple intelligences don't have application only for pupils, but also in the work place. This is why companies choose to evaluate their employees using multiple intelligences tests, in order to match the person abilities and skills, with job description.

Integrating the truth that reveals from intellectual intelligence, or emotional intelligence, can be done only through transdisciplinarity concept and by the use of spiritual or quantum intelligence.

Mentoring is both a professional and a vocational occupation, and it requires knowledge, self-awareness, positive values and leadership abilities.

This paper give a starting point in analyzing mentorship activity, which includes various skills, competencies, behaviour, and above all, ethics. Mentoring in general is about responsibility and

support in development of others - the mentees. This is why, in the matter of intelligences, mentor should be at least emotional intelligent.

The study contribution consist in defining an behaviour pattern for mentor, based on the four cases that result from behavioural matrix described in this paper. From the action-attitude matrix we can conclude that mentor behaviour is influenced by his level of consciousness. Being conscious both in attitude and actions, the mentor will provide a series of benefits for the organization: helps the mentees in understanding and adapting to the organization's culture; improves interpersonal relationship skills, networking, provide a role model, knowledge transfer.

LEADERSHIP AND MENTORING WITHIN THE ORGANIZATION

Solomon, Ionela Gabriela; Gheata Madalina

Bucharest University of Economic Studies, Romania

ABSTRACT

About mentoring and leadership plenty of books and outstanding journals have been written by now. Unfortunately there are not too many about the relation between these two concepts and the socio-economic liaison between them.

This short presentation intends to be a small introduction into what the fundamental concepts known from economics could become if the psychological approaches are revitalised through complex system theory.

Keywords: *mentoring, leadership, management, human resources*

INTRODUCTION

Leadership and mentoring are two key concepts when we look at any organizational culture.

Mentorship, leadership and management are applied within organizations in close connection with the organizational culture.

Geert Hofstede (1991) has provided a concise definition of culture: culture is the software of the mind, a program that makes people mentally to behave in a certain way. These words, captures the essence of culture: deeply rooted in the mind, in our subconscious, it determines our every action.

Terms as leader and mentor are often confused and used to present same characteristics. The truth is, in reality, that these two concepts although assume the same perspective team management but differ greatly.

Often, mentoring is considered as part of leadership, an essential characteristic and skill of a leader. (Vance, 2001) Mentoring activity even it is a way of leading by example or motivate the employees, it's not necessarily the leader attribution. From this hypothesis the paper provide a distinction between formal and informal mentoring activity on the one hand and leader and mentor as individuals on the other. The research aims to analyse the mentor occupation, by comparing some occupational standards from European Union member states. It also provides a new approach regarding the mentoring understanding and responsibility of top management. The purpose of this analysis is mainly to highlight the importance of a mentor in a private or public organization. We often remark at the top management level, different types of leader, the political placed one, or the specialist. But there is the third situation, where the leader doesn't occupy any position in top management, yet he is Innovation, Entrepreneurship and Digital Ecosystems

appreciated and recognized by the others as being a leader and a mentor. Through this article it will be provided a new model for leadership, by the fusion of these leaders' features, in order to adapt the mentorship pillars to a performance business.

The effects of organizational culture can be seen both in long terms by controlling relationships between the leader and his members and in short term seen as the main way of integration into the team of all his members.

Organizational culture is the one that creates significance connections between the team members meant to consolidate the community. Organizational Culture creates a strong link with the existent values representing the standards collective values, beliefs and customs rules.

Organizational culture is the interaction between members regardless the hierarchical level where they are situated, by identifying common elements.

Culture diversity increasingly greater and greater brings new approaches reflected in the organizational culture that can be present positive cultures characterized by the homogeneity of values and performance. This type of culture can be perceived as a rigid one, hard to change because of the high standards adopted;

In the same time, exist also a negative culture found usually in big corporations, mostly based on concepts and bureaucracy where the interest is oriented to customers and not to employees.

Organizational culture is also influenced by the manner of taking decisions, form of organization or management style. Therefore we can say that leadership has a direct influence on the culture of an organization.

Leadership and mentoring are two key concepts when we look at any organizational culture. Often, mentoring is considered as part of leadership, an essential characteristic and skill of a leader. Mentoring activity even it is a way of leading by example or motivate the employees, it's not necessarily the leader attribution. From this hypothesis the paper provide a distinction between formal and informal mentoring activity on the one hand and leader and mentor as individuals on the other. The research aims to provide a new approach regarding the mentoring understanding and responsibility of top management (Voegtlin and Greenwood, 2016).

Regarding the correlation between aims and results, this analysis is mainly to highlight the importance of a mentor in a private or public organization. We often remark at the top management level, different types of leader, the political placed one, or the specialist. But there is the third situation, where the leader doesn't occupy any position in top management, yet he is appreciated and recognized by the others as being a leader and a mentor. Through this article the authors, will identify elements needed to provide a new model for leadership, by the fusion of these leaders' features, in order to adapt the mentorship pillars to a performance business.

For this research, we examined the trends in the mentorship literature and from this point we analyse a new perspective for further development.

DEFINING MENTOR /MENTORSHIP AND LEADER/LEADERSHIP

For a better understanding of what a mentor is, we selected from literature relevant definitions of this concept, as following. Mentor can be: “a trusted guide or friend -young people today do not get much of an opportunity to be friends with adults, especially adults who are going to listen to them; a caring, responsible adult-he or she provides access to people, places and things outside the mentee’s routine environment; a positive role model- a mentor may be a positive role model. A role model is someone the youth aspires to be like, whereas a mentor is someone who offers to help the youth be whoever he or she wants to be. Today, youth have many role models; however, they are not necessarily positive role models.”(Mentor Training Handbook, 2012)

“The mentor is usually a senior, experienced employee who serves as a role model, provides support, direction, and feedback to the younger employee regarding career plans and interpersonal development, and increases the visibility of the protégé to decision-makers in the organization who may influence career opportunities” (Noe, 1988, p. 458).

“[Mentoring is...] the long term passing on of support, guidance and advice. Also a form of apprenticeship whereby an inexperienced learner learns the tricks of the trade from an experienced colleague backed up as in modern apprenticeships by offsite training.”(The Chartered Institute of Professional Development - CIPD)

The ability of a leader is to take certain decisions, sometimes radicals, in order to achieve objectives. The leadership involves combining various issues such as determination, courage, charisma and ambition that a leader can proof. All these features are assigned easily to the mentor, both of representing the highest sphere of influence team members.

In the past, the leaders were those on higher positions whose decisions were irreversible and mandatory executed. Nowadays the idea of leadership is present at all hierarchical levels such as operational members that have the ability to prioritize tasks themselves, to take the best decisions for the process, without the intervention of a superior.

Although the responsibilities are different, the literature identified three types of leadership no matter the hierarchical level at which member do his activity.

Situated on top of the pyramid namely strategic leadership undertaken by the team leader-that is the one that elaborate techniques such as developing new visions, strengthening values in organization and strategic thinking.

The second one is the team leadership includes tasks performed by mentor its main tasks are team trainings, orientation to people and positive influence on the mentality of the other members.

At the bottom of the pyramid are the employees themselves that can coordinate daily activities even without supervisor intervention.

INTELLIGENCES - A NEW PERSPECTIVE IN MENTORING AND LEADERSHIP

Our approach on mentoring and leadership is related to one of the most popular theories is that of Howard Gardner (2011), who forward the hypothesis of the eight types of intelligence: musical and rhythmic intelligence, bodily-kinaesthetic intelligence, naturalist intelligence, interpersonal and intrapersonal intelligence, verbal-linguistic intelligence, logical-mathematical and spatial-visual intelligence. These intelligences are autonomous and allow the individual to assume different roles that lead to different ways of knowing the reality. To understand and measure how people differ in terms of mental ability, researchers designed intelligence tests, which measure samples consisting of mathematical logic, spatial ability, understanding correlation, and other constituent elements of intelligence.

No.	Type of intelligence	Main feature	Type of leader
1	Physical intelligence (PQ)	The ability to do	Authoritarian
2	Intellectual intelligence (IQ)	The ability to learn and think	Authoritarian
3	Emotional intelligence (EQ)	The ability to communicate	Charismatic/transformational/participative
4	Spiritual intelligence (SQ)	The competence to give	Spiritual

Table 1 – Intelligence and leadership according to Nita, 2012

Most often in an organization we identify a manager and an informal leader (Bargal, 2000). The literature offers a variety of comparative analysis to differentiate the characteristics and attributes of a leader and a manager (Hyden, 1994; Hull and Ozeroff, 2004; Kossoff, 2008) Also it can be observed in a number of situations that the leader is a distinct person from the manager (formal or informal), or situations where the manager plays the role of a leader. (Gharehbaghi and McManus, 2003)

The main difference is that the leader has a power of decision, officially recognized, both his superiors (managers, directors) and also by the team; If one of the members made a mistake he must respond just in front of the leader and not to the mentor. Although the mentor and leader are equally popular and appreciated by the team, in employees mind is only a person that they must bring justifications - the leader.

The mentor although is a highly favourable element in a team he can have only an informal power of influence over the others colleagues. The mentor is regarded as a team member with operational role but through his experience, knowledge and relationship skills acquired to become an intermediary

between the leader and the team. The mentor existence is always beneficial because each action can be more easily implemented when more initiators and proponents of the same idea exist because the progress involves continuous improvement, not an isolated element.

Figure 1 – The manager-leader-mentor trinity (after Mihoreanu, Costea, 2016)

The UK government has recently identified the importance of mentoring to business growth.

Mentoring includes providing information [Mihoreanu, Costea, Stefanescu, 2016] and advice to individuals and facilitating their access to the people and resources they need in order to develop and progress.

Comparing mentor occupational standards, we noticed similar characteristics in competencies and skills such as: communicating, empathizing, empowering, evaluating, influencing, management information, inspiring, leading by example, learning, mentoring.

CONCLUSIONS

The new pattern of behaviour should be seen as a symbiosis of manager-leader-mentor. Starting from occupational and professional standards in this field and in accordance with European Qualification Framework – EQF, we can design a new set of traits, adapted to the organizational culture of a business. In this case, European Qualifications Framework is an essential tool for developing a European employment market. The EQF is a tool based on learning outcomes rather than on the duration of studies. The main reference level descriptors are: skills; competences; knowledge. The most important principle of the EQF is the learning outcomes approach. The learning outcomes approach shifts focus to what knowledge, skills and competences the learner has acquired by the end of the learning process. These competencies can be obtained in a formal, informal or a non-formal way (Colardyn and Bjornavold, 2004).

The research represent a work in progress and future results related to specific skills and competencies for both mentor and leader are going to be integrated and correlated in order to provide a new behavioural pattern, adapted to society current needs.

The leader through his position and the mentor through recognition by the team, propose collective action and generate positive changes by increasing competence or founded motivation. The main common element between leader and mentor is based on a strong operational implementation but also on the emotional sphere.

FINANCIAL INSTRUMENTS IN THE OPERATION OF CONTEMPORARY ENTERPRISES

Spoz, Anna

Department of Financial Markets and Institutions, John Paul II Catholic University of Lublin

ABSTRACT

Financialization is a process of increasing role in financial sector in domestic economies as well as the global economy. This is “a form of accumulation, in which profit are made mostly through financial channel instead of production and trade” (Janc et. al 2015). The phenomenon of financialization is changing model of enterprises’ operation. The aim of the paper is to verify the hypothesis that as a result of changes taking place in the world economy, the share of financial instruments in assets and liabilities of enterprises is increasing. If the hypothesis is proven, the Author will examine whether the discussed tendency concerns all enterprises (small, medium and large one).

Keywords: *financialization, financial instruments, financial assets, liability*

INTRODUCTION

The phenomenon of financialization, which has been present in the world economy for almost four decades, consists in excessive growth of the financial sector in relation to the real sphere, and its autonomization.

A consequence of transformations occurring in economy is a change in the conduct of entities operating on the market.

The aim of the paper is to verify the hypothesis that as a result of changes taking place in the world economy, the share of financial instruments in assets and liabilities of enterprises is increasing. If the hypothesis is proven, the Author will examine whether the discussed tendency pertains to all enterprises or only to large ones. Moreover, the Author will study the structure of financial assets and liabilities of enterprises in relation to the size of an entity.

The research methods used to accomplish these research objectives are: a critical analysis of literature on the subject, an analysis of empirical data and a deductive method.

THE ESSENCE AND CONSEQUENCES OF FINANCIALIZATION

Even though the “financialization” neologism has been present in literature on the subject from the beginning of the 1990s, this term is still ambiguous. The contemporary view on this phenomenon has been shaped to a large extent by K. Phillips who in 1993 in “Boiling Point” and a year later in a chapter of “Financialization of America” defined it as a prolonged split between the divergent real and financial economies (Phillips, 1994).

A few years later, G. Krippner defined a financialization as a pattern of accumulation in which profits are made by financial channels instead of trade and production (Krippner, 2004). Gostomski goes one step further and describes this phenomenon as “the dominance of the financial sector over the real sector” (Gostomski, 2014).

However, one of the most famous and most frequently quoted definitions is authored by G. Epstein who described the financialization phenomenon as “the increasing role of financial motives, financial markets, financial actors and financial institutions in the operation of the domestic and international economies.” (Epstein (ed.), 2005). The author points to a growing influence of financial elites and financial markets on decisions of governments and economic entities at the domestic and international levels.

Some of researchers (Froud, Haslam, Johal and Williams, 2001) perceive financialization as a new stage of capitalism, called “rentier” capitalism, “coupon pool” or “cash in capitalism”. C. Lapavitsas stresses that financialization is more than normal, systemic transformation of capitalism that occurred during the last four decades. Financialization as a systemic transformation manifests itself in three fundamental aspects (The era of financialization, 2014):

- financialization of commercial and production enterprises,
- financialization of households,
- transformation of banks – from taking deposits and giving loans to focusing on transacting in open markets.

As a summary we can use the definition created by P. Marszałek, who describes financialization as: (Marszałek, 2012; Janc et al., 2015)

- dissemination and quick development of financial markets,
- deregulation of financial systems and particular economies,
- extension of the range of available financial instruments and institutions,
- decisions in the sphere of social and economic policy, conducive to development of financial markets,
- increase in consumption facilitated by loans,

- popularity and growing significance of financial institutions, markets, instruments and schemes in the economic and social life,
- formation of a specific (individual, market-oriented and utilitarian) financial culture.

Effects of the financialization phenomenon can also be noticed at the microeconomic level. First of all it has changed the way to measure the performance of company from the net profit to earnings per share. The change is visible also in the sphere of ownership and management, especially in the case of large economic entities. Increasingly, holders of enterprise ownership rights are institutional proprietors from the financial sphere who are not interested in sustainable growth of an entity which generates substantial revenue only after certain time, but in large profits earned in a short period. They treat their participation in the real sphere as one of alternative ways of investing financial means and reaping profits. Commercial and production enterprises have a lot of money capital, but they don't invest it in new, modern fixed assets but they use it for making financial profit. Finance has become a mechanism for the extraordinary growth of profit for enterprises.

This attitude is reflected in enterprise management where a shift has occurred from the perspective of stakeholders towards the perspective of shareholders or stockholders. Harris and Raviv wonder if a control over corporate decision by shareholders should be increased. On the one hand it is needed to reduce the agency problems associated with management decisions. But on the other hand it would have a negative impact on the enterprises because in general shareholders have less information about company and its environment. They also don't have a knowledge of management so their decisions could be wrong.

The management staff of enterprises, evaluated by owners of business entities from the perspective of profits made and resultant dividends paid, also looks for the ways to quickly generate extraordinary profits. In this situation corporate objectives and objectives of managers are different. To achieve goals alignment managers can be compensated with stock options. Unfortunately this leads to focusing on rising prices of shares instead of long-term growth of an enterprise as less money is spent on research and development(). A good solution to this problem may be contractual protection of managers such as severance pay agreements. According to Xia Chen and Qiang Cheng (2015) CEO contractual protection have positive impact on innovation. They revealed that the longer duration and larger monetary strength of the agreement result in less tendency to reduce expenditure on R&D by the CEO.

THE NOTION AND TYPES OF FINANCIAL INSTRUMENTS

In the Polish language, the word “instrument” means a way, a method of operation, a means to achieve a specific goal.¹ The term “financial” signifies that an instrument is used to obtain a specified and expected economic result.

The notion of a financial instrument is defined in Article 3 section 1 item 23 of the Accounting Act. According to its provisions, a financial instrument should be understood as a contract that gives rise to a financial asset of one party and a financial liability or equity instrument of another party on condition that the contract concluded between two or more parties obviously brings about economic consequences, irrespective of the fact whether execution of rights or obligations resulting from the contract has an unconditional or conditional character. (The Act of 29 September 1994). On the other hand, M. Wypych (2001) defines a financial instrument as “a financial claim (or obligation) of one business entity towards another or as a contract between two entities, regulating their financial relationship.”

Financial instruments functioning on the market differ in terms of their structure, character of an obligation, manner of execution, autonomous operation, type of the market or underlying instrument. However, literature on the subject most frequently provides the following division of financial instruments: (Garstecki and Kamela-Sowińska, 2014)

- primary financial instruments – these are assets and liabilities which generate financial rights and obligations in the amount which is specified or possible to specify. This group comprises instruments of uncomplicated structure and high liquidity. Examples of underlying instruments are standard purchase-sale contracts, loan agreements, issue of shares and debt securities (Krzywda, 2005).
- Derivative instruments, called financial derivatives – these are instruments whose value is derived from value of underlying instruments which can be: interest rate, share price, exchange rate, value of commodities or stock market index (Mikita and Pełka, 2009). The essence of such instruments is transfer of risk connected with an underlying instrument between the parties of a contract concerning a given derivative instrument. This group of instruments comprises options, contracts and swaps.
- Compound financial instruments – a contract based on an equity instrument and a financial obligation or an obligation of another character (Rozporządzenie Ministra Finansów, 2008). This group of instruments includes: convertible bonds and callable bonds.

Financial instruments form two kinds of financial flows. An inflow of financial resources is registered in an entity’s balance sheet among assets. On the other hand, liabilities containing financial

¹ Słownik języka polskiego, Wydawnictwo Naukowe PWN,
Innovation, Entrepreneurship and Digital Ecosystems

instruments which are an entity's financial obligations form an outflow. Appropriate synchronization of both these flows enables an enterprise to stabilize financial liquidity and maintain it at a satisfactory level, and in consequence to continuously implement planned economic processes.

Furthermore, financial instruments are important for an enterprise also from the point of view of its solvency. Since they are resources of a high liquidity level, they protect an entity against its loss. Moreover, they are a source of financial revenue and expenditure for an entity, even though their amount and date of reception/payment depends on the type of a given instrument.

Enterprises can obtain financial assets for a short or a long term. Such financial assets as: stock or shares, securities, loans granted and others should be classified as short-term if they are payable and due or allocated for disposal within 12 months from the balance sheet date or from the date of their establishment, issue or purchase (The Accounting Act, Article 3 section 1 item 18). Hence, all financial assets held by an entity for over a year from the balance sheet date or from the date of their establishment, issue or purchase ought to be treated as long-term.

It can be reflected here that if enterprises made long-term investment of their monetary surplus on the capital market, the banking sector would lose deposits which constitute the foundation of their basic credit activity.

FINANCIAL INSTRUMENTS IN THE OPERATION OF CONTEMPORARY ENTERPRISES IN THE EMPIRICAL ASPECT

The analysis in this chapter drew attention to value and structure of financial assets of non-financial corporations in Poland. The data comes from OECD Statistics. The period available is from 2008 to 2012.

Figure no 1 presents the structure of financial assets of polish non-financial corporations. In 2008-2011 the value of financial assets was systematically growing from almost 895 billion in 2008 to over 1,187 billion in 2011. In the following year it decreased slightly to 1,170.5 billion. In 2012 the highest value had "other accounts receivable". The following were: shares and other equity and currency and deposits. Securities other than shares had the lowest share in all assets.

Most of assets of the non-financial corporation were other equity and unquoted shares. (Figure 2)

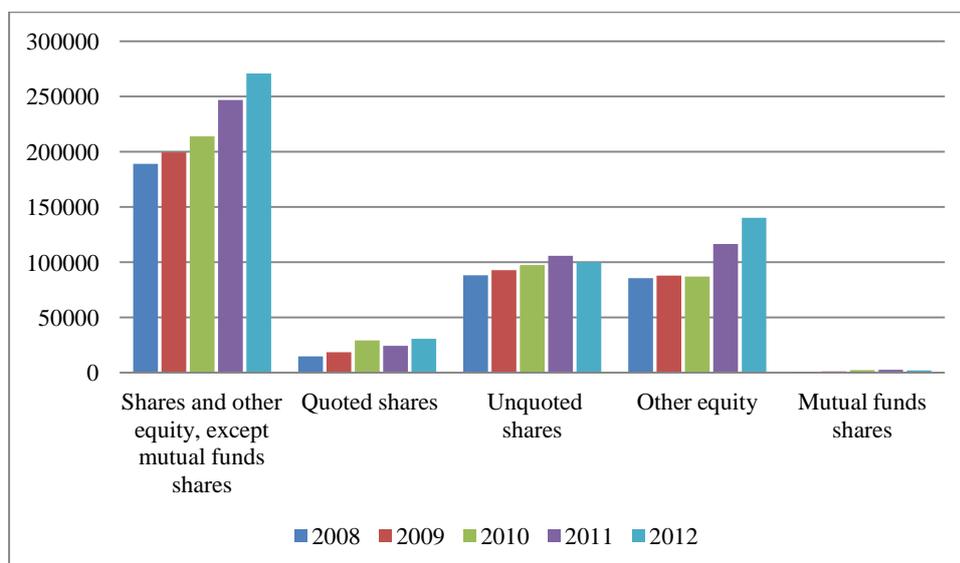

Figure 2. Structure of shares and other equity of non-financial corporation in Poland in 2008-2012 (Zloty, millions).

Source: Own work based on OECD data.

The assets of the highest liquidity were dominated by transferable deposit and other deposits. (Figure 3). The value of currency in companies is getting less and less.

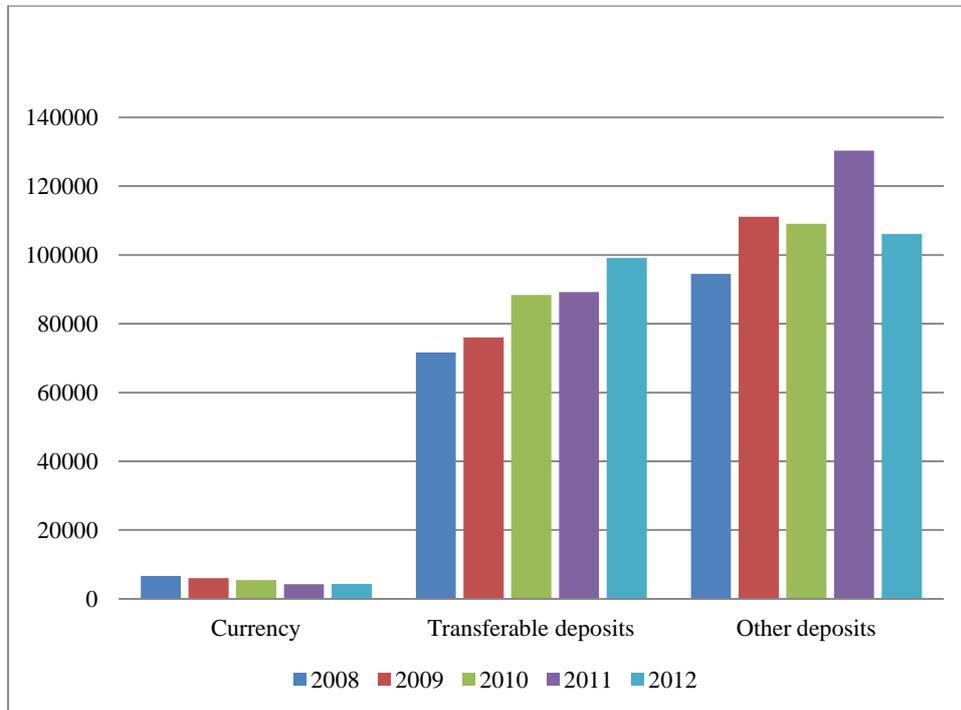

Figure 3. Structure of currency and deposit of non- financial corporations in Poland in 2008-2012.

Source: Own work based on OECD data.

When analyzing securities other than shares of these entities it must be observed that the highest value had long-term securities, and the lowest the financial derivatives (Figure 4).

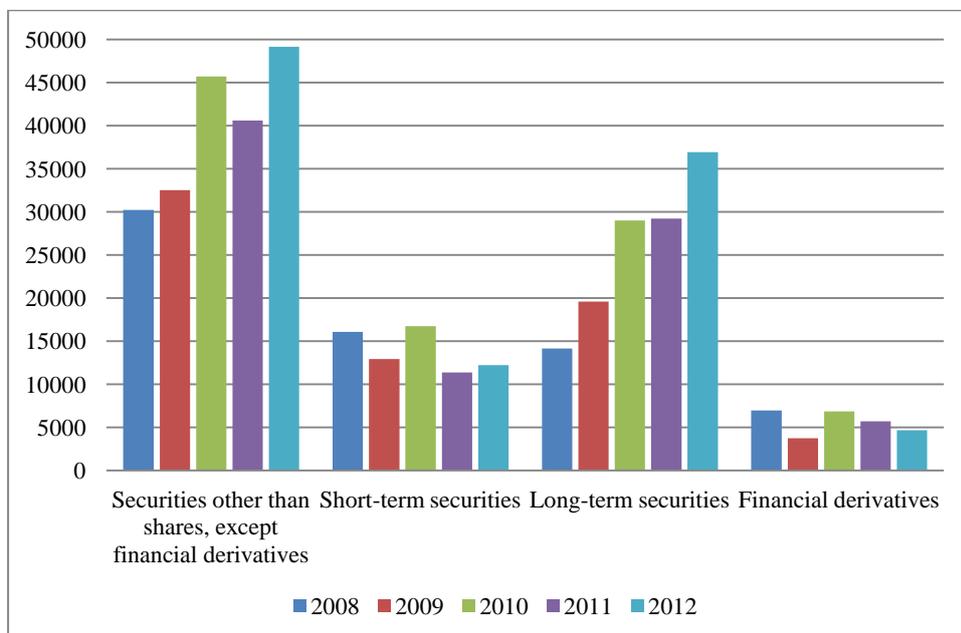

Figure 4. Structure of securities other than shares of non-financial corporations in Poland in 2008-2012.

Source: Own work based on OECD data.

The liabilities were dominated by share and other equity. The second as regards the value were loans and the lowest were securities other than shares (Figure 5).

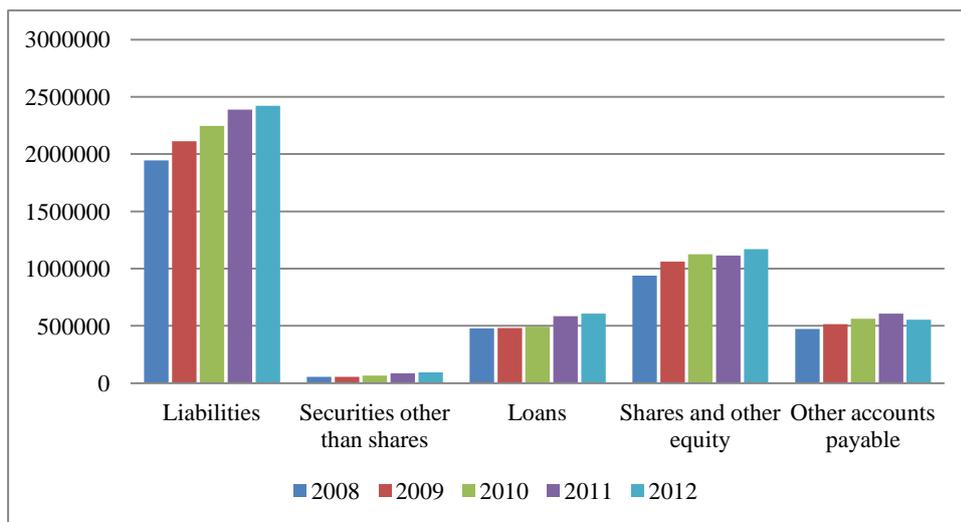

Figure 5. Liabilities of non-financial corporation in Poland in 2008-2012.

Source: Own work based on OECD data.

To confirm the hypothesis that the share of financial instrument in assets of enterprises is increasing, the author analyzed also financial results of economic entities in 2005-2015¹ based on GUS data.

The Author studied the value of financial revenues and financial costs of non-financial entities and their share in revenues and costs from their total activities. In 2005-2009 financial revenues were systematically increasing, but in 2010 this tendency was interrupted and revenues fell by almost 8 billion Zloty (Figure 6).

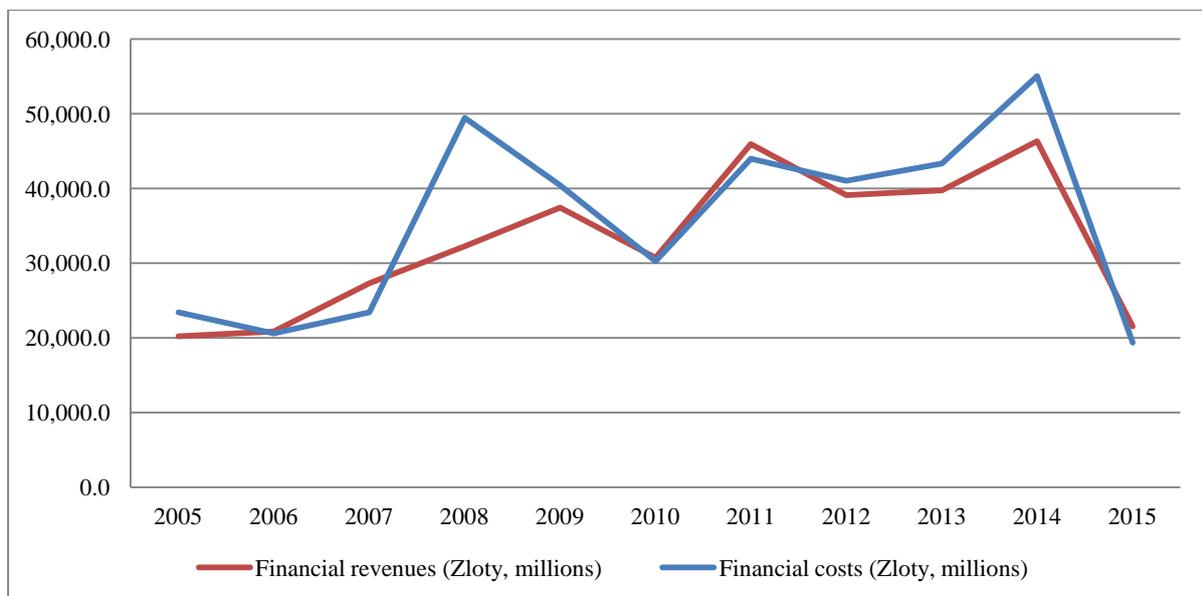

Figure 6. Financial revenues and financial costs of non-financial enterprises in Poland in 2005-2015.

Source: Own work based on GUS (2005-2016), "Financial results of economic entities in 2005-2015", GUS,

¹ The data presented for 2015 include only first half of the year (January-June).

Warsaw.

The similar situation was with financial costs, which were growing from 2005 to 2008, felt in 2009 and from 2010 to now are increasing. The main reason for this is global financial crisis which started in the middle of 2008 and its consequence – economic slow-down.

Looking at financial revenues in regard to sizes of enterprises it must be observed that the larger the company is, the greater the value of financial revenue it has (Figure 7).

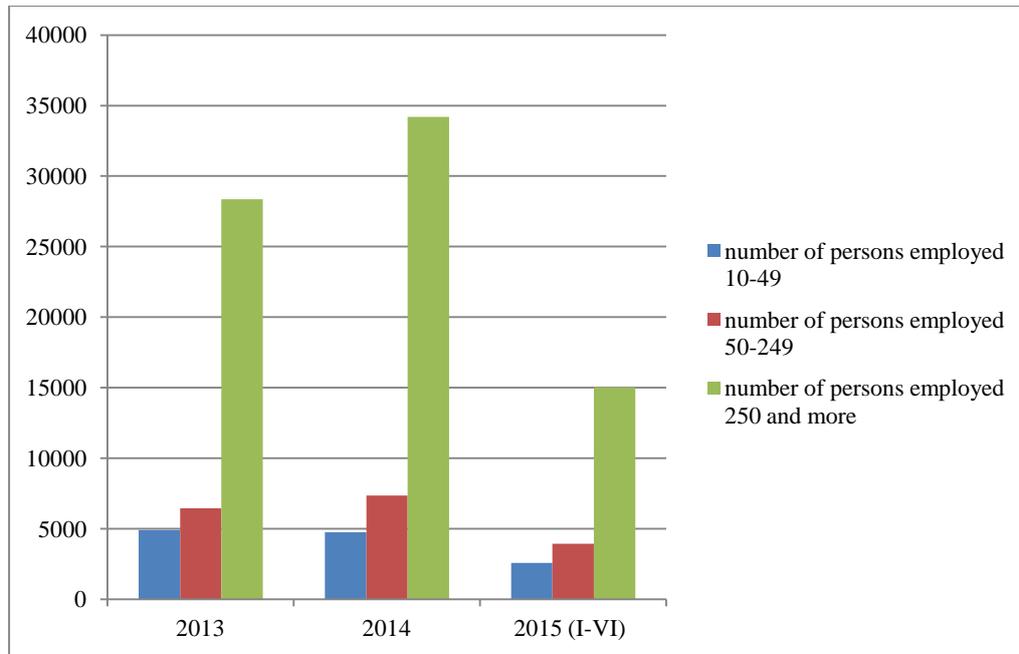

Figure 7. Value of financial revenues in regard to sizes of enterprises.

Source: Own work based on GUS (2004-2016), "Financial results of economic entities in 2013-2015", GUS, Warsaw.

Usually the larger the company is, the higher the surplus funds it can invest in financial instruments. The share of financial revenues in revenues from total activities in 2013-2015 increased slightly. The largest increase was recorded in large entities. (Figure 8)

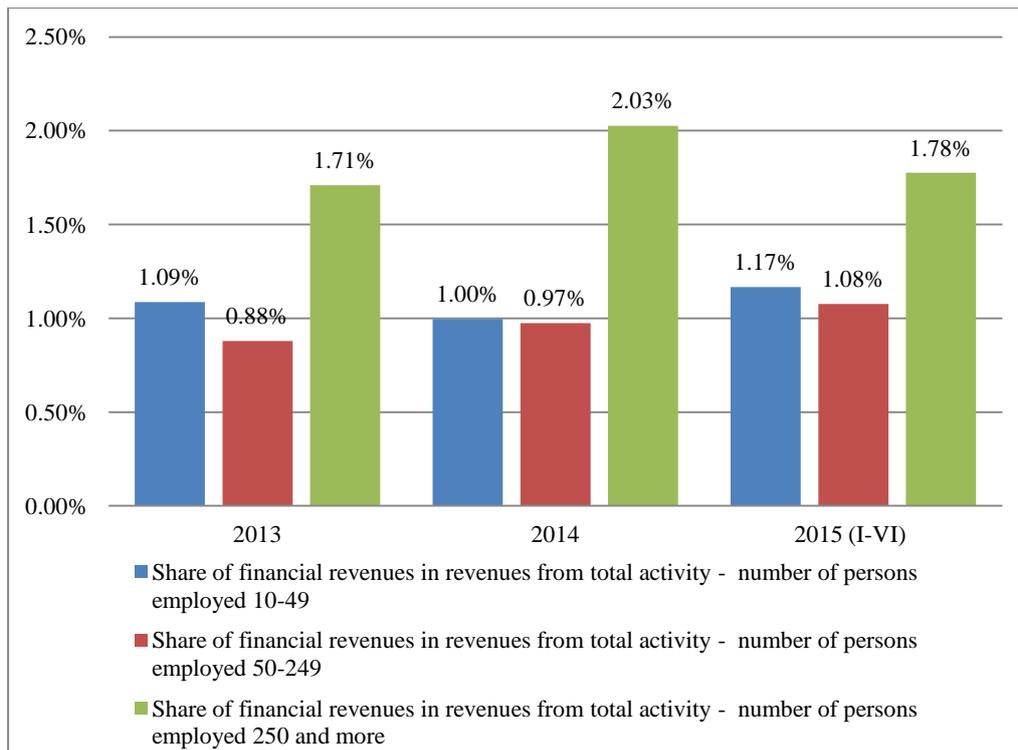

Figure 8. The share of financial revenues in revenues from total activities in non-financial enterprises in 2013-2015.

Source: Own work based on GUS (2004-2016), "Financial results of economic entities in 2013-2015", GUS, Warsaw.

The investment activity of small and medium enterprises is similar as the largest entities. They mostly buy equity capital instruments or share. Most seldom they buy investment certificates and embedded derivatives and hedging. (Figure 9)

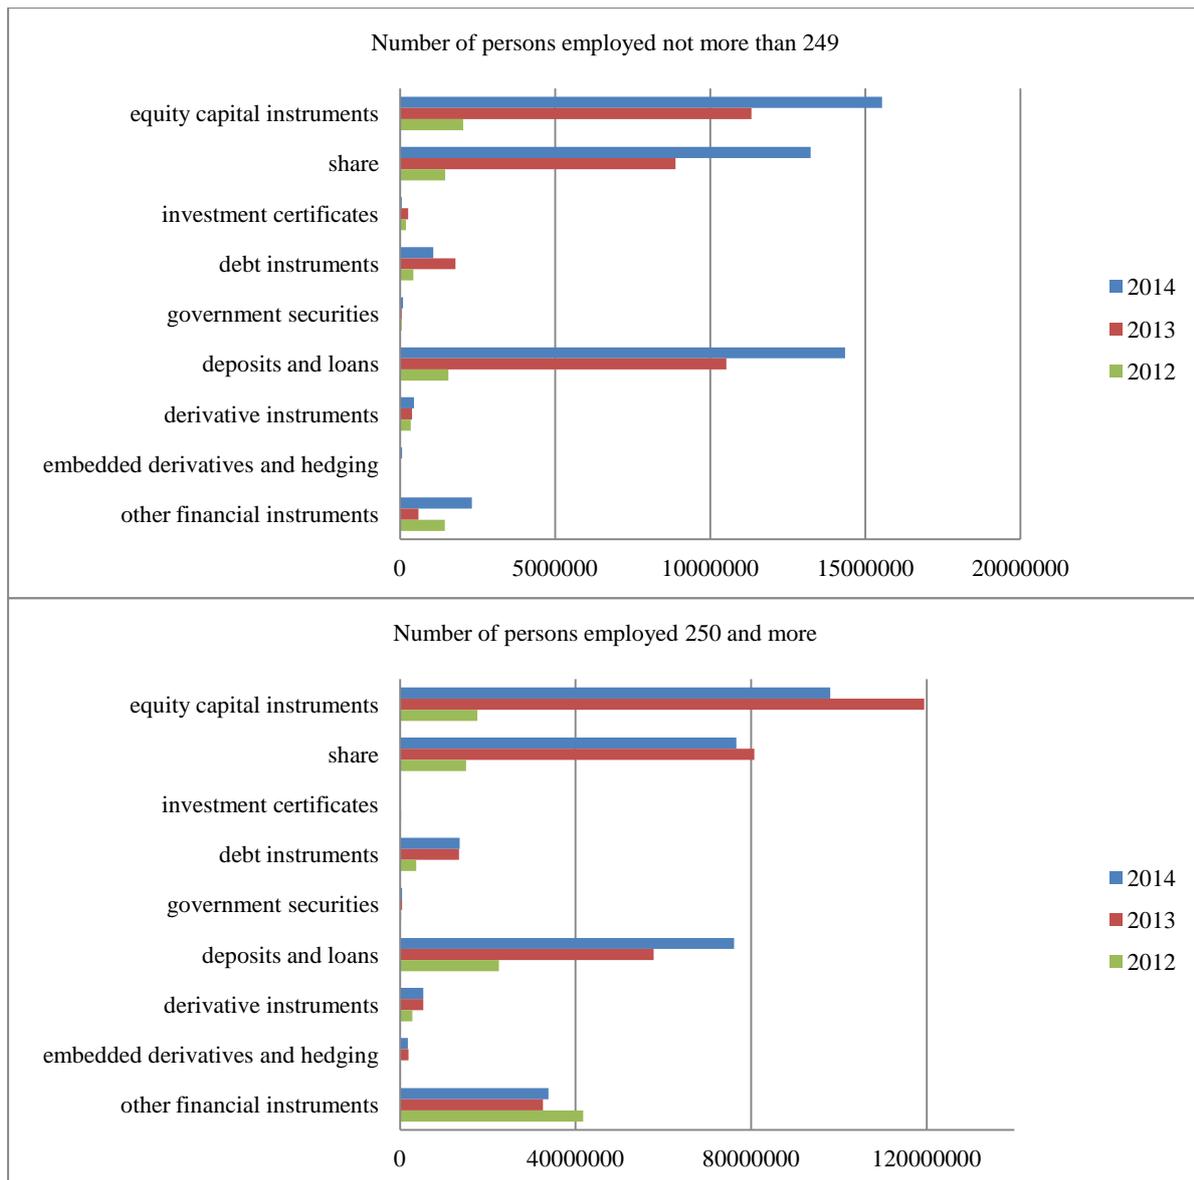

Figure 9. The share investment activity of economic entities in 2013-2015.

SUMMARY

The developing phenomenon of financialization clearly transforms the model of enterprises' operation. The shift from the perspective of stakeholders towards shareholders shortened the time horizon for decisions taken in an entity. In pursuit of quick and extraordinary high profits, management boards of enterprises invest in financial instruments more and more frequently. On the basis of the research conducted, the Author has confirmed the hypothesis put forward at the beginning that the value of financial assets of enterprises increases year by year.

ABSTRACT

The article deals with the issues of the destination quality. The significant factors were designed based on the contemporary theories and on the qualitative research. The importance of quality aspects related to travel tourism were identified and assessed for the Czech population. The paper presents a statistical evaluation of the significance of the destination quality factors with emphasis on dependency especially for categories related to the education and the occupation. The results can be used by destination managers to design communication strategies for different segments of consumers for individual destinations to improve their competitiveness.

Keywords: *travel tourism; destination quality; quality factors; consumer's perception; social aspects*

INTRODUCTION

The income from travel tourism represents a significant part of the total income of both developed and less developed economies in the world despite the current difficult situation. However, the positive balance of tourism due to the rising costs of Czech residents abroad declines. Even though, the Czech Republic ranks among the two thirds of the European Union countries where tourism revenues exceed expenditures. In recent years, the share of tourism in GDP in the Czech Republic is just under 3%. This is similar to the value of GDP for Sweden, the Netherlands, and Germany in the time before the immigration crisis. But tourism is not only important from macroeconomic view, but also from microeconomic perspective. Very important from a social point of view is employment in services. The share of tourism in total employment is slightly above 4.5% and the total number of people employed in tourism of about 230,000 people – approximately 80% of employees and 20% of entrepreneurs. In this environment, it is necessary to maintain high level of competitiveness and results from marketing

research could help to increase a quality of offered services in the field of tourism. The research discussed in this article relates to the perception of quality destination factors by visitors.

MATERIAL AND METHODS

The aim of this study is to determine whether there are statistically significant differences in the perceived quality of the destination for different groups of consumers; groups with different social status. Status defines the rights and responsibilities of individual in relation to other individuals and it is also forming expectations that other people can require from the holder status in certain situations. The relationship between different social statuses is defined by social roles. The education and occupation is usually thought as the major determinant of social status in modern societies. Another term that is used is socioeconomic status, based on income, education, and occupation. For a person's overall standing within a social stratification system is also important gender, age, and location/address; mentioned in the article as well. Further important determinants are the religion, social and cultural capital, material possibilities, and administrative ascription. This research is primarily focused on the influence of education and the position, that is characterized by the four categories – student, employee, employer, and old-age pensioner, so more focused on status obtained by the own efforts rather than the innate status, albeit category students and pensioners are closely related to the innate status. Education and occupation are the basic characteristics of the demographic aspects consumers when creating segmentation strategies used for travel tourism marketing activities.

In the literature, there are several definitions of destination quality, which vary considerably. Ryglova *et al.* (2015) states that the definition of destinations quality is also difficult because of the differences between the perception of visitors and residents, and also due to the complexity of the environment. Vajcnerova and Andrasko (2013) have found also many differences between the destination quality evaluations done by the experts from travel industry and by the residents, at least for the Czech Republic. World Tourism Organization has designed six standards for tourist product or service that have to be put into consideration when destination managers are making decision related to tourism and marketing. These standards could be summarized as follows: safety and security, hygiene, accessibility, transparency, authenticity, and harmony. According Buhalis (2003) the most important components of destinations are attraction, amenities, ancillary services, accessibility, available packet, and activities. Middleton and Clarke (2001) in addition to attraction, amenities, and accessibility see as the most important components moreover: image, perception of the destination and also price. Eraqi (2006) writes that the quality should be implemented through a comprehensive system under the condition of consistency and harmony for the quality system components or its subsystems.

The factors used in the survey were designed also on the base of the theoretical and scientific research and models (SERVQUAL, GAP, Kano, EFQM) related to quality destination (Buhalis, 2003; Middleton and Clarke, 2001; Woods and Deegan, 2003; Grönroos, 2007) and on own previous qualitative and quantitative research. During May-August 2015, a total of 1,097 respondents, determined the importance of 19 factors. The quota sampling has been used, based on population characteristics published by the Czech Statistical Office for the year 2014. Kruskal-Wallis test has been used for determination dependency resulting from each ranking factors by the respondent classification. We determine whether the evaluation of significance of observed factors is dependent on education or occupation/employment. One-way analysis of variance cannot be used because of non-normality of data; therefore, non-parametric test was used. With regards to the individual groups of Czech consumers and their perception of destination quality were determined following main hypotheses:

With the achievement of a higher degree of education there is an increasing need for information.

The group of students prefers active experiences in comparison with other groups.

For a group of employers are important factors associated with the business.

For a group of the pensioner are important factors as the cost and safety.

Table 1. *The significance of the destination quality factors perceived by consumers*

RESULTS AND DISCUSSION

The following Table 1 states the order of the quality factors according to their significance perceived by the visitor of the destination when evaluating the overall destination tourism quality. Significance was set based on the average evaluation values of respondents of examined sample (n = 1097).

The Table 1 shows the sequence number of examined factors quality, how they were perceived by their importance by the respondents. All factors are evaluated comparatively high at the 5-point scale. The most significant factors also show a lower standard deviation. At the top there are factors, where the median is equal to the maximum value – the factor *Sense of security* that represents security issues of the destination, which includes not only local security situation but also security in form of health risks (e.g. infectious diseases, drinking water, health system), safe natural conditions (e.g. earthquakes, floods), crime rate etc. The factor *Destination cleanliness* represents clean natural environment (water for swimming, air, way of dealing with local waste, cleanliness of public places, urban cleanliness etc.). The last factors, the least three significant, are factors *Respect to sustainable development of the destination*, *Additional infrastructure*, and *Local transportation*.

Kruskal-Wallis test verifies the null hypothesis, where the assumption of a factor under examination for all groups has the same distribution. The monitored variable (importance of factor) is at the ordinal level. Rejection of this hypothesis implies that the differences are statistically significant; there is the dependence of an examined factor on the segmentation issue – education or employment. The level of significance for a test was chosen 5% and 10%. YES+ means that the dependence was demonstrated at the 5% level, YES means that the dependence is significant only at 10% significance level, and NO indicates that dependence has not been proven. The only factor, at 10th place in the sequence, *Friendly acceptance by the locals* is the same as for education and employment/job, in respect to dependence, NO in both cases. It's value is relatively high for both tested groups – average 3.65 and median 4. The dependence on gender was proven at a 5% significance level in 11 factors out of 19 (F2, F3, F5, F6, F7, F9, F10, F11, F12, F13, F14, F15) and dependence on age was proven at a 5% significance level in 16 factors out of 19 (F2, F3, F4, F5, F6, F7, F8, F9, F10, F12, F13, F14, F15, F16, F17, F18) – as described in detail in Ryglova *et al.* (2015). As regards to location, place of residence monitored in the countryside or in the city, there is dependence found at 5% significance level in two factors *Overcrowding of the destination* and *Uniqueness of destination*. The dependence found at 10% significance level in next four factors *Accommodation*, *Image of the place*, *Social and experiential events*, and *Local transportation*.

The average values of surveyed quality factors for each group of education and employment are described in Table No. 2 and 3. For factors with statistically significant differences between the groups, the group that reached the highest average rating is highlighted.

Number of factor	Factor	Mean PRIMARY	Mean SECOND.	Mean HIGHER	Symbol of dependence
F14	Sense of security	4.21	4.31	4.35

Table 2. *The significance of the destination quality factors – the dependency on the level of education*

There are results of the test dependence of the individual factors related to education in the Table 2. The last column shows the symbol of dependence – only for factors for which the dependence is statistically conclusive. The significance of factor increases with a higher education only for three factors – *Natural attractions*, *Uniqueness of destination*, and *Respecting sustainable development of the destination*. However, other three factors *Image of the place*, *Social and experiential events*, and *Additional infrastructure*, for graduates of high school or university are almost identical. Significant difference is only lower rating for the category of elementary education. An interesting result is also the evaluation of the factor *Overcrowding destination*. This is the most important factor for respondents with secondary education.

Category "Occupation" is divided into four groups. Factors *Social and experiential events* and *Uniqueness of destination* are maximally rated by students, which confirms the results that this is related to younger age – the highest mean 3.45 for the first factor F5 evaluated by 18 - 23 years old respondents to compare all age groups, second – the highest mean 3.66 for the second factor F17 evaluated by 24 - 30 years old respondents to compare all age groups. The factors those are the most important for the old-age rentiers are related to the price, the availability of transportation, services and information, especially to a sense of security in the area, and also to cultural monuments. It is evident that the importance of these factors is related to age as well. Further group of factors – related to the level of

quality of tourism services as *Destination cleanliness, Level of personnel quality in tourism services, Accommodation, Food* – is important for a group of entrepreneurs. This is apparently related to their attitudes to business. However it must be noted that in this group of factors is not significantly different assessment also for groups of employees.

Number of factor	Factor	Mean STUDENT	Mean EMPLOYEE	Mean SELF-EMPLOYED	Mean SENIOR
F14	Sense of security	4.11	4.34	4.42	4.49
F15	Destination cleanliness	4.07	4.28	4.46	4.42
F1	Natural attractions	4.04	4.10	3.97	3.93
F12	Level of prices of services and goods in the destination	3.89	3.94	3.95	4.16
F13	Level of personnel quality in tourism services	3.71	3.96	4.11	3.90
F3	Accommodation	3.58	3.91	4.03	3.90
F4	Food	3.56	3.88	4.02	3.91
F6	Availability of transportation to the destination	3.50	3.75	3.81	4.24
F2	Cultural monument	3.58	3.63	3.70	4.15
F10	Friendly acceptance by the locals	3.66	3.67	3.51	3.65
F16	Overcrowding of the destination	3.61	3.53	3.68	3.70
F9	Information and communication prior to arrival	3.47	3.64	3.71	3.54
F8	Availability and quality of information	3.07	3.45	3.64	3.90
F17	Uniqueness of destination	3.57	3.44	3.50	3.08
F11	Image of the place	3.34	3.38	3.30	3.25
F5	Social and experiential events	3.37	3.17	3.35	3.02
F19	Respecting sustainable development of the destination	3.15	3.18	3.30	3.11
F18	Additional infrastructure	3.19	3.14	3.27	2.44
F7	Local transportation	2.86	2.84	2.82	3.61

Table 3. *The significance of the destination quality factors – the dependency related to employment/job*

The results found in the category of "student" and "senior" certify results published in a previous study (Ryglova *et al.*, 2015), which dealt with quality destination factors with respect to age. As Kandampully (2000) has stressed, quality will be the main driving force as tourism firms strive to meet the competitive challenges of the future. And according Atilgan, E. *et al.* (2003) among the service industries, tourism is especially significant in terms of its sensitivity to quality issue. For these reasons, it is obvious that the results of this research may help to specify the marketing activities for different customer groups. The present time is an instant time. Speed communication is required; therefore the message has to be short. Consumers do not like to read (or listen) long texts. Customers are oversaturated by advertising messages constantly attacking them from all sides, their ability to perceive is that reduced most of the day. Often, first sentence, first line, the first word is critical. Therefore organizations in tourism focused on students should emphasize in their messages in advertising, public relation, direct marketing etc. factors F17, F5, and organization focused on seniors, then F14, F16. Companies constantly collect data on their clients (eg. evaluation of completed tours)

and on potential future clients (eg. trade fair tickets lottery) and on the basis of creating targeted offers – for higher educated consumers is therefore more important to emphasize environmental issues in direct marketing activities. Also “persona” as the epitome of the segment is increasingly used for marketing strategy design. The main characteristics of this representative include education and occupation, so results of this research could help to marketing managers.

CONCLUSION

Today, there are significant changes associated with climate change, political conflicts, terrorist threats, and migration crises affecting not only travel tourism. Despite these uncontrollable threats, entrepreneurs in tourism must strive to improve their offers. The entrepreneurs try to identify the reasons for consumers’ behavior to be more competitive within the framework of controllable factors. From 19 highly rated factors, *Sense of security*, *Destination cleanliness*, and *Natural attractions* are the most important factors for respondents.

Defined hypotheses were confirmed by Kruskal-Wallis test. The results could help destination managers to improve their marketing strategy. Acknowledgements – the results presented in this paper are part of the project No. 15-21179S „The Quality Evaluation of Tourism Destination “, which is conducted with support of Grant Agency of the Czech Republic.

INTERNET USAGE AND MOBILE OWNERSHIP: THE DIRECTION OF CAUSALITY

Teerakapibal, Surat

Department of Marketing, Thammasat Business School, Thammasat University, Bangkok, Thailand

ABSTRACT

This study examines the causal relationship between Internet usage and mobile ownership using Thai macroeconomic data. A series of bivariate Vector Autoregressive (VAR) models are estimated. Granger causality tests are conducted to determine the direction of causality. Results show that mobile ownership 'Granger cause's Internet usage for consumers aged 6-10, 15-19, and over 60 years old segments. Conversely, the null hypotheses that Internet usage does not 'Granger cause' mobile ownership cannot be rejected for any age segment. Empirical findings imply that governments should initially focus on making mobiles accessible by their citizens, rather than enticing them to use more Internet by emphasizing its benefits. Age remains a significant determinant of technology adoption decision.

Keywords: *Internet Usage; Mobile Ownership; Granger causality; Vector Autoregressive Models*

INTRODUCTION

The rapid growth of Internet usage has been documented virtually in all nations. Although less than 1 percent of the world population has access to the Internet in 1995, this figure has reached approximately 40 percent today (Internet Live Stats, 2016). The most apparent benefit of the Internet is its ability to eradicate any geographical boundaries among global citizens. For businesses, consumers' adoption of Internet allows firms to reach a larger audience via electronic channels both in terms of communication and sales. Interestingly, these benefits extend beyond nations where economy is already fully developed (Robey, Gupta and Rodriguez-Diaz, 1990; UNCTAD, 2001). Statista (2016) estimates that B2C e-commerce sales worldwide account for 1.7 trillion U.S. dollars in 2015 and is expected to increase to over 2.4 trillion U.S. dollars in 2018. In 2016, it is forecasted that 19 percent of smart phone users in the United States will transact with their phones at the point of sale, which implies an approximate 61 percent year-over-year increase (Frederick, 2016). Globally, more than 1 billion consumers have purchased products or goods online via desktop, mobile, tablet, or other devices (Statista, 2014).

It is, therefore, inarguable that Internet is one of the key drivers to nation's economic growth. Chile, as an example, announced a national broadband strategy which signifies its vision that ICT is a priority Innovation, Entrepreneurship and Digital Ecosystems

ISBN: 978-9963-711-43-7

for economic development. Other countries, with similar vision, set targets and goals for promoting Internet usage. While Brazil aims to provide access to broadband for 50 of every 100 households, Malaysia's goal is broadband penetration rate of 75 percent in 2010 (World Bank Group, 2016). Consequently, governments employ various measures in order to improve their citizens' access to the Internet. For instance, over 13,000 miles of publicly-owned digital infrastructure, worth over 1.5 billion pounds, has been constructed in the United Kingdom (Curtis, 2015). However, Korean government adopts a more integrated approach: manufacturing promotion, user awareness, and digital literacy (World Bank Group, 2016).

Though developed countries may have a larger pool of resources to expend on promoting Internet usage, less fortunate nations are forced to focus their efforts. Findings of extant researches posit that governments should emphasize to its citizens the benefits of the Internet (Chen, Gillenson, and Sherrel, 2002; Teo, Lim, and Lai, 1999; Wang *et al.*, 2003). This is supported by the finding of Teo, Lim, and Lai (1999) where participants extensively use the Internet mainly because they perceive that the Internet is useful to their tasks. Within the framework of Technology Acceptance Model (TAM), perceived usefulness is commonly used to explain individual's decision to adopt a technology such as the Internet. Perceived usefulness is the degree to which an individual believes that using the technology can improve his/her performance (Saade and Bahli, 2005).

On the contrary, governments could also bolster Internet usage by facilitating easier access to the Internet. This concept is based on the fact that ease of use is also found to be a key determinant for Internet usage based on the Technology Acceptance Model (TAM). Specifically, perceived ease of use is the extent to which a person believes that using a technology is free of effort (Davis, 1989). Despite the public effort to construct infrastructure to extend the reach of the Internet to rural areas, making mobiles affordable to citizens could prove to be a fruitful alternative. A recent report by Pew Research Center suggests that smartphone is a viable means through which consumers can access the Internet (Pew Research Center, 2014). Consequently, those with mobile phones could readily access the Internet with ease.

Notably, another stream of researches posits that factors which are individual-specific are also important determinants of Internet usage. For instance, Porter and Donthu (2006) suggest that socio-demographics play an important role in determining consumers' decision to use the Internet. In their study, those who are older, are less educated, and possess lower income have lower Internet usage rate than their counterparts. These findings coincide with those of Teo (2001), which argues that demographic variables such as age, gender, and education level are associated with Internet usage activities. Therefore, analyses regarding Internet usage should consider variations due to factors such as age.

In this paper, I aim to determine the direction of the causality between internet usage and mobile ownership for consumers of different age groups. In particular, the objective of this paper is to answer the following research questions:

1. Does increase in Internet usage boosts number of mobile owners? If so, does it differ across age groups?
2. Does increase in number of mobile ownership translate to growth in Internet usage? If so, does it differ across age groups?
3. Does the causality between Internet usage and mobile ownership run in both directions?

From the perspective of public policy makers, results could identify the appropriate direction for fostering usage of the Internet to procure nation's economic growth. In addition, this paper contributes by determining age-group-specific strategy for promoting Internet usage. If empirical evidence of a bi-directional causality exists, it would urge policy makers to be aware that the effectiveness of marketing campaigns, which highlight the usefulness of the Internet, must be accompanied by government's support to create ease of accessibility such as the subsidies on mobile prices.

The rest of the paper is organized as follows. In the next section, I describe the time series data utilized in the analysis. Methodology which includes unit root tests for stationarity of time series and Granger causality tests are then explained along with empirical results. Finally, I conclude in the last section with discussions and conclusions.

DATA AND METHODOLOGY

Data

As the objective of this paper is to examine the causality between Internet usage and mobile ownership, it requires that the data must come from a market where neither access to the Internet nor ownership of mobiles has reached the maturity stage at the time when data is initially collected. Therefore, Thai macroeconomic data are used for the analysis. In terms of Internet usage, more than 24.5 million Thais currently are able to access the Internet. This figure has grown tremendously from merely 8.5 million in 2006. Similarly, the number of mobile owners has also skyrocketed during the same period. In 2006, approximately 24.7 million people own a mobile, whereas 49.5 million people possess a mobile in 2015.

This paper utilizes the annual number of Thai Internet users by age groups from 2006 to 2015, made available by the Thai National Statistical Office. The data is collected by the Ministry of Information and Communication Technology via the Information and Communication Technology survey. In the

same survey, the number of mobile owners by age groups is also obtained. The 2 time series data are then merged in order to investigate the relationship between Internet usage and mobile ownership.

Unit root tests

Prior to performing Granger causality tests, time series data must be evaluated for their stationarity. According to Engle and Granger (1987) and Enders (1995), stationarity refers to a series whose mean, variance, and autocovariance do not vary over time. In order to test for stationarity, Dickey-Fuller unit root tests are conducted using proc AUTOREG in SAS. Specifically, the following hypotheses are tested for each time series:

$$H_0: \alpha = 1$$

$$H_a: |\alpha| < 1$$

, where α is the autoregressive coefficient. In order to test for a unit root, I allow time series to follow 3 distinct types of models:

1. The zero mean model

$$y_t = \alpha y_{t-1} + \varepsilon_t \quad (1)$$

2. The constant mean model

$$y_t = \mu + \alpha y_{t-1} + \varepsilon_t \quad (2)$$

3. The trend model

$$y_t = \mu + \beta t + \alpha y_{t-1} + \varepsilon_t \quad (3)$$

, where y_t is the time series and ε_t is the white noise error.

The results of testing the order of *Internet_Usage* and *Mobile_Ownership* are provided in Tables 1 and 2, respectively. The tests suggest that both time series are stationary under all three distinct specifications: zero mean, single mean, and trend (p-value for all time series data are greater than 0.05). Therefore, the original time data series can be used directly to determine the relationship between number of mobile ownership and Internet usage.

VAR model

As mobile is a common means through which consumers access the Internet, there should exist a relationship between number of mobile ownership and Internet usage across age groups. In other words, I conjecture that these variables are not only contemporaneously correlated to each other, but they are also correlated to each other's past values. According to Sims (1980), models only containing exogenous variables are not suitable. In this study, the vector autoregressive model (VAR), which allows for an estimation of a short-run dynamic relationship among endogenous variables, will be estimated to fit the time series data. The 1st-order bivariate VAR system is given by:

$$\begin{bmatrix} Internet_Usage_t \\ Mobile_Ownership_t \end{bmatrix} = \delta + \Phi \begin{bmatrix} Internet_Usage_{t-1} \\ Mobile_Ownership_{t-1} \end{bmatrix} + \varepsilon_t \quad (4)$$

, where $\delta = \begin{bmatrix} \delta_1 \\ \delta_2 \end{bmatrix}$ is a constant vector and $\Phi = \begin{bmatrix} \Phi_{11} & \Phi_{12} \\ \Phi_{21} & \Phi_{22} \end{bmatrix}$ is a 2×2 matrix of parameters. ε_t is a vector of white noise process with $\varepsilon_t = \begin{bmatrix} \varepsilon_{1t} \\ \varepsilon_{2t} \end{bmatrix}$ such that $E(\varepsilon_t) = 0$, $E(\varepsilon_t \varepsilon_t') = \Sigma$, and $E(\varepsilon_t \varepsilon_s) = 0$ for $t \neq s$.

A series of bivariate VAR systems are estimated using VARMAX procedure in SAS. In order to assess model fit, Corrected Akaike Information Criteria (AICC) and Schwartz Bayesian Criteria (SBC) are reported.

$$AICC = \log(|\bar{\Sigma}|) + \frac{2r}{T-k} \quad (5)$$

$$SBC = \log(|\bar{\Sigma}|) + \frac{r \log(T)}{T} \quad (6)$$

, where r denotes the number of parameters estimated, k is the number of dependent variables, T is the number of observation used to estimate the model, and $\bar{\Sigma}$ is the maximum likelihood estimate of Σ . Table 3 reports criterion values for models across age groups.

Table 3
Model Fit Statistics

Age Group	AICC	SBC
6-10	45.75	45.22
11-14	47.44	46.91
15-19	45.84	45.30
20-24	47.06	46.52
25-29	47.52	46.99
30-34	46.78	46.25
35-39	46.46	45.93
40-49	48.38	47.84
50-59	45.03	44.49
> 60	46.61	46.07

Granger causality tests

The concept of Granger causality is rather a straightforward one. In particular, this sense of causality is defined by Granger (1969) and Sims (1972). That is, a variable Grange causes another variable if its inclusion into equation for another variable makes a significant contribution. Therefore, the Granger causality test as suggested by Enders (1995) is employed to determine causality between mobile ownership and Internet usage. Though a conventional F-test may be utilized to test the restriction that all lags of the variable do not enter significantly into VAR model specification, this paper employs Wald statistic instead. Consider (4) in the following form:

$$\begin{bmatrix} \Phi_{11}(B) & \Phi_{12}(B) \\ \Phi_{21}(B) & \Phi_{22}(B) \end{bmatrix} \begin{bmatrix} Internet_Usage_t \\ Mobile_Ownership_t \end{bmatrix} = \begin{bmatrix} \delta_1 \\ \delta_2 \end{bmatrix} + \begin{bmatrix} \varepsilon_{1t} \\ \varepsilon_{2t} \end{bmatrix} \quad (7)$$

, where $\Phi_{ij}(B)$ are vectors of coefficients.

According to (7), the variable *Internet_Usage* causes *Mobile_Ownership* if $\Phi_{21}(B)$ is statistically different from zero. On the other hand, $\Phi_{12}(B) = 0$ would infer that *Mobile_Ownership* does not cause *Internet_Usage*. The implication of this model structure is that future values of the process *Internet_Usage* can either be influenced by its own past value and not by the past value of *Mobile_Ownership* or both, and vice versa. For the case where the future *Internet_Usage* are not affected by the past values of *Mobile_Ownership*, it would be more appropriate to model *Mobile_Ownership* separately from *Internet_Usage*. That is, the VAR model is unnecessary.

The CAUSAL statement under VARMAX procedure in SAS is employed to conduct Granger causality tests. Specifically, Wald statistic is calculated for the 2 following sets of hypotheses:

$$H_0: \Phi_{12}(B) = 0$$

$$H_a: \Phi_{12}(B) \neq 0$$

and

$$H_0: \Phi_{21}(B) = 0$$

$$H_a: \Phi_{21}(B) \neq 0$$

Table 4 contains Chi-square and corresponding p-value for Granger causality tests. The first set of hypotheses examines whether mobile ownership 'Granger cause's Internet usage. Results indicate that being an owner of mobile devices causes a consumer to use more of the Internet for consumers aged 6-10 (p-value < 0.0001), 15-19 (p-value = 0.0357), and over 60 years old (p-value = 0.0182). For consumers belonging to other age groups, inconclusive results are obtained from Granger causality tests at the significance level of 0.05. On the other hand, there exists no evidence that an increase in Internet usage would 'Granger cause' higher number of mobile owners. In other words, it is unable to conclude that number of mobile owners assists in explaining Internet usage. This is due to the fact that p-values for Granger causality tests exceed 0.05 for all analyses across age groups.

Table 4
Granger-causality wald tests for each age group

Hypothesis	Chi-square	p-value
Ho: Mobile ownership does not 'Granger cause' Internet usage		
Ha: Mobile ownership 'Granger cause's Internet usage		
Age Group		
6-10	15.72	< 0.0001

> 60	0.22	0.6406

* *Boldface denotes Chi-square statistic which is significant at the 0.05 level*

DISCUSSIONS AND CONCLUSIONS

Due to its significant contributions to economic growth, governments employ various measures in order to boost Internet usage within the nation. In line with the Technology Acceptance Model (TAM), perceived usefulness and perceived ease of use tend to play a major role in determining adoption of technology. Consequently, policy makers attempt to promote benefits of the Internet to their citizens in order to entice them to use the Internet more extensively. Moreover, governments also attempt to improve accessibility to the Internet by spending more on related infrastructure and affordability of mobile devices. Towards proposing a more appropriate direction for policy makers, this paper aims to investigate the causality and its direction between mobile ownership and Internet usage. The analyses conducted are age-specific as demographics have been shown to influence Internet usage rate.

Estimation results suggest that mobile ownership 'Granger cause's Internet usage for consumers aged 6-10, 15-19, and older than 60 years old at the significance level of 0.05. For consumers of other age groups, there is not enough evidence to reject the null hypothesis that mobile ownership does not 'Granger cause' Internet usage. Interestingly, empirical results do not support the hypothesis that Internet usage 'Granger cause' mobile ownership for any age segments at the significance level of 0.05. Essentially, this implies that consumers who use Internet more will not encourage them to purchase mobiles, a means through which they would access the Internet with. On the other hand, if more consumers own a mobile, the number of Internet users will also be increased.

This paper therefore contributes to both literatures and practitioners. First, empirical results shed light on an appropriate policy to raise Internet usage rate. That is, if mobiles are made affordable to a wider audience, the use of Internet will require less effort as the device to access is readily available. Ultimately, nation's usage rate will gradually rise as a result. On the other hand, promotional campaign which encourages citizens to perceive benefits of the Internet will not be sufficiently effective to motivate them to purchase a device. Secondly, similar to Porter and Donthu (2006) and Teo (2001), finds that age remains a significant determinant of technological adoption. Policy makers must, therefore, be aware that variation in effectiveness of marketing efforts does exist across age groups.

ABSTRACT

Previous research suggests that corporate social responsibility (CSR) can be a firm's communication instrument to stimulate positive consumer behaviour such as positive word-of-mouth. Skarmeas & Leonidou (2013) find that when firms faces allegation concerning social irresponsibility, CSR strategies might aggravate consumers' negative, instead of positive, responses. To complete research in the CSR domain, this study focuses on the condition when a firm lapses into scandal and examines the effect of CSR initiatives on consumers' skepticism and attitude toward that firm. This study integrates three CSR strategy communication factors: proactivity (proactive/reactive), length of time (longer/shorter) and communication sources (internal/external). The results indicate that consumers perceive a firm with moral or ethical character when it conducts long-term engagement CSR strategy. On the other hand, if a company reactively involves in CSR initiatives, consumers will attribute the firm with more egoistic-driven motives. Egoistic-driven attribution relates positively to consumer skepticism and has negative influence on consumers' attitude. On the contrary, values-driven attribution relates negatively to consumer skepticism and has positive impact on consumers' attitude. This research investigates the effect of CSR strategy and the results could provide corporates guidelines as to how to conduct CSR tactics during crisis.

Keywords: *Corporate social responsibility, Attribution Theory, Skepticism, Equity, Word of Mouth.*

INTRODUCTION

Ting Hsin is a Taiwanese-owned conglomerate based in China and a major manufacturer and retailer for food and beverage products in the Greater Chinese market. The group is well known for its philanthropic efforts; for instance in 2010, it has set up a charitable foundation with an input of US\$ 3.2 million for schools, scholarships, and disaster relief. Nevertheless in late 2013, Ting Hsin was embroiled in a food scandal of tainted cooking oil. Despite its reputation for the charitable acts, a nation-wide boycott was triggered in Taiwan, from individual consumers to local governments. It is reported that the boycott has results in over US\$31 million lost.

Business experts increasingly have stressed the importance of corporate social responsibility (CSR), which is considered a key instrument to enhance a firm's reputation and affect consumers' intention and behaviours including positive word of mouth (Bhattacharya and Sen, 2004). Some scholars argue that even during crisis, a company's past performance in CSR could still enable consumers to retain positive attitudes toward it (Coombs and Holladay, 1996), while others are more reserved with its effect as a crisis communication tool (Vanhamme and Grobben 2008).

Recent research indicates inconsistent implications of CSR. Groza et al. (2011) find that when the motive for a CSR act is perceived to be stakeholder-oriented, consumers would have a more negative attitude towards the company and lower their purchase intention. Skarmas and Leonidou (2013) conclude that a stakeholder-driven CSR strategy would trigger consumer skepticism which ultimately lead to decrease on positive word-of-mouth. Vanhamme and Grobben (2008) argue that when a company faces a crisis, shorter length of CSR history would impact negatively on consumer perceptions. Vanhamme et al. (2014) suggest that if allegations of social irresponsibility emerge, firm transmits CSR information through third-party will aggravate consumers' negative attitude toward the firm. Romani et al. (2013) conclude that CSR may work to influence consumer responses in negative scandals, but only in a neutral position.

Bhattacharya et al (2009) put a call to a better understanding of CSR activities and the underlying processes driving consumer responses. This research attempts to respond to this call and examine the effect of CSR strategies on consumers' intention and behaviour when social irresponsible issues surface.

LITERATURE REVIEW

Consumers' perception on a firm's CSR contribution depends on how much it commits itself to a cause (L'Etang, 1994). The level of perceived commitment is constituted of three components: the amount of input, the durability of the association, and the consistency of input (Dwyer et al., 1987). These components can be translated into different strategic tools that a company adopt to communicate their CSR activities, including level of proactivity (proactive/reactive), length of time (longer/shorter) and communication sources (internal/external).

The timing of engaging in CSR is the determinant in relation to whether it is a proactive or reactive CSR activity (Rim, 2013). Proactive strategy refers to a firm involved with CSR initiatives prior to any negative information being received by consumers (Du et al., 2007). Similarly, reactive strategy refers to that firm reactively involve in CSR activities after consumers receiving negative information about a firm's irresponsible actions (Wagner et al., 2009). Firms usually conduct reactive strategy so as to restore their reputation and image of the organization; whereas proactive strategy is adopted when

firms intend to maintain or enhance their reputation (Rim, 2013). When a company engages in proactive CSR, publics tend to attribute more altruistic motives to its CSR and evaluate the company reputation more positively than a company without proactive CSR (Rim, 2013).

Consumers consider a firm that has longer commitment to a social cause as more genuine and well-motivated whereas that has shorter commitment as egoistical and firm-serving motivated (Webb & Mohr, 1998). The length of time in CSR activities can be used as a cues to determine a company's social legitimacy, which is a key to a firm's long-run survival (Handelman & Arnold, 1999). Vanhamme & Grobten (2008) indicate that consumers and other stakeholders are found to more willing to trust companies with a longer record of CSR engagement. Therefore during scandals regarding to a firm's irresponsibility, it should defend its social legitimacy and reputation through emphasising on the firm's past performance. Barton (1993) suggests that the majority of customers seem more willing to forgive a company with longer performance history.

Communication of CSR activities can be disseminated through channels controlled by a third party, such as magazine articles, or those that companies have full control of, such as advertisements or newsletter (Vanhamme et al. 2014). The perceived credibility of a source has a substantial influence on the degree to which people are persuaded by the message (Newell et al., 1998). Most consumers expect more credible information to come from third-party sources (Mohr et al., 2001). They tend to become more sceptical and view corporate as more self-interests when messages are sourced from company-controlled channels (Wiener et al. 1990). Simmons & Becker-Olsen (2006) conclude that consumers perceive a firm's CSR initiatives more positive when they receive the information from an independent association, compared to from corporate source.

In marketing, consumer skepticism refers one tendency to doubt and question the marketing agent's claims (Chylinski & Chu, 2010). Skarmeas and Leonidou (2013) identify four factors as the underlying drives for consumer skepticism. Stakeholder-driven motives indicate consumers belief in that a company's involvement in CSR is to achieve different stakeholders' expectation. Egoistic drive refers to when consumers believe that companies, rather than provide their support, take advantage of the social causes. These two drives are more self-centred and would trigger consumers' skepticism. On the other hand, values-driven motives reflect consumers belief in that the company participate in CSR activities purely because the company have moral, ethical characteristic. When consumers believe that company can achieve its business goal while supporting the causes, the company might be attributed to strategic-driven motivated. These two drives are other-centred motives. They would induce consumers' more favourable responses to the company and reduce consumer skepticism.

The study of Groza et al. (2011) find that proactive CSR initiative have a positive effect on values-driven attribution. On the other hand, reactive CSR only occurs when there are unexpected events and a firm will right their social wrongdoings to achieve all stakeholders' expectations. Thus, when a company engages in proactive CSR, publics tend to attribute more altruistic motives to its CSR and evaluate the company reputation more positively than a company without proactive CSR (Rim, 2013). Consumers are found to view a shorter commitment as egoistic-driven and/or stakeholder-driven by strategic performance demands while a longer commitment is more likely to be value-driven (Ellen et al., 2006). This is because a shorter commitment is more likely to be a reactive response to an unexpected event. However, this research regards proactivity and length of time as two independent factors as there have been firms reactively make promises to start engaging in long-term CSR activities. Therefore, it is not definite in practice that proactive CSR always match a longer term commitment and reactive CSR always match a shorter term commitment.

The choice of communication to deliver a company CSR messages would also influence consumer perception of a company's CSR strategy. Conveying proactive CSR information from internal channel will maximise positive returns from CSR investment; yet relying on external sources to disseminate reactionary information may minimise any possible negative effects (Groza et al., 2011). Vanhamme et al. (2014) further explore the topic and find that when the CSR initiatives of a company are irrelevant to the domain of social irresponsibility, delivering CSR information via a company-controlled source will buffer decreased attitude toward that company. On the other hand, transmitting CSR information through a third-party source will aggravate negative consequences in a company crisis.

Consumer skepticism would lead to various results, including consumers' tendency to spread good word-of-mouth, their resilience to negative informaiton, and brand equity. Consumers would engage in word-of-mouth to communicate their positive or negative experiences, feelings and emotions with a firm (Herr et al. 1991). Forehand and Grier (2003) find that consumers' skepticism toward firms will facilitate them to share their doubts, verify their suspicions and warn others. Skarmeas and Leonidou (2013) also suggest that consumers, who are skeptical toward CSR efforts of a firm, will inhibit their willingness to talk positively about the firm to their acquaintances. On the other hand, consumers who are less sceptical and perceive the firm with a "reservior of goodwill" would be less likely to allow external but negative information to underrate their general view of the firm (Eisingerich et al. 2010).

Consumer skepticism could impact brand equity in the sense that, once consumers perceive a firm pays attention to CSR initiatives, they will have more positive attitudes to that company (Cho, 2006). However, once consumers' skepticism surface, the value of that firm in consumers' mind will be undermined. Brand equity would further influence consumers' level of resilience to negative

information (Ahluwalia et al., 2000) and tendency to produce positive word-of-mouth (Skarmeas and Leonidou, 2013). The research framework is presented in Figure 1, with consumer support of CSR as a control variable. Congruence between consumers' perception of themselves and the company would vary with consumers' CSR support. Compared to consumers who do not support CSR efforts, consumers who are more supportive would have more positive evaluation toward companies (Sen, 2001)

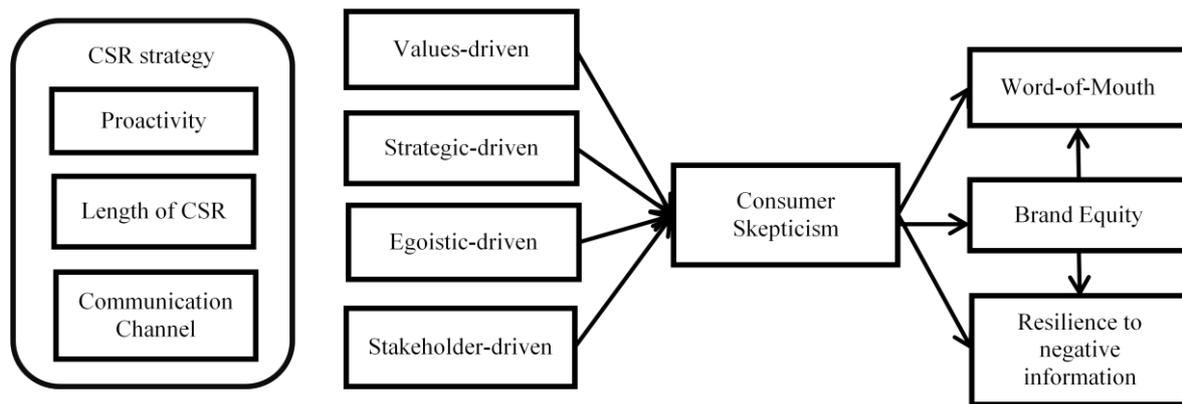

Figure 1. *Research Framework*

METHODOLOGY

To test the hypotheses, we used a between-subject experimental design with eight conditions including 2 (long and short CSR length of time)*2 (proactive and reactive)*2 (internal and external communication sources). This research uses a fictitious company, DARKCHOCOLATE, to ensure the absence of any prior knowledge of the company among respondents, which could influence the research results. Participants first are asked read a text including three sequential parts. The first section consists of the introduction of the fictitious company and the company's CSR information sourced from an online press. In the next page, there is a statement: "Two weeks later, you see another press which is about distributing dividend of DARKCHOCOLATE." Finally, respondents read a piece of news describing fictive incident about that company's irresponsibility derived from an online press. We counterbalance the first and the last sections to manipulate proactive CSR and reactive CSR. Before conducting the experiment, this research conducts 4-step sequential pretests with over 70 participants across 4 focus groups to ensure the validity of our scenarios.

Multiple item scales measuring each variable and the effect between them are identified from previous research and modified to fit the context of this research. They are translated and back-translated between English and Chinese ensure absence of ambiguities. All items are measured on a 7-point

Likert-scale response format ranging from strongly agree (1) to strongly disagree (7). The items measuring consumer attributions are sourced from the study of Ellen et al. (2006) and Vlachos et al. (2009). The measure for consumers' skepticism toward the CSR efforts of a firm is adopted from Skarmeas and Leonidou (2013). The measure for consumers' willingness to share positive word-of-mouth is adopted from Arnett et al. (2003), brand value from Yoo et al. (2000), and consumers resilience to negative information from Eisingerich et al. (2010). Lastly the control variable of CSR support is sources from Vanhamme and Grobben (2008).

The data collection procedure for this research is an online survey, and respondents were derived from the convenience sampling method. Potential respondents were approached randomly. Based on the topic of the stimuli, we target people form age 20-44 which is because they tend to be heavy chocolate consumers. To check for the success of the manipulations, participants rate the extent to which they believe the company conducts strategies of longer time, proactivity and internal information sources.

RESULTS AND ANALYSIS

A total of 300 participants took part in this research. After deducting invalid questionnaires, there are 296 participants employed in the analysis, which is include 140 male and 156 female with in average 37 participants for each stimuli. Exploratory factor analysis and item-to-total correlations are used to examine the internal consistency of the scales. Items with low item-to-total correlations, weak individual loadings on each factor, and high cross-loadings are dropped from further analysis. Confirmatory factor analysis with maximum likelihood estimation is used to assess the validity of the remaining set of items. Multivariate kurtosis value and skewness value for all factors are less than 3.

Findings for the measurement model indicate a good fit to the data with the chi-square ($\chi^2= 752.417$) for this model is statistically significant ($p<0.001$) for 314 degrees of freedom, favorable fit indices include a ratio of chi-square to the degrees of freedom (χ^2/df) of 2.396, a comparative fit index (CFI) of 0.923, an incremental fit index (IFI) of 0.924, a root mean square error of approximation (RMSEA) of 0.069, a standardized root mean square residual (SRMR) of 0.0696. All indicators loaded significantly on the latent variables they were intended to represent (the average factor loading was 0.82, and the minimum t-value was 0.903), which provides evidence of convergent validity. Cronbach's alpha scores for the constructs range from 0.770 (strategic-driven attributions) to 0.895 (Word-of-Mouth and brand equity). Table 1 shows the means, standard deviations, and intercorrelations of the constructs.

Measures	1	2	3	4	5	6	7	8	9
1.values -driven	1.00								
2.Egoistic-driven	-.29	1.00

Standard deviation	1.07	1.12	0.95	1.13	1.19	1.19	1.08	1.14	0.98

Table 1. Correlation Matrix, Reliability, and Descriptive Statics

Several steps are taken to reduce the risk of common method bias. For instance, the particular design and administration phases of the survey ensured the use of clear grammar and concise scale items; guaranteed and communicated anonymity and confidentiality to all study participants; made explicit that the questions had no right or wrong answers; grouped construct items in general topic categories, and employed different response formats. Using varimax rotation, the results of an exploratory factor analysis with all the model variables showed that nine factors accounted for 65.84% of the total variance, with the first factor explaining only 32.93% of the variance, suggesting the absence of a single general factor in the data set.

At first, we conduct SEM to test the relationship between consumer attributions and consumer skepticism. The results summarized in table 2 reveal that, with the exception of H1c—stakeholders-driven attributions positively relates to consumer skepticism ($\beta=0.177$, $p<0.01$)—the relationships between consumer attributions and skepticism are all supported and in the theorized direction. To follow up, this research tests values-driven and egoistic-driven in different scenarios.

Hypotheses	Standardized loading	t-value
values -driven→consumer skepticism	.66	24.26 **
egoistic -driven→consumer skepticism	-.22	8.32**
strategic-driven→consumer skepticism	-.09	.72
stakeholders -driven→consumer skepticism	.20	9.26**
consumer skepticism→WOM	.46	15.68**

consumer skepticism→ resilience to negative information	.33	6.41**
consumer skepticism→brand equity	.78	57.61**
brand equity→WOM	.46	15.85**
brand equity→resilience to negative information	.46	9.36**
CSR support→consumer skepticism	.06	3.09**
CSR support→WOM	.06	3.97**
CSR support→resilience to negative information	-.00	0.02
CSR support→brand equity	.11	5.95**

Table 2. *Model Factor Loadings and Significance*

Univariate results indicated that participants exposed to the proactive information perceived the company to be more egoistic-driven ($M_{\text{proactive}} = 3.27$, $M_{\text{reactive}} = 2.82$, $F_{1, 294} = 12.79$, $p < 0.01$); participants exposed to the longer time of CSR perceived the company to be more values-driven ($M_{\text{long}} = 3.16$, $M_{\text{short}} = 3.68$; $F_{1, 294} = 19.22$, $p < 0.01$). Proactivity of the CSR initiative has no significant influence on values-driven attribution ($M_{\text{proactive}} = 3.30$, $M_{\text{reactive}} = 3.54$); the length of CSR initiative has no significant influence on egoistic-driven attribution ($M_{\text{long}} = 3.17$, $M_{\text{short}} = 2.92$). Moreover, consumer perceived values-driven attribution has no statistical significance between internal and external communication channels ($M_{\text{internal}} = 3.41$, $M_{\text{external}} = 3.43$); consumer perceived egoistic-driven attribution has no statistical significance between internal and external communication channels ($M_{\text{internal}} = 3.06$, $M_{\text{external}} = 3.03$). The overall result suggests that reactive CSR initiatives make consumers perceive company to be more egoistic-driven; whereas longer length more values-driven. In addition, consumers are more skeptical toward a company when they think the firm is egoistic-driven; but less skeptical when values-driven. Longer-time engagement in CSR initiatives would buffer consumers' skepticism; but reactive CSR would aggravate consumers' skepticism.

In line with past studies, CSR skepticism associates positively with WOM ($\beta = 0.46$, $p < 0.01$), brand equity ($\beta = 0.78$, $p < 0.01$), and resilience to negative information ($\beta = 0.33$, $p < 0.01$), respectively. Brand equity relates positively to WOM ($\beta = 0.46$, $p < 0.01$) and resilience to negative information ($\beta = 0.46$, $p < 0.01$), respectively. Overall, the research model predicts more than half of the observed variance for resilience to negative information (56.2%), equity (67.7%), CSR skepticism (75.5%) and WOM (80%).

DISCUSSIONS

In summary, the findings include that if a firm engages in CSR initiatives for a long time, consumers will attribute the company to be more values-driven motives; if a firm reactively involves in CSR activities after the company facing allegations, consumers will attribute the firm to be more egoistic-driven motives. In addition, values-driven motives and stakeholder-driven motives buffer consumers' skepticism, while egoistic-driven attributions contribute to the development of consumer skepticism

toward a firm's motivation to engage in CSR initiatives. On the other hand, strategic-driven attributions neither facilitate nor alleviate CSR skepticism. Our findings indicate that corporates should pay more attention to consumers' attributions, especially for values-driven and egoistic-driven to buffering consumer skepticism. In order to buffer consumer skepticism when a corporate facing allegation, the firm should disseminate the CSR information about long time of CSR engagement, while the company should avoid convey the information about reactive CSR initiatives. There is an indirect relationship between CSR strategies especially for length of time in CSR and reactive strategy and consumer skepticism.

With regards to the third strategy which is communication channels, the results claim that there is no significant influence on consumer attributions no matter what communication sources CSR information comes from. The findings suggest that compared to CSR information sources, consumers pay more attention to the length of time in CSR engagement and proactivity, which will result in values-driven attribution and egoistic-driven motivations respectively.

The results of the relationship between consumer skepticism, brand equity, WOM and resilience to negative information support the findings of Skarmeas and Leonidou (2013). The findings indicate that consumer skepticism will mitigate consumers' willingness to disseminate positive word-of-mouth. In addition, consumer skepticism also results in lower levels of brand equity, resilience to negative information. It is an indication that when consumers are skeptical toward CSR engagement, the incremental value of a brand in consumers' mind will decrease. Collectively, corporates should pay more attention to their brand equity, since brand equity triggers resilience to negative information and facilitate positive word-of-mouth.

This study extends previous research on CSR skepticism by verifying the model including antecedents and consequences of skepticism in different scenarios consisted of CSR strategies. More specifically, the findings reveal that longer time in CSR strategy alleviate consumers' skepticism indirectly, while reactive CSR strategy triggers consumers' skepticism indirectly. Collectively, the findings demonstrate that corporate should acknowledge that adopting CSR programs can backfire unless they pay particular attention to consumers' attributions to CSR engagement. Compared to Skarmeas and Leonidou (2013), our results indicate that values-driven attribution is a critical factor of CSR engagement; thus, corporates should pay more attention to values-driven attribution in our culture. Briefly, our findings structure an integrative CSR framework including CSR strategies, consumer attributions, consumer skepticism and consumer attitude. In addition, the underlying process and the effect of CSR strategies on consumer skepticism and attitude can be evaluated though this framework.

Managerially, these findings have crucial implications for practice because a successful CSR program often depends more on buffering the “bad” than on accumulating the “good” (Baumeister et al., 2001); in addition to that, this research does much effort to investigate how to mitigate consumer skepticism and consumers’ negative attitude for enterprises in a crisis.

At first, companies should disseminate their efforts in CSR over a long time because consumers will attribute the firm to be more values-driven motives. In this case, we manipulate the scenarios of time in CSR engagement: ten years for longer time; three months for shorter time. Once consumers perceive a corporate to be values-driven attribution, they believe the company has moral character and is genuine to engage in CSR activities. Consequently, even if the company is facing allegation, consumers’ skepticism will be mitigated. Managerially, if an enterprise involved in CSR initiatives for a long time, managers should communicate with consumers especially emphasize on the length of time in CSR engagement when the company was in a crisis. The effect of disseminating high commitment to CSR initiatives not merely can mitigate consumer skepticism but also can trigger consumers’ resilience to negative information, increase brand equity and prompt positive word-of-mouth indirectly.

In regard to proactivity, our research outcomes also have great contribution to practice. The results suggest that if a firm reactively involves in CSR activities after consumers receive negative information about the firm, consumers will perceive the company to be more egoistic-driven motives compared to proactive CSR strategy. Once consumers attribute a corporate to be egoistic-driven motivation, they think the company pays more attention to their own benefit instead of supporting the cause. Accordingly, if a firm disseminates their reactive action about CSR in a crisis, consumers will be more skeptical and regard the motivation of the firm as self-serving such as restoring brand reputation. When consumers are skeptical toward a firm, they are unwilling to talk up the company; in addition to that, the brand equity and the resilience of negative information will decrease.

Collectively, this research contributes a manual for practice about CSR strategies. During a crisis, enterprises should communicate with consumers about their high commitment to cause instead of conveying their reactive action to the cause. It is possible to alleviate consumer skepticism and facilitate consumers’ positive attitude when a company facing allegation if the corporate follow the manual.

One of the limitations of this research is time constraint. We cannot conduct the fifth step of pretest; as a result, the effects of communication sources on consumer attributions were not proved. To build up an overall structure for CSR, future research should do further investigation of the relationship between communication strategy and consumer attribution. In addition, future studies could also

confirm whether a company's facebook fan page represents a firm's internal source and weekly publication stands for external source. Other unanswered questions for future research include whether it is possible to investigate what scenarios that can lead to combination of two or few consumer attributions.

ABSTRACT

The factors that enhance or weaken entrepreneurship in urban and rural areas have been analyzed very carefully but the scientific research on rural entrepreneurship is considered to be relatively poor. The research provides, a “deeper” knowledge of the procedures that promote or hinder social entrepreneurship in both areas, willing to be able to bridge this research gap. The research also manages to activate entrepreneurial and other types of dynamics in the areas under investigation, under the context of a pilot planning of Social Entrepreneurship according to actual and tacit needs of the local population, in order to create a favorable environment for social economy. Based on empirical data from two representative areas in Greece, Pyli and Thessaloniki, a systematic approach in recording the populations’ opinion on the issues was attempted. Main findings show that Social Economy sector can provide important solutions for creating job opportunities and could constitute an alternative dealing with the severe economic crisis in the country. The main contribution of the study seems to be its indication that there is a significant difference or rural and urban entrepreneurship even at local level. Findings actually support the assumption that different entrepreneurship support policies should be prepared for different regions at local, regional, national and European level in order to address successfully the distinctive culture and environment of the communities involved.

Keywords: *Social entrepreneurship, social economy, urban entrepreneurship, rural entrepreneurship, economic crisis.*

INTRODUCTION

European Commission places particular emphasis on the Social Economy sector during the current programming period (2014-2020), through the initiatives provided by the Social Business Initiative. Social Economy can play an important role in the development of social innovation in many policy Innovation, Entrepreneurship and Digital Ecosystems

ISBN: 978-9963-711-43-7

areas, such as addressing the unemployment and the environmental protection, while it can combine profitability through solidarity, new job creation, enhancement of social cohesion, active participation and empowerment of local communities, by giving priority to the people. It can be argued that Social Entrepreneurship is an emerging alternative form of entrepreneurship based on the Social Economy. Recently, a new legal form of entrepreneurship, the Social Cooperative Enterprise (SCE), has been instituted in Greece (Law 4019/2011) by setting the operating framework for these types of enterprises. The profit of this new form of entrepreneurship comes from the activities that serve the social welfare. The third sector, as it is also known, according to a study of the International Scientific Committee for Social Economy (2000), it is well developed in European Union and mainly in Netherlands (14,7%), Ireland (12,6%) and in Denmark (12,6%), while to the lowest places in ranking stand Portugal (2,5%) and Greece (1,6%). More specifically, regarding Greece, we have to mention that according to existing statistics, the percentage of people dealing with social economy is approximately the 1,8% of the total occupation in the country and the 2,9% of the stipendiary occupation (Glaveli, 2014). Till recently the forms of social economy in Greece were occasional without showing any significant growth (Cicopa, 2013), mainly because of a number of weaknesses such as the lack of the legislative context, entrepreneurial know how and training on the issue, bureaucracy etc. (Glaveli, 2014; Baloyrdos and Geormas, 2012; Goniotakis et al., 2013).

In recent years, the factors that enhance or weaken entrepreneurship in rural and urban areas have been analyzed very carefully (Jack and Anderson, 2002), but the scientific research for the social entrepreneurship in both areas is considered relatively poor. Therefore, a “deeper” knowledge of the procedures that promote or hinder social entrepreneurship in both areas, will be able to bridge this research gap. Several researchers have attempted to analyze entrepreneurship in these areas, by using a large number of theoretical research backgrounds from various fields of science, such as Business Administration, Economics, Sociology and Geography (Stathopoulou, Psaltopoulos, and Skuras, 2004; Jack and Anderson, 2002). The aim of the present research, is to benchmark the opinions of the Greek citizens, both in urban and rural areas, about the potentials for this new form of entrepreneurship in Greece and the role that it could play for sustainable development, through the creation of new job opportunities with respect to environmental, social and cultural issues.

LITERATURE REVIEW

Entrepreneurship and rural areas

It is common that a field of social entrepreneurship, especially in rural areas, is environmental protection aiming to alternative ways for production and income earning (Borzaga et al., 2013). This new rising form of economic activity, combines the efforts for compromising economic growth and

environmental protection (Christacis, 2013), promoting a model for sustainable development based on innovation (Trigkas et al., 2012; 2011a; 2011b; Papadopoulos, et al., 2014; 2010), boosting simultaneously both local and national economies, by using local resources (Christacis, 2013; Sideartou, 2011).

The economy of rural regions depends mainly on the service sector. In general, the tertiary sector or the service sector is the main area of economic activity in the EU. In 2010 this sector represented 64.6% of added value in predominantly rural regions (Harpa et al. 2016). The secondary sector (mining, manufacturing and construction) in rural regions contributed with 30.9% of added value in 2010, slightly more than in intermediate regions and predominantly urban (29.1% and 20.8% respectively). The primary sector (agriculture, forestry and fishing) accounted for only 4.4% of added value in predominantly rural regions of the EU27 in 2010. The structure of the economy varies greatly depending on the type of region and country. The primary sector in predominantly rural regions in Greece, is only 7.0% of the total VGA, standing among the last countries in the EU-27 (Harpa et al. 2016). The importance of the secondary sector (which includes food), in predominantly rural regions in Greece recorded only 22%. On the other hand, predominantly rural regions in Greece (70.6%) presented the greatest importance of the services sector. In most countries, in rural regions, the importance of the secondary sector decreased in favor of the third sector during that period, probably due to greater impact of the economic crisis in the industry and, in particular, in construction activities in some Member States (Harpa et al. 2016)..

Relations between rural and urban entrepreneurship in SME's

Rural regions show a significant differentiation than urban ones, regarding establishment and growth of entrepreneurial activity (Backman and Palmberg, 2015). Thus, some locations are characterized by an abundance of important input factors for firm growth, such as labor, capital, information, financial resources, and material. On the other hand, urban sites bring several advantages to firms (Parr, 2002). Norton (1992) considered these advantages within three categories, and thereby found that an urban location offers (1) a diversified supply of various producer services; (2) a regional network for information flows about new production techniques, products, customers, and suppliers; and (3) a large and differentiated supply of labor.

A disadvantage with urban areas is, however, an increased competition level for resources, inputs, customers, and suppliers that has a negative influence on firm employment growth (Stearns et al., 1995). In addition, firms located in urban areas jointly create an environment in which ideas and knowledge can flow rapidly. As opposed to knowledge that can be codified, the type of complex local knowledge referred to here is distance sensitive and typically requires face-to-face meetings for

knowledge exchange to occur. Urban locations have a natural advantage over rural locations because face-to-face meetings are a positive function of the size of the location. These knowledge spillovers increase the propensity to innovate and thus increase firm growth (Audretsch, 1998; Malmberg and Maskell, 2002; Storper and Venables, 2004).

In rural areas, personal interactions and, hence, knowledge externalities are less frequent, and firms face less demand for their products in both their immediate surrounding environment (Duranton & Puga, 2004). Moreover, rural areas often lack important resources needed for firm growth, such as skilled labor and/or financial capital, or at least the supply of these production factors is less diversified in rural regions than in larger and denser regions (Backman, 2013). These factors lower the average employment growth relative to that of firms located in more urban settings (Littunen, 2000; Tunberg, 2014). However, rural firms tend to have a higher survival probability, which might be due to a lower level of competition and lower costs of doing business (van Horn & Harvey, 1998).

Davidsson and Honig (2003) found that small firms located in a rural context are heavily reliant on the resources and knowledge that can be accessed through friends and family. Consistent with that result, Meccheri and Pelloni (2006) established that firm performance in rural areas depends more on the human capital in the firm and the social local anchoring. Thus, social capital – contacts through professional and private networks – facilitates the identification and exploitation of economic opportunities and resources. This facilitation is especially important in rural areas because such resources are scarcer in these locations (Uzzi, 1999). The importance of social bonds and regional embeddedness, as previously discussed, is also important for a firm's ability to foster and sustain innovation abilities. Studies focusing on the innovation capabilities of firms have found that these social bonds are mainly built through a common corporate or educational background or family connections (Breschi & Lissoni, 2001).

Another component influencing firm growth is the financing of firms, with rural firms more often relying on financing through personal and professional networks (i.e., relationship lending). These financial resources have a geographical aspect, in that they are provided by friends and family who are in close proximity (Meccheri & Pelloni, 2006). Family firms also have an advantage in this regard because they are more locally (socially) embedded in the region. This characteristic might be very significant because rural home-based businesses were found to generate less income (Olson et al., 2003) and family businesses in rural locations were more likely to have cash flow problems (Brewton et al., 2010). Firm survival dynamics varied for rural and urban firms. Olson et al. (2003) found that rural firms were less successful than urban firms and that rural owning families derived less income from their firms than urban owning families.

For social entrepreneurship, Harding (2006) argues that, the regional differences are much narrower than they are for mainstream entrepreneurship. However, there are differences in stages of development: the most deprived wards have significantly higher levels of baby social entrepreneurs and established social entrepreneurs suggesting that there is a role for social entrepreneurship in regenerating deprived communities. Similarly, rural areas are more socially entrepreneurial than urban areas (Harding, 2006).

The Greek reality in rural areas

According to the OECD definition of rural areas (2010), 85% of the total area of Greece is rural, while the population in rural areas represents 27.2% of the total population (10.9 million in 2010). Therefore, we can say that rural areas of Greece are far more important than the average in the EU-27.

The Greek primary sector has a special social and environmental role in the global economy and provides a significant percentage of jobs (11.4% in 2011). The main industry sectors of the rural economy are meat, milk, vegetable cultivation, organic farming etc. There is a strong presence of Greek enterprises in the agro-food sector in international markets, while there is a favorable climate for agricultural production and organic livestock. Rural areas in Greece are also rich in cultural heritage and provide opportunities for diversification of the rural economy. The weak parts of rural economy vary according to geographical areas. Mountain areas are characterized by low incomes, an aging and declining population, low level of education, low social and cultural level, and a lack of infrastructure. Islands, despite the advantageous positioning, face problems of social services and transport, leading to a reduced level of exploitation of their potential. On the other hand, the favorable climate, the demand for quality products and large amount of agricultural products exported are opportunities that can be exploited in order to improve rural environment (Harpa et al. 2016).

In mountainous areas, the need for economic differentiation and integrated development is even more intense since the topography, the remoteness of these areas, the environmental constraints and the social and economic structure of the population, reduce the number of job opportunities. On the other hand, many opportunities are presented including the increased demand for recreational activities, for quality food products or for renewable energy sources etc. Furthermore, some mountainous areas are experiencing significant inflows of new residents, as a result of the economic crisis and the unemployment that occurred on the available forms of work in Greece (Trigkas et al., 2012). The population movements in these rural communities create the conditions for new investment projects and an increased income, since the new inhabitants are carrying significant entrepreneurial experience, capital and knowledge.

On the other hand, the traditional approaches concerning the development of mountainous rural areas have focused on the discovery of factors that lead to isolation by providing the conventional development tools (Efstratoglou and Psaltopoulos, 1999). The creation of competitive Small-Medium Enterprises (SMEs) constitutes a desirable solution to the existing problems. The mobilization of local resources so as to enhance the competitive advantage, local entrepreneurship and innovation, constitutes some of the development strategies that should be under serious investigation (Pezzini, 2001). Rural areas provide an innovative and entrepreneurial environment where the entrepreneurs may either prosper and grow or face very serious difficulties. The features of mountainous areas are considered major leaders not only regarding the opportunities for local entrepreneurship and innovation, but also for the weaknesses of the business process, forming a dense, complex and dynamic network of mutual interactions.

In particular, in the mountainous regions of Greece, it is observed that isolation exists from the markets and access to the consumers, the suppliers, the information sources and the institutions (Sergaki and Iliopoulos, 2010). The transportation cost of inputs/outputs is a very high and at the same time, adverse effects in information dissemination are observed. It is a major disadvantage since it impedes the function of the economies of scale and the diffusion of new technology, leading to non-competitive costs of business and finally, restricting the workforce mobility. The existence of significant natural resources and the climatic conditions of an area combining with the overall landscape can affect entrepreneurial activities, providing opportunities for the optimal use of those resources. Furthermore, in the less developed mountainous areas, cultural traditions can be found, while social trust, solidarity rules, cooperation networks and support mechanisms are absent.

Moreover, local capacity utilization has been limited to the use of local added value through local varieties, local products, special environmental conditions or even inputs of workers and knowledge. Ray's argument (1998) for the need for commercialization of local culture is a dynamic strategy for the development of innovation and entrepreneurship in rural areas. Furthermore, many researchers have highlighted that a possible development strategy for rural areas exists in the product quality markets (AEIDL, 2000; Barham, 2003; Ilbery and Kneafsey, 1998). A possible strategy as part of the broader product quality market could be the promotion of products with local or regional identity. By linking products with the "culture markets - culture economies" or local scenes such as cultural traditions and heritage, the value of the product increases because the consumers matches specific areas with specific products. Goodman (2003) claims that in Europe, the switch towards the quality of diet has offered significant opportunities for entrepreneurial activity in a new economic environment, more capable of withstanding the forces of globalization. Concurrent use of opportunities offered by Information and Communication Technologies (ICTs) will gradually set the boundaries of local markets and will

expose the economic activity to a greater competition (Grimes, 2001; Hetland & Meier-Dallach, 1998). Therefore, cognitive skills of local people will increase as access to the information will be improved (Grimes, 2000). The limited scale and sphere of influence of local markets, forces local entrepreneurs to develop innovative products and efficient marketing strategies (Papadopoulos et al., 2010, 2012) in order to compete with their counterparts in urban areas (Smallbone et al. 1999).

RESEARCH METHOD

The research method in the present study, uses as a basic instrument a specially constructed questionnaire for the purposes of the research, according to the basic disciplines of market research (Gordon and Langmaid, 1988; Tull and Hawkins, 1990; Doyle, 1998; Aaker et al, 2004). The questionnaires were collected through personal interviews with the residents and population in the study areas, which represent a typical urban area in Greece such as Thessaloniki is, as long as in a rural area, such as the mountainous regions of the municipality of Pyli in Trikala prefecture. The research was conducted by skilled researchers who addressed the residents by personal face-to-face interviews. The questionnaire consisted by three groups and a total of 28 questions. The first group consisted of eight questions regarding the level of familiarization and information of respondents regarding the concepts of social economy and social entrepreneurship. The second group of seven questions investigated the factors that impact development and existence of social entrepreneurship in the research areas. The third group of questions offered information about the respondents' profile such as age, sex, educational level, type of business ad profession, income etc.

The sample was chosen to include respondents of different background. In order to collect the necessary data a random sampling was engaged in the areas of Thessaloniki and mountainous regions of Pyli. The questionnaires were collected during September 2015 – June 2016. Questions are short, precise and easy to be understood by the majority of respondents. Likert scale was used for the majority of the questions.

At the beginning of the research, the researchers performed content validity of the questionnaire; this regarded an extensive literature review and several conversations with experts on the social entrepreneurship issue. Furthermore an extended literature review was conducted regarding the research issues. A pilot implementation of the questionnaire was initially launched in a small number of the population. Through this pre sampling the questions that had to be improved were detected and thus the quality of the final questionnaire was improved (Dillman 2000). The data were recorded, processed and analyzed via the statistical package SPSSWIN ver 22.0 and the appropriate tests for frequency (Frequencies), descriptive statistics (Descriptives), variable comparison analysis (Crosstabs),

and Correlation analysis (Person correlation) were conducted, in order to derive critical conclusions in regard of the issue under investigation.

RESULTS

Social entrepreneurship in urban areas

The first part of the results presents the opinions of the residents in urban areas in Greece.

The percentage of the questioned that have answered positive regarding the awareness of the meaning of social entrepreneurship rises up to 43,5%, while the rest 56,5% stated that they were unfamiliar, a percentage which is quite significant showing some lack of awareness. However, these percentages could be improved throughout extended and aimed information strategies on the issue.

The awareness of the meaning of social entrepreneurship is statistically related to some of the characteristics of the profile of the surveyed population. More specifically, this relation has to do with the level of education and age (marginal) (p-value (sig.) =0,040 and 0,049 respectively) at a significance level 5%, while no statistical relation occurred regarding the sex, occupation and annual income. The adjustment of the model to the used data was tested using (p-value (sig.) =0,675) while it's prediction reaches 61.3%. Information on social entrepreneurship comes mainly through internet (49,8%) and media (16%). At lower percentages stand the word of mouth information (8%), through school (6,7%) and the newspapers (4,9%), while a significant percentage (14,7%) was informed by other means except the above mentioned.

The majority of the sample (84,8%) has answered that there is a positive contribution of social enterprises towards the confrontation of the problems that the economic crisis generates. On the contrary, only a 15,2% believes that social enterprises don't give answers towards this direction during periods of economic instability and downturn.

The answers have shown that as major result of developing social entrepreneurship in urban areas is the creation of new occupation positions and the reduction of unemployment (4,23/5). Further significant results seem to be the motivation of local resources (human capital, knowledge, culture etc.) (3,86/5), the introduction to market of new capabilities and knowledge (3,76/5), the boosting of economic activity at local level (3,74/5), the creation of an innovative entrepreneurial ecosystem (3,64/5) and finally the improvement of incomes (3,62/5). As the main sectors and activities that social entrepreneurship could be developed in urban areas, the research has highlighted the vulnerable social groups (4,17/5), education (4,13/5), health services (4,09/5), environmental protection (3,95/5), utility services (3,90/5), culture (3,71/5), the preservation of traditional activities in urban areas and corporate social responsibility (3,31/5)

Further analysis revealed a very strong relation between the positive attitude in participating to social enterprises and the belief that social enterprises contribute towards the confrontation of problems during the economic crisis period, (p-value (sig.) = 0,000) at a significance level 5%, with the model showing a prediction capability of 87,0%. More specifically, since odds ratio (OR=exp(B)) is 18,463, when a surveyed has the belief that social enterprises contribute positively towards the confrontation of problems generating from the economic crisis, has a 100% increased possibility for participating in a social enterprise in relation to someone with no such belief.

The significance level of the factor regarding the improvement of incomes is statistically different in relation to the participation in social enterprises or not. More specifically income improvement seem to be more significant for the surveyed that have answered positively in participating to a social enterprise (sig. = 0.010 at a significance level 5%). Hence, we can argue that social entrepreneurship in urban areas of Greece, could constitute an alternative for the mitigation of the consequences of the economic crisis, based to participatory attitude of Greek urban population, leverage of their social needs and motivation of their capabilities. Thus, if we consider as desideratum the development of social entrepreneurship in urban areas, this could be achieved through aimed information and promotion strategy on the issue in urban population. This strategy should also take under consideration the results that the study has highlighted regarding the means of information to be used regarding social entrepreneurship.

Social entrepreneurship in rural areas

The results indicate that the majority of the residents of the Pyli area are rather unfamiliar with the concepts of social entrepreneurship and social economy. A significant percentage of them (22.4%) were informed about the two concepts by the researchers that contacted the research. Almost half of the surveyed sample had a low knowledge of the concepts and only the rest 23.5% were really familiar with them. The respondents state that they lack knowledge on the issues (66.7%). Women appear to be more informed with a significant statistical relation (Pearson $X^2 = 10.448$, for a significance level $>99.9\%$ Approx. Sig= 0.001). Most informed are entrepreneurs of the age 41-60 years (Pearson $X^2 = 6.580$ for a significance level $>95\%$ Approx. Sig= 0.037). It is quite interesting that people of the lower income (below 10.000 €) seem to be the less informed about social entrepreneurship with a statistically significant relation (Pearson $X^2 = 23.976$ for a significance level $>99.9\%$ Approx. Sig= 0.0001). This group perceives the concept of social entrepreneurship as the creation of business where employees are paid in the usual way but part of the profit goes to society as a whole. Those with as minimum to quite satisfactory knowledge on the social entrepreneurship concept claimed as their main sources local and regional institutes (36.7%), internet (16.3%) and mass media (10.2%). Word of mouth was the information media for only a 6.1%.

As expected, the 86.2% knew nothing about the institutional framework for social economy and social entrepreneurship in Greece or at global level. The rest 13.8% declared a rather low level of knowledge. However, the 70.8% of the respondents believes that social entrepreneurship in Greece must be supported by both public and private initiative. This percentage believes that social entrepreneurship needs more than 5 years to be well established in Greece. This can be attributed to the rather negative mood of the local residents and entrepreneurs due to the downgrading of the area the last seven years because of the severe and long-lasting economic recession.

However, when informed, almost all respondents (96.9%) agree that social enterprises can definitely (44.6%) and almost definitely (52.3%) assist the local society in solving the significant problems of the area due to the severe recession. Quite the same percentages seem to be positive in participating in a social enterprise which targets social benefits (Fig. 1). Women stated in total that they are positive but also rather skeptical in the perspective of participating into the creation of a social enterprise. The total negative percentage belongs to males. Furthermore and according to crosstabs control, there is a significant statistical relations between the intention to participate in a social enterprise and age (Cramer's $V=0.301$ for a significance level $>95\%$ Approx. Sig= 0.019). Actually, the bigger the age, the bigger the intention is. On the other hand, it appears that there is no significant statistical relation between the intention and the educational level or the yearly family income.

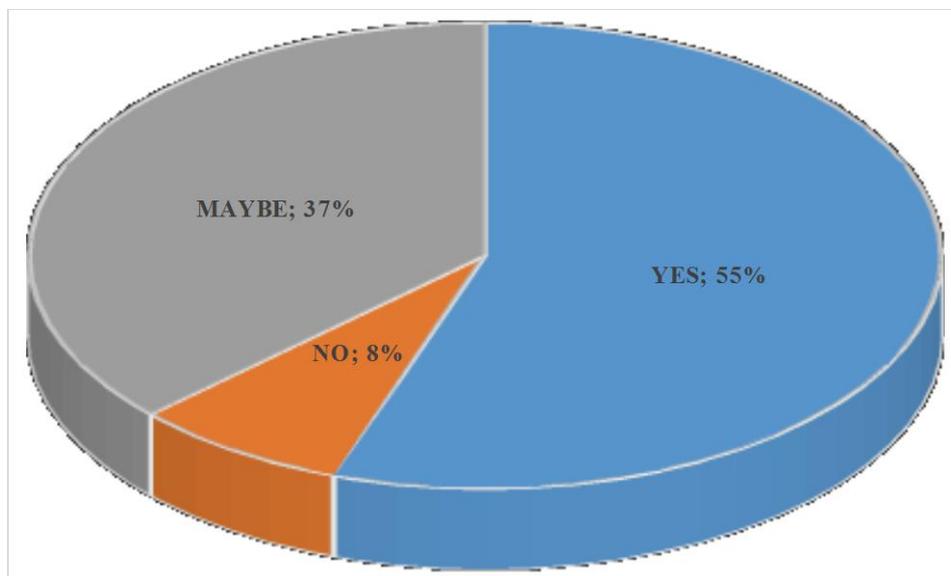

Figure 1: Intention of participation in social enterprises for social benefit

The importance of social entrepreneurship development in the mountainous area of Pyli appears to be: the creation of jobs (1.42); the support of the financial support at local level (1.68) and the increase of income (1.69) using the 1-5 Linkert scale (1=very important) (Table 1)

Table 1: Importance of social entrepreneurship development in the mountainous area of Pyli (Likert scale: 1-5; 1= strongly important)

Factors	Means	Std. Deviation
Job creation – unemployment reduction	1.42	0.99
Strengthening of the economic activities at local level	1.68	0.86
Income increase	1.69	1.17
Local resources exploitation (human capital, knowledge, natural resources)	1.74	1.02
Environment protection	1.76	1.01
Introduction of new skills and knowledge in the market	1.81	1.18
Creation of innovation entrepreneurial environment	2.05	1.21
Development of cooperation culture	2.16	1.22
Transparency and social accountability of the entrepreneurial activities	2.22	1.37

The sectors more prone to social entrepreneurship at the area of research, are: health services (1.3), livestock (1.42), forestry (1.45), tourism (1.47) as well as the socially vulnerable groups (1.48) using the Likert: 1-5 scale with 1 as very important.

The benefits that respondents expect from social entrepreneurship at Pyli area (Table 2) are according to results and using the 1-5 Linkert scale (1=very important): unemployment reduction (1.46) (unemployment has reached a percentage of 23.4% according to the Hellenic Statistical Service, 2016); the effort to keep people and more specifically the young at the area (1.52), the preservation of the local identity (1.66) and easier access to markets (1.92).

Table 2: Benefits which respondents expect from social entrepreneurship at Pyli area

Rates Benefits	Means	(1) Extremely important	(2) Very important	(3) Quite important	(4) Somewhat important	(4) Unimportant	(1)+(2)
Unemployment reduction	1.46	77.8	9.5	6.3	1.6	4.8	87.3
The effort to keep people and more specifically the young at the area	1.52	66.1	22.6	8.1	0.0	3.2	88.7
Preservation of the local identity	1.66	61.3	16.1	17.7	4.8	0.0	77.4
Easier access to markets	1.92	48.4	27.4	9.7	12.9	1.6	75.8
Protection of cultural and natural environment	1.94	48.4	24.2	16.1	8.1	3.2	72.6
Support of social innovation	2.07	43.3	25.0	15.0	15.0	1.7	68.3
Remove of socio-economic exclusion of the area	2.18	41.0	23.0	21.3	6.6	8.2	64.0
Niche markets creation	2.18	34.4	29.5	24.6	6.6	4.9	63.9

for innovative products							
Competitiveness support	2.25	35.0	30.0	16.7	11.7	6.7	65.0
Reduction of the deficit of social acceptance regarding entrepreneurial activities	2.26	25.8	33.9	29.0	11.0	0.0	59.7
Development of cooperative culture	2.39	32.3	21.0	27.4	14.5	4.8	53.3
Mitigation of social inequalities	2.61	29.0	19.4	29.0	6.5	16.1	48.4
The efficiency of the use of resources	2.96	25.0	12.5	16.7	33.3	12.5	37.5

Since the thirteen factors of Table 2 seem to relate each other more or less, Pearson correlation coefficient (Pcc) was used. Results at a significance level of 0.01 indicate that the most important factors that appear to impact positively each other are the following:

- Unemployment reduction impacts positively the intention especially of young people to stay at the area of (Pcc = 0.647) while it impacts positively the protection of the natural and cultural environment (Pcc = 0.567).
- The creation of niche markets for innovative products that may be developed by social enterprises are strong reasons to keep young people at Pyli area (Pcc = 0.540), support the local identity (Pcc = 0.634), the development of co-operative culture (Pcc = 0.63) and of course enhance the easier access to markets (Pcc = 0.689).
- Social innovation is a crucial precondition for the creation of niche markets for them (Pcc = 0.678), as well as it may constitute a significant reason to develop a culture of collaboration (Pcc = 0.712). Of course it facilitates access to markets for both local products and services (Pcc = 0.787).
- Consequently, the more competitive the products and services of the area (Pcc = 0.630), the easier creation of niche markets for them since they can penetrate markets much easier (Pcc = 0.712). This supports further the reduction of the deficit of social acceptance regarding entrepreneurial activities (Pcc = 0.571).
- The development of collaborative culture appears that affects positively the remove of socio-economic exclusion of the area (Pcc = 0.734), while enhancing the social innovation potential (Pcc = 0.712). This, in turn, facilitates market access (Pcc = 0.787), as well as the much more efficient use of the local resources (Pcc = 0.773).

DISCUSSION - CONCLUSIONS

The concept of the research proposal is based on the systematic development of the Social Economy sector, focusing on differentiations among urban and rural areas of Greece. As a major finding in both areas, the research has highlighted the fact that, Social Economy sector can provide important solutions for creating job opportunities and could constitute an alternative dealing with the severe economic crisis in the country. Furthermore, social economy could promote social cohesion, which is threatened due to the adverse economic environment, by contributing to the preservation of the natural environment and the cultural heritage, especially in rural areas. The successful development of the Social Economy requires an approach that relies primarily on the local social dynamics and supporting policies and mechanisms which will play the central role for the manifestation of this dynamic. Social Economy can play an important role in the development of social innovation in many policy areas, such as addressing the unemployment and the environmental protection, while it can combine profitability through solidarity, new job creation, enhancement of social cohesion, active participation and empowerment of local communities. This is crucial, especially for rural areas, where a significant lack of knowledge spillover effects are observed, leading to an unfavorable environment for innovative business activity.

According to the findings, social entrepreneurship seems to be rather unknown to most Greeks while its nature and benefits are quite ambiguous. However, when explained, it seems to attract interest mainly among women in rural areas and among the better educated in urban ones. People perceive social enterprises as a solution especially for young and unemployed while it appears that all types of proposed activities are thought to provide chances for social enterprises. It is interesting that the quite sensitive sector of health services is considered to be the more important reflecting the inadequate existing system especially for vulnerable groups within the severe crisis framework in rural areas. In urban areas the inclusion of social vulnerable groups and education issues play more important role in developing social enterprises. These differences also show the differentiation of needs among urban and rural population in Greece. . This form of entrepreneurship could deal with the production of goods and services in sectors such as: culture, environment, ecology, education, public utility, local products, preservation of traditional activities and professions.

Another issue highlighted by the present research is that in both urban and rural areas, the successful development of the Social Economy requires an approach that relies primarily on the local social dynamics and the manifestation of this dynamic. Social Economy can play an important role in the development of social innovation in many policy areas, such as addressing the unemployment and the environmental protection, while it can combine profitability through solidarity, new job creation,

enhancement of social cohesion, active participation and empowerment of local communities. Particular emphasis should be given on young unemployed people.

- The combined research on social entrepreneurship, in both urban and rural areas in Greece, offers some insights regarding the policies and initiatives that could be developed in the country, for promoting and supporting social economy. Among others we could distinguish:
- The promotion and strengthen of networks and partnerships among population, enterprises, research organizations etc. The participating regional public and national and international research organizations could facilitate transfer of knowledge and experience as well as capacity building for key mountain entrepreneurship institutions.
- Creation and strengthen of value chains to benefit mountain communities, for example through branding of specific goods and services.
- Strengthen the information and knowledge base on sustainable mountain development and make it accessible to all concerned.
- Encouraging the private sector through appropriate policy and regulatory support so that the market can become an option for financing social sector, providing adequate financing targeted to the specific regions and social groups.
- Investing in rural regions to unlock their potential in a green economy and sustainable development, e.g., for energy, high-quality agricultural products, nature-based and organic products, culture, tourism etc. generating long-term benefits and high welfare gains regionally and nationally; they can be an important source of revenue for the local communities helping towards their social incorporation and treatment of unemployment.
- Strengthen national and international support for R&D activities on relevant issues.

The main contribution of the study seems to be its indication that there is a significant difference or rural and urban entrepreneurship even at local level. Findings actually support the assumption that different entrepreneurship support policies should be prepared for different regions at local, regional, national and European level in order to address successfully the distinctive culture and environment of the communities involved. A multidisciplinary approach is recommended, with emphasis on the target group needs, the adoption of best practices and knowledge that have been developed internationally and finally, the adjustment of related policies to the specificities of the populations and of the related economic activities. Another distinguished field promoted by the research is the need for more extensive and better research in this field in Greece, having as a starting point the systematic collection of data. A better building capacity for social economy organizations could derive by improving related research studies (EU 2013). Similar research through the mapping activities of entrepreneurial, social and other productive dynamics of urban and rural areas, the specialized Innovation, Entrepreneurship and Digital Ecosystems

market research and the activities of networking, measuring social capital and monitoring of Social Entrepreneurship, could be launched, in order to set the directions for similar research studies and to create a framework for the development and promotion of Social Entrepreneurship in several social groups and areas.

IMPLICATIONS - LIMITATIONS

The research contributes to further definition of the factors that influence social entrepreneurship in urban and rural areas of Greece, so that a holistic view regarding entrepreneurial processes will be adopted, by seeking a more realistic approach and consolidation of business processes in these areas. The theoretical frameworks that have been analyzed emphasize the need to take seriously into account the environment in which the entrepreneurial process is implemented, as well as the mechanisms by which the entrepreneurs interact with the wider environment.

The results of the research bear certain limitations. Firstly, the size of the sample and was the lack of sample diversity are significant drawbacks; the field study was limited to only two geographically bounded sample in urban and rural areas, limiting the generalizability of the findings. However, this choice enabled the control for potential confounds due to cross-region differences, increased the internal validity and provided the main contribution of the study highlighting the significance of bottom-up approach of every single area of interest when regarding social entrepreneurship and policy making.

ACKNOWLEDGMENTS

The research leading to these results has received funding from the EEA Mechanism 2009-2014, under Project Contract n° 3580 and under the title "Establishment of a Supporting Mechanism for the Development and Promotion of Social Entrepreneurship for Populations of Mountainous Areas".

THE DETERMINANTS OF CONSUMER REPURCHASE INTENTION ON GREEN BEAUTY PRODUCTS

Tsai, Stephe Hsin-Ju¹; Ting, Pei-Ju Lucy²; Yang, Aqiong¹

¹School of Materials, The University of Manchester, Manchester, UK

²Business Administration Department, National Taipei University, New Taipei, Taiwan

ABSTRACT

Green beauty products accounted for the third largest portion of sales in the UK green products market. In practice, marketing strategies with heart-felt slogans and aesthetic packaging are commonly used in green beauty products to stimulate consumers' intrinsic concern about their well-being and the environment in anticipation to boosting sales. Previous studies also place great significance on how emotional value can initiate purchases and repurchases. Underlying with Theory of Consumption Value this study targets the consumers with experience of buying and using green beauty products, and endeavours to comprehend determinants to their repurchase intentions. Multiple regression analysis was conducted to empirically examine the hypotheses on a sample of 134 respondents in the UK. The results suggest that consumers' repurchase intention is primarily motivated by their perceived value on price, followed by environmental concern and perceived value of product quality. On the contrary social value and emotional value have limited impact.

Keywords: *Perceived consumption value, environmental-friendly products, repurchase intention, green beauty products*

INTRODUCTION

Environmental concerns and pro-green attitudes are enjoying a progressive growth in recent years (Olson, 2013). Consumers have become more aware of the relevance of environmental issues (Tanner and Wölfing Kast, 2003), and that some products can have a negative impact on the environment as well as their health (Gurau and Ranchhod, 2005). Being One of the most popular environmental-friendly products on the market, green beauty products (GBP) in recent years occupy at a faster pace more shelf space in green retailers as well as conventional retailers (KeyNote, 2015). COSMOS standard (2013) specifies basic rules for green beauty products: use products from organic agriculture, use natural resources responsibly, adopt manufacturing process that is respectful to the environment. Green beauty product refers to a personal care and beauty product that utilises natural and organic

formulas, minimises the use of non-organic additives and only from a restricted list, meets environmental standards for packaging and manufacturing, and most importantly does not test on animals.

Compared to conventional products, green products are often considered inferior in some traditional products attributes such as higher price and reduced performances (Ginsberg and Bloom, 2004; Olson, 2013). Therefore some green marketers advocate awakening consumers' intrinsic care about the environment (Stern, 2000), and some others believe in strengthening additional emotional values with the hope that consumers would be motivated to purchase green products. For instance, green marketers can stress the sense of pride demonstrating one's altruism and social status when driving a hybrid car (Griskevicius et al., 2012).

The marketing strategy for GBP commonly attaches an aesthetic value of well-being into the notion of beauty (Todd, 2004). GBP usually presents consumers with imagery of grassy landscape and clear water as well as heart-felt slogans with the aim to trigger positive emotional responses of well-being from the customers. For example The Body Shop, a large British GBP retail chain, is well-known for being environmentally minded (Crittenden et al., 2011) and its ethical values are reflected in its company slogans: 'Enrich, not exploit' (The Body Shop, 2016) and 'Beauty with Hearts' (The Body Shop, 2013); as well as its logo design: the colour of Olive Green. Burt's Bees, another brand known for its environmental friendliness, emphasise 'nature's power' of their GBP (Burt's Bees, 2016).

The application of these added aesthetic values is based on the rationale that emotion is a key element influencing consumers' purchase intention (Moons and De Pelsmacker, 2012). It is one of the most important factors explaining specific consumer responses to marketing stimuli (Johnson and Stewart, 2005) and consumers' perceived emotional value during consumption determines their post-consumption behaviours such as brand loyalty (Koller et al., 2011). Consumers' emotional reactions to GBP's use of "Feel Green and Feel Good" strategy may be sufficient to initiate first purchase; yet its effectiveness to retain consumers and encourage repurchase remains rather unexplored.

Generally the influence of emotions on consumer behaviour is determined by their valence. Nevertheless, some other studies indicate inconsistent results that positive emotions may not always result in positive behaviours (Louro et al., 2005) and not all kinds of positive emotions can contribute to repurchase intention (Soscia, 2007). Studies on beauty products purchase decision suggest that beauty product attributes such as performance, ingredients, price and aesthetic packaging have the most significant influence on the purchase and consumption of a beauty product (Johri and Sahasakmontri, 1998). This could be the reason why emphasising product performance and ingredients continue to be

the main marketing focus for conventional beauty products (Beane, 2013). For green products and brands, similar results are found that green brands focusing mainly on functional attributes, plus a touch of emotional benefits, would earn the highest positive attitudes from the consumers (Hartmann et al., 2005).

The understanding of consumption values is particularly vital for GBP brands as large investments are made to enhance the aesthetic value of well-being in the brand meaning. Therefore the aim of this study is to explore the effect of consumers' perception of values on GBP. Specifically this paper intends to explore how emotional value would impact on consumers repurchase intention of GBP. The Theory of Consumption Values, which has been used both for traditional consumption goods and green products (Lin and Huang, 2012), is adopted as the conceptualisation framework for this research.

THEORETICAL BACKGROUND AND HYPOTHESES

The concept of consumer perceived values has been widely studied in the past 30 years and its importance to initiate positive consumer purchasing behaviour continues to be acknowledged (Gallarza et al., 2011). Consumer perceived values refers to "the consumer's overall assessment of the utility of a product based on the perceptions of what is received and what is given" (Zeithaml, 1988). It is the key to the formulation of a successful marketing strategy, and is a crucial determinant in a firm's survival and maintaining long-term relationships with their customers (Holbrook, 2006).

Sheth et al (1991) provide a useful conceptualisation of consumer perceived value, namely the Theory of Consumption Values. This theory claims that it can assist researchers to understand how consumers make their purchase decision. The theory suggests that consumers' purchase decisions not only rely solely on the functional aspects of products or services, but the psychological dimensions, such as emotion. There are five independent dimensions which make varying contributions to different choice situations, including functional, emotional, social, epistemic and conditional value. Sweeney and Soutar (2001) further modify the construct on the basis that the value dimensions can be correlated and that value perception can be generated without having bought or used the product. They distinguish four different dimensions of perceived value, namely emotional value, social value, functional value with regard to price and functional value with regard to quality. This construct can also be applied to the context of post-consumption behaviours such as loyalty (Koller et al., 2011).

Environmental Concern

Environmental concern is defined as the "extent to which individuals are aware of environmental problems and struggles to solve them or signify their readiness to contribute personally to the solution"

(Dunlap and Jones, 2002, p.485). It determines how individuals feel about environmental issues and what actions one can take to help or harm the environment (Peattie, 2001). Despite some concerns that there may be a low causal correlation between environmental concern and consumers' actual purchase behaviours the majority of studies indicate that consumers' concerns toward the environment is a major factor influencing their purchase decision and post consumption behaviours.

Hypothesis 1: Consumers' environmental concerns positively influence their repurchase intention on green beauty products.

Perceived value of Green Beauty Products

Social value associates consumers with a social group which can enhance perceptions such as social image, identification, social self-concept, expression of personality and pursuit of social class membership (Pura, 2005; Sweeney and Soutar, 2001). Social value reflected by purchasing green products is also considered a main determinant factor (Chen, 2010). The effect of social value on green product purchase has attracted research attention from marketing scholars in recent years (Bollinger and Gillingham, 2012; Griskevicius et al., 2010). Purchasing green products may reflect a person's sense of social responsibility and convey expressions about their self-concept to the public audience (Mazar and Zhong, 2010).

Hypothesis 2: Social value positively influences consumers' repurchase intention on green beauty products.

Functional value is defined as the perceived utility acquired from the capacity for functional, utilitarian, or physical performance of products (Sheth et al., 1991). Generally there are two main indicators of perceived functional value: product quality and price. Product quality is the basic result of functional performance, which can be evaluated by the degree of customisation and how reliably the product meets consumers' demands. High product quality can obtain greater consumer acceptance and guide their decision making process (Schellhase et al., 2000). With regards to green products, it is also found that product quality contributes to how satisfied consumers feel about the products, and as a result can significantly influence consumers' green purchase behaviour).

Hypothesis 3: Quality value positively influences consumers' repurchase intention on green beauty products.

Price has been found to have a negative effect on purchase intention (Sweeney et al. 1999) and it is no exception for green products (D'Souza et al., 2007). In other words, consumers are motivated to acquire better deals to get more for their money. It is in this sense that price value is defined as the utility derived from the product due to the reduction of its perceived short term and longer term costs (Sweeney and Soutar, 2001). De Pelsmacker et al. (2005) find that consumers' willingness to pay for

price premium is inconsistent with their positive attitude towards green products. If green products do not offer consumers with clear and obvious advantages over conventional products, it would be hard to justify their higher prices and consumers become less likely to purchase them (Olson, 2013).

Hypothesis 4: Price value positively influences consumers' repurchase intention on green beauty products.

Emotional value refers to the perceived utility acquired from a product's ability to arouse feelings or affect states (Sheth et al., 1991). It is similar to Hedonic Value that is associated with the emotional responses aroused during consumption activities. A purchase decision can involve all kinds of emotional response, such as pleasure, pride, anger, and sadness (Laros and Steenkamp, 2005). Lin and Huang (2012) identify the sense of pride that consumers have when they feel they can contribute to protecting the environment by purchasing environmentally friendly products.

Hypothesis 5: Emotional value positively influences consumers' repurchase intention on green beauty products.

Following the literature review and hypotheses development, the conceptual framework proposed in this study is presented in Figure 1.

METHODOLOGY

This study conducted a questionnaire-based survey to evaluate consumers' environmental concern, perceived value of GBP and their intention to repurchase. A pilot test was carried out in forms of interviews and focus groups. Three experienced academics were interviewed to assess the face or content validity of the measurement scales. The questionnaire was subsequently pre-tested to 18 respondents with wide range of socio-demographic background. Minor changes were made to the descriptions of questionnaire items to improve the clarification and adapt the original items to fit better with the research context.

The target population is defined as consumers who have purchased GBP before. With previous experience of purchase and (assuming) usage as well, consumers' motivation to repurchase may, or may not be similar to their first-purchase. Convenience sampling method is adopted for this survey. In order to ensure that the best chance to locate the target population can be achieved, questionnaires were handed out in person, in and near retailers that sell GBP. Respondents were first asked whether they had previously purchased any GBP products and only those who had would be invited to complete the questionnaire. Consents were sought from store managers with, if any, research ethical concerns considered. Data was collected in Manchester, UK. A total of 134 usable questionnaires were collected.

As outlined in Table 1, the majority of respondents (94%) are female, about three quarters (75%) have received higher education, and two thirds (67%) are employed (either full-time or part-time). When cross-checking the income and employment status, it is found that 36 out of 40 of the respondents whose monthly wage is less than £500 are students. Nevertheless the rest of the 94 respondents spread rather evenly across the spectrum of income.

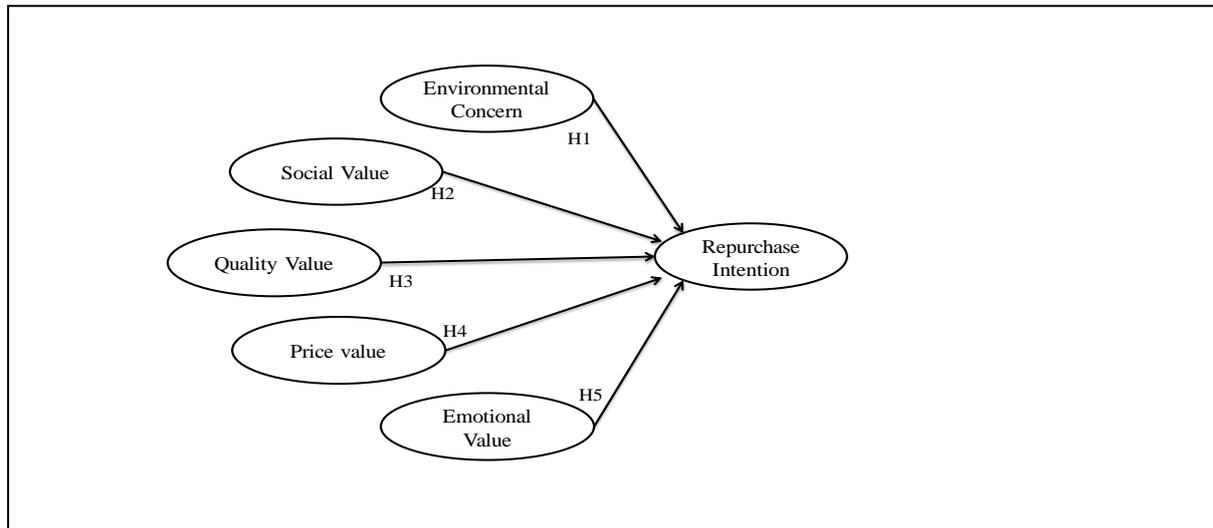

Figure 1. *Research Framework*

Variable		Frequency	Percentage	Variable		Frequency	Percentage
Gender	Male	8	6	Monthly income	£0-500	40	29.9
	Female	126	94		£500-1000	10	7.5
Age	18-24	49	36.6		£1000-1500	24	17.9
	25-34	38	28.4		£1500-2000	16	11.9
	35-44	30	22.4		£2000-3000	22	16.4
	45-54	10	7.5		£3000-4000	14	10.4
	Over 55	7	5.2		Over £4000	5	3.7

	Retired	5	3.7		Doctorate Degree	9	6.7
	Other	2	1.5		Other	18	13.4

Table 1. *Respondents socio-demographics*

Construct measurement

To examine the proposed hypotheses, the questionnaire was composed of four sections: perceived value of GBP, consumer environmental concern, repurchase intention and socio-demographic information as control variables.

Perceived value

To operationalise *Perceived Value*, Sweeney and Soutar (2001) develop a measurement model (PERVAL) that assess customers perceived value at four distinct dimensions - Social Value, Quality Value, Price Value and Emotional Value. The measure was initially developed to assess customer's value perceptions of consumer durable goods, and was subsequently being used in a wide range of contexts, e.g. franchise (Grace and Weaven, 2011), tourism (Petrick, 2004), sport merchandise (Lee et al., 2011). With minor modifications, its measurements are found to be both reliable and valid in various research settings including services and non-durable goods (Walsh et al., 2013). Therefore the majority of PERVAL measurements were adopted in the questionnaire.

A total of 13 variables are employed to operationalise the four elements of Perceived Value. With only one item being eliminated, the remaining 12 show decent reliabilities and are similar to the short 12-item PERVAL (Walsh et al., 2013). All items are evaluated on respondents' agreement with the 7-point Likert scale from 1 (totally disagree) to 7 (totally agree).

Environmental concern

Green consumers characteristically take into account the consequences of their consumption and attempt to use purchasing power to bring about social change. To measure the importance of different GBP features, respondents were asked them to rate again their level of agreement from 1 (totally disagree) to 7 (totally agree) on the following statements: i) it is important that packaging of GBP use recyclable materials; ii) it is important that GBP does not conduct animal testing; and iii) GBP is less harmful to the environment. These items are based upon Johri and Kanokthip (1998) in which they evaluate customers' attitude of product environmental friendliness toward green cosmetics and toiletries. With an average of 5.76, these three variables yield 0.83 of Cronbach's alpha.

Repurchase intention

To gauge customers' intention to purchase GBP, three outcome variables are used: i) I would be willing to buy GBP again, ii) I would recommend GBP to friends or relatives, and iii) I would choose GBP over other non-green beauty products. These variables were based on Sweeney and Soutar (2001), with

adaptation made to fit into our research context. Because the respondents had purchased and used green beauty products before, these measures are designed to assess their intention to re-purchase. Cronbach's alpha for these three items altogether is a satisfactory level of 0.80.

Reliability and validity of measurements

Harman's single-factor test has been applied to address the issue of common method when using single-source data (Jarvis et al., 2003). After loading all of the research variables into an exploratory factor analysis, the unrotated factor solution indicated a single factor accounted for 34 percentage of the total variance, which suggests the problem of common-method bias does not exist for this dataset. Further, Cronbach's alpha was used to evaluate the internal consistency reliability. With only *Quality Value* being slightly below the internal consistency threshold of 0.7, the reliabilities of the measurement model were acceptable. In addition to the reliability assessment, convergent validity and discriminant validity were also tested. With all average variance extracted (AVE, i.e. the average variance shared between a construct and its indicators) greater than 0.6, it suggested a decent convergent validity of measurement models (Fornell and Larcker, 1981). By further examination of the cross-loadings of items, the study confirmed the discriminant validity of reflective measurements. Detail correlation matrix of research factors is presented in Table 2.

	Mean	Std. Dev	EC	SV	QV	PV	EV	RI
Environmental Concern (EC)	5.76	1.14	1.00					
Social value (SV)	4.36	1.33	.24	1.00				
Quality value (QV)	5.61	0.77	.45	.20	1.00			
Price value (PV)	4.76	1.15	.40	.27	.48	1.00		
Emotional value (EV)	5.16	0.99	.46	.47	.35	.29	1.00	
Repurchase intention (RI)	5.00	1.20	.51	.35	.53	.64	.44	1.00

Table 2. *Correlation matrix of research factors*

RESULTS

After the measurement items have been purified and tested with reliability and validity, we calculated un-weighted indices of each of the six latent variables for subsequent regression analysis for hypotheses testing.

Model 1 as illustrated in Table 3 examines the impact of socio-demographics on repurchase intention. Age, income, education level are included as ordinal measures and gender and employment as categorical variables. Model 1 has an insignificant F-value of 1.41 and a very low R-square of 0.06 which indicates that the above five socio-demographic variables combined explain merely 6% of consumers' Innovation, Entrepreneurship and Digital Ecosystems

intention to repurchase GBP. It is apparent that repurchase intention of GBP cannot be predicted by using only socio-demographic variables. This is consistent with the findings of previous studies that green consumer cannot be fully profiled with only socio-demographic characteristics (Akehurst et al., 2012; Diamantopoulos et al., 2003; Fisher et al., 2012; Park et al., 2012).

Model 1	Repurchase Intention		
Socio-demographics	Coefficient	(sig.)	VIF
Gender	0.14	(0.14)	1.05
Age	-0.11	(0.39)	1.72
Employment	0.09	(0.54)	2.33
Income	-0.21	(0.23)	3.27
Education	0.01	(0.88)	1.06
Model summary			
R-square (Adjusted R-square)	0.06 (0.02)		
F value (sig.)	1.41(0.23)		

Table 3. *Impacts of socio-demographic characteristics on repurchase intention*

In Model 2 as shown in Table 4, our research constructs are the predictor variables of Repurchase Intention. The variance inflation factors (VIFs) are considerably low (<2) suggesting little concern of multicollinearity (Hair et al., 2009). Model 2 has a significant F-value of 30.96 (sig < 0.01). Consumers' environmental concern and perceived value of GBP together have substantially higher predicting power (55%) on repurchase intention.

To interpret individual impacts more specifically, Price Value is the strongest predictor with standardised coefficient of 0.42 (sig < 0.01) followed by *Quality Value* (coefficient = 0.19, sig = 0.01) and *Environmental Concern* (coefficient = 0.18, sig = 0.02). The results show strong support for Hypothesis 1, 3 and 4. Nevertheless, *Emotional value* (coefficient = 0.12, sig = 0.11) and *Social value* (coefficient = 0.10, sig = 0.13) both have positive impacts on repurchase intention, but significance levels are greater than 0.05 which suggest Hypothesis 2 and 5 are thus not supported.

Model 2	Repurchase Intention		
Research Construct	Coefficient	(sig.)	VIF
Environmental concern	0.18	(0.02)	1.50
Social value	0.10	(0.13)	1.32
Quality value	0.19	(0.01)	1.48
Price value	0.42	(0.00)	1.42
Emotional value	0.12	(0.11)	1.57
Model summary			
R-square (Adjusted R-square)	0.55 (0.53)		
F value (sig.)	30.96 (0.00)

DISCUSSION

This study investigates the factors that influence consumers' repurchase decisions on green beauty products. Based on the Theory of Consumption Values, five hypotheses are proposed and only three of them are supported. The result supports the hypothesis that respondents with more environmental consciousness are more likely to purchase GBP again. This result furthers the findings from many previous studies that, even for highly-involved products like fashion, the awareness of environmental problems and their negative impact not only serves as an important factor to initiate consumers' first purchase (Chen and Chang, 2012; Gam, 2011), but continue to motivate consumers to repurchase green products.

The hypotheses of quality value and price value have also been supported. Amongst all, price value is the most critical dimension in consumption value pertinent to consumer intention to repurchase. This indicates that, even for green products that are beneficial to the earth, price still needs to be justified in accordance with consumers' perception of worth. This finding is also consistent with that from the previous research that most people are not prepared to compromise on product functions for a better environment (Mondelaers et al., 2009). Even for people who claim to be environmentally friendly, these functional characteristics remain critical influencing their post-purchase behaviours of green products (Lin and Chang, 2012).

The remaining two hypotheses assuming that social value and emotional value also positively influence repurchase intention are not supported. Previous research suggests that green product has the ability to demonstrate socially, especially for female consumers, the owners' voluntary willingness and capacity to incur the cost of compromising one's benefit for the greater good of the environment (Griskevicius et al., 2010; Koller et al., 2011). Yet similar result is not found for GBP whose consumers are mainly female and its consumption would indicate one's altruistic gesture of changing everyday life to help protecting the environment. Reasons for this negative result could be twofold. Firstly, little physical elements in GBP could demonstrate publicly its nature of being environmental friendly. It is found that people tend to purchase green products when the product choice can be observed and influence one's reputation (Griskevicius et al., 2010). Comparing to other product categories like hybrid car or green fashion, the use of which can signal their greenness via, for example, product design, the application of GBP leaves not visible traces for the users to display their product choice and their courtesy. Secondly, the pressure and/or negative reputation consumers experience may not be as much when using conventional beauty products. In contrast to some product categories, e.g. fashion industry uses cheap chemical dye that pollutes water resources or fuel-powered vehicles contributes to air pollution, there are considerably less reports about how traditional approach of manufacturing beauty

products has created appalling consequence to the environment or to the counterparts in the supply chain. In other words, it may not be as widely known as to how the act of GBP buying and consuming can contribute to improving environment sustainability. In short, together these factors may provide little motivation and risks for consumers to continue purchasing GBP for social reasons.

Perhaps most surprisingly, emotional value is found in this study to have no significant impact on consumers' intention to continue purchasing GBP. Emotional value though has been highly emphasised in terms of its importance to attract first-time purchase of green products. Our results on the contrary show that such pertinence diminishes substantially when it is about repurchase intention. In this research it is assumed that consumers would have high emotional involvement for beauty products, similar to what they may have for fashion products. Also, people who have purchased GBP previously are assumed to already have experienced the production functions and are more likely to be receptive to the "Feel Green and Feel Good" marketing strategy. This finding suggests the contrary that unlike fashion, consumers may see GBP as a common everyday product and thus invest little emotional involvement. Therefore, corresponding to, e.g., Johri and Kanokthip (1998) and Hartmann et al. (2005), that product performance is still one the key determinant even for GBP.

It is also worth noting that socio-demographic characteristics cannot be used to predict consumer intention to repurchase GBP. They may not be the appropriate variables for segmenting GBP consumers. Diamantopoulos et al. (2003) indicate that such socio-demographic variables may be useful to profile environmental knowledge and attitude but not as successful with green consumption behaviours. Socio-demographic segmentation is not an effective option to profile green consumers or predict purchase intention.

IMPLICATIONS AND FUTURE RESEARCH

This study set out to understand how consumers' repurchase intention of GBP is affected by their environmental concern and perceived value. The findings suggest that price value is nevertheless central when it comes to the decision of buying GBP again. This will be a challenge for companies who offer GBP. The higher price is common to all green product categories, e.g. organic food, green clothing, owing to their ethical sourcing of ingredients. Further, it is found that emotional value does not play a role as significant as expected. Such finding provides an alternative perspective to GBP marketers as to whether they should use the same marketing approach to encourage repurchase. For future research, it would be interested to conduct a comparison study that focus on respondents who have no previous experiences with GBP purchase and understand whether the relationships between their perceive value and purchase intention would be similar to the findings of this study.

BUILDING ENVIRONMENTAL AWARENESS THROUGH MASS MEDIA IN CHILDHOOD

Tsantopoulos, G.¹; Dalamagkidou, A.¹; Bantoudi, F.¹; Petkou, D.¹; Aggelopoulos, S.²

ABSTRACT

Nowadays, people go about and live their daily lives often guided by the Mass Media. This fact can easily be observed if we follow the daily activities of both adults and children. If we examine the potential existence of a relationship between the information conveyed by the MM and the stimuli they provide to adults and children, it becomes evident that there is some kind of effect. The aim of this paper is to study the attitudes and perceptions of primary school students in the region of Evros concerning a range of issues, in relation to the media they use to receive information both regarding their daily habits, and especially regarding the environmental issues that concern them, in order to determine which characteristics can help raise environmental awareness. A structured questionnaire was used to achieve the goals of the survey, which was completed by 412 students in the 5th and 6th grade of primary school, during the period May-October 2014. The main results show that their key interests relate to entertainment and pleasure, for which they primarily use the TV and the Internet, in order to find answers to their questions or address their expectations; nevertheless, they are not greatly satisfied with the programmes on TV. The environmental issues that interest them are mainly related to water, animals and the sea, and these concerns are usually addressed by their school or family environment.

Keywords: *Environmental communication, natural environments, mass media, children's environmental perceptions.*

INTRODUCTION

In modern times, the key reasons for the limited awareness of environmental problems have been linked to the overall values, attitudes and beliefs that have been adopted with regard to wealth and modern technological and scientific achievements (Catton and Dunlap, 1980 Trobe and Acott, 2000), which are daily displayed and cultivated by the two most fundamental social institutions, family and

education, and through certain stimuli provided by the mass media. A two-way relationship exists between mass media and the public. It could be argued that the mass media not only decide to a great extent about the information we receive in general, by providing the necessary knowledge about the images related to our world, but also affect the way in which we evaluate and appraise this information (Papathanasopoulos et al., 2014). Moreover, mass media involves businesses whose primary objective is to make a profit and not provide information, entertainment or education, which is why they are subject to certain restrictions. More specifically, in order to protect and increase their ratings or number of readers, and therefore their profits, they choose to convey messages, which are deemed to have a higher resonance with the targeted audience. Therefore, it is easily understood that the viewers' degree of environmental awareness is highly likely to affect the content, form and frequency of the environmental information provided. Hence, it is the responsibility of these institutions to transmit those values to young children that can lead to the adoption of an environmentally responsible attitude, and eventually create personalities with an established environmental awareness. Thus, through the creation of a demanding and environmentally aware young audience and its consistent pressure, the mass media will be forced to readjust its policies concerning the environment, and environmental information in general.

The time devoted by modern students to mass media and the close bond they develop with the latter, in combination with the allure of image and sound, render mass media highly attractive and important for the transmission of the appropriate stimuli which will lead through entertainment, emotion and speculation to environmental awareness, as described above. Through the promotion of films relevant to environmental issues, educational programmes, conversations concerning the environment and the diffusion of environmental information, mass media has the power to contribute to the environmental awareness of the audience (Skanavi, 2004) in general, and of students in particular.

The above observations highlight the necessity to examine both the audience's and, in this particular essay, the students' daily habits and attitudes, as well as the policies utilized by the mass media to provide information to this specific age group on environmental issues. In other words, this essay aims to scrutinize the students' various perspectives and attitudes regarding a number of issues, in relation to the media through which they are informed about their daily habits and mainly about the environmental issues that concern them, so as to determine and identify all the characteristics that contribute to raising environmental awareness.

LITERATURE REVIEW

The extensive interest that environmental problems have received in modern days and the necessity for immediate action in this field, require an examination of the concept of children's environmental

awareness, since this age group is the pillar supporting our global future and our guarantee for a sustainable planet. It is generally accepted that the primary concern of our society should be to raise young citizens with the right knowledge, values and attitudes, who will resist displaying apathy towards the environment and will be led to make certain choices, which will render them environmentally responsible citizens. Environmental awareness, as a trigger for behavioural change and for the identification of factors that contribute to the transition from intention to behaviour, has regularly been the topic of numerous studies. One of the models that explains the influence of people's behaviour towards environmental problems is "the value-belief-norm theory" (Stern et al., 1993; Dietz et al., 2005; Berenguer, 2010). According to this theory, people take action regarding environmental problems when they believe they can protect environmental aspects that are important to them (Berenguer, 2010). When asked today, however, what aspect they evaluate as being of high importance to their lives, the effect of mass media and the issues it chooses to reveal and highlight is a decisive factor. Due to its range, regularity and repeatability, mass media has become the most important information system in today's society. It has the potential to affect a person's ultimate choice concerning a subject, since it is able to reveal and present the numerous choices of action offered to him as regards this subject, whilst favouring or decreasing the importance of certain actions accordingly (Skanavi, 2004).

Closely connected to people's daily habits and the meaning of awareness are the notions of values and attitudes. Values represent the way a person evaluates different people, facts and situations. Values and attitudes do not have the same meaning, as values are more general, abstract and deeper-rooted in the individual self-concept, thus harder to change (Schwartz, 1992; Schwartz, 1994; Feather, 1995). On the other hand, numerous definitions of the term "attitude" are given in the relevant bibliography. Some view the term in a uni-dimensional manner, as the feeling connected to specific intelligible objects (Greenwald, 1989), a connection with the human soul's "incensive" aspect (*thymikon*). Others see it multi-dimensionally, with the term "attitude" used to describe predispositions of reactions to certain stimuli, involving the emotional, cognitive and behavioural dimension (Rosenberg and Hovland, 1960). An environmental attitude can thus be defined as a learned predisposition to respond in a consistently favourable or unfavourable manner with respect to the environment (Shanahan et al., 1999). However, in all definitions, a basic element is the notion of evaluation and the discrimination between the emotional, cognitive and behavioural consequences of attitudes.

On the other hand, positive attitudes towards the environment, as a result of environmental education and information in general, are directly connected with awareness, without however guaranteeing the adoption of a pro-environmental or responsible environmental behaviour. In other words, awareness, according to Newhouse (1990), entails that the individual is knowledgeable, awake, alert and informed

about environmental issues, but does not necessarily take relevant action. Many other scholars (Hungerford and Volk, 2003; Hsu 2004) arrive at the same conclusion, and emphasize the distance between the notions of 'awareness' and 'action', since their relationship is neither linear nor deterministic. This statement has led to a study of the factors, which cause the transition from 'intention and positive disposition' to 'responsible environmental behaviour', which has resulted in the expression of numerous theories and models, the most predominant being those of Hungerford and Volk (1990) and of Ajzen (1991). In these theories, the importance of incorporating values, attitudes and one's way of life in the decision-making process, along with the importance of public information on environmental problems, are noted.

Greek researchers have dealt with the role of television in the education of children, the structure and content of Greek children's television programmes, the viewing habits of schoolchildren aged 9-13, of primary school students aged 5.5-6.5, and of preschool children (Pantzou et al., 1988; Dakounakis, 1996; Diamantopoulos, 2000; Doulkeri, 1994, Vryzas, 1997; Oikonomidis, 2005; Diamantaki et al., 2001; Kourti, 2005). Due to the fact that, even nowadays, along with an anthropocentric perception of nature, students' perceptions are dominated by a utilitarian relationship between humans, plants and animals (Lazarou and Papadopoulou, 2013), it is interesting to observe the way in which these are presented on TV and also whether and how a pro-environmental attitude is accordingly cultivated. All of the above acquire a particular significance if we take into account the conclusions of Nila & Kotsis, (2007) regarding the students' lack of familiarisation with several ecological terms, and their inability to distinguish between the causes and effects of grave environmental problems. Furthermore, the knowledge of the environment which is provided by the mass media is of major importance, since it is regarded as fundamental for the construction of an environmentally aware society, and for the cultivation of positive values and attitudes towards the environment in society (Ivy et al., 1998).

RESEARCH METHODOLOGY

For the collection of data regarding the perceptions and attitudes of students in the 5th and 6th grade of primary school in the prefecture of Evros, a questionnaire with closed questions was used. This research constitutes part of a larger research project for which the questions were divided into five categories, namely: 1) student activities-interests and the role of parents, 2) information – communication media, 3) student knowledge of environmental matters, 4) habits of the students and their families and 5) demographic characteristics of the students and parents. In order to achieve the goal of the present research, only part of the above-mentioned questions were used. The sampling method used was cluster sampling. The sample included seventeen (17) primary schools in the Prefecture of Evros, and 412 questionnaires were completed by 5th and 6th grade students. Regarding

the required permission to conduct the research, the researchers followed the guidelines provided by the Pedagogical Institute (Pedagogical Institute, 2004). The collection of data was carried out during the period May-October 2014. Cronbach's α coefficient and Friedman's non-parametric test were used for the data processing. In addition, the researchers used the statistical programme SPSS. Friedman's test and Cronbach's α coefficient were applied to the multidisciplinary variables, namely "interests", "the media through which you obtain information on issues of interest", "types of TV programmes you watch", "topics about which you surf the Internet", "communication media you use to get information on nature" and "which environmental issues do you find most interesting", which were measured using the Likert scale from 1= never to 5= always.

In the survey, Cronbach's α coefficient is used to identify the internal consistency of the questionnaire, i.e. whether the data have the tendency to measure the same fact. It expresses the squared correlation between the score (observed) that a person is assigned on the given scale and the score that they would have obtained (true) if they had been asked about all issues (Siardos, 1999). Friedman's test is used to compare the values of three or more correlated groups of variables. The distribution of Friedman's test is a X^2 distribution with (df) $df = k-1$ degrees of freedom, where k is the number of groups or samples. This test classifies the values of the variables for each subject separately and calculates the mean rank of the classification values for each variable (Freund and Wilson, 2003; Ho, 2006).

RESULTS

As regards the students' demographic characteristics, there were a few more boys (52.4%) than girls, and the 6th grade students (50.5%) exceeded the 5th grade students by one percent. As for their parents, over half the fathers were employees (public 33.3% and private 19.2%), self-employed (27.7%) and farmers (10.8%), while less than half the mothers were employees (public 26.2% and private 18.7%) and 28.4% were housewives. Finally, almost one in three fathers were university graduates (29.4%) and also one in three were secondary school graduates (31.1%); there is a similar pattern for the mothers (31.1%). The classification of the students' interests was the result of the application of Friedman's test. After the application ($N=412$ Chi-Square=429.818 $df = 6$ Asymp. Sig = 0.000) (Table 1) and with Cronbach's α coefficient being 0.771, we see that the main subject of the multidisciplinary variable "students' interests" is "entertainment / pleasure" with a mean rank of 4.86. Second in the classification of interests is "personal issues", then "sports", with "educational matters related and unrelated to school" coming fourth. As expected, they are not interested in issues related to finance and nature. They are at an age where they have exactly the opposite interests to adults, since, according to Tsifodimou et al., (2011), the main problems currently concerning Greek citizens are the economy, unemployment and environmental downgrading.

	Mean rank
Entertainment / Pleasure	4.86
Personal issues (your family, friends etc)	4.71
Sports	4.5
Educational matters related and unrelated to school	4.17
Nature	3.65
Social (on the relations of the people around you – between them and with you)	3.64
Finance	2.47

Table 1. Application of Friedman's test regarding "students' interests"

	Mean Rank
Discussion with family/friends/fellow students	8.74
Education – School	8.42
Internet	7.95
Television	7.61
Books – Encyclopedias	6.09
Events	6.04
Information leaflets	5.03
Magazines	4.70
NGOs (WWF, Make a Wish Greece, etc)	4.44
Radio	3.79
Newspapers	3.20

Table 2. Application of Friedman's test on "the media through which you obtain information on issues of interest"

As regards the media through which they obtain information on issues of interest (Cronbach's α coefficient 0.732), they mainly involve interpersonal communication methods, such as discussions with friends, with the family and at school. In second place, we find mass media, namely the Internet and TV. The final places are taken up by NGOs, the radio and newspapers ($N=412$ Chi-Square=1,600.546 df = 10 Asymp. Sig = 0.000) (Table 2). People depend on mass media for information, entertainment, even to communicate, although their perceptions are mainly shaped through interpersonal communication and their contact with their immediate social surroundings; nevertheless, mass media constitute the most frequently used, direct or indirect source of information (Papathanasopoulos et al., 2014).

	Mean Rank
Comedy series	12.66
Children's films	12.44
Comedy films	12.40
Action films	12.35
Fiction films	12.35
Children's programmes	11.57
Sports programmes	10.94
Old Greek films	10.49
TV games / Quiz shows	10.21

Documentaries	10.00
Entertainment programmes	9.98
Historical series / films	9.59
Police stories	8.81
Social series / films	8.06
Horror films	8.05
The news	7.89
Environmental programmes	7.81
Information programmes	7.55
Drama series	6.88

Table 3. Application of Friedman's test on "types of TV programmes you watch"

Their preferences as regards types of TV programmes (Cronbach's α coefficient 0.841) are dominated by comedy series and then films (children's, comedies, action and fiction films). At the bottom of the list we find drama films, information programmes and environmental programmes (N=412 Chi-Square=1,017.384 df = 18 Asymp. Sig = 0.000) (Table 3). Through television, children enter a part of the adults' world very early on, and its allure lies in the variety of programmes and films. Television ranks high in their preferences compared to other activities and "eats away" at their valuable time (Vryzas and Tsitouridou, 2002) nevertheless, its power can be put to good use by the school in an educational way, and thus restore its lost value. As regards children's preferences regarding specific types of programmes, the AGB data for 2005-2006 shows that young viewers watch children's programmes, but also: Greek comedy films are one of their top choices, with TV games, "light entertainment" and reality shows also high on the list, while Greek and Latin American soap operas are also popular with many children. However, the minor fluctuations noted in recent years, do not reverse the overall trend (a count of 165 or 161 minutes of TV time per day), which is rising. What is of concern is the fact that many children are often "glued" to a screen (TV or computer) watching DVDs or playing computer games – and that this time is not taken into account, at least by the systems used at present. In other words, the adoption of new technologies has not changed the TV habits neither of children nor of adults (Tziantzi, 2007).

	Percentage (%)
Don't know	2.7
Not at all	1.2
Slightly	11.9
Quite	41.5
Very	24.3
A great deal	18.4
Total	100.0

Table 4. Level of satisfaction with TV programmes

Table 4 presents the perceptions of students regarding their satisfaction with TV programmes: 42.7% say they are "very" or "a great deal" satisfied with them, while 41.0% that they are "quite" satisfied with the programmes shown on TV. Over one in ten students (13.1%) state that they are "slightly" or "not at all" satisfied with them.

	Mean Rank
Entertainment / Pleasure	5.26
Sports	4.46
Educational matters related and unrelated to school	4.38
Nature	4.06
Personal issues (your family, friends etc.)	3.85
Social (on the relationships of the people around you – between them and with you)	3.57
Finance	2.42

Table 5. Application of Friedman's test on "topics about which you surf the Internet"

Following the application of Friedman's statistical test (Table 4), it is observed that the main topic of the multidisciplinary variable "topics about which you surf the Internet" is "entertainment/pleasure", with a mean rank of 5.26 (N=412 Chi-Square=506.643 df = 6 Asymp. Sig = 0.000) (Table 5), with Cronbach's α coefficient being 0.698. Students also surf the Internet for issues related to sports, education and nature. As regards the latter and the environment in general, they most probably receive stimuli from school to do so, rather than being driven by their own concerns. According to a study by the University of Athens, almost the majority of children in the 5th and 6th grade of primary school are members of at least one social networking site, while 52.0% say that they know more about new technology than their parents. Furthermore, students mention that they first came into contact with the Internet aged 6.2 years, use facebook for two hours on a regular school day, 20.0% use a mobile phone, 22.0% use the Internet daily in their bedroom, 39.0% use the Internet daily to communicate and for social networking, and 8.5% use it daily to study at home (Bibi, 2016)

	Mean Rank
Education – School	8.94
Television	7.81
Discussion with family/friends/fellow students	7.66
The Internet	7.58
Books - Encyclopedias	6.18

NGOs (WWF, Greenpeace, etc)	4.75
Magazines	4.69
Radio	3.98
Newspapers	3.46

Table 6. Application of Friedman's test on "communication media you use to get information on nature"

As regards the communication media they use to get information on nature (Cronbach's α coefficient 0.791), they primarily get this information from school, TV, their family and friends, and from the Internet. On the other hand, they do not receive information, as expected, from newspapers, the radio

or magazines, which are not as accessible to them and are also not seen as suitable tools (N=412 Chi-Square=1,396.871 df = 10 Asymp. Sig = 0.000) (Table 6).

	Mean Rank
Water	7.67
Animals	7.45
Sea	7.41
Litter – Recycling	6.30
Forest	6.17
Air pollution	6.17
Plants	5.92
Energy	5.61
Climate change	5.55
Soil – Ground	4.28
Insects	3.46

Table 7. Application of Friedman's test on "which environmental issues do you find most interesting"

Of the topics on nature that mainly concern students (Cronbach's α coefficient 0.878), water is the primary topic, followed by animals, the sea, litter-recycling and the forest. On the contrary, in the last places we find insects, soil and climate change (N=412 Chi-Square=845.731 df = 10 Asymp. Sig = 0.000) (Table 7). The students' region is dominated by water and characterized by numerous sites of natural beauty, as well as areas of particular natural importance, such as the Evros river delta and the Forest of Dadia. In fact, on several occasions, the river Evros, which is second in size to Danube in Southeast Europe, and the main river of the Balkan Peninsula, causes flooding in the region and large-scale disasters that affect farming and animal breeding, as well as residential areas.

DISCUSSION

One of the primary results provided by the present paper is the observation that nature and environmental issues do not feature amongst the main interests of students, since they come out low on their list of preferences. This classification of their interests is particularly disheartening as regards their support of pro-environmental movements, since, according to Schwartz (1977), values, beliefs, and personal norms, feelings of personal obligation that are connected to one's self expectations, constitute the base for general movement support. For Schwartz (1977) a key role is played by personal norms and altruistic values, that mobilize a person to take part in any form of social movement, while Stern and Dietz (1994), Stern et al., (1995) view the environmental movement as one example where the views expressed by Schwartz (1977) can be applied. In developing their theory concerning people's involvement in pro-environmental action, Stern et al., (1999) also consider the above-mentioned concepts, namely personal norms and altruistic values, as having a core value for people to comprehend that environmental conditions "pose threats to other people, other species, or the biosphere and that actions they initiate could avert those consequences". Therefore, while examining

the attitudes and perceptions of primary school students in the region of Evros, it is observed that there is limited interest in undertaking pro-environmental actions, possibly due to the stimuli and information the students receive or do not receive, concerning nature and the environment; it is noted after all, that their preferred types of TV programmes include comedy series and then films, while, on the other hand, we find information and environmental programmes at the bottom of their list. In fact, the relevant data are not particularly encouraging as regards the development of environmental awareness, since Bartkus et al. (1999) claim that objective knowledge has been proven to be closely linked to environmental behavior.

High on the students' list of preferences we find the Internet and TV, through which they obtain information on issues of interest. Thus, the influence of these particular media on the specific age groups is documented, along with the importance of how the former formulate and present environmental issues, when they put forward the aspects of various environmental problems and risks, and reveal the numerous choices of action offered to individuals as regards these subjects, so that the relevant risks may be averted (Skanavi, 2004).

Students in this particular region are concerned about water on the one hand, which they place high on their agenda, while climate change does not concern them greatly, since they live in a region where two rivers (Evros and Ardas) form part of their daily life, and an integral element of their contact with nature. According to Barraza (2004), children do not only tend to remember but can also understand and explain environmental terms when they are related to their own experiences; on the other hand, Nila and Kotsis (2007) state that the majority of students are not particularly well versed in several ecological terms and relations, and are extremely confused about the causes and effects of environmental problems, such as climate change. Along the same lines, and in relation to the messages provided by the media, Nitz (2000), expresses the view that public awareness is raised when people believe that the related message directly concerns them, which means that the children's place of residence and own experiences affect the way in which they view environmental issues or concerns.

CONCLUSIONS

The present study is an attempt to examine the attitudes and perceptions of students regarding their daily habits and the media they tend to use to obtain information regarding their everyday needs and the environment, in order to arrive at the most suitable strategies for raising environmental awareness. One of the main conclusions shows how the students' interests differ from those of the adults. More specifically, the former mainly focus on entertainment and pleasure, as well as personal issues, while not being at all interested in issues related to finance. They are not particularly interested in nature, about which they mainly get information through the Internet. Nevertheless, the fragmented

information provided by the Internet can often be unreliable and misleading. Thus, education must contribute decisively at this point, since having knowledge and correct information concerning environmental issues is strongly linked to raising awareness around these issues.

As regards television, it is observed that students are not very satisfied with the quality of its programmes. However, when they decide to watch television during their free time, they mainly choose to watch comedies, children's films and television series; documentaries and environmental programmes are at the bottom of their list of preferences. At first, what needs to be examined is the quality of the environmental films and programmes, and to seek those elements that would make them more attractive and appealing to students. Taking into account the student's preference for comedy films and programmes, and in order to raise environmental awareness, TV channels should try and convey messages with an environmental content through their programmes, but present them in a comical manner where possible, in order to achieve the maximum results.

Children who live far from urban centres do not face the same environmental problems, and therefore have different priorities. Therefore, the stimuli they receive mainly come from their family environment, and the problems and natural assets of their region. The main source of information on environmental problems is their family and school, whereas television and the Internet are not the main sources of information in this case. Therefore, for the school to be able to encourage a positive attitude towards the environment and raise awareness among students regarding environmental issues, it should incorporate in its educational process the use of mass media and films of a comical or entertaining nature, since they attract the interest of students, and are at the top of their list of preferences.

Finally, it is suggested that this research be repeated with face-to-face interviews and a semi-structured questionnaire that could highlight new data to be examined or clarify ambiguous perceptions. Similar studies should not only focus on students but also their parents, since they influence the perceptions and attitudes of their children; such a method however requires specialized knowledge, experience and quite a lengthy period of time. Moreover, it would also be interesting to expand the present study in order to cover the population of neighbouring regions, where a significant differentiation exists regarding religious and cultural customs.

ABSTRACT

The aim of the present paper is to examine the factors that influence the gross margin and the productivity of goat sector in Greece. The paper uses structural equation modeling (SEM) which is a superior statistical technique to multiple regression used to determine the effect of financial and non-financial factors on the productivity of goat farmers in Greece. The research data was collected using questionnaires and through personal interviews with the "heads" of the goat farms during the years 2014-2015 in the Municipality of Thessaloniki. This model hypothesizes that gross margin (Y) is predicted by labor in hours (X_1), loans (X_2), feed in kg (X_3), fixed capital expenditures (X_4), education level (X_5), age of the head of the goat farm (X_6). Results show that labor in hours, kilos of feed and fixed capital expenses have a direct contribution to gross margin. Moreover, fixed capital expenses have a strong correlation with labor and feed. Education level and fixed capital expenses have an indirect effect in gross margin.

Keywords: *Goat farming, Structural Equation Modeling (SEM), Agricultural Finance, Managerial practices*

INTRODUCTION

Greece is a country with a long tradition in animal breeding, particularly involving small ruminants. Within its territory goat farming is an important livestock industry. It employs 260.500 families and its share in the gross value of the total animal production is about 16% (NSSG, 2011). A large proportion of goat milk and meat production takes place in mountainous and disadvantaged areas in Greece, which are characterized by poor resources in comparison to other rural areas and remoteness from main centers of population. Livestock production, which is largely extensive, is one of the main economic activities in such areas and is considered to be a potential option for rural development.

Greece holds the fourth position in world production of goat's milk, while holding the second position among the EU countries, after France. The total number of goats in the country is around 4.8 million heads (FAO, 2009). The number of livestock farms in Greece is very important and focuses primarily on Macedonia, Thessaly and Thrace.). According to FAO (2011), the number of milked adult female goats in Greece is 3.350.000.

Goat farming has a major financial impact, due to: a) the production of large product quantities of a high biological and dietary value, b) the fact that it provides employment and an adequate stable income to a large number of animal breeders, and c) the creation of added value through the processing and trading of goat's meat and milk.

Despite the high productivity and high quality of products, the goat industry shows low competitiveness due to high production costs compared to other EU countries (Vlontzos et al., 2006; Aggelopoulos et al., 2009). This fact implies the reduced efficiency and the low competitiveness of the industry.

The aim of the present paper is to examine the factors that influence the gross margin and the productivity of goat sector in Greece. The paper uses structural equation modeling (SEM) which is a superior statistical technique to multiple regression used to determine the effect of financial and non-financial factors on the productivity of goat farmers in Greece.

MATERIALS AND METHODS

The research data were collected by using questionnaires and through personal interviews with the "heads" of the goat farms during the years 2014-2015. Stratified random sampling was used to determine the sample (Siardos, 2005), with the regions of Greece representing the strata being studied. The selected research area was the geographical region of Thessaloniki, where a large number of goat farms are concentrated. The variety of breeding conditions in this region allows a generalization of the research output for the whole country, with no major deviation from reality.

The empirical data are analyzed using Structural Equation Modeling (SEM). Structural Equation Modeling, though stemming from econometrics, is increasingly applied in various disciplines such as psychology, sociology, political science, education, and in business-related disciplines like marketing, strategy, and management accounting. Generally, Structural Equation Modeling is defined as "a class of methodologies that seeks to represent hypotheses about the means, variances, and covariances of observed data in terms of a smaller number of structural parameters defined by a hypothesized underlying model". A structural equation model consists of (a) the measurement models, which link the observed variables to the latent variables, i.e. to the constructs; and (b) the structural part, which links the latent variables by using systems of simultaneous equations.

Structural Equation Modeling provides estimates of the strength of all the hypothesized relationships between the constructs in theoretical models, by comparing the model to the empirical data. This comparison is accomplished by means of fit statistics. The fit statistics can be used for accepting or rejecting the assumed relationships between the latent and observed variables (measurement models) on the one hand, and the latent variables (structural model) on the other.

The construction sequence of a SEM is to specify the model's structure and economic relationships, to estimate the parameters from historical data and to validate the model in a simulation routine (Labys, 1988). Supply, demand and price formation processes are represented by endogenous relationships that simultaneously interact to determine each other's values. The main goals of SEM are to understand the patterns of correlation/covariance among a set of variables and to explain as much of their variance as possible with the model specified (Kline, 1998).

The hypothesized SEM model for gross margin is presented as Figure 1 below. Within the context of structural modeling, exogenous variables represent those constructs that exert an influence on other constructs under study and are not influenced by other factors in the quantitative model. Those constructs identified as endogenous are affected by exogenous and other endogenous variables in the model. This model hypothesizes that gross margin (Y) is predicted by labor in hours (X_1), loans (X_2), feeds in kg (X_3), fixed capital expenditures (X_4), education level (X_5), age of the head of the goat farm (X_6). The single-headed arrows represent causal relationships between explanatory variables and the dependent variable while double-headed arrows represent covariances between explanatory variables.

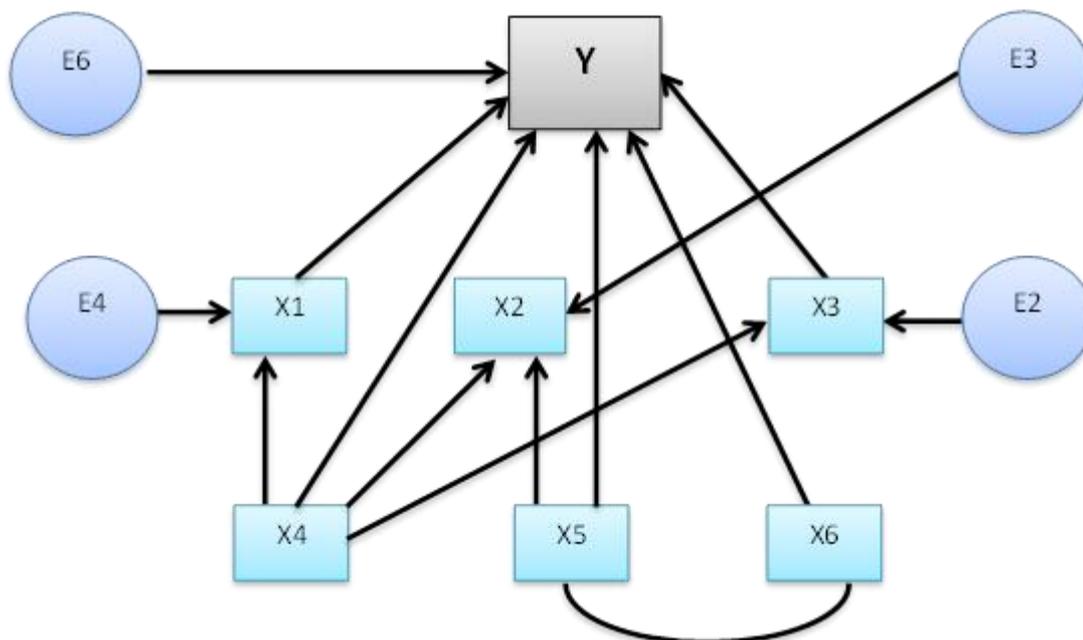

Figure 1. Impact of endogenous and exogenous factors in gross margin

Work is an integral variable to the operation of agricultural production. There are several definitions for the job. For example, Baumol and Blinder (2006), define as labor input in the production function

the number of hours. Holding other factors constant, the output increase as labor inputs growing. This leads to the first hypothesis of this study:

H1: Labor (hours) is assumed to be directly related to gross margin

Many researches have focused on the relationship between finance and economic development in the real economy. According to Coetzee et al. (2002), the lack of credit, has negatively affected the productivity of farms. Wynne and Lynne (2003) confirmed that lack of credit was hampering the development of smallholder farmers in South Africa but did not test the contribution of credit to farm performance. Chisasa and Makina (2013) using the Cobb- Douglas production function with the method of the Ordinary Least Squares (OLS) verified that at a macro level, credit makes a positive and significant contribution to agricultural production.

Sial et al. (2011), found that the improved seeds, fertilizers, biocides and the use of tractors play an important role in agricultural production and the market is directly affected by the availability of bank loans. Carter (1989) argues that bank lending affect agricultural production in two ways. First, encourage the efficient allocation of resources to use in an optimal way. Second, if the loan is used to purchase new technology would lead to increasing technical efficiency of farmers. Finally, according to Kumar et al., (2013), bank lending may affect the profitability and effectively improve farm management. Saleem and Jan (2011), considered the agricultural gross domestic product as the dependent variable, while agricultural production was the dependent variable from various financial institutions. The results showed that more than eighty percent of agricultural gross domestic product is due to total credit granted.

The Asfaw and Admassie (2004), found that through access to credit and loans, farmers are able to invest in new technologies. Gillespie et al. (2007) report that farmers who used most of their land for livestock adopted more innovations which improved the value of their land.

The Olagunju and Babatunde (2011), in their work on the effect of lending to farms, said that the lack of funding and lending result in low agricultural incomes, while the negative impact on poultry productivity was evident.

H2: Credit is assumed to be directly related to gross margin

The costs for the purchase of feed are one of the main factors that affect the profitability, because they represent a large part of the costs for the rearing of sheep and goats (Theodoridis et al., 2012). In another work, Tzouramani et al. (2011) report that the cost of feed is the main element of the total cost, reaching an average of the 48.03%.

H3: Kilos of feed is assumed to be directly related to gross margin

The suitable building and mechanical equipment is assumed to be directly related to gross margin (Aggelopoulos et al., 2011, Pavloudi et al., 2013).

H4: Fixed capital expenses is assumed to be directly related to gross margin.

Zuberi (1989), states that in order to increase productivity, government entities should focus on investment in human resources development with emphasis on the creation of primary and secondary agricultural schools training session.

H5: Education level (years) is assumed to be directly related to gross margin

According to Adesina and Baidu-Forson (1995), the age of the breeders, despite their experience, they are not innovate and take risks in order to increase the productivity of their holding. This is mainly due to lack of education. Younger age breeders are willing to receive education, which enhances their ability to respond to innovate (Asfaw and Admassie, 2004).

H6: Age of the head of farms is assumed to be directly related to gross margin

DATA AND METHODOLOGY

To test the hypothesized model, the paper utilizes survey data from the region of Thessaloniki in Greece. A total of 120 goat farmers were surveyed using a structured questionnaire. A two-stage sampling technique was used by applying simple random sampling. The data were analyzed using the Statistical Package for Social Sciences (SPSS) Version 22.0. For the analysis data were converted into per animal for the better understanding of the results. This study utilizes structural equation modelling (SEM) using the Analysis of Moment Structures (AMOS) for robust results. Thus the study hypothesized that gross margin is predicted by labor in hours (X_1), loans (X_2), feed in kg (X_3), fixed capital expenditures (X_4), education level (years) (X_5), age of the head of the goat farm (X_6).

Table 1. Descriptive statistics

	Mean	Standard Deviation	N
Gross Margin	156.192	27.609	120
Labor (hours)	14.216	3.197	120
Loans	2.494	4.926	120
Feed (kilos)	248.813	74.699	120
Fixed capital expenses	37.706	10.788	120
Education level (years)	10.300	4.030	120
Age	46.241	15.928	120

RESULTS

In Table 1, the average total valid observations summed to $n = 120$. An analysis of the descriptive statistics reveals that the mean score of gross margin is 156.192. Labor in hours were in the range of 14.216. Loans were in the range of 2.494 and the mean score of feed in kilos were 248.813. Fixed capital

expenses were in the range of 37.706. Moreover, the mean of the years of education level was 10.300 and the mean of the age of the head of goat farms was 46.241.

Pre-analysis testing

The suitability of the data set for the performance of factor analysis was tested via estimation of the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy. Chi-square =15,185 , df =10, sign = 0.125), characterized as “marvellous” by Kaiser (1974). It indicates that the data set can be used for the analysis and that the items will form specific factors (Hutcheson and Sofroniou, 1999).

Best fit model for gross margin

Maximum likelihood estimates.

The regression model that forms part of the SEM process confirmed that there are relationships between most variables, which are consistent with theory. The path coefficients presented in Table 2 are positive and significant at 5 per cent ($p < 0.5$). It is observed that kilos of feed have a direct contribution to gross margin (0.126). Fixed capital expenses have also a direct contribution to gross margin (1,505). Labor has a direct contribution to gross margin (1,344). Finally, fixed capital expenses have a direct negative contribution to feed (-1, 491) and to labor (-0,069).

Table 2. Regression weights (group number 1 - default model)

			Estimate	S.E	C.R.	P
Gross Margin	←	Feed (kilos)	0,126	0,027	4,612	***
Gross Margin	←	Fixed capital expenses	1,505	0,195	7,708	***
Gross Margin	←	Labor (hours)	1,344	0,643	2,091	0,036
Feed (kilos)	←	Fixed capital expenses	-1,491	0,620	-2,405	0,016
Labor (hours)	←	Fixed capital expenses	-0,069	0,026	-2,628	0,009

Table 3. Indirect effects- Two tailed Significant (PC) (group number 1 - default model)

			Estimate
Gross margin	←	Fixed capital expenses	0,092
Gross margin	←	Education level	0,741

Table 3 shows the indirect effects to gross margin. Fixed capital expenses and education level have also an indirect effect in gross margin.

Model Fit for SEM using goodness of fit indices.

The main objective of this study was to test the relationship between gross margin and some exogenous and endogenous variables. All the indices in Table 3 confirm that all the sample data fit to the model.

Table 4. SEM model fit indices

Index	Recommended value	Remark
CMIN/DF	1.519	Very good
GFI	0.966	Very good
TLI	0.942	Very good
CFI	0.972	Very good
AGFI	0.904	Very good
RMSEA	0.066	Very good

The GFI and the AGFI were 0.966 and 0.904 respectively. The CFI was 0.972 and the RMSEA was 0.066. Moreover, TLI was 0.942 and CMIN/DF was 1.519.

CONCLUSIONS

As shown from the results, labor in hours, kilos of feed and fixed capital expenses have a direct contribution to gross margin. Fixed capital expenses also have a direct contribution to labor and kilos of feed.

The competitiveness of goat farming in Greece can be improved either through a further increase in productivity, or by lowering the overall production costs. First of all, labor has a strong correlation with gross margin. That means, a rational valorisation of labor, mechanising production (e.g. installation of milking systems), a modernisation of the facilities for ergonomic purposes, should lead

to a reduction of this cost component. Moreover, in order to lead to the optimum exploitation of feed factor, a well-balanced and inexpensive feeding is recommended. The knowledge of animal feed contents in nutritious ingredients and their suitability as well as efficient mixing, feeding and storage facilities of animal feed should lead to the improvement of the used animal feed. Finally, modernization of building facilities and machinery were not designed rationally and they were based on limited data and misleading projections of the future, which finally led to an overestimation of their efficiency. Furthermore, the formal education enhances the ability of farmers to acquire, synthesize, and quickly respond to disequilibria, thereby increasing the probability of adopting a better management practices and reorganizing the production rates.

Additionally, the application of structural equation modeling can constitute a “guide” for goat farms for the provision of financial support, for an evaluation of the existing status and for gaining a competitive advantage in relation to other similar form of farms. Through structural equation modeling the investigation of the relationship between inputs and outputs is also possible. This allows the rational exploitation of inputs and outputs, the restructuring of the used inputs and the reduce of production costs.

ADOPTION AND USE OF SOCIAL MEDIA BY HOSPITALS' STAFF IN GREECE

Vaitsi, Apostolia-Spefania; Kehris, Evangelos; Karavasilis, George; Vrana, Vasiliki

Department of Business Administration, Technological Education Institute of Central Macedonia, Serres, Greece

ABSTRACT

Nowadays, a plethora of social media are available for health care professionals. Their use has change the way that health care professionals get informed, communicate with patients and raise awareness of public health-related issues. Despite evidence demonstrating their use by medical professionals, in Greece there is no research describing their adoption and use by hospitals' staff. The paper aims at filling this gap and investigates the attitudes of medical, nursing and paramedical staff of Greek hospitals towards the use of social media for personal and/or professional purposes. A questionnaire was distributed to four public Greek hospitals and was filled in by 188 respondents. The statistical analysis highlights that the most members of the hospital's staff are familiar with the social media although the individuals don't have equivalent computer competencies. They trust social media for personal use but they are rather cautious for professional use. Social media use by hospitals' staff in Greece for professional use is in the early adoption stage. Profession affects the attitude of the staff towards medical blogs whereas the age of the staff does not have statistically significant influence.

Keywords: *Internet, web 2.0, social media, health, hospitals' staff*

INTRODUCTION

Social media is one of the defining phenomena of present times, reshaping the world. It refers to a set of "tools, practices, and ideologies that emerged after the dot-com crash" (Boyd, 2015 p.1) and comes in many forms, including blogs, wikis, social networking sites, forums, business networks, photo and video-sharing platforms, social gaming environments, microblogs and chat applications. The power of social media is the number of worldwide users. In 2016 the number of worldwide users amounts to 2.2 billion and is expected to reach some 2.5 billion by 2018 (Statista, 2016a). Facebook, Twitter and Instagram are of the most famous social media (Boyd, 2015). Facebook was the first social network that surpassed 1 billion registered accounts. On April 2016, Facebook had 1.65 billion monthly active users (Statista, 2016b) and five new profiles were created every second. Facebook users are active and consistent in their visits to the site as 1.09 billion of Facebook users log onto their accounts daily (Zephoria 2016).

Twitter is the most popular microblogging platform that allows users to share information via short messages of 140 characters. Currently, Twitter has more than 1.3 billion registered users (Smith, 2016) and more than 320 million monthly active users (Statista, 2016), who send 500 million tweets per day.

Adults use social media to access health information and according to Hughes (2010) nearly 80% of physicians who consult with patients online use social media channels to create or share medical content. Social media have broadly affected medicine and health professionals are increasing using them (Thackeray et al., 2012; McKee, 2013; van Muhlen & Ohno-Machad, 2012). Social media has changed the way that health care professionals get informed and communicate with patients (van Muhlen & Ohno-Machad, 2012). More explicitly, social media can be used to promote health behaviors, to inform, educate, and empower people about health issues and public health programs (Vance et al., 2009) to disseminate health promotion messages (Neiger et al., 2012) including emergency broadcasts during natural disasters (van Muhlen & Ohno-Machad, 2012) and information during meetings and conferences (Desai et al., 2011; McKendrick et al., 2012) to enhance professional networking and medical education (Chauhan et al., 2012; Farnan et al., 2013; Forgie et al., 2013; van Muhlen & Ohno-Machad, 2012) and to mobilize community partnerships and action on health issues (Thackeray & Hunter, 2010).

On the other hand, patients are using social media to find health information (Chretien and King, 2013), to communicate with doctors and other health care professionals (Fox, 2011; Ventola, 2014), to share their stories with “patients like me” and gain knowledge (Sarasohn-Kahn, 2008) and to find support through discussion groups and forums for illnesses (Fox, 2011). Thus, through social media patients are acting as sources of mutual support for others with similar ailments (Sugawara, 2012).

Internet penetration in Greece (63.2% of the population) is quite low compared to other European countries (Internetworldstats, 2016). Regarding the profile of the Greek Internet users, more than 6 out of 10 men are using the internet and the ratio is almost the same among women. However, there is a strong variation, between different age groups. More than 9 out of 10 Greeks aged between 16 and 24 are using the internet, compared to 1 out of 10 Greeks aged between 65 and 74. The variation between groups of different educational levels is also considerable: the internet is used by 9 out of 10 Greeks of high educational level, by 7 out of 10 Greeks of moderate educational level and by about 2 out of 10 Greeks of low educational level (Adamantopoulou, 2014). Half of the Greek population is registered on at least one social media platform and spend more than 80 minutes per day networking (Kassimi, 2015) Facebook is the leader and on 15 November 2015 had approximately 4.800.000 users in Greece (Internetworldstats, 2016). Blogs remain a steady force in the social media world, with 55.636 recorded sites. In 2015 the largest growth of all social media platforms has been recorded for Youtube: Greek Youtube user accounts have increased by 79 percent, making for a total of 634.050 users. The second

largest increase in subscriptions is awarded to Twitter. Twitter has 509.448 Greek accounts (Kassimi, 2015).

Social media applications have attracted considerable attention as a means to improve health care delivery (Hughes et al., 2009). Despite evidence demonstrating their use by medical professionals, in Greece there is no research describing their adoption and use by hospitals' staff. Thus, the paper aims at filling this gap and investigates attitudes and use of social media for personal and/or professional purposes by medical, nursing and paramedical staff of Greek hospitals.

USE OF SOCIAL MEDIA BY MEDICAL STAFF

Previous studies have investigated the use of ICT and social media by medical staff and health settings in different countries around the world. The Health Care Social Media List includes health organizations that actively use social media. In the U.S.A 1599 health organizations are included in the list; 1301 organizations maintain a Facebook, 1080 a FourSquare and 1010 a Twitter account (Mayo Clinic, 2016). Thackeray et al. (2012) also reported social media use by U.S.A. state public health departments. According to their findings, 60% of the departments are using at least one social media application, 86.7% of them have a Twitter account, 56% a Facebook account, and 43% a YouTube channel. They made on average one post per day, primarily to distribute information. The most common topics related to staying healthy and diseases and conditions. Health departments have few followers or friends on their social media sites and very little interaction with audiences.

Loeb et al. (2014) investigated the extent to which urologists and urology trainees' use social media. 74% of the responders in the survey had an online social media account. The most commonly used social media platform is Facebook (93%), followed by LinkedIn (46%), Twitter (36%) and Google+ (26%). Doctors aged under 40 years use social media at a percentage of 83% while those over 40 use them less (56%). 28% of respondents use social media entirely for professional purposes. The authors also reported that social media, use in urology conferences has greatly expanded. McDonald et al. (2010) also claim that young doctors are active members of Facebook. They conducted a cross-sectional survey of the use of Facebook by recent medical graduates and found that 65% of the responders had Facebook accounts. A quarter of the doctors did not use the privacy options to restrict their information to 'Friends'. Information included some healthy behaviors but they also revealed personal information that might cause distress to patients. Motives, barriers and expectations of social media use of both health professionals and patients were examined by Antheunis et al. (2013). A considerable proportion (59.3%) of health professionals uses one or more social media. Specifically, 43.1% use Facebook, 38.6% use YouTube, 35.9% use LinkedIn, 22.9% use Twitter, and 11.1% use Hyves. A quarter of the health professionals use social media for health-related reasons. LinkedIn (70.7%) and Twitter (51.2%) are

used primarily, especially for communication with colleagues and Marketing. The main expectations of the respondents for future social media were: *“that they can decide for themselves when they use social media”* and *“that they can refer to their background information”*. Finally, the respondents who do not use social media think that it is inefficient and they lack of skills.

Gonzalez de Dios et al. (2011) surveyed 44 pediatricians (36 neuropsychiatric staffs and 8 residents) to investigate bibliographic information resources and social media use. They found that the four most used social media applications are YouTube (73%), Facebook (43%), Picasa (27%) and blogs (25%). They used two age groups (minus or equal to 34 and major or equal to 35 years) and analysis showed that there were no differences in the responses between the two age groups. Usher (2011) examined the types of social media (Web 2.0) usage associated with eight of Australia's major allied health. Australian health professionals are using social media to interact for personal use but are failing to implement such technologies throughout their health professions to deliver health care. Wheeler et al. (2011) evaluated attitudes and practices of aesthetic surgeons to social media applications. 46.7% of the respondents used social media in their personal life while 28.2% in their practice. Most plastic surgeons managed their social media themselves or through a staff member and the majority of the respondents who used social media in their practice claimed that their efforts were directed toward patient referrals. Brown et al. (2014) provided the national profile of Australian doctors' attitudes and use of social media. They mentioned that the majority of the doctors use social media privately. Doctors make limited use of online communication in clinical practice. Most of the participants in the study were hesitant to immerse themselves more fully in social media and online communication due to worries about public access and legal concerns. Regarding social media use from nurses, Hughes (2010) mentioned that U.S. nurses are using micro-blogging and status update services to communicate with patients and three out of four recommend health websites to patients.

METHODOLOGY

The study aims at investigating the use of ICT and especially social media applications by medical, nursing and paramedical staff of Greek Hospitals. The research was conducted by administering a questionnaire which consisted of three sections. The first section of the questionnaire contained demographic data (age, sex, specialty), the second section contained items describing the education, training, working experience and the third section was related to the usage of the internet, social media and ICT.

The selection of questionnaire items was based on previous studies (Gonzalez de Dios et al., 2011; Usher, 2011; Wheeler et al., 2011). A five point Likert scale was used for the assessment. A jury of 12 experts (medical professionals employed at public hospitals) was surveyed to determine the content

validity of the proposed questionnaire. Then, a pilot study was conducted by administering the questionnaire to 35 healthcare practitioners. Taking into consideration the responses from the pretest group, considering variables and statistical analysis from the pilot test, the questionnaire was revised into a new validated version. Then the questionnaire was send to 4 public Greek hospitals to be approved by the Scientific Councils. The final version of the questionnaire was created by taking into account the comments and suggestions of the Scientific Councils. The questionnaire was distributed to 4 public Greek hospitals and was filled in by 188 respondents: medical, nursing and paramedical staff.

		Frequency	Percent %
Gender	Male	48	25.5
	Female	140	74.5
Age	20-30	15	7.98
	31-40	81	43.08
	41-50	73	38.83
	51-60	16	8.51
	>61	3	1.60
Profession	Nurse	106	56.38
	Doctor	61	32.45
	Technician	21	11.17
Level of education	Nursing school / Technical school	37	19.68
	Higher education	123	65.43
	MSc	12	6.38
	PhD	16	8.51

Table 1. *Hospital's staff sample description*

FINDINGS

In this section the findings of the empirical research are presented. The statistical elaboration of the data sets has been implemented by R, the software environment for statistical computing and graphical display (R Core Team, 2016a).

Demographic characteristics of the sample

Table 1 presents the sample profile of the 188 respondents. The majority of the hospital's staff were females; specifically 74.5 % were females and 25.5 % males. The vast majority of the respondents were middle aged staff, since 81.91 % of them were between 31 and 50 years old. About the half of the sample (56.38 %) consists of nurses whereas the 32.45 % were doctors. The rest of the sample was

technicians. The level of staff's education is very high because only one fifth of the respondents have graduated from a postsecondary institute while the rest of the sample has a higher education or postgraduate degrees.

Digital competencies of the staff

In order to investigate if the staff had the knowledge and ability to use computers efficiently the dimension Computer Competency was included in the questionnaire. It consisted of eight Likert type questions regarding manipulation of documents, spreadsheets and presentations with a computer, internet navigation, email communication and use of specialized medical applications. The range of the responses is extended from 1 (lower level of competencies) to 5 (higher level). The distribution of Computer Competency for all respondents is depicted in the histogram of Figure 1. The distribution reveals that for all levels of computer competencies we have a considerable high number of responses. Furthermore, the distribution is close to Normal with mildly negative skewness showing that the respondents with high level computer competency are a small majority of the sample. This evidence is confirmed by the mean value of the dimension, 3.23, which is slightly higher than 3 (corresponds to moderate computer competency).

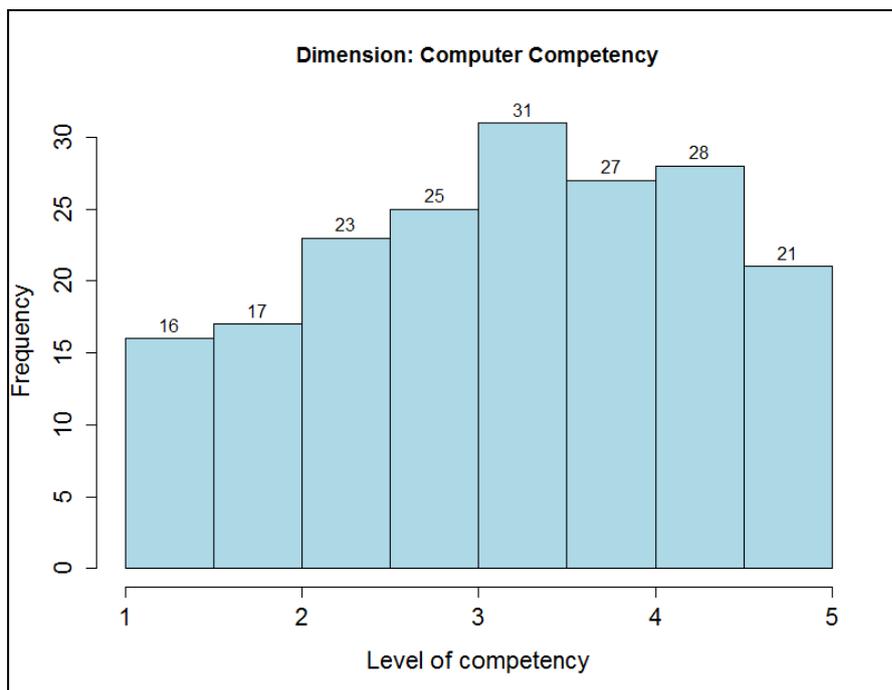

Figure 2. *Staff's computer competency.*

Another interesting question about the computer competency refers to the use of the Internet either for personal or professional reasons. The vast majority of the respondents (96.81 %) use the internet for personal reasons but only 66.49 % of the staff use the internet for professional reasons, as it is shown in Table 2.

Personal use %	Professional use %		Total
	Yes	No	
Yes	65.96	30.85	96.81
No	0.53	2.66	3.19
Total	66.49	33.51	100

Table 2. *Use of the Internet**The staffs' attitude towards social media*

The majority of the respondents (82.4 %) are familiar with the term "social media" but only a few of them use the social media for professional reasons (see Table 3). Specifically, 57.47 % (108 members of the hospitals' staff) use social media for personal reasons but only 16.49 % (31 respondents) for professional reasons. The last result indicates insufficient usage of web 2.0 applications, which may be due to lack of confidence in specialized medical social media.

Personal use %	Professional use %			Total
	No answer	Yes	No	
No answer	1	0	0	1
Yes	1	30	77	108
No	1	1	77	79
Total	3	31	154	188

Table 3. *Use of the social media*

In order to investigate the staff's attitude towards social media the Social Media dimension was included in the questionnaire. It consisted of five Likert type questions regarding the use of social media in the medical and healthcare professions. The range of the responses extended from 1 (disagreement) to 5 (agreement). The distribution of the responses of Social Media is presented in the histogram of Figure 2. The mean value and the median of the Social Media are 2.97 and 3 respectively. The distribution has similar characteristics with the one of Computer Competency as it is close to the Normal distribution.

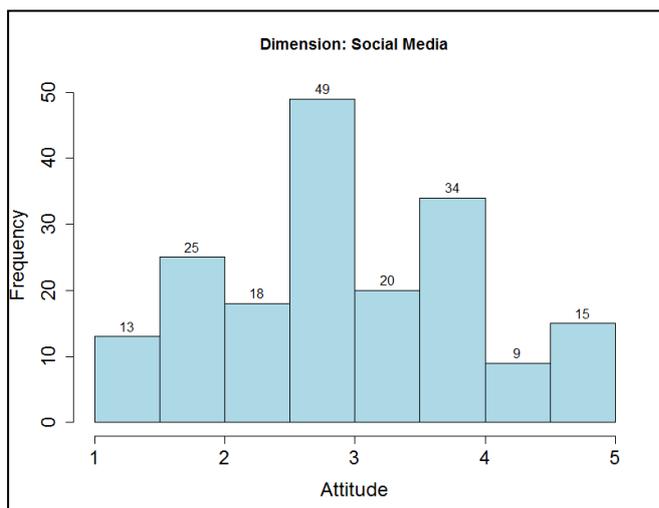

Figure 3. *Staff's attitude towards social media. The sample size is 183 (five individuals didn't answer the questions of the dimension).*

Only a small minority (16.49%) of the staff uses social media for professional reasons and their attitude towards medical blogs is more positive, as it is represented in the histogram of Figure 3. The same conclusion is deduced by the mean value of the dimension, which is 2.89.

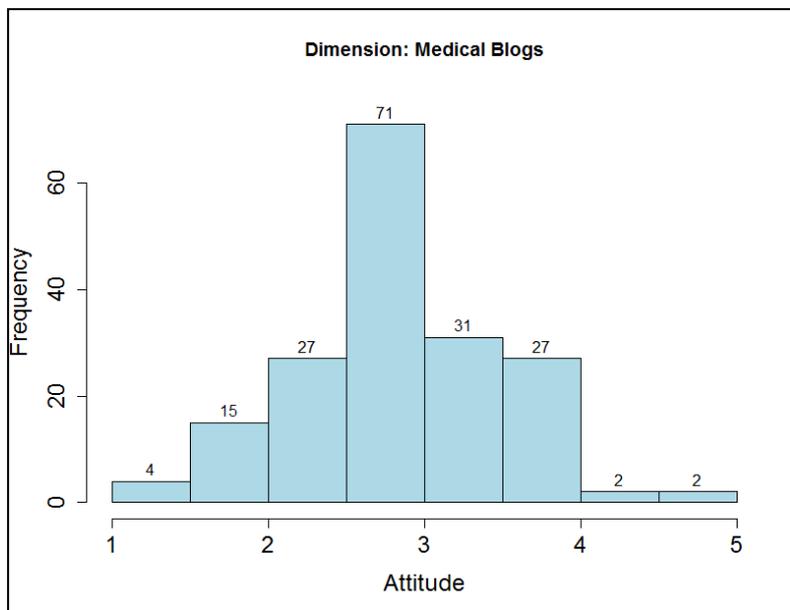

Figure 4. Staff's attitude towards medical blogs. The sample size is 179 (nine individuals didn't answer the questions of the dimension).

The preferences of the respondents to the most known social media are presented in the bar chart of Figure 4. Facebook, as it was expected, is the dominant choice with 55.9% and Google+ is second with 12.8%.

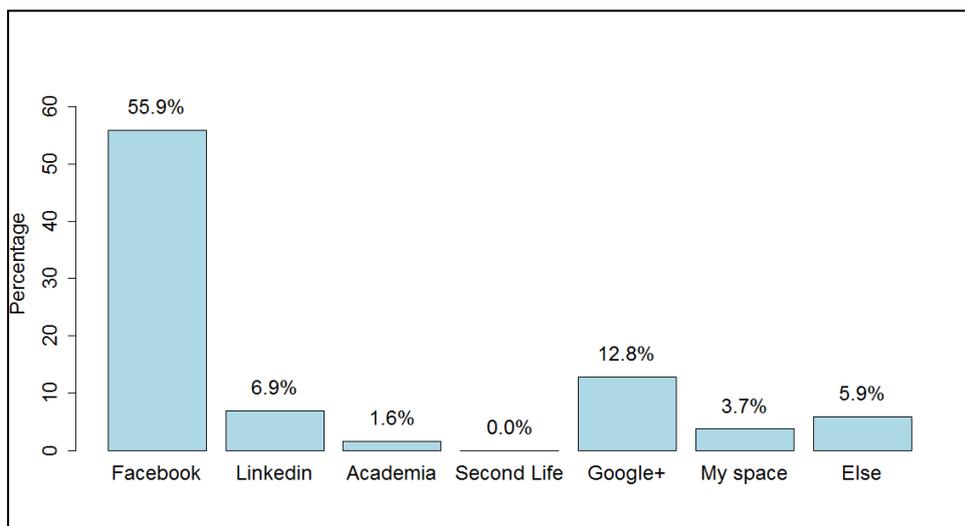

Figure 5. Staff's preferences about social media. 13.2% of the sample didn't answer the question.

Next, the influence of the profession on the staff's attitude towards medical blogs is examined. For this purpose the Analysis of Variance is employed (Rencher & Schaalje, 2008, ch. 13). The calculations, Innovation, Entrepreneurship and Digital Ecosystems

summarized in Table 4, indicate that there is a statistically significant difference in attitude towards medical blogs between doctors, nurses and technicians.

	Df	Sum of Squares	Mean Square	F value	Pr(>F)
Profession	2	4.94	2.4693	6.142	0.00264 **
Residuals	176	70.76	0.4021		

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Table 4. ANOVA table for staff's attitude towards medical blogs according their profession.

Having detected statistically significant difference between the levels of the factor profession (doctors, nurses and technicians) we proceed on the pairwise comparisons using Tukey's Honest Significant Differences method which is "a set of confidence intervals on the differences between the levels of a factor ..." (R Core Team, 2016b, pp. 1630-1631). If the confidence interval includes zero then the two mean values of Medical Blogs do not differ significantly between the corresponding levels of the factor whereas if zero is outside the limits a statistically significance difference is detected. According to Figure 5 it is noticed that nurses have more positive opinion about medical blogs than doctors. Generally, doctors have the most negative attitude towards medical blogs compared to the other professionals. This may mean that doctors prefer to consult more valid sources than medical blogs.

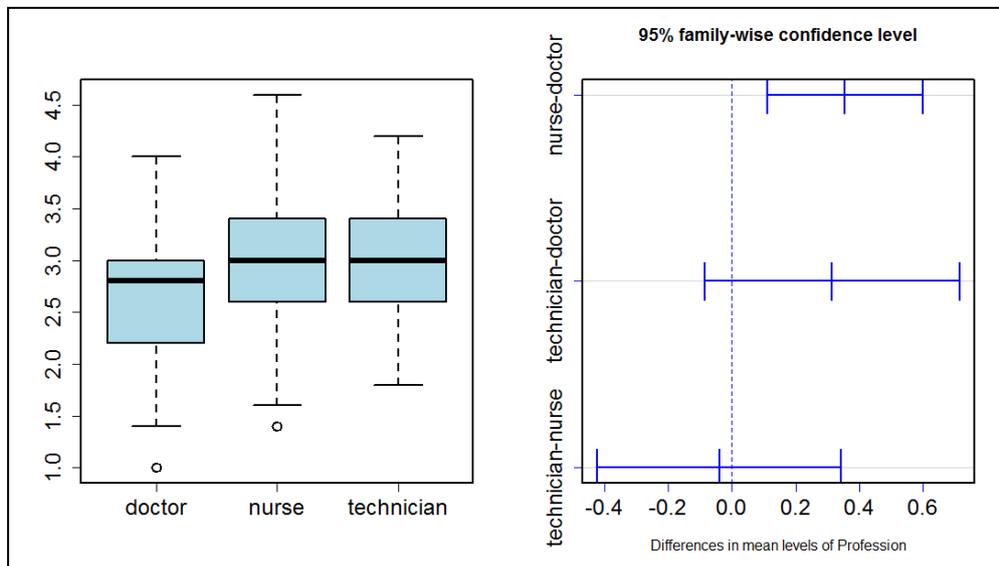

Figure 5. Box plots of Medical Blogs (on the left) and Tukey's Honest Significant Differences (on the right) for each level of the profession.

Similarly, ANOVA on the staff's attitude towards medical blogs between the levels of the factor age has been undertaken. As it is seen by Table 5 there is no statistically significant difference between the

levels of the factor. Therefore, the age of the staff does not affect their opinion about the use of medical blogs.

	Df	Sum of Squares	Mean Square	F value	Pr(>F)
Age	4	0.88	0.2209	0.514	0.726
Residuals	174	7482	0.4300		

Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1

Table 5. ANOVA table for staff's attitude towards medical blogs according their profession.

CONCLUSIONS

Social media offer new choices to medical, nursing, paramedical staff and patients. This paper aims at investigating social media use by hospital staff in Greece. The statistical analysis highlights that most medical practitioners in Greek hospitals are familiar with the social media although the individuals do not have equivalent computer competencies. This is in line with the major premise of social media which is the fact that the users can create their own content without having high computer competencies. Pedley (2005, p.95) characteristically wrote that "A major attraction of Weblogs is their relative ease of construction/ updating and the lack of the need or any special skills in web design or of HTML coding". As analysis revealed, the hospitals' staff trust social media for personal use but they are rather cautious for professional use. This finding is in accordance to those of Usher (2011), Wheeler et al. (2011) and Brown et al. (2014). Despite the fact that social media are becoming an increasingly common feature of the world hospital's staff has different practices and views regarding personal and professional use. There is an open argument about how much faith to place on social media. Hughes et al. (2009) highlighted the widespread concern with the risk of poor quality information in social media. Profession affects the attitude of the staff towards medical blogs whereas the age of the staff does not have statistically significant influence. Thus, it seems that social media is viewed as an increasingly important source of medical information for nurses while doctors are more skeptical. Doctors concern with the quality and authorship of online information and the risks associated with using potentially inaccurate or anonymously written information. However, recent growth of social media use implies that it is important for hospitals' staff to develop a better understanding of social media and their impact on health communication. In this vein, hospitals' administrations should propose and undertake staff training on the new digital media technology.

The study gives a first piece of evidence on the adoption and use of social media applications by hospital staff in Greece. However, the research was limited to the staff of four public hospitals and did

not investigate the factors involved in the adoption of social media. Thus, further research is needed to investigate the factors affecting the adoption of social media.

PREVIOUS CONVICTION (CRIMINAL RECORD) AND ITS EFFECT IN SOUTH AFRICAN LAW

Van der Bank, Christiena Maria

Vaal University of Technology, South Africa

ABSTRACT

The purpose of expungement statutes would be to promote and protect the right to equality and therefore promote re-integration into society after a criminal conviction. A criminal record has serious implications, for example, in practice a convicted person is branded as an untrustworthy member of society and are the subject of suspicion and mistrust. It will help adult offenders in their rehabilitation efforts and promote their re-integration into society. The retention of expungement of criminal records centres on two issues: the duty to promote safety in society and to protect citizens from dangerous and dishonest individuals and the right to equality and the constitutional duty on the state to free the potential of each person. This paper will evaluate the constitutional implications of all relevant legislative provisions, and how the principle of the expungement of criminal records should be interpreted, with due regard to South Africa's constitutional dispensation. The constitutional validity of legislation dealing with expungements and the extent to which it could be justified should be done having considered and weighed both the rights in question.

Keywords: *expungement, criminal record, protective, constitutional rights.*

INTRODUCTION

Bearing having a criminal record can have serious implications for an individual's prospects of finding employment. The rationale for legislation providing for expungement of criminal records infringe the rights contained in the Constitution namely the right of the community to protection and secondly the rights of an applicant to equity and dignity. In South Africa the issue of criminal records was recently brought to the public by an amendment to the Criminal Procedure Act 51 of 1977, through the Criminal Procedure Amendment Act 65 of 2008 which came into force on 6 May 2009.

IDENTIFYING THE ISSUES

Expunging your criminal record in South Africa is the process of applying to the Department of Justice under the South African Expungement of a Criminal Record in terms of the Criminal

Procedure Act, 1977 (Act 51 of 1997). If the expungement application is granted, you will no longer be considered convicted of the crime, and your criminal record will be permanently removed off the national criminal register. Subsequently, once the conviction is expunged by the Department of Justice you can truthfully tell employers, your family, and all other interested parties that you have not previously been convicted of a crime. Furthermore, the expunged conviction will no longer show on employer background checks. There is no universal accepted definition but in general refers to the destruction or obliteration of an individual's criminal file by the relevant authorities in order to prevent employers, judges, police officers and others from learning of a person's prior criminal activities.

The Criminal Procedure Amendment Act 65 of 2008 created a mechanism for the expungement of certain criminal convictions but various legislations are complex and in certain cases very confusing on the mechanism.

THE RIGHT TO PROTECTION AND THE STATE'S DUTY TO PROTECT SOCIETY

The duty to promote safety in society and protect citizens from dangerous and dishonest individuals is a State constitutional responsibility and liability and on the other hand the right to equality and the constitutional duty on the state to free the potential of each person must be balanced. Chapter 2 of the *Constitution 1996* contains no express hierarchy of rights and is affirmed by the Constitutional Court in *Khumalo and Others v Holomisa*.

The state has a duty to promote safety in society and protect citizens from dangerous and dishonest individuals. The question to ask is what is the state's responsibilities regarding effective criminal justice system and its liability to pay compensation to victims of crime in cases of failure to meet the required standards.

RELEVANT LEGISLATIVE AND CONSTITUTIONAL PROVISIONS

The question of the state's responsibilities regarding an effective criminal justice system and its liabilities to pay compensation to victims of crime in cases of failure must meet the required standards. Do the victims of crime have a right to compensation against an offender or the State in criminal proceedings or, following criminal proceedings in civil proceedings, should it be considered with reference to applicable legislation and the Constitution.

The Constitution does not create a right to compensation but confirms general rights applicable to all citizens which are therefore also applicable to victims of crime and have specific relevance to the

treatment of victims, for example the right to be treated with dignity, the right to protection, the right to life, the right to security of the person, etc.

THE LEGAL POSITION IN THE RESPECT OF COMPENSATION PRIOR TO THE CONSTITUTIONAL ERA

An offender's liability to pay compensation has been recognised in terms of the common law (civil cases) and in terms of national legislation (criminal cases).

Prior to 1994 claims against an offender were based on the common law and relevant legislation and liability of the offender was considered in terms of the law of delict and that of the state was considered in terms of the common principle of vicarious liability, where the state was held liable for the actions of its employees because of the existence of a special relationship between the State and its employees where the State acts through its employees.

Generally speaking, an employer is vicariously liable for a delict committed by an employee, provided that the employee was acting within the course and scope of his/her employment when the harm was caused (Neethling and Potgieter, 2010) (Boberg, 1984). The employer is held liable without fault for an employee's wrongdoing and the delictual liability of the employee is transferred

THE LEGAL POSITION IN THE CONSTITUTIONAL ERA

The Constitutional principles was considered for the first time by the Constitutional Court in *Carmichele v Minister of Safety and Security* and again in *K v Minister of Safety and Security* when considering vicarious liability in civil cases. In the *Carmichele* case a delictual claim for damages against the State by a rape victim not in the employ of government was submitted. The basis of the claim was that:

- 1) Despite the accused's history of sexual violence, the police and prosecutor had recommended his release without bail.
- 2) The complainant also relied on the duties imposed on the police by the Interim Constitution and on the State under the rights to life, equality, dignity, freedom and security of the person and privacy.

The Constitutional Court considered the potential liability of both police and prosecutors. As to the police, it held that the State is obliged by the Constitution and international law to prevent gender-based discrimination and to protect the dignity, freedom and security of women. It is important that women be free from the threat of sexual violence. In the particular circumstances of the present case the police recommendation for the assailant's release could therefore amount to wrongful conduct

giving rise to liability for the consequences. Similarly, the Court held that prosecutors, who are under a general duty to place before a court any information relevant to the refusal or grant of bail, might reasonably be held liable for negligently failing to fulfil that duty (*Carmichele v Minister of Safety and Security*).

The case of *F v Minister of Safety and Security* raised the question whether the Minister of Safety and Security should be held vicariously liable for damages arising from the rape of a 13 year old child by a policeman who was on standby duty in a typical so-called case covered by the common law.

The constitutionalised approach to vicarious liability set out by O'Regan J in *K* has been justifiably described as revolutionary and ground-breaking. In providing that policy, considerations and other norms must now play a direct and pivotal role in deciding questions of vicarious liability, the Constitutional Court gave the green light for courts to impose vicarious liability on employers in circumstances where the factual links between the conduct of the employee and the business of his employer were weak, but where compelling policy considerations existed to justify the imposition of vicarious liability on the employer. In the majority judgment of Judge Mogoeng CJ expressly emphasises the importance policy considerations now play in deciding questions of vicarious liability, and proceeds to set these out in some detail. However, a close reading of the judgment reveals that it was, in fact, the factual linkages that existed between the wrongdoer employee's conduct and the business of the SAPS which led the judge to make a finding of vicarious liability in this instance (Scott, 2012). O'Regan's decision to impose liability on the state was the constitutional imperative for doing so. The majority judgment in *F* would have been more internally coherent and better aligned with *K* if Mogoeng CJ had acknowledged the weak factual link between Van Wyk's delictual conduct and the business of his employer, but justified his decision primarily on the basis of constitutional norms and public policy. Such an approach would have set a precedent for other judges to consider a broad range of policy considerations when deciding whether or not to impose vicarious liability on the state, instead of being circumscribed by the restrictive and somewhat artificial "intimate link" enquiry with its emphasis on factual connections (Linscott, 2014 volume 17 no 6).

The justification for expungement legislation requires a consideration of two competing constitutional rights. On the one hand it entails the right to protection and on the other hand it entails the right to equality and dignity of citizens. The Supreme Court of Appeal in *Minister of Safety and Security v Van Duivenboden* concluded that while private citizens might be entitled to remain passive when the constitutional rights of other citizens are under threat, the state has a positive constitutional duty to act in the protection of the rights in the Bill of Rights. Secondly the current legislation enabling the expungement of criminal records entail an administrative process of a public official to approve the expungement of criminal records. The Constitution places an obligation on the organs of state,

through legislative and other measures, to ensure the impartiality, independence, dignity, accessibility and effectiveness of the court.

EXPUNGEMENT IN COMPARATIVE JURISDICTIONS

Expungement in the United States is a process which varies across jurisdictions. Criminal records may be expunged, though laws vary by state. Many types of offenses may be expunged, ranging from parking fines to felonies. In general, once sealed or expunged, all records of an arrest and/or subsequent court case are removed from the public record, and the individual may legally deny or fail to acknowledge ever having been arrested for or charged with any crime which has been expunged.

Expungement is experienced in the United States of America over many years and because of the variety in the legislation in the different states while expungement in South Africa is of recent origin.

A number of states in the USA provide for the expungement of criminal records in respect of both juvenile and adult offenders (Funk; 1996). There are differences in operation between the various states and federal statutes but all have one shared goal and that is they seek to prevent the courts, law enforcement agencies and employers from gaining access to information concerning an individual's prior juvenile arrest record and juvenile adjudications.

Once an expungement has been granted, the court will seal or destroy the criminal records in its possession. But what about the agencies and organizations that have previously entered the conviction into their databases? In many states, it is the individual's responsibility to submit a copy of the expungement order to these entities along with a request that they update their records accordingly. Individuals or their attorneys may need to disseminate proof of the expungement to other courts, prosecuting attorney offices, the department of motor vehicles, family services agencies, and so forth.

Convincing an agency to honor an expungement order can raise issues of jurisdiction and comity. For example, the record of a state felony conviction may appear in the FBI database, to be found by employers or others conducting a background check. After expunging such a conviction, a copy of the court order instructing that all records must be destroyed should therefore be sent to the FBI. However, because the FBI is a federal agency, it is not bound to follow an order issued by a state court. To resolve issues like this, it is wise to hire an attorney not only to obtain the expungement order, but also to make sure the order is distributed to, and recognized by, the appropriate agencies.

The justification for the expungement of criminal records of adult offenders are similar to those advanced in support of expungement of the criminal records of juvenile offenders. Both are motivated by a desire to mitigate the collateral consequences of having criminal record by providing convicted offenders with an opportunity to enhance or promote their re-integration into society under certain

circumstances. Therefore, the principle motivation for enacting an expungement process in respect of both juvenile and adult offenders, are similar. Most US jurisdiction offenders seeking to put their criminal past behind them are frustrated by a legal system that is too complex and unclear and therefore inadequate to the task. Discretionary decisions are often unfair and also unreliable. Pardon has never been routinely available to ordinary people in more than a handful of states, and administrative certificates of rehabilitation have not caught on outside New York. A pardon can be granted only by the President of the United States for federal offenses, and the state governor, certain other state executive officers, or the State Board of Pardons and Paroles (varies from state to state) for state offenses.

In the United Kingdom the term "spent conviction" is used. The relevant legislation is the Rehabilitation of Offenders Act 1974. The information needed to begin the process includes the date of the arrest, the offence you were arrested for, the original summons, warrant, complaint number or indictment. Also needed are the dates of the disposition or the date of the plea of "not guilty," as well as the specific punishment rendered by the court. The process to follow are;

- 1) Fill out the forms. There are six forms that need to be filled out and filed for criminal record expungement. The forms include the following: 1) Request for Police Records, 2) Petition for Expungement, 3) Order for Hearing, 4) Expungement Order, 5) Cover Letter and 6) Proof of Notice.
- 2) File the forms and have them served to the proper destinations. Three copies should be made of the Petition for Expungement, the Order for Hearing, and the proposed Expungement Order.
- 3) Once the forms have been filed, you will receive copies of the forms mentioned above with docket numbers stamped on them, and they will be marked as filed. Make seven copies of each of the three forms.
- 4) The seven copies should be mailed to the following government agencies via certified mail: The Attorney General, the Superintendent of State Police-Expungement Unit, the County Prosecutor, the Court Clerk, the Chief of Police where the offence was committed, the Chief Law Enforcement Officer of the state where the offence took place, and the warden of any institution where the person in question was incarcerated. The county probation office should be notified if the case involved a conditional discharge or pre-trial intervention.
- 5) Wait for your hearing to be set. Not all jurisdictions require attendance, but it would be in your best interested to attend. If there is no opposition presented against the expungement,

your record will more than likely be cleared by the judge. If there is an opposition, most likely from a law enforcement officer, the judge will hear his side of the story and then make the final decision.

- 6) Receive a copy of the expungement order; this is signed by the judge and stamped as filed by the court.
- 7) Make copies of this form and mail it to the government agencies listed, plus the records division of any institution where you were incarcerated, as well as the identification bureau where the arrest was made. http://www.ehow.co.uk/how_4618562_criminal-record-expunged.html

A very real distinction exists between an expungement and a pardon in the United Kingdom. When an expungement is granted, the person whose record is expunged may, for most purposes, treat the event as if it never occurred. A pardon (also called "executive clemency") does not "erase" the event; rather, it constitutes forgiveness.

In Germany the classification of Herzog-Evans (2011b)(Morgenstern, 2011) explains that the German system does not leave much leeway for ceremonies that would formally acknowledge desistance. The ex-offender does not even receive a notice once his or her record has been cleared.

PROBLEMS IDENTIFIED IN THE LEGISLATIVE FRAMEWORK OF EXPUNGEMENT IN SOUTH AFRICA

There are problems of non-alignment of different Acts (Constitution, The Criminal Procedure Act, Child Justice Act and Criminal Act) in the expungement legislative framework.

- 1) Differences in process, qualifications and consequences.

The Constitution does not specifically provide for expungement, it categorically states that a disqualification for membership of the National Assembly and the Provincial legislature ends five years after the sentence following a conviction has been completed and in fact confirms that no effect could be given to a conviction for purposes reintegration into society with reference to becoming a member of parliament five years after completion of the sentence. The Constitution does not provide for expungement of a criminal record in the same sense as the Criminal Procedure Act, but provides for the clearing or fall away of the consequences of such a conviction for purposes of employment.

Clarity should be provided regarding the implications and consequences of the falling away provision (Muntingh, 2011). In *S v Mqwathi* it was stated that the court had an unfettered discretion and does not mechanically take into account the 10 year period. It can be decided having regard to the nature,

number and extent of similar previous offences and the passage of time between them and the present offence, to leave out of account the previous convictions, even where the last conviction is less than ten years old, and treat the accused as a first offender.

2) Differences in the qualifying criteria for expungement in some of the different Acts.

The qualifying criteria for expungement in terms of the Criminal Procedure Act is based on sentence imposed whereas the qualifying criteria in respect of juvenile offenders is based on the offences listed in Schedule 1 and 2 of the Act.

The Director-General of the Department of Justice and Constitutional Development has no discretion to issue a certificate of expungement since a certificate must be issued if the Director-General is satisfied that there is compliance with the criteria in the Act. Section 87 of the Criminal Procedure Act does not provide that the issuing of a certificate of expungement leaves no discretion to the approving authority. It provides that the Director-General of the Department of Justice and Constitutional Development must on receipt of the written application of an applicant issue the prescribed certificate of expungement, and direct that the conviction and sentence of the child be expunged if the Director-General is satisfied that the child complies with the criteria as set down in the Act, namely the time lapse of five years in respect of the offences in Schedule a and ten years in respect of Schedule 2. The question arises whether or not provision should not be made for both juvenile and adult offenders to submit an application to court for an expungement in respect of a criminal conviction in respect of an offence or sentence not covered in the legislation and before expiration of the qualifying time frames based on the amended qualifying criteria and against the benchmark of consideration of the existence of exceptional circumstances.

Mr Muntingh state that there are a number of problem areas in relation to the procedure for removal (Muntingh, 2011). The time line for an application for removal from the National Sex Offenders Register is different from the time line required for submission of an application for expungement in terms of the Criminal Procedure Act. The recommendation is that the time line for applications for expungement and for removal of the name on the Sex Offender Registrar should be aligned.

Section 297 of the Criminal Procedure Act provides for an acquittal even though a conviction is recorded. The Criminal Procedure Act must be amended. A conviction remains a conviction and cannot be regarded as an acquittal.

An application for removal from the National Register for Sex Offenders has more formal requirements than an application for expungement. The applications must also be aligned.

CONCLUSION AND RECOMMENDATIONS

The Criminal Procedure Amendment Act has created a mechanism for the expungement of criminal records in certain instances but there are also further developments relevant to expungement and the consequences of a conviction and criminal record in respect of certain crimes. In respect of apartheid era crimes this was long overdue, but the new mechanism has now also drawn attention to the broader issue of criminal records and how this is designed, managed and utilised.

The various legislative interventions is a complex and often confusing due to a system that sets different sets of yardsticks when dealing with criminal records and their expungements. For example the key variable may be the date of conviction, the date when the sentence expires or the date of release from prison.

The question that must be asked is what purpose(s) the retention of criminal records aims to serve. Fundamental to the debate is the acknowledgement that having a criminal record can be severely detrimental to a person's access to employment and social status in general.

On the one hand for law enforcement purposes the state collects information on and maintains vast database on criminal convictions. This information appears to be accessible to third parties, especially the private sector. On the other hand, the state has a positive obligation not to discriminate and to promote equal treatment for all (section 9 of the Constitution). If finding employment is affected by discrimination based purely on having a criminal record. This may result in the violation of other rights namely dignity, the limitation of this right needs to be measured against the standard set in section 36 of the Constitution, namely the limitation clause. It needs to apply rules universally with minimum exceptions, striking a balance between the protection of public safety and Constitutional obligations.

A system of expungement needs to be understandable to lay persons and those who would stand to benefit from it. The provisions for the expungement of criminal records are complex since different provisions apply to different cases and in some instances these are connected to the registers that have their own criteria for removal.

The possibility of expungement should create a real incentive for a broad range of convicted offenders to refrain from committing further offences.

Developing policy and legislation for the expungement of criminal records should be based on reliable information describing offending and re-offending patterns.

The retention of criminal records should be selective and purposeful. There is a small group of offenders who will continue to pose a risk to society and/or who have committed such heinous crimes that the expungement of the conviction(s) is not morally justifiable. There is also offenders that such persons to be expunged is not in the interest of public safety. The aim should be to define these

categories of offenders as narrowly as possible with the purpose to protect public safety, rather than blanket categorising that have been the basis for the existing legislation on the expungement of criminal records.

There is no man, however wise, who has not at some period of his youth said things or lived in a way the consciousness of which is so unpleasant to him in later life, that he would gladly if he could, expunge it from his memory. (Marcel Proust, French Novelist and Author 1871-1902).

ORGANIZATIONAL DECLINE IN PUBLIC SECTOR ORGANIZATION: KEY PUBLIC POLICY

Vinarski - Peretz, Hedva

Department of Political Science and Department of Healthcare Management, YVC College & Department of Public Policy, Tel Aviv University, Israel

ABSTRACT

Purpose: This paper aims to understand causes of organizational decline in the public sector, while focusing on how lack of public policy and reducing budgets intensify the incidence of decline in public organizations. This topic is likely to remain a highly relevant concern to worldwide management and public policy scholars studying how organizations fail to mitigate decline and how such consequences arise. However, research on this phenomenon within the public setting remains empirically and theoretically fragmented.

Methodology: The paper relies on a qualitative dataset and analysis of public documents and reports, committees of inquiry findings and institutional publications all used to identify the policy causes of prolonged decline in the public Fire Fighting Services in Israel.

Findings: The findings suggest a dynamic view of the organizational failure, showing that over three decades, two main external factors – lack of public policy and unsuitable budget policy – simultaneously affected the nature and outcomes of organizational decline in the public Fire Fighting Services in Israel.

Practical implications: Organizational response is an important factor in coping successfully with conditions of organizational decline. Both the theoretical framework and the findings are likely to motivate leaders and managers to recognize major weaknesses or features that may potentially intensify decline and threaten the robustness of the organization in the public sector.

Originality: The paper emphasizes the insight that effective measures to prevent or remedy organizational decline in the public setting require a prior understanding of its root causes.

Keywords: *Organizational decline, Public Policy, Public Management.*

INTRODUCTION

Organizational decline is a common phenomenon in the organizational domain. Notably, about half (49.8%) of the companies in the SandP 500 index for the year 2010 had experienced more than three years of decline within the prior five years (Trahms, Ndofor, and Sirmon, 2013:1278). Organizational Innovation, Entrepreneurship and Digital Ecosystems

ISBN: 978-9963-711-43-7

decline refers to "a substantial, absolute decrease in an organization's resource base [that] occurs over a specified period of time" (Cameron, Kim, and Whetten, 1987a: 224) and potentially threatens the stability as well as the existence of the organization.

Drawing on the idea that whether decline results in a positive or negative consequence depends on how it is managed (Cameron, Kim, *et al.*, 1987), the main argument in the paper is that organizational recognition and response are inevitable. Specifically, managers and decision makers in the organization should understand the onset of decline, its characteristics and its specific roots. The paper aims to describe how specific external causes may intensify decline and failure conditions in public sector organization, because less effort has been invested in reviewing or exposing these topics in public settings (Amankwah-Amoah and Debrah, 2010; Jas and Skelcher, 2005) than in private ones.

In the literature organizational decline is discussed extensively in several disciplines, and the core body of study has tried to understand and investigate the nature of the phenomenon, its characteristics and its hazardous consequences. The literature suggests several causes of decline in the organizational setting (Anheier, 1999; Levine, 1978; Mellahi and Wilkinson, 2004; Meyer and Zucker, 1989; Whetten, 1988). It distinguishes between external and internal sources of decline and examines the ability of the organization to influence or manage that decline (Jas and Skelcher, 2005). However, so far "we are still unable to fully capture the underlying dynamics or explain how and why firms, even seemingly successful firms, may decline" (Serra, Ferreira and Almeida, 2013, p. 135).

Based on the assumptions that effective measures to prevent or remedy organizational failure and decline require an understanding of its root causes (Amankwah-Amoah and Debrah, 2010; Carmeli and Schaubroeck, 2008), the paper aims to discuss the role of lack of public policy and the reduction of resources and budgets in augmenting organizational decline in the Fire and Rescue Authority in Israel. The paper is congruent with the actions of Western European countries such as the UK who introduced, a decade ago, performance management regimes to address perceived weaknesses in public service and avoid failure within their organizations (Andrews, Boyne, and Enticott, 2006).

The relevance of a public-sector context of the literature on organizational decline is limited. To date, most studies that discussed causes of organizational failure and decline targeted business, economic and organizational behaviors or strategic aspects (Cameron, Sutton, and Whetten, 1988; Carmeli and Scarbroak, 2008; Debrah, 2010; Latham and Braun, 2009; Mellahi, Jackson, and Sparks, 2002; Mellahi and Wilkinson, 2004, 2010; Mone, McKinley, and Barker, 1998) rather than public management or public policy. As Jas and Skelcher (2005; 199) point out, the empirical evidence is largely drawn from the private sector, where there are different institutional and organizational characteristics. In contrast, public organizations present a different performance and more complex results. From the private sector viewpoint, failure is principally conceived in terms of organizational scale (employees,

turnover or product range) or market share, criteria that do not translate into the public-sector environment where scale is a function of legal and political decisions, and services still retain a quasi-monopolistic status. Another tendency of the core body of empirical studies is to concentrate on private sector organizations located in North America and Europe (Bruton, Ahlstrom, and Wan, 2001, 2003). Consequently, less empirical research and theorizing exist in the public-sector context.

The paper is organized as follows. It starts by suggesting a definition of organizational decline in the public organization context and follows by presenting the main perspectives used to examine this topic. Next the case study of organizational decline in the Fire Fighting Services of Israel presents two main external causes – a lack of public policy and a reduced budget – and explains how these intensify organizational decline. Finally, a brief conclusion follows after the topic entitled Implications for Public Policy and Decision Making

THEORETICAL BACKGROUND

DEFINING ORGANIZATIONAL DECLINE

Researchers that discuss organizational decline mainly focus on two major topics: the first, which is the basis of our study, being the causes of such decline (Anheier, 1999; Cameron, Sutton, and Whetten, 1988; Finkelstein, 2003; Mellahi, 2005; Mellahi *et al.*, 2002; Sheppard and Chowdhury, 2005). The second topic is organizational learning from previous experiences, in particular during periods of failure. Here the discussion concentrates on how great organizations put failure to work in order to improve and innovate (Cannon and Edmondson, 2005), and how companies can learn from their failures (Baumard and Starbuck, 2005; Carmeli and Schaubroeck, 2008; Desai, 2010; Yeo, 2010).

The classic studies which form the basis of this research describe organizational decline in a variety of ways, such as reduction of organizational dimension or a downturn in organizational size or performance (McKinley, 1987), stagnation or cutbacks (Whetten, 1980b), a decrease in the number of organizational employees and resources a decrease in an organization's resource base (Cameron, Kim, and Whetten, 1987) or maladaptation to a changing environment. Freeman and Cameron (1993) distinguish organizational decline from organizational downsizing. The former is an involuntary, unintended resource decrease that affects an organization, whereas organizational downsizing is an intentional workforce reduction engineered by managers (McKinley, Latham, and Braun, 2014:90).

Regarding unique characteristics of the public sector, some external symptoms noted above are irrelevant when seeking to understand the decline phenomena within organizations with national or public stakeholders. Hence, we adopt the McKinley, Latham and Braun (2014) idea – originally suggested by Cameron *et al.*, (1987a) – concerning the most relevant definition that generalizes across profit-making and not-for-profit organizations. These researchers explain organizational decline as a

successive, year-after-year decrease in an organization's resource base of a minimum two year duration. In other words, a "two-year period is a useful minimum time period for defining organizational decline because it provides enough time for the resource reductions to be noticed by managers and to evoke a response" (McKinley, Latham and Braun 2014: 90).

Within public organizations the measurement, evaluation and determination of decline are distinctive since governmental policy and actions focus more on social strategy than on profit-making and competitive goals. Naturally, public sector organizations are not targeted on a profit basis and are generally evaluated regarding their provision of goods or services that create public and social value. Gillespie and Dietz (2009) describe failure and decline situations as a single major incident, or as a cumulative series of incidents, resulting from the action or inaction of organizational agents. Such actions threaten the legitimacy of the organization and can potentially harm the wellbeing of one or more of the organization's stakeholders (p. 128). Based on that idea, public sector declines occur in cases where at least some of the key stakeholders in the organization (employees, citizens and other beneficiaries) believe that it faces problems that seriously threaten its legitimacy, resource base or even its survival. These problems imply a reduction of skills, capabilities and resources within the organization (Cameron *et al.*, 1998; Mordaunt and Otto, 2004). This is consistent with the idea that decline and failure conditions generally have prolonged negative consequences. To help understand their causes, one may take both organizational and environmental factors into consideration (Mellahi and Wilkinson, 2004).

CAUSES OF ORGANIZATIONAL DECLINE

Causes of decline can be classified into two points of view with two different perspectives: one focuses on environments (specifically, the external environment) (Aldrich and Pfeffer, 1979; Cameron *et al.*, 1988), whereas the other concerns managerial behavior (specifically, internal factors) (Brown and Starkey, 2000; Doganis, 2006; Hodgkinson and Wright, 2002; Tedlow, 2008). In the external environment, studies have suggested a range of causes for organizational decline, which are mainly rooted in the changes and challenges of market, global and public environments and economic conditions (Kam, 2005). The second dominant perspective focuses on internal behavioral factors (Kam, 2005; Tedlow, 2008), primarily emphasizing internal and human factors in organizations. Among these are strategic persistency (), a threat-rigidity effect (Staw, Sandelands and Dutton, 1981), decision-makers' judgments on failure (Larson and Clute, 1979) and organizational inertia (Miller and Chen, 1994). These research studies suggest that internal traits are the main contributors to an organization's decline and eventual failure, while (Kam, 2005: 401) downplays the influence of the external environment. Managers, who play a central role, can shape the fate of their organization by

responding well or poorly to external changes (Barker and Duhaime, 1997). Management actions tend to be influenced by their mental models of the organization and its environment (Mellahi and Wilkinson, 2004; 28).

Studies on the public sector have noted that public organizations are more likely to fail and display decline conditions if they have weak political and managerial leadership (Andrews *et al.*, 2006). Research on decline in state-owned companies found relationships between excessive bureaucracy, poor management, lack of clear strategy, overstaffing, political intervention and undercapitalization (Doganis, 2006). Amankwah-Amoah and Debrah (2010) argued that performance and failure occur mainly as a result of environmental factors in a process of “natural selection”, where companies that do not fit their environment are “selected out” and “pay the high price” or “collapse” (Andrew *et al.*, 2006).

Regarding external causes that are relevant to the public sector, organizational ecologists seek to explain how social, economic or political conditions affect the relative abundance and diversity of organizations. (Clegg and Hardy, 1999) emphasized that other organizations can play a role in the likelihood of success or failure of an organization (Mellahi and Wilkinson, 2004: 24). Similarly, government units and political decisions enhance the potential of organizational decline. Next we present a specific case study of the public Fire Fighting Services of Israel. Here two main external factors in the governmental and political environment – lack of public policy and budget reduction – coalesce, intensifying and prolonging organizational decline.

CASE STUDY METHODOLOGY

DECLINE IN THE FIRE FIGHTING SERVICES OF ISRAEL

On July, 2012, two years after the Mount Carmel Forest mass disaster in Israel, in which, 44 people were killed and almost 17000 citizens evacuated and transferred, the Israeli government accepted Decision No. 2699 to establish a new operation of the Fire and Rescue Authority within the public sector (Prime Minister's Office, Decision No. 2699, 2011). Currently this authority operates under the new law of "Israel Fire and Rescue Services – 2012" that is based on intensive policymakers' work. The law was passed as part of a comprehensive reform of the Firefighting Services in Israel and assumes the necessary legal infrastructure to operate the national authority of the Fire and Rescue Services in Israel.

Structurally, before 2012 the activities of the Fire and Rescue Services in Israel were regulated under the Fire Department law of 1959 and operated as municipal entities. Overall there were 24 authorities: 20 of them were conurbations of Fire Fighting Services, and four other authorities worked directly under local authorities. The head of these 24 authorities was appointed commander of the Firefighting

Service. One of the main changes in the public policy manifested in the new law is the transition from decentralized conurbations to the establishment of a national authority that operates on a nationwide basis under the Ministry of Public Security.

Between January and June 2011 the State Comptroller investigated aspects of the structure of the firefighting system and its services. The findings published on June 20, 2012 by the State Comptroller's office emphasize that recognizing decline in public sector organization is a critical skill that involves understanding its roots, so as to predict and to avoid problems.

THE RESEARCH CONTEXT

Edmondson and McManus (2007) indicate that qualitative research is appropriate to explain the dynamics. Using case studies or a narrative provides at least two key advantages to this type of inquiry. First, through this process informants can assign meanings to their lives and their social environment (Weick, 1995; Gabriel, 2000). Second, individual case studies or narratives often represent facts and interpretations of a broader collective reality (Boje, 1991).

DATA COLLECTION

Qualitative data was collected for study for a comprehensive examination of the organizational failure within the Fire Fighting Services of Israel between 2010 and 2012. The data included numerous examples of official publications such as the State Comptroller's report (Omissions, Failures and Conclusions 20.6.2012), the main audit report, a committees report, policy papers and documents provided by Ministry of Interior committees.

The data were analyzed in a two-step process. First, I identified common themes that repeatedly appeared in the content data and organized them into frameworks representing the identified dominant responses (Miles and Huberman, 1984). Secondly, I compare the documents and located central themes (Kets de Vries and Miller, 1987).

ANALYSIS OF THE EXTERNAL FACTORS OF DECLINE – PUBLIC POLICY

When the general public and policymakers believe that government needs to intervene to correct a social problem, they create or alter policies (Kraft and Furlung, 2015). In the case of the Fire Fighting Services of Israel, over the years policymakers discussed its decline and mentioned the responsibility of government to confront its critical deterioration of organizational capabilities and resources. Six public reports published by government agencies in 1995, 1998, 2007, 2009 and 2012, and one main audit report by the State Comptroller after the Second Lebanon War examined the Fire Fighting

Services' preparedness for emergencies and functions during wartime and in general. The reports list deficiencies that were found in the Fire Fighting Services in terms of organizational structure and resources (equipment and manpower) (The state comptroller, 2010:19). Repeated conclusions documented in these reports argue that the lack of clear policy in handling the Fire Fighting Services was the main cause for the ongoing decline. Analysis of public reports focuses on government actions since 1978. They reveal that the Israeli government mainly dealt with Fire Fighting Services problems by writing reports and appointing public committees to investigate and examine conditions, instead of initiating meaningful actions, such as legislation, government support and resource allocation (Audit Report, 2012-004: 5). In other words, the main policy was inaction (Audit Report, 2012: 467-469).

Year	Event	Main Policy implemented
1948	Expansion of fire system within the conurbations	
1995	Fires in the Jerusalem and Judean hills, Golan Heights, hazardous materials in Ashdod and Haifa mountains	The government appoints the Lapidot Committee to investigate the condition and activities of the Fire Fighting Services.
1998		The government appoints the Genosar Committee to examine how to implement the recommendations of the Lapidot Committee.
2006	Second Lebanon War 2006	
2007		State Comptroller publishes Report - recommendations for immediate changes after the Second Lebanon War 2006.
2009	Firefighters' Strike	Government discussions and examination of the decision by the Ministry of the Interior and the Ministry of Treasury.
2010	August - Fire in the Golan Mountains. Fire in Tel Aviv – Allenby Building	
2010	December - The Mount Carmel Forest Mass Disaster	Investigative committee and government decision following the Mount Carmel forest fire. The State Comptroller's Report: Preparation Fire and Rescue Service for Emergency.
2012		20.6.12 - State Comptroller's report published with the findings of the failure within the public services after the Mount Carmel Forest mass disaster.
2013		8.2.2013 - The National Fire and Rescue Authority now operating by force of the "2012 National Fire Authority" law.

The State Comptroller's Report regarding government policies and responsibility concludes that the degree of failure in this case is very high since most government officials understood that inaction has a harmful impact on the organization. The absence of policy was accompanied by not anticipating the future and not providing crucial resources for dealing with emergency issues on a daily basis. Since policymakers and leaders adopted a closed-eye strategy for a long time and ignored the deteriorating conditions, the organizational decline intensified. There was severe continued neglect by government

leadership, although its basic duty was to provide policies and avoid organizational decline and failure in these emergency public services (Default, Failures and Conclusions, Audit Commission, 2010; 505).

BUDGET POLICY

In the public sector one major cause of organizational decline is reduced public finance and resources. As suggested by McKinley, Latham and Braun (2014), organizational decline is defined as a successive, year-after-year decrease in an organization's resource base that lasts for at least two years. As mentioned, in the public sector decline occurs in cases where at least some key stakeholders in the organization (employees, citizens and other beneficiaries) believe that it faces problems that seriously threaten its legitimacy, resource base or even its survival. Decline also implies a reduction of skills, capabilities and resources within the organization (Cameron *et al.*, 1998; Gillespie and Dietz, 2009; Mordaunt and Otto, 2004). In the case of the Fire Fighting Services government decisions led to low budgeting and reducing resources. As a result, the organization faced critical problems that negatively affected its capabilities and performance.

Analysis of the document regarding the Fire Fighting Services budget revealed that it was based on three financial sources: local authorities, self-generated income and the Ministry of Interior. It was found that over an entire decade the Ministry of Finance implemented a budget-cutting policy in many public emergency units. An audit report after the Second Lebanon War (2007) noted that the ability to improve preparations for emergency firefighting services depended primarily on the allocation of funds required, and on execution of organizational change. The systematic reducing of budgets endangered the survival of the organization in those years, adversely affecting its routine work.

Until 2012, the annual budget of the Fire Fighting Services of Israel was NIS 500 million. Only part of this amount, NIS 200 million, was provided by the state budget, and the rest came from two different sources: NIS 200 million from local authority budgets, and NIS 100 million from Fire Fighting Services fees and taxes (15% of the budget was based on fees, 35% was funded by the Ministry of the Interior and the remaining 50% came from local authorities). Although by law the state was required to pay 50% of the budget, it paid only 35%, while claiming that the Fire Fighting Services must complete the 15% through municipal grants. Ironically, the vast majority of the annual firefighting budget, 85% (NIS 425 million), was directly channeled to payroll expenses. The remaining 15% (NIS 75 million) was allocated for all other expenses, including property tax, construction, maintenance and purchase of new equipment (Research and Information Center Israeli Knesset, 2009: 4; Preparations of the Fire and Rescue Service for Emergency report, 2010:9).

The financial state of the firefighting agencies was affected by the fiscal and economic stability of local authorities. As a result, differences in solvency among local authorities caused obvious differences among regional stations as regards standard manpower, the number of fire stations, fire training and other critical resources. In this context, the Firefighting and Rescue Commissioner claimed that a major budgetary problem was the involvement of local authorities in funding firefighting in Israel. Since the authorities are both governmental and municipal, they are headed by the central government and by local governance. Also, the economic crises within local government authorities in Israel since 2004 worsened the situation (Research and Information Center Israeli Knesset, 2009: 6).

Shortage of human resources in the professional arena impairs the ability to provide daily services. In 2007, the basic standard for personnel services was 1,783 jobs, namely 1,532 for firefighters and 251 for administrative jobs, but in fact only 1,633 jobs were staffed – 1,375 jobs for firefighters and 258 administrative jobs. The main reason for that gap was local authority budgetary difficulties that did not enable them to finance the basic standard. In the short run, this gap created major damage in routine work and basic activities (Audit Report, 2007).

The cutback policies dramatically influenced organizational decline and, as documented, most of the fire stations across the country suffered from a shortage of resources, a reduction of skills and capabilities, and a lack of coordination between the units (Default, Failures and Conclusions, Audit Report, 2010). The paradox is that even five years after the extensive investigation of organizational conditions nothing had change. The fire department's weaknesses and inability to successfully cope with its duties during the 2006 Second Lebanon War were soon apparent. The next State Comptroller's report (2012) documented that the only significant step taken by the Ministry of the Interior was to decrease budgets temporarily, rather than learn the lessons of previous public reports and committees. In short, the main government policy was that of cutbacks.

DISCUSSION

As the public-sector performance improvement agenda develops, and the problems of poor performance organizations come to the fore, so there is a need for theoretically based policy and management (Jas and Skelcher, 2005: 208). In light of this, the main goal of this paper is to illustrate how specific external causes in government and political policies intensify the decline and failure in public sector organization, particularly since less effort has been devoted by scholars to review or expose these topics (Amankwah-Amoah and Debrah, 2010).

Organizational decline in public sector organization is explained here as a successive, year-after-year decrease in an organization's resource base that lasts for at least two years. As McKinley, Latham and Braun (2014) suggest, a two-year period is a useful minimum time period for defining organizational

decline because it provides enough time for resource reductions to be noticed by managers and to evoke a response. The publicity data published by the State Comptroller, together with government reports and documents, were analyzed in light of that idea. The findings indicate that lack of public policy during three decades and an unsuitable budget policy significantly fueled organizational decline within the Fire Fighting Services in Israel. Over the years the government focused on writing reports and appointment of public committees to investigate conditions and circumstances, rather than actively coping with the decline and failure conditions. Although these official extensive works recognized the negative symptoms of the decline, no act was taken and the decline consequently intensified. Poor strategy was adopted by policymakers, and while committees studied the case they allowed a suspension of decisions and did not lead policy on this complicated situation.

Concerning organizational decline in the public sector, the literature is currently deficient. This paper suggests an initial formulation for such a theory of public sector decline by analyzing data from a case study in the Israeli public sector. This attempt may motivate future researchers to further conceptualize and rethink organizational decline.

IMPLICATIONS FOR PUBLIC POLICY AND DECISION MAKING

Regarding government actions and theoretical policy, policymakers and politicians are all concerned about the impact of organizational decline and challenged to avoid such conditions among public services. On the practical level, however, they are required to make and implement decisions about the issue at hand. Concerning that policy decision process, "the irony is that, today, the primary threats to our survival, both of our organizations and of our societies, come not from sudden events but from slow, gradual processes; the arms race, environmental decay, the erosion of a society's public education system, [...] are all slow, gradual processes. [...] If we focus on events, the best we can ever do is predict an event before it happens so that we can react optimally" (Senge, 1990: 21-22).

The test case of the Fire Fighting Services in Israel showed that government inaction concerning organizational decline and its non-response strategies did not eliminate the fact of decay or mitigate its implications. These findings are relevant to policy makers who need to prevent decline and avoid failure within public services. Understanding the impact of these causes as well as addressing organizational decline in public services is beneficial and contributes to the wellbeing of society. The decisions that were reached, and the actions that were taken two years after the Mount Carmel mass disaster, and twelve years after the public committees' conclusions and two state comptroller's reports may provide an important lesson for public policy makers.

LIMITATIONS AND FUTURE RESEARCH

There are two major limitations to the approach adopted here. First, the study was based on a single organization in a non-experimental setting. Therefore, the findings cannot be generalized beyond the scope of this study to other organizations in a similar environment. As such, future research should seek to replicate this study in other organizations to provide a better understanding of conditions that are common to declining organizations in the public sector. The second limitation relates to the fundamental difference between public and private organizations in terms of their goals, stakeholders, culture and processes. This implies that the findings and lesson from this study might not be generalizable to the private sector. For this reason, future research should seek to replicate the study in the other sectors to confirm the findings' applications and limitations.

IMPLEMENTING HEALTH INFORMATION TECHNOLOGY (HIT) TO IMPROVE SERVICE DELIVERY: THE CASE OF THE NEONATAL INTENSIVE CARE UNIT (NICU)

Vitner, Gad

School of Engineering, Ruppin Academic Center, Emek-Hefer, Israel

ABSTRACT

The study presents a real life case of developing an HIT package to support the management of a clinical department in a public hospital. The NICU of Hillel Yaffe Medical Center serves premature babies (born prior to week No. 37) until they reach the stage where they are mature and may return home and the community. The service of a NICU department is very complex due to the fact that in addition to treating the premature infant there is a very high involvement of the family members. The Service Concept of the department: our customer is the premature infant together with his parents. Thus, the concept's components include processes supporting this complex clinical environment as: Admission process controlled and measured by Yield measures (Medical Yield and Nursing Yield), family escorting process to support the family with updated data on a regular planned basis regarding the child clinical condition and training sessions prior to the child discharge. A computerized system was developed to support the management and control of all processes including a digital patient record. It created a paperless working environment. The various processes' Yields are presented to the staff (physicians and nurses) every month and a discussion is conducted to verify needed improvement and correction activities. Satisfaction surveys are conducted prior to discharge in order to get inputs regarding all the subjects related to the family's service perception while their child was hospitalized. Results show improvement of the various yield measures.

INTRODUCTION

One of the largest and fastest growing industries in the service sector is the health care industry. The healthcare system of a country is expected to meet the emerging challenges and caters to the health needs of the population effectively and adequately (Andaleeb, 2001).

Hospitals are information - intensive organizations which has to be carried out by using appropriate information systems. A hospital information system (HIS) is a computer-based system designed to facilitate the integrative management of the administrative and medical information within the hospital (Aggelidis and Chatzoglou, 2008).

Recent studies have stated a pronounced interest of healthcare executives and practitioners in taking service quality to a higher level, often adopting leading techniques in other industries. Therefore, a useful way to introduce the concept of managing service of special care units is to relate it to another well-known type of organizations, the management of manufacturing firms (Vitner et al., 2011). Applying the lessons learnt by manufacturers' efforts to improve their production processes can be transferred to healthcare, thus reducing a patient length of stay, providing a higher quality of care, maintaining hospital sustainability and raising patients' safety and satisfaction (Burge, 2008 ; Vitner, 2011).

The remarkable evolution of information technology (IT) over the past four decades bears a striking position in healthcare. As both a witness to and an active participant in this evolution, the healthcare industry moves into the future with ever-changing technology as its catapult. In IT's infancy, healthcare organizations could use technology to support limited payroll and accounting functions. Today, healthcare organizations can use technology for direct deposit of their payroll, remote patient monitoring, and remote delivery of diagnoses (Bernstein, et al., 2007).

Healthcare IT seeks to achieve a level of sophisticated interaction between provider and patient through the use of technology. Healthcare providers can incorporate patient data, test results, medication data, and treatment histories into a cohesive system to thoroughly evaluate each patient's health situation and determine the safest and most appropriate course of action. Similarly, from an administrative perspective, success in either the clinical or administrative domain requires collaboration between managers, end users, IT staff, providers, and patients. Each plays an important role in the successful and effective integration of IT in healthcare.

Several studies have reported evidence of the positive impact of HIT on healthcare quality, including lower mortality rates (Amarasingham et al., 2010) higher vaccination rates (Dexter et al., 2004) and patient safety indicators (Aron et al., 2010). In a widely cited study, Amarasingham et al.(2010) report that greater automation of hospital information is associated with reduced rates of inpatient mortality, complications, costs and length of stay, based on a study of older patients across a cross section of 72 hospitals in North Texas. Their results suggest that an increase in automation of electronic records is associated with a decrease in fatal hospitalizations, and higher rates of electronic medical order entry

were associated with lower rates of myocardial infarction and coronary artery bypass graft procedures, across all medical conditions. Appari et al. (2010) also report that hospitals with higher Electronic Health records (HER) capability perform better on healthcare process quality. HIT systems such as electronic health records and computerized physician order entry hold the potential to improve quality while reducing costs. In particular, they are designed to improve communication among the disparate providers within a health care organization (McCullough, et al., 2010). Bardhan and Thouin (2013), studied the impact of HIT applications, not only on hospital operating expenses, but also on the process quality associated with evidence-based measures for treatment of four major health conditions. Study results indicate a positive association between usage of clinical information systems and patient scheduling applications and conformance with best practices for treatment of heart attacks, heart failures, and pneumonia. Our results

Health care management of special care units is the process of identifying and administering the activities needed to achieve the customer-driven objectives of the hospital (Gryna et al., 2007).

A manufacturer develops a product from scratch according to customer or market requirements. In healthcare this is not the case. The patient is a given person and the staff has to specify his or her requirements. Care planning should involve similar steps. Only now, material type, for example, concerns the patient's physiological status and there are additional psychological and socioeconomic dimensions that should be considered.

In special care units the patient is the "product" while his family and friends is the "customer". The Committee on Pediatric Emergency Medicine of the American Academy of Pediatrics defines the patient and family – centered care as an approach to health care that recognizes the integral role of the family and encourages mutually beneficial collaboration and partnership among the patient, family, and health care professionals (Committee on Pediatric Emergency Medicine, 2007). Special care units may be related to Hi Tech organizations. These units usually operate the most advanced technologies and equipment. The random patient is the "product" to be tested, diagnosed and repaired, so that he or she may return to normal life in the community in the shortest time with minimum total costs.

In healthcare organizations it is common that the customer's voice is filtered through a screen of the organization's own internal concerns and needs (Chaplin & Terninko, 2000). In special care units, the voice of the customer can't even be heard in most of the cases, due to the fact that the clinical situation does not allow any communication channels with the patient. It creates an objective problem as the organization itself defines the customer's wants and needs while the customer is not involved and cannot give feedback. The organization designs and implements the functions and processes to treat

the patient; it creates the measurements to check performance and decides when the service is completed. The patient is a “black box” in an open loop system. Healthcare has evolved within a strong tradition of paternalism; the doctor or nurse knows what is best for the patient.

The purpose of this paper is to highlight the various aspects of HIT in healthcare focusing on the case of special care units.

METHODOLOGY

The NICU Department

The study was conducted at the NICU of Hillel Yoffe medical center. Premature infants are born before the 37th week. At present, there are cases where babies born after 24 weeks may survive. In 2015, 422 infants, 70 under 1,750gm, were admitted to the NICU. The average stay was 11 days, but in extreme cases a baby may stay up to 120 days. There are 20 incubators in the department; six equipped for intensive care. Forty physicians, nurses, physiotherapists and social workers care for the premature and sick babies and their families. The NICU “customer” is more complex than others because it combines baby and parents. The department gets all medical and logistics support from hospital various departments and units.

Department Head Leadership

Management commitment is the most important issue when conducting an IT project. In our case, the department head decided to initiate the program in order to improve the ability of serving his patients and their families. It can be said that without his absolute dedication to this long journey we could not complete the project and start a new era in the department operations.

IT Project

At the beginning we established few managing mechanisms to guide and support the program. A steering committee chaired by the department head was leading the program and process working teams conducted business process reengineering activities. Finally, an internal department team developed the computerized package to support the daily activities.

Steering Committee

The steering committee chaired by the department head and assisted by the chief nurse contained eight members including physicians and nurses and was guided by an engineering consultant. The committee met on a weekly basis. A master plan with specific milestones was defined and controlled

weekly. The first activity of the steering committee was to develop the department's process infrastructure (see figure 1). Then, process teams of four members were established to define the detailed procedure of each process.

Process Teams

The steering committee defined twenty eight processes. Process teams were allocated for all the processes. A master generic procedure was guiding the teams in the development of the process procedure. Once a procedure was completed it was presented at the following week steering committee meeting in order to achieve a validated and agreed procedure.

Business Process Reengineering

When the program started there was no set of written procedures in the department. Written procedures were created including working instructions for all the activities in each process. It was accompanied with a detailed flow chart such that it could be the corner stone for the development of the IT system.

Performance measurement

The major processes were assigned with a detailed checklist. Each checklist was controlled periodically in order to verify the process yield. The yield is calculated as follows:

$$Y = \frac{\text{Number of items performed successfully}}{\text{Total number of items in the checklist}}$$

IT System

A computerized program was developed supporting all the activities of the department. Any staff member may use the system in order to verify the process details, working instructions or hospital guidelines. It enables the staff to create and update the patient record and to manage logistics activities. It supported the chief nurse to develop weekly schedules and manage the yearly training activities. It supported the management of facilities maintenance and enabled the physicians to write prescriptions. It may be said that the IT system created a paperless working environment.

RESULTS

NICU Process Infrastructure

There are 28 processes divided into broader activities: core medical and hospital administrative and logistics support (Figure 1). Core medical services are the process chain from admission to discharge. Administrative processes, supporting NICU's daily work and management, including: physician visiting; escorting families; shift change

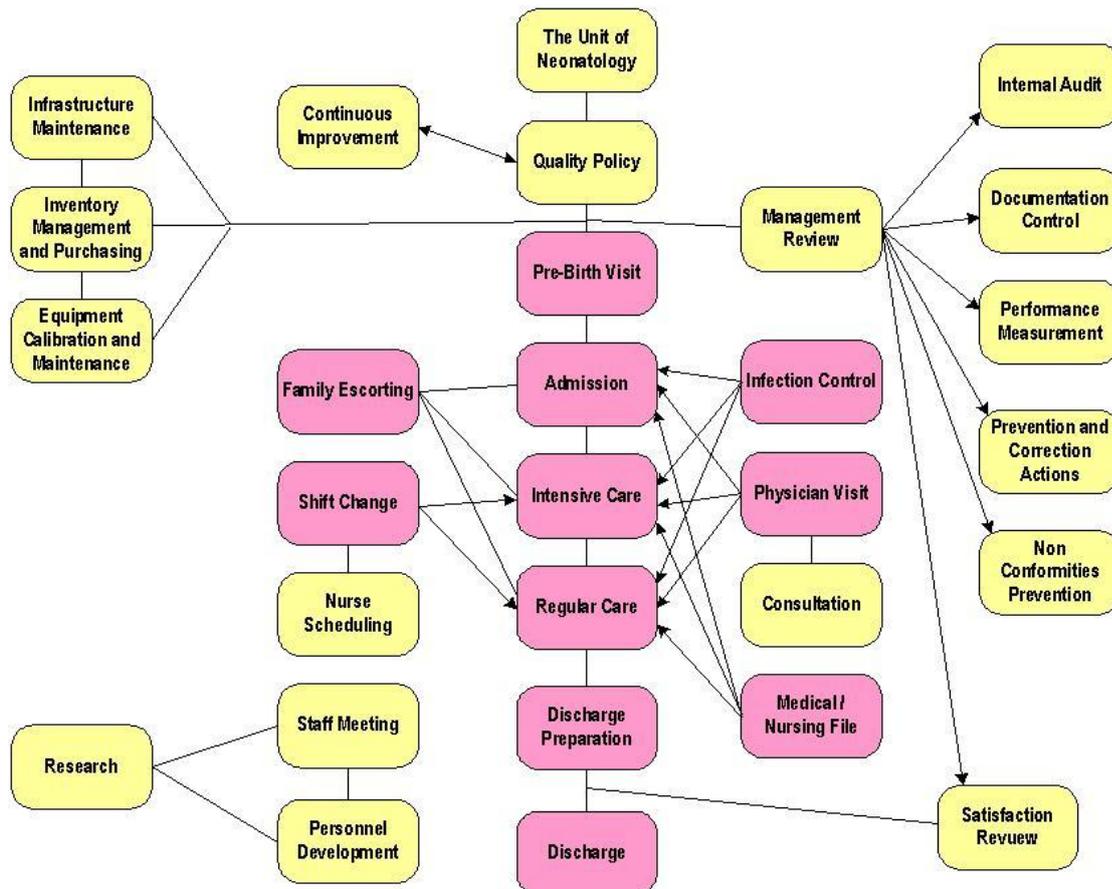

Figure 1. *NICU process infrastructure*

The IT System

Computerized system

A computerized system included all processes and working instructions was developed. Every process interfaces with working instructions related to any stage and by clicking the keyboard it becomes available. Any form or file related to the hospital or the health ministry is available. In the department

there are several computers, which every staff member may use any time. All staff members received a compact disk with the quality manual so they may study the details in their free time.

Improving Service Delivery

Quality manual

The quality manual contains the NICU department's 28 processes. Each process was documented according to a master document including definitions, process details, responsibilities and timing. Each process interfaces with working instructions that details specific activities (e.g. feeding procedure).

Performance measurements

The admission yield indicates how effectively the admission process was conducted. Periodically observing these yield results and trying to understand what may cause low yields, creates opportunities to improve the process. Figure 2 presents' admission process yields.

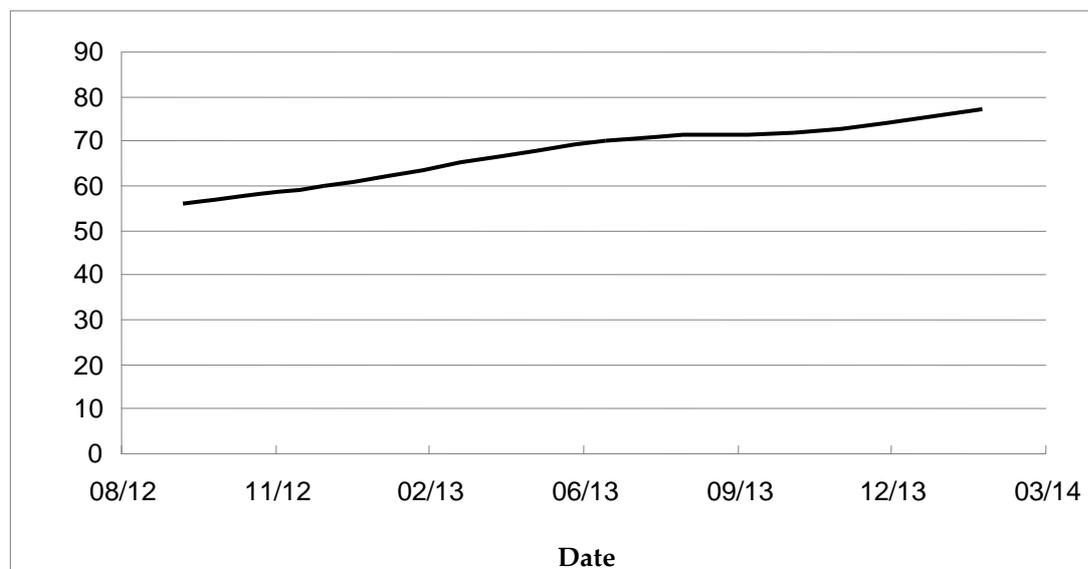

Figure 2. *Admission process yield*

Other interesting examples are mobile incubator and resuscitation trolley yields. The resuscitation trolley is needed in emergency cases when there is a call for a neonatal expert either from the delivery room or from the operating room. The trolley should be fully equipped and ready for use 24 hours a day. To keep readiness at a high level, we decided to measure this yield. Figure 3, illustrating results over 12 months, shows a significant gap between day shifts and night shifts, so managers decided to assign a team to study the issue and recommend improvements. Other measurements are based on

infant daily chart verification processes using checkpoints such as whether all procedures were performed by nurses and therapists; etc, involved in the treatment.

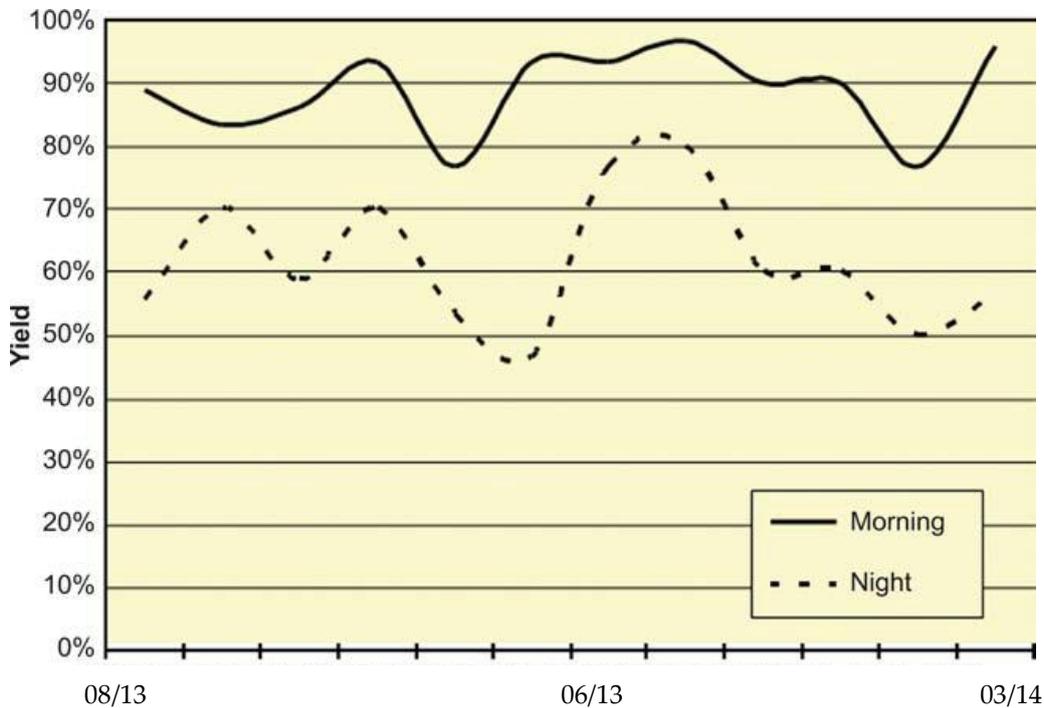

Figure 3. *resuscitation trolley yield*

Service satisfaction review

A satisfaction review was developed to get feedback from mothers and fathers. The survey is anonymous and takes place during the NICU discharge process. It covers all relevant aspects (17 questions using a 1-5 scale) related to the hospitalization period. Owing to family origins and to get the most reliable feedback, the satisfaction survey was available in three languages: Hebrew, Arabic and Russian. It enabled the department head to get objective information from families observing treatment and care over many days. Figure 4 presents satisfaction scores (a 3,939 item average) for 2014. We can see that 66 percent items scored 4.8 to 5 (the highest score).

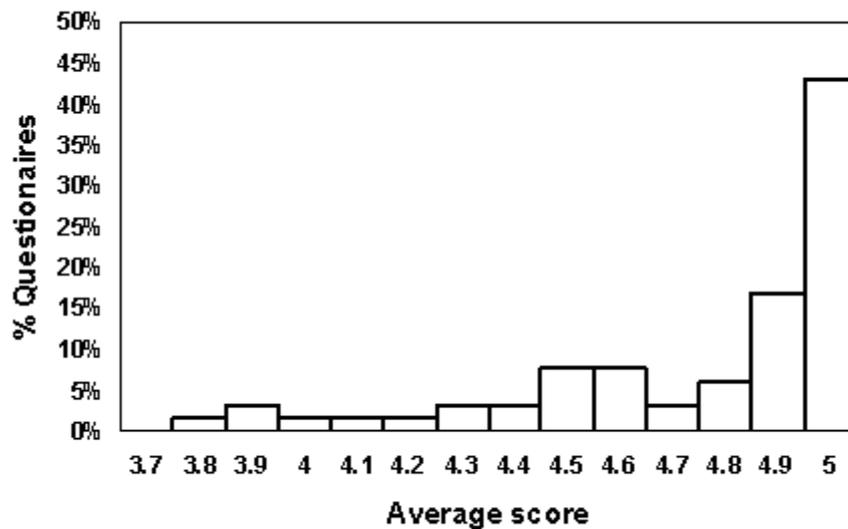

Figure 4. *Patients' service satisfaction score*

SUMMARY

The paper presented an HIT program that was conducted in a clinical department of a public medical center. It was a successful project that was initiated by the department head who felt that a major change should be conducted in order to support the hard work of the staff members and to improve the service delivered to his patients and their families. A steering committee chaired by the department head was guiding the program which involved the entire staff members who were participating in process working teams. Performance measurements based on process checklists were developed allowing measuring the yields of the major processes. Yield measurements were presented and discussed in periodic staff meetings where preventive and/or corrective activities were created. A computerized system based on the detailed process procedures was developed enabling any staff member to get any needed data during the shift. Results show that the HIT package enables to operate the department paperless with higher reliability and improving patients' satisfaction.

EXTERNAL KNOWLEDGE SOURCING AND NEW PRODUCT DEVELOPMENT: EVIDENCE FROM THE FOOD AND BEVERAGE INDUSTRY

Vrontis, Demetris¹; Santoro, Gabriele² Bresciani, Stefano²

¹School of Business, University of Nicosia, Cyprus

²Department of Management, University of Turin, Italy

ABSTRACT

This paper analyses the role of external knowledge sourcing in the innovation process of firms from Food and Beverage industry (F&B) and the effects on New Product Development (NPD) performance. Regarding external knowledge sourcing in the open innovation context, we identify two types of sources, namely market-based and institutional-based sources. For a complete analysis of NPD performance, we employed the number of incremental and radical innovations introduced into the market, and the share of income from new products. Relying on data from 103 Italian firms operating in the F&B industry, results show that they actively engage in open innovation with strong ties with market-based sources, and that this strategy is positively associated with NPD performance and incremental innovation.

Keywords: *open innovation, external knowledge sourcing, new product development, food and beverage industry.*

INTRODUCTION

Continuous and effective New Product Development (NPD) is widely recognized as a way to sustain competitive advantages, in the current scenario of globalization, hyper-competition and the rising of new technology (Bresciani, 2010). However, innovation required investments and usually lead to high risks. These and other enablers leded firms to open their "boundaries" collaborating with other actors and external source of knowledge in order to share costs, ideas and technologies (Chesbrough, 2003). This is line with the open innovation model, according to which firms have to establish relationships with suppliers, customers, universities, and other external sources in order to accelerate innovation (Gassmann and Enkel, 2004). In recent years, this paradigm has aroused a lot of interest in both the academic and the industrial world. From this point of view, however, the open innovation effectiveness and the positive effects are evident only in certain industries such as high-tech (Chesbrough, 2006). In fact, among all the suggestions and ideas for future research found in the

literature, the relationship between open innovation and firm's innovation performance seems to be the topic that has attracted more interest.

Although the topic of innovation in Food & Beverage (hereafter F&B) industry is widely developed (Avermaete et al., 2004), still lacks empirical evidence of food companies engaging in open innovation (Knudsen, 2007). In fact, only few studies have contributed to this field (Sarkar and Costa, 2008; Enzing et al., 2011). The topic is relevant because the F&B is a very innovative and it is the largest manufacturing sector in Europe in terms of turnover and direct employment (FoodDrinkEurope, 2014). Furthermore, prior performance studies that assessed the effects of open innovation on firm's performance have generated mixed findings (Laursen and Salter, 2006; Belderbos et al., 2006; Un et al., 2010). This is mainly because most of them are conducted at firm level (Du et al., 2014), and because they focused on different industries and different countries. Moreover, previous studies have not thoroughly investigated the relationship between the different practices of open innovation and different kinds NPD performance. In fact, our study uses two measures of NPD performance. Hence, the purpose of this work is to analyse the effects of external knowledge sourcing on NPD performance in the F&B industry. Moreover, we consider two categories of external sources, namely market-based and institutional-based (Du et al., 2014). To reach this goal, we employed a quantitative method using several OLS regression models on a sample of 103 Italian firms operating in the F&B industry. Results show that firms are adopting external knowledge sourcing strategies and they are positively associated with NPD performance and incremental innovation.

The paper is structured as follows. First, we review extant literature on open innovation paradigm and innovation in the F&B industry. Next, we describe the method, the sample and the purpose of the research. Then, we analyse the impact of the open innovation practices on firms' innovation performance, through several OLS regression models. Finally, we summarise the conclusions of our analysis, draw implications for the future of open innovation in the food sector and highlight areas where more empirical research is needed.

LITERATURE REVIEW

Open innovation and external knowledge sourcing

In many industries, companies need to accelerate innovation by introducing new products quickly, limiting the costs and risks. This is mostly due to the increasing competition and the rising of new technologies. These and other factors have led to a new innovation model, namely "Open Innovation", which considers internal sources and external sources of knowledge for innovation of equal importance (Chesbrough, 2003). In particular, Chesbrough and Bogers (2014, p. 17) define it as "a distributed innovation process based on purposively managed knowledge flows across

organizational boundaries, using pecuniary and non-pecuniary mechanisms in line with the organization's business model". Furthermore, they should complement internal R&D with external knowledge, interacting with external individuals and organizations with formal and non-formal relationships (Laursen and Salter, 2006; Dahlander and Gann, 2010; Bresciani and Ferraris, 2014 Ferraris and Santoro, 2014). Thus, firms can build synergies adapting the organizational structure and the corporate culture, creating the internal conditions to better evaluate and integrate external knowledge and select the right partners (Cohen and Levinthal, 1990). Literature found two main flows of knowledge and technology (Gassmann and Enkel, 2004; Dahlander and Gann, 2010): a) Outside-in flow (inbound activities), identifying the search for innovative solutions and new sources of knowledge from external partners to incorporate those developed internally; b) Inside-out flow (outbound activities), bringing ideas to market selling IP and transferring technology and knowledge to other business models.

In such a framework, and focusing on the inbound open innovation aspect, among all the external source of knowledge and technology, literature identifies: a) market based sources; and b) institutional sources. Within the first categories fall suppliers, customers, competitors, R&D intermediaries (Laursen and Salter, 2006; Du et al., 2014; Bresciani et al., 2015). Institutional sources are represented by universities, research centres, trade associations, useful to access both tacit scientific knowledge (Cockburn and Henderson, 1998), and codified knowledge (Fabrizio, 2009).

Many scholar, focusing on external knowledge sourcing, usually define openness as the number of external sources used by firm in the innovation process (Laursen and Salter, 2006; Spithoven et al., 2013). More specifically, Laursen and Salter (2006) define this variable as "search breadth". In addition, the authors introduce the measure "search depth" in order to consider the intensity of the relationship with each source of knowledge. In this context, they showed that external knowledge sourcing is positively associated with innovation performance, but with an inverted U-shaped relationship.

Other scholar, define openness considering whether a firm establish cooperation with external sources (Fey and Birkinshaw, 2005; Vega-Jurado et al., 2009). Belderbos et al., (2006) found a negative relationship between the share of technological collaborations and firm's market value, suggesting that the potential advantages of collaborations may be lower than the consequent disadvantages (such as increasing coordination costs). Bengtsson et al. (2015) found evidence that breadth of the collaborations is negatively associated with innovation performance.

Finally, mainstream open innovation research focused on high-tech industries such as ICT and computers (Christensen et al., 2005) and little on specific industries such as F&D. For this reason, our

paper intends to fill this gap. The next literature section intends to focus on external knowledge sourcing and NPD process in the F&B industry.

External knowledge sourcing and new product development in the Food & Beverage Industry

The F&B industry is typically considered mature, slow growing and show low levels of investment in R&D compared with other industrial sectors (Sandven and Smith, 1993; Costa and Jongen, 2006; Rama, 2008). Moreover, since technological change in the F&B is largely technology-based rather than science-based, NPD is not related to R&D intensity (Martinez and Britz, 2000). Along with this, the rate of technological change in the F&B, measured by the number of patented inventions, seems less dynamic than other manufacturing sectors (Christensen et al., 1996). However, the needs of consumers have changed over time and this requires increasing innovation orientation. Thus, NPD in the F&B industry is the key strategic factor in a context of growing competition both at national and international level (Rama, 2008). Since product innovation can be considered the ability to introduce new products able to satisfy consumer's needs, it is high correlated to market orientation (Traill and Meulenbergh, 2002). In fact, consumers are increasingly demanding more product variety, with different tastes and dietary products (Costa et al., 2007). Due to the large number of actors in the value chain of firms in the F&D industry, along with the factors mentioned above, the innovation process must take into account both internal sources and external sources of knowledge to develop and market new products (Mikkelsen et al., 2005). In line with this, according to Capitanio et al. (2010), innovation process in the F&B is leveraged by internal (R&D investments, culture, values, human resources, organizational structure) and external factors (social embeddedness, institutional and market environment). For these reasons, we expect an increasing use of open innovation practices in this field, even if literature does not provide strong support. In fact, there are few qualitative contributions on open innovation in food industry (Sarkar and Costa, 2008; Thomke and von Hippel, 2006; Vanhaverbeke and Cloudt, 2006), and statistical support is still scarce. Nevertheless, Archibugi et al. (1991) underline how firms from the F&D industry rely more on external sources of knowledge than the average of all industries. Knudsen (2007) found that European firms operating in F&B sector are active in collaborating for product innovation purposes. Moreover, they prefer cooperate with market-based external sources rather than science-based external sources. As for the degree of innovation, many authors agree that the firms focus more on incremental innovations rather than radical innovations (Capitanio et al., 2010; Baregheh et al., 2012), and usually on packaging innovation (Grunert et al., 1997; Menrad, 2004). For these reasons, firms in this sector usually forge strong ties with market-based sources such as customers, suppliers and distributors (Enzing et al., 2011). Customers and distributors are important sources to get market information, while competitors'

products can be easily analysed since their IP is not protected and this could be an available source of new products ideas (Enzing et al., 2011).

Within qualitative research, Huston and Sakkab (2006) show how acquiring a technology from a strategic partner has enabled P&G to decrease product development costs and the time of introduction of the product into the market. Literature also shows that firms in the F&B industry can engage in open innovation in order to achieve product differentiation and improve competitiveness (Sarkar and Costa, 2008).

For these reasons, we expect that firms from F&B industry are active in external knowledge sourcing, and this strategy leads to better NPD performance, in the extent of the number of incremental (rather than radical) product innovations and the share of income from new products. In addition, we can predict that the market-based sources are those that lead to better NPD performance.

METHODOLOGY

The main purpose of this paper is to analyse the effects of open innovation practice on NPD performance in the F&B industry. To reach this goal 1000 Italian firms operating in the F&B industry were randomly selected from the database AIDA-Bureau Van Dijk. Then, a semi-structured questionnaire was sent to the CEO and R&D managers of each firm, which was answered by 103 respondents (response rate of 10.3%). The data collection was carried out in the 2015.

The questionnaire was divided in two parts: the first, investigates general information about the firm, including firm values and strategy, and economic/financial data such as revenues, R&D expenses, share of income from new products; the second investigates the product development process, with focus on external knowledge sources. The firms in the sample operate in the F&B industry and they are active in the production of fresh food, beverage and preserves.

Several ordinary least squares (OLS) regression models has been employed in order to test the relationship between several open innovation strategies and innovation performance, in line with previous study on open innovation (Lichtenthaler, 2009; Parida et al., 2012).

To measure the NPD performance of each firms (dependent variable), we used two variables in line with many previous studies (Griffin and Page, 1993; Laursen and Salter, 2006; Parida et al., 2012; Spithoven et al., 2013; Visser et al., 2014; Ahn et al., 2015; Brunswicker and Vanhaverbeke, 2015):

- a) the share of income from new products and services (introduced in 2012-2014) on total income of the year 2014;
- b) the introduction of incremental and radical product innovations into the market. In particular, respondents were asked the number of radical and incremental product innovations introduced in 2014.

Using both number of innovation (incremental / radical) and income from new products, is an effective way to understand the company's ability to develop new products, and to translate this ability in financial revenue (Atuahene-Gima, 2005). In order to classify product innovation, we followed Bessant and Tidd (2007), according to which incremental product innovation is something improved from the previous version, while radical product innovation results in something brand new.

External knowledge is the independent variable. In order to measure it, we asked respondents to assign a value of importance in using external sources (with a five-point Likert scale), counting and summing only those with a score of 4 or 5. In this context, previous studies focused on the concepts of search breadth (number of sources) and search depth (intensity of each source) (Laursen and Salter, 2006). In our work, we consider only sources that received 4 or 5 points on the Likert-scale, to include in the analysis only those deemed important in NPD process.

Finally, several variables were controlled. First, the R&D intensity (expenditures by a firm on its research and development divided by the firm's revenue) is recognized as measures of absorptive capacity (Cohen and Levinthal, 1990). In particular, internal R&D acts as a source to develop new products, but also to better manage external ties and knowledge acquisition. Second, the firm age can influence the innovation outcomes (Mazzola et al., 2012). In fact, the firm's age may affect the likelihood of having accumulated knowledge, experience and strong networks. Third, firm's size can further emphasized the absorptive capacity due to the increased availability of financial, human and organizational resources (Drechsler and Natter, 2012).

Table 1: Descriptive statistics

	N	Min	Max	Mean	S.D.
<i>Size</i>	103	22	523	158.00	151.860
<i>Age</i>	103	6	163	42.71	36.328
<i>Income from new products</i>	103	0	42.00%	12.77%	8.17%
<i>Nr. Market-based sources</i>	103	0	4	1.44	0.88
<i>Nr. Institutional Sources</i>	103	0	3	0.58	0.79
<i>External knowledge</i>	103	0	5	2.02	1.20
<i>Nr. Radical Innovations</i>	103	0	3	0.36	0.59
<i>Nr. Incremental Innovations</i>	103	0	6	1.26	1.05
<i>R&D intensity</i>	103	1,03%	13.56%	4.51%	2.77%

RESULTS

Table 1 shows the descriptive statistics of the sample, with minimum and maximum values, mean and standard deviation. It consists of 103 Italian firms from F&B industry. The average R&D intensity (4.51%) indicates that firms surveyed do not invest large amount in internal R&D activities, in line with literature (Costa and Jongen, 2006). In addition, the average number of employees is 158. Finally, the average age of the sample is 42.71. *Table 2: OLS regression models*

Note: Estimates are beta coefficient and standard errors are in parentheses.

Analyzing the descriptive statistics, it appears that firms of F&B industry constantly rely on external source to introduce new products. On average, they incorporate 2.01 external sources in the innovation process. For what concern the categories of the external sources, firms in the sample prefer market-based sources rather than Institutional sources, as highlighted in literature (Martinez and Britz, 2000). In fact, on average, firms rely on 1.44 market-based sources and 0.58 Institutional sources.

In order to investigate the nature of open innovation in F&B industry six regression models were used as presented below (Table 2), all tested on the final sample of 103 firms.

Summarizing, results (shown in Table 2) suggest that the adoption of external knowledge sourcing strategy in innovation positively influence NPD performance in F&B industry.

In particular, MODEL 1 indicates that External knowledge (the independent variable) has a strong and positive impact on innovation performance in the measure of income from new products (0,512, $p < 0,001$). MODEL 2 show in detail that Market-based sources are positively associated with income from new products (0,454, $p < 0,001$), as well as Institutional sources but with lesser extent (0,215, $p < 0,001$). In addition, MODEL 3 and 5 show how External knowledge is positively associated with incremental innovation (0,615, $p < 0,001$) but not with radical innovation.

Finally, MODEL 6 underlines that, since External knowledge is positively associated with incremental innovation, market-based sources have a stronger effect on innovation performance than institutional sources (respectively 0,475 with $p < 0,001$; 0,338 with $p < 0,05$).

Finally, we observed that firm's size and age do not have significant effect in the models, and that internal R&D is significantly and positively associated with innovation performance but only with "turnover from new products" as dependent variable.

DISCUSSION AND CONCLUSIONS

This paper has analysed the role of external knowledge sourcing of firms from F&B industry and the effects on New Product Development (NPD) performance.

Results show that firms of the sample are increasingly incorporating external sources of knowledge in the innovation process and this strategy lead to higher innovation performance both in term of income from new products, and the number of incremental innovation developed. This provides some interesting managerial implications. First, due to the hyper competitive environment that affects the F&B industry, including fast changing customer needs and tastes, and due to the low level of R&D investment in the sector, firms need to open up their "innovation boundaries" in order to develop and introduce products more quickly, efficiently and with lower risks of failure. Strategically, incorporating external sources can also be a response to the increasing competition from emerging countries due to business and technological innovation. Therefore, external knowledge sourcing could be a vital strategy in order to develop incremental innovation. This is strongly supported by our data that show that R&D intensity is not significantly associated with NPD performance. Second, results underline that firms in F&B industry mostly rely on market-based external source rather than institutional sources (Knudsen, 2007), and this leads to higher NPD performance with relation to incremental innovation. This is because traditionally F&D industry is contingent to the role of final

demand and technological change driven by suppliers. This also stress the importance of changing consumer taste and requirements that must drive the firm's innovation process (Christensen et al., 1996). Firms (not only in the F&B industry) have recognized the key role of customer engagement in the innovation process, tapping more and more in customer's ideas and knowledge, and the NPD process is closely linked to the characteristics of food demand. Thus, knowledge directly provided by customers (also suppliers and competitors could give important information on customers' needs), may help firms to assess needs reducing the risks associated with products failure (Ogawa and Piller, 2006). Incorporating customers in the innovation process is the key for recognizing emerging and changing needs and to sustain competitive advantage. This approach is closely linked to the development of incremental innovations, as shown by the regression model results. Along with this, within market-based source, suppliers' involvement is positively associated with NPD performance. In fact, suppliers can contribute to the innovation process with specific capabilities and technologies (Hagedoorn, 2002).

This study, of course, has some limitations. First, it points out that certain of open innovation strategies are closely related to NPD performance, but does not explain in detail which customer and suppliers engagement practices are most effective and what are the internal organizational adjustments to be adopted to facilitate the absorption of external knowledge. Second, the sample includes only Italian firms; therefore, the results could be influenced by local contexts. From this point of view, it would be interesting to make a comparative analysis between two or more country, by considering control variables that take account of country-level peculiarities. Third, we find that openness leads to higher income from new products, but our regression models do not take into account the costs related to open innovation. In fact, they could increase more than proportionally.

FAMILY BUSINESS RESPONSIBILITY AND ALLOCATION OF PROFIT AND OPENNESS TO INNOVATION

Więcek-Janka, Ewa¹; Hadryś-Nowak, Alicja²

¹Department of Marketing and Economic Control, Poznań University of Technology, PUT, Poznań, Poland

²International Management Chair, Poznań University of Economics and Business, UEP, Poznań, Poland

ABSTRACT

The paper presents an original concept of *family business responsibility* as a principal link between business and family spheres and as a distinguishing feature of a family business against the backdrop of non-family businesses in the context of Hommes and Blau's social exchange theory. The empirical part of the paper features a two-stage research methodology for the concept in question, based on a sample of 420 family businesses with the results discussed and presented in its final part. One of the distinct features of family business responsibility, namely the chosen direction of company profit allocation, was subject to an in-depth analysis.

Key words: family business, family business responsibility, openness to innovation

INTRODUCTION

Observing behavioral patterns in members of a business family both in family and business circles leads to the conclusion that introducing a change, like succession is a difficult process as it meets, irrespective of the kind of change, a multi-layered resistance. Succession is one of the variables inscribed in the functioning of multigenerational family businesses. The positive course of succession is shaped by many factors [Aronoff, Ward, 1995; Cascio et al., 1997; Rothwell, 2002; Mandl, 2008]. One of them (thesis of the author) is the responsibility of the family business. This thesis and analysis of the context of behavioral actions of family businesses in the Polish conditions led to the definition of the empirical objective. The main objective of the topic be undertaken is to find factors related to the transfer of generational family businesses related to the responsibility of the family for the business sphere. Identification of factors was considered the specific objective to develop.

BEHAVIORAL BASIS OF REFLECTION

Behaviorism, as a trend in psychology in the 20th century, assumes that all analyses of phenomena should stem from the observation of human and animal behavior. Management sciences borrowed Innovation, Entrepreneurship and Digital Ecosystems

ISBN: 978-9963-711-43-7

from behavioristic concepts, particularly utilitarian ones, the notion of reinforcements, i.e. reward and punishment. The modification of basic behaviorism ideas by theorists such as Frazer, Malinowski, Mauss and Levi-Strauss allowed to develop an exchange theory in sociological terms, which is expressed in a few generalizations [Turner, 1991]. One of them is the idea of creating welfare: (1) "In a given situation organisms will exhibit a behavior which brings as many rewards and as few punishments as possible". Another paradigm of the behavioral attitude is reward satiation: (2) "The more rewards an organism gets as a result of a specific behavior the less rewarding this kind of behavior becomes due to reward satiation. An organism will be more likely to exhibit an alternative behavior to seek other rewards" [Turner, 1991]. Both of the presented research generalizations may be implemented in the area of research on family businesses. If the operation of a business is viewed in the same way as it is viewed by organists [Spencer, 2006], then family businesses, as it is observed by the author, record a tendency towards establishing welfare (1) between family and business spheres, when one sphere expects the other to provide reinforcements connected with two types of goods: financial means and time. An example might be the choice of the direction of financial means allocation (geared towards a business vs. geared towards a family or devoting time towards meeting business needs vs. family needs). The key factor out of those listed for effecting succession in family businesses is to maintain equilibrium between allocating profit to business expansion and satisfaction of family needs. Type two behavior (2) pertains to the issue of gathering positive reinforcements geared towards the satisfaction of both spheres of family business activity, which may result in lowering interest in co-participating in the development of both spheres. In the situation when the owner of a firm does not gain financial or non-financial benefits out of managing a firm, he/she may seek the satisfaction of their needs outside the business sphere. It may bring about a relaxation of internal relations and transfer managerial responsibility to other people. The situation when the family sphere expects a continuous increase in outlays for ever-growing needs may lead to consuming the profit and in consequence to lowering the competitive edge through the lack of developmental investments. In both cases the consequence might be the dissolution of a firm or inability to effect succession.

FAMILY BUSINESS RESPONSIBILITY

In the opinion of Polish researchers, a deciding factor in the discussion about family businesses is processes which take place in family-business areas and which allow to carry out succession often considered as the *sine qua non* condition for defining a business as a family one [Safin, 2007]. A clear definition of factors responsible for successful succession becomes a challenge which is hard to deal with due to not only a wide variety of enterprises but also different personalities of owners, family

members and successors. Moreover, what also needs to be taken into account is a broadly defined context of a business, the close one – employees, clients, competitors and the distant one – local and national policies, legal and economic conditions, regional culture, etc. [Safin, 2015]. In properly prepared family businesses under Polish market conditions, the latter decade of the 2000s will either be the time of succession or the time of sale or dissolution once owners have retired [Więcek-Janka, Mierzwiak, Kijewska, 2016].

Analyzing the course of succession processes is connected with the mutual interaction of internal forces of a family business. Lansberg and Astrachan [1994] point to two systems: family and business where the family interest being at one with the business interest leads to activities for the benefit of succession. In the model featuring three systems apart from the two systems listed above, there is a system of individual interests. According to the author, taking no heed of personal needs, aspirations and value systems may destroy not only the succession process but also the functioning of the remaining two areas of a family business. The third area of a family business may be considered in relation to a successor or successors, which is often connected with trust they can inspire in founders [Więcek-Janka, 2013] and their willingness to retain decision-making power and control over the business activity [Kujawińska, Fogt, Wachowiak, 2015]. Such a conservative behavior may be a result of apprehension that decisions concerning the firm's transfer might turn out to be erroneous, which raises psychological costs on both parties involved in succession [Sharma, Chrisman, Chua, 2003]. There are also more complex concepts. The approach by Bienert and his team [Safin, 2015] is of particular importance to this paper. The approach states that the functioning of a family business, its success and chance of a good succession lies in harmony and convergence of business aims with individual aims of family members. While conducting research on the so-understood harmony, success factors responsible for harmony in family businesses were identified. They include: economic factors, psychological factors, legal factors and fiscal factors [Więcek-Janka, Mierzwiak, Kijewska, 2016; Safin, 2015; Hamrol, Kowalik, Kujawińska, 2011].

The harmony factor was recognized by the author of the article as particularly important, especially in the context of the exchange theory, which became a basis for tackling research problems and refers to "the exchange theory" considered in the way it is treated by Hamanas and Blau [Turner, 1991]. It specifies a mutual influence of benefits and costs in a given exchange relation. If the operating norms are thrown out of balance, the party experiencing dissonance may show passive behaviour or even aggression. Similar situations are encountered by observers of succession processes in Polish family businesses when succession-related decisions are taken without due preparation, are excessively prolonged or become complex because of relating to a large group of successors. Blau also notes the possibility of conflict emergence when the development of equilibrium in one type of relation may

disturb the harmony of the other. The author analyzing the succession experiences of Polish family businesses notices difficulty in maintaining appropriate relations with all stakeholders of family businesses during the generational change [Więcek-Janka, 2011].

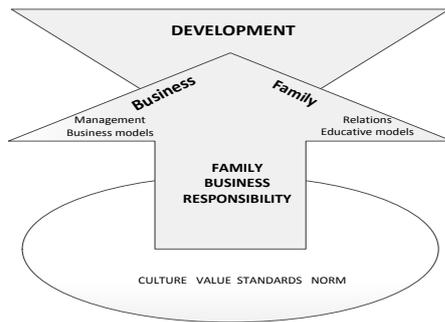

One can notice in succession processes the existence of another regularity connected with the exchange theory, namely “social attractiveness” [Turner, 1991], which has a strong bond with perceiving the benefits of remaining and rendering services to a given unit or group. The owner’s decision to transfer the business and the successor’s decision to accept it bear the symptoms of social exchange encumbered with additional expectations connected with family-business culture and observing the value system developed by predecessors. Both the doyen and the successor hope that the exchange transaction will bring them expected fruits. Blau [Turner,1991] presents the hierarchy of the benefits of exchange, which include: power, respect, social acceptance and money. Exercising power allows to subject others to one’s own aims which, in the case of succession, is of great significance as beneficiaries (successors) do not have the possibility to use coercion measures or opposition to benefactors (at least not during the succession process). There may also be another type of behavior connected with the business owner’s inability to give up managing the business and transferring it to next generation. The process getting increasingly long causes the potential successor to cease being interested in taking over the family business. The remaining benefits mentioned by Blau (social acceptance, money and respect) may be relatively easily obtained outside work in a family business. Hence, according to the author, the possibility to make other people compliant and thus exercise control over them is a decisive factor in lengthy succession processes in Polish family businesses.

Dwelling on the rule of reciprocity, which says that “we are obliged to return favours after people do favours for us”, we can state that:

The multi-annual upbringing process in business families allowing for family values and entrepreneurial behaviour requirements may contribute to perceiving by successors benefits resulting from taking over family businesses;

The development and implementation of ethical business models in the operation of family businesses will increase the value of succession in the eyes of successors.

The analysis of the collected premises allowed the author to present and analyze a preliminary model of family business responsibility. The author assumes that there is awareness of activities, both business-related i.e. operational and strategic activities contained in business models and family-related which should be understood as conscious decisions and educational activities accounting for social norms, universal and family values.

Figure 1. Model treatment of family business responsibility

Source: own elaboration

Business family responsibility should be regarded as the behavior of a conscious balance between the sphere of family life and business operations. The combination of two areas of decisions and activities including individual requirements of individuals and the remaining stakeholders will be possible through the implementation of family business responsibility postulates. The concept of *family business responsibility* (FBR) shows intellectual debt towards the accomplishments of the exchange theory as treated by Hommes and Blau [Safin, 2015]. According to the author, a responsible family, in the accepted upbringing model¹, voluntarily takes account of the developmental aims of a business model² hoping that it will obtain particular benefits (e.g. financial, security, succession of ownership and power, etc.). Meeting such assumptions becomes a basis for building a multi-generational family business.

RESEARCH METHODOLOGY

Undertaking research on family business responsibility became a basis for developing a methodology adjusted to the specific character of family businesses. The research was conducted in two stages: an expert interview and a survey [Więcek-Janka, 2015].

The first stage comprised an interview with 6 experts³. The aim of the study was to identify variables affecting family business responsibility in family enterprises. The selection of experts for the interview was intentional. The second stage aimed to assess variables affecting the shape of family business responsibility in Polish family companies.

The population unit represented by the analyzed sample was a family business understood as *a business in which the majority of decision-making rights are in the possession of the natural person(s) who*

¹ The upbringing model is understood as a process of shaping human personality which covers social culture (including family culture), social structure, personality, adopted (also imposed) social roles, attitudes, needs, self-evaluation and the resulting behaviour.

² The business model is understood as a long-time strategy which covers the use and expansion of resources in order to obtain and maintain a competitive advantage.

³ The experts were involved both academically and practically in family business activity: three scientists and three family entrepreneurs. The first stage of the research was carried out in January and February 2015.

established the firm, or in the possession of the natural person(s) who has/have acquired the share capital of the firm, or in the possession of their spouses, parents, child, or children's direct heirs, moreover at least one representative of the family or kin is formally involved in the governance of the firm¹ through the owner or co-owner.

The analyzed population was assessed on the basis of information concerning the number of family businesses as 41.4% of the total number of firms in Poland [Jeżak, 2014]. The size of the analyzed population was 1 172.4 thousand family businesses. The size of the sample obtained during the research was greater than the assumed minimum one which allowed to generalize analyzes² and was at the level of 422 family businesses. In order to efficiently conduct the research, a survey method was adopted and was carried out along three paths using CATI (*Computer Assisted Telephone Interview*)³, PAPI (*Paper & Pen Personal Interview*)⁴ and CAII (*Computer Assisted Internet Interview*)⁵. The collected material was analyzed in the form of tables, discussed and verified. Two questionnaires containing errors were excluded from the whole set of questionnaires collected. The remaining 420 questionnaires were used in the statistical analysis.

RESULTS ANALYSIS

During the first stage of the study six in-depth expert interviews in three rounds were conducted. Their main aim was to identify variables allowing family businesses to combine family and business areas with the perspective of successful succession in the future. The list of variables obtained⁶ comprised several points, which were narrowed down to a few ones in discussions with the experts. Table 1 contains variables singled out in the first stage of the study, which allow – in the experts' opinion – for coexistence and synergy in the development of family businesses.

Table 1. Results of the first stage of the research – expert interview

Abbreviated	Marking a feature in the research
Allocation of profit to enterprise development	APED
Allocation of profit to family development	APFD
Family decision-making takes into account the interests of the enterprise	FDB
The family takes the time to improve business organization	FTO
Employing on the basis of merit	EBM
Engaging the family in the construction of the enterprise's strategy	EFbS
Raising children in entrepreneurship	RCE

¹ def. *European Family Business Foundation*

² The minimum sample was 383 firms, with $\alpha=0.05$, $b=0.05$ and $p=0.5$.

³ The CATI method was used to conduct research with 75 respondents.

⁴ The PAPI method was used to conduct research with 67 respondents.

⁵ The CAII method was used to conduct research with 280 respondents.

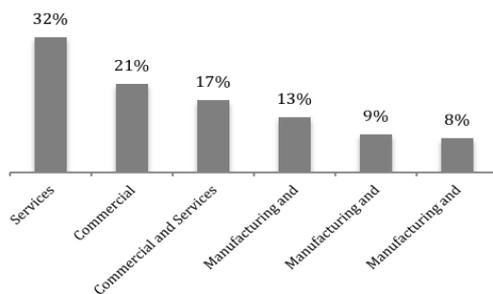

⁶ Variables understood by the author as features, behaviour and decisions which can be generalized and which are observed in family businesses.

The preliminary analysis of the collected material – in the second stage – concerned (apart from the main aim) the recognition of the studied population structure. A particular interest was attached to the following features: size of the business, type of business, legal form, generation managing the business, and gender of the person managing the business.

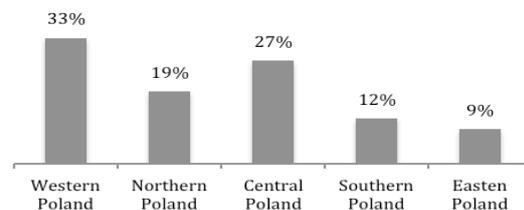

One of the research assumptions was to secure the representative character of the study. The research was conducted in all regions in Poland¹, and the results are presented in figures 3 – 9.

In Jeżak's research [2014] one can note a similar distribution of the sample in relation to family business activity. Services were identified as the most frequently realized form of family business activity (46.9%). In the research conducted a "pure" form of services was declared by 32% of respondents, but the other 26% stated that services were an important part of business activity. Commercial activity in the presented sample was declared by 21%, but the remaining 30% realize it as an additional activity. In Jeżak's research [2014] close to 40% of respondents declared commerce as the main business activity. Manufacturing activity and industrial processing were declared by 8% of respondents, which exactly reflects the distribution of results in Jeżak's research [2014].

Figure 3. Declared business line in the studied sample (n=420) **Figure 4. Distribution of analyzed family businesses in Poland (n=420)**

Source: own elaboration

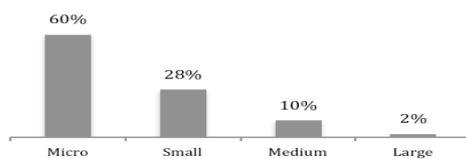

Source: own elaboration

The representative sample accounted for differences in the size of a firm, understood as the number of people employed. Jeżak's research comprised firms which did not have any people employed (50%). The present paper had this category classified as microenterprises which made up 60% of the analyzed firms (number of people employed – up to 9). In turn: 28% were small firms employing from 10 to 49 people, 10% medium-sized firms employing from 50 to 249 people, 2% were large firms employing over 250 people.

¹ The regional division was as follows: eastern Poland (Podlaskie Region, Lublin Region, Subcarpathian Region), southern Poland (Opole Region, Silesian Region, Małopolska Region), central Poland (Kuyavian-Pomeranian Region, Masovian Region, Świętokrzyskie Region), northern Region (West Pomeranian Region, Pomeranian Region, Warmian Masurian Region), western Poland (Wielkopolska Region, Lower Silesian Region, Lubuskie Region).

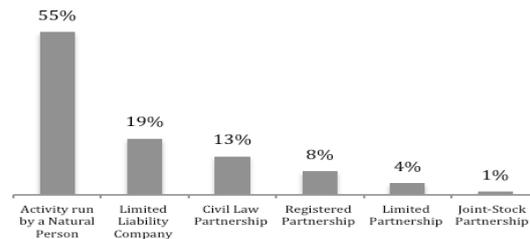

In accordance with the distribution of enterprises operating in Poland, small and medium-sized enterprises were represented by 98% of firms. The most popular legal form declared by respondents was a registered business activity run by a natural person (55%), limited liability company (19%), civil law partnership (13%), registered partnership (8%), limited partnership (4%) and joint-stock partnership (1%).

Figure 5. Size of family businesses in the analyzed sample (n=420)

Source: own elaboration

Figure 6. Legal form of business activity declared in the analyzed sample (n=420)

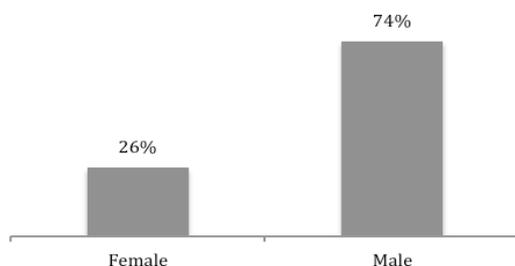

Source: own elaboration

A large percentage (68%) of legal forms such as a business run by a natural person or a civil law partnership is a sign of lack of knowledge about possible benefits and losses resulting from a given legal form. As it is shown by the quoted data, the most often an entrepreneur is a natural person as it is the easiest way of running a business.

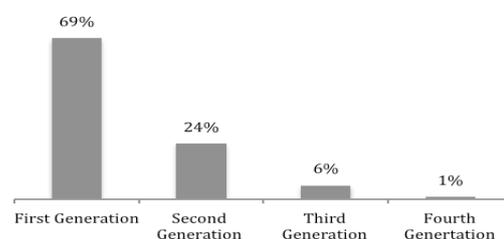

Another important feature which was analyzed was the gender of the current owners of family businesses. The structure of the obtained data is illustrated in figure 7. Female owners made up 26% of the sample. Another important feature specifying family businesses in Poland is the generation exercising authority in family businesses. A large majority of enterprises has not gone through succession yet (69%). It turns out that 24% of family businesses are run by the second generation, 6% by the third generation, 1% by the fourth generation.

Figure 7. Managers in the studied sample according to gender (n=420)

Source: own elaboration

Figure 8. Managing generation in the studied sample (n=420)

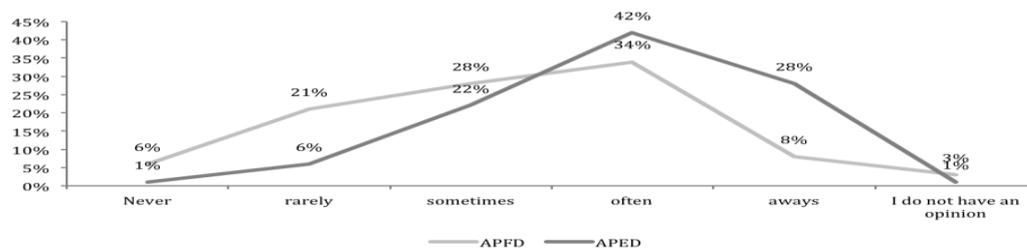

Source: own elaboration

The excerpted sample has a similar structure to the material that Jeżak and his team obtained in 2014, which allows the author to draw statistical conclusions regarding *family business responsibility*. In the detailed analysis – for the purpose of this study – a particular attention was paid to first two

features of *family business responsibility*, which were activities connected with profit allocation (APFD, APED). The activity of owners and chief managers of family businesses were evaluated on the scale ordering the frequency of their occurrence. The following expressions were used as parameters: “it never happens to me”, “rarely”, “sometimes”, “often”, “always”, and “I do not have an opinion”. One of the factors singled out by experts which has an influence on the stable development of both spheres of a family business is the way of dividing profit between family needs and developmental needs of a business. The results are presented in figure 9. Only 7% of the analyzed businesses declare that they never or rarely spend profit on business development, which corresponds with the results of 27% of firms in which it is declared that revenue is never or rarely spent on meeting family needs. Almost 28% of entrepreneurs declare that they sometimes invest acquired profit in family development, whereas 22% of owners sometimes invest in business development.

Figure 9. Distribution of answers for one of the variables describing family business responsibility (profit allocation, n=420)

Source: own elaboration

Data collected in this part of the analysis should not raise doubts. It should be remembered that a great majority of respondents were owners of microbusinesses where the border between the business sphere and family sphere is sometimes very narrow. Hence, the differences in the obtained answers were so small. Significant differences, however, may be observed in declared behaviour for results *often and always (...spend the profit made on the development of a business/family)*. 70% of entrepreneurs stated that they allotted profit to the development of the business sphere, whereas 42% stated they allotted it to the development of the family sphere.

DISCUSSION

Trying to provide a fuller explanation of activities connected with profit allocation in family businesses, an attempt was made to identify interdependencies between dependent variables and independent variables [Kujawńska,Więcek-Janka, 2010].

The main hypothesis, which became an introduction to further analyses, assumes that family businesses consciously allocate profits to company development and satisfy family needs. This

assumption is complemented by seven auxiliary hypotheses in which it was essential to recognize relationships between dependent variables (allocating profit to the development of the business sphere/satisfying family needs) and independent variables (enterprise metrics):

1. Profit allocation (PA) is connected with the age of a business (AB).
2. Profit allocation (PA) is connected with the size of a business (SB).
3. Profit allocation (PA) is connected with the owner's gender (OG).
4. Profit allocation (PA) is connected with conscious investment planning (IP).
5. Profit allocation (PA) is connected with children's entrepreneurial engagement in the business sphere (EE).
6. Profit allocation (PA) is connected with business-related conflicts (B-RC).
7. Profit allocation (PA) is connected with family-related conflicts (F-RC).

Each of the auxiliary hypotheses made was broken into two detailed ones connected with the place of profit allocation (here: business – B or family - F). A chi-squared test was used as a verifying tool of the hypotheses made. As a result of that, each detailed hypothesis was divided into next two ones: the null hypothesis stating there is no relationship between the analyzed variables and the alternative hypothesis stating there is a relationship between them [Więcek-Janka, 2015]. The test results for the detailed hypotheses are contained in table 2.

Table 2. Test results for auxiliary hypotheses ($\alpha=0.05$; $n=420$)

auxiliary hypothesis		relationship between	chi-squared test	df	p	V-Cramer
H.1	1.1	PA-B/AB	19,583	15	,189	,124
	1.2	PA-F/AB	21,457	15	,123	,112

H.4	4.1	PA-B/IP	63,216	25	<,001	,173
	4.2	PA-F/IP	24,363	25	,498	,012
H.5	5.1	PA-B/EE	45,026	20	,0012	,238
	5.2	PA-F/EE	46,726	20	,001	,216
H.6	6.1	PA-B/B-RC	87,750	25	<,001	,204
	6.2	PA-F/B-RC	16,837	25	,888	,023
H.7	7.1	PA-B/F-RC	46,398	25	,006	,259
	7.2	PA-F/F-RC	19,365	25	,0779	,121

Source: own elaboration

The analysis of the detailed hypotheses allowed to single out relationships between the variables of family businesses in Poland. The first of the detailed hypotheses assumed a relationship between the forms of profit distribution and the age of a business. No relationship with the age of a business was recorded either in the case of allocating profit to business development or securing family needs (H.1). It may mean that, regardless of the length of duration of a business, the directions of revenue

allocation are similar. Common observations of family businesses and their decision-making processes may indicate another type of behaviour, e.g. “consuming” profit in the first years of business operation. Statistical results unequivocally exclude the influence of this independent variable on the directions of financial means allocation.

The second hypothesis underlined the relationship between the analyzed variable and the size of a business. The obtained results of statistical testing indicate the lack of relationship between profit allocation to family needs and the size of a business which may signify a balanced distribution of such support irrespective of the size of a business (H.2.2). However, in the case of activities connected with profit allocation to business development, there is a link with the size of a business (H.2.1). It means that businesses along with their development invest profit earned (or part of it) into progressive measures.

The third hypothesis tested the relationship of gender with the selected directions of profit allocation. The analysis made did not show connection between gender and the selected direction of financial means distribution (H.3). The obtained result disclaims the stereotypes of female managers taking decisions in a more emotional way and directing profit to be consumed in the family.

Another testing area comprised relationships between the analyzed dependent variables and investment planning. A relationship between allocating profit to business activity and planned investments was confirmed (H.4.1). At the same time, the hypothesis regarding interdependency between using profit to satisfy family needs and implementing investment plans in the business sphere was rejected (H.4.2). Such results are in keeping with the logic of management which states that profit (or its specific part) should be spent on business developmental activities (profit reinvestment). It testifies to family enterprise owners’ and managers’ business maturity.

An appropriate preparation of future successors is an essential problem of family business responsibility. The fifth detailed hypothesis assumed a relationship between profit allocation directions and children’s entrepreneurial engagement in the enterprise’s business activity. Testing the hypothesis revealed that both in the first case (allocation in the business) and the second case (allocation in the family) there is a connection with children’s entrepreneurial engagement in business matters (H.5). The presented relationship between the researched variables may have different origins. First, it may result from adopted family models and values which oblige children to help their parents. Second, according to the exchange theory, children, observing the business development and growth in family living standards, notice the benefits of running the business and commit themselves more willingly to work in it. Third, according to the exchange theory, young people see their commitment to work for the good of the business as an opportunity to obtain more quickly benefits such as: power, respect (of both family members and people from outside) and social acceptance.

While conducting the research, attention was also paid to the emergence of conflicts in family businesses. Two of the hypotheses made (H.6 and H.7) concerned the analysis of the relationship between profit allocation directions and conflicts which were subdivided into business- and family-related. The existence of relationships between allocating profits to business company development and the emergence of business- and family-related conflicts was confirmed. Using profit to meet family needs does not give rise to conflicts. Such an outcome may be explained by the lack of co-deciding by other family members about detailed plans connected with financing the business area and family.

Table 3. Results of testing the main hypothesis ($\alpha=0.05$; $n=420$)

The main hypothesis	relationship between PA-B/PA-F	chi-squared test	df	p	V-Cramer
		215,7982	25	<,001	,34

Source: own elaboration

The main hypothesis concerning activities connected with the conscious allocation of profits in both business and family spheres was confirmed. In accordance with the results contained in table 3, it can be stated that family entrepreneurs consciously divide profit into business development and satisfaction of needs signaled by the family.

The results of the multiple-path analysis justify the conviction that: first, owners of Polish family businesses show great awareness and maturity in harmonizing activities undertaken for the sake of the development of both spheres of a family business, second: the postulate of shaping *business responsibility* as regards activities related to the direction of profit allocation should be acknowledged as fulfilled.

CONCLUSIONS

In search of theoretical bases for developing the concept of *family business responsibility*, the behavioural perception of social exchange was adopted. It allows to analyze the activity of family businesses as a system created by at least two players (business and family), whose present and future welfare is contingent on developing and satisfying mutual considerations.

In the course of the preliminary research, a few variables were singled out which may influence *family business responsibility*. The present paper features and thoroughly analyzes one of the variables singled out by experts, namely *the direction of profit allocation*. The main hypothesis, verified during the interpretation of statistical data, points to the ability of Polish owners of family businesses to effect a harmonious division of profits between the development of a business and needs of the family. Moreover, a few dependencies were proven to be linked to the analyzed variable:

1. The bigger the business, the more often profit is earmarked for business development;

2. Innovative (or aspiring to be innovative) businesses earmark profit for business development more often;
3. Raising children in the entrepreneurial spirit and engaging them in making business decisions is tied with a harmonious profit allocation;
4. Family-related conflicts are connected with a higher frequency of allocating profits in the sphere of business development.

The result of the development of a complete business model family responsibility will be to indicate the actions that should be taken by the family company seeking to maintain longevity. Work on the concept of *family business responsibility* will be continued and its consecutive variables will be analyzed and published in research papers.

THE PHENOMENON OF THE BIG DATA – WHERE IS THE RESPONSIBILITY OF OSP ?

Włoch, Renata; Katarzyna, Śledziowska

University of Warsaw, faculty of economic sciences, Digital Economy Lab, Warsaw, Poland.

ABSTRACT

By clicks, likes, tweets, photos, blog posts, online transactions, we (people and businesses) allow to create Big Data. Our digital traces tell the story about our professions, preferences, choices, transactions, traveling, habits etc. They permit to get information about who we are and what we do as individuals and organisations. This process is associated with a threat but also an opportunity for the social and economic development. The key question is how to ensure that the data we create continue to improve our lives, innovation and sustainable development. A majority of Big Data is no longer housed in statistical agencies, but housed by businesses including Online Services Providers (OSP). We state that regulators should consider this data as a public good and build the platforms for public and private partnerships to ensure advantage of digital technology, improved connectivity and data revolution.

Keywords: *Big Data, digital trucks, Online Service Providers.*

INTRODUCTION: A NEW BRIGHT WORLD OF BIG DATA

Big Data is a buzzword. And like most of buzzwords – globalization, synergy, and innovation – it remains a loosely defined notion. One of the most commonly recognized definition was offered by Gartner: Big Data is “high-volume, high-velocity and/or high-variety information assets that demand cost-effective, innovative forms of information processing that enable enhanced insight, decision making, and process automation”¹. Big Data may differ as to their structure (structured, unstructured, semi structured) or their source (internal to the organization or external). It may be collected by public institutions, but the bulk of it consists of the enterprise Big Data, collected and processed by private Online Service Providers (OSP).

The Internet offers multiple platforms for people to consume, disseminate and produce their own content – or leave their digital traces. This results in exponential rise of data and information. The oft-cited IBM source claims that 90% of all existing data has been generated in just last two years, daily there appears 2.5 quintillion of bytes, and up to 2020 there will be 43 trillion of gigabytes (IBM 2015).

¹ <http://www.gartner.com/it-glossary/big-data/>

There are many different types of Big Data sources collected by OSP: social media data, personal data from tracking devices, sensor data, transactional. The total sum of data store by biggest OSPs (Google, Amazon, Microsoft and Facebook) is estimated to equal at least 1,200 petabytes¹. Google receives over 4 million search queries per minute. Facebook users shared 2,460,000 pieces of content. This increase of Big Data is mainly related to the growth of Internet users. In one decade, the global internet population grew from 0.5 billion to 3 billion people. It means that now 3 billion users produce data as part of their everyday participation in the digital world.

Source: ITU

In this article we bandwagon in the trend of analysing the Big Data revolution. We try to defend our right to do so by introducing the elements of economic and sociological reflection concerning the private and public goods in order to analyse the specificity of the enterprise Big Data. We start by reviewing the basic assumptions of economics of information, and then we continue to discuss their social and economic consequences, in the light of the emergence of Big Data. We underline that there is an unlimited potential in Big Data to be realized but first there are some challenges that have to be resolved. Not only issues related to individual privacy, data protection and data integrity should be discussed and regulated. The Big Data should be considered as a public good. On this paradigm the cooperation between businesses, academic institutions, and statistical organizations should be built. In this process the crucial role should be played by those who generate the biggest amount of data – the Online Service Providers.

Innovation, Entrepreneurship and Digital Ecosystems

INFORMATION AS A PUBLIC GOOD

The point of departure, then, is that recently we witness the data revolution: never before humanity had so much data on their hands (Cukier, Schoenberger 2013). But, to state the obvious, having data is not coterminous with having information, which, in turn, does not automatically lead to possessing more knowledge. Information (if it is to be reliable, needs to be extracted from data with use of rigorous, scientifically grounded methods) is always contextual and involves the process of ordering, structuring and presenting of data. While knowledge is generated in the process of culturally defined understanding of information (Elsner, Heinrich, Schwardt 2014). As many social scientist proposed – e.g. American economist and Nobel Prize winner George Stigler and French thinker Michel Foucault – knowledge is power. And to take this argument further, power is equivalent with the potential to change the behaviour of other people, the functioning of the institutions and consequently the shape of the society.

Owing to contributions from the aforementioned Stigler, George Akerlof and Joseph Stiglitz the theory of economy gained valuable insights into the economics of information. The later assumes that information is a kind of a product, although by no means a typical one. It is relatively easy to generate and disseminate, and when accumulated it has more value than the sum of the individual values. What's more important, there are immense economies of scale. Information is not consumed by being used or transmitted to others: many persons may possess and use the same information, even at the same time, without diminishing its value to others.

It was Joseph Stiglitz who noticed that the economic properties of information have those characteristic of public goods. Besides, it should be emphasized that in his view for all practical reasons, information can be equated with knowledge (Stiglitz 2008: 1693). He pointed out two main critical properties that allow such classification, precisely: nonrivalrous nature and nonexcludability (nonexclusion?). The former implies that there is zero marginal cost for an additional consumer to enjoy the benefits of the knowledge and the latter implies that the knowledge and all its benefits cannot be provided privately. While these two characteristics may seem very easy and clear to be identified, the precise understanding of these properties give the origin to the strong economic implications.

Namely, Stiglitz (1999) emphasised that when we consider nonrivalrous nature of the knowledge we should notice that zero marginal costs imply that the knowledge with the zero price is the knowledge that can be produced at the zero costs. And besides, we should not forget about the costs stemmed from transmission of the knowledge: private providers of the knowledge can charge the transmission of the information to reflect the marginal cost of transmission though without alerting the nonrivalrous nature of the good itself. In other words, while there is a cost related to transmission, the

good itself remains free of charge. Therefore, the existence of private providers of the information does not take the information out of the public good classification.

When it comes to the nonexcludability (nonexclusion), this implies that no one can be excluded from the consumption of knowledge. However, Stiglitz discusses that there are many cases when some forms of the knowledge (for instance secrets of the firms to produce particular products, etc.) are excludable. In this direction, we may see patents as the tools for disclosing the information from the information owners. More precisely, by giving rights to inventors to enjoy the fruits of their innovative activity over a limited period of time, we get the information about the details of their innovations. This process additionally generates positive externalities since availability of the new knowledge is in fact the source of further innovations. So patents basically can determine the pace of innovations. However, since nonexcludability is not fully satisfied by the phenomena of the creation and transmission of the knowledge, the latter is rather considered as an impure public good.

The proposition of Stiglitz (1963, 1999) counters the classical economic approach by Paul Samuelson that emphasizes that public goods are, by definition, generated by public sector. As Holcombe puts it, "An economist argues that a good has the characteristics of either jointness in consumption or nonexcludability, and then, because that makes the good a public good, implies that the good should be produced in the public sector" (Holcombe 1997: 1). Stiglitz's argument goes hand in hand with the approach of the researchers working in the area of development and underdevelopment who emphasize that "public goods are socially defined and constructed: the outcome of complex political processes which evolve around the definition of public need" (Wuyts 1992). Stiglitz (1999) furthermore argues that besides being the public good, information could be moreover classified as a global public good. The idea is that the access to information and knowledge have to be guaranteed and safeguarded so that the asymmetry of information does not diminish the equal playing ground for individuals and firms, especially when that knowledge is crucial to internal and international development. In other words, a public good is not defined as a good that is characterised by nonexcludability and nonrivalrous nature, but as such that *should* be nonexcludable and nonrivalrous, and this includes the access to information and knowledge.

Let us assume, then, that information is a global public good. Does this classification unequivocally relate to data? Does the data, particularly Big Data, represents a public good?

WHO'S BIG DATA?

The Big Data are intermittently generated by various organizations, public and private, and by individuals who are – mostly unwittingly and sometimes unwillingly – leaving their virtual tracks while surfing the net, interacting via social media, or using their mobile. What's even more important,

this process of data production is not passive: people are being actively tracked by plethora of entrepreneurs.

The *Atlantic* journalist Alexis Madrigal found out with the help of Mozilla's software Collusion, that in 36 hours of "standard web surfing" his data was tracked and collected by 105 companies, mostly by "smaller data and advertising businesses that form a shadow web of companies that want to help show you advertising that you're more likely to click on and products that you're more likely to purchase"¹.

The digital traces left by digital subjects in virtual activity are collected by Online Service Providers (OSP). They play the role of intermediaries for consumers and enterprises by providing them online access to the digital goods and services, but at the same time they use search engines to generate and maintain extensive databases of Internet addresses and content (web pages, images or other types of digital files) in an easily searchable format. Unsurprisingly, they use the collected data for their own benefit, e.g. in order to improve their services and monetize them by targeted advertising. The revenue from advertising makes it possible to provide valuable services that are offered to users at low (subsidized) prices or for "free". Yet there are no free lunches. The cost that the customer has to pay for those services often takes the shape of the acceptance of the fact that his or her data will be gathered and used for (mainly) marketing purposes. This way the Internet intermediaries are located at the crucial nodes of power: they have an access to an unimaginably large pool of data from which they can extract information, building themselves an informed and intimate knowledge about the preferences of their customers, trends in social, political and economic areas of life. And, only naturally, they use their privileged epistemological position to strengthen their hold on the market.

These new possibilities of data-nourished market adjustment were readily taken up by other private entrepreneurs. The collection and use of customer data is practiced not only by online firms, but also by traditional offline businesses, by both new players and established ones, by firms of all sizes, by firms offering a wide array of services to users. More and more firms have been taking their day-to-day operations first to computers, and then online. They collect large-scale and even real-time data on prices, employment, spending, costs, sales contracts, physical shipment and transport (McKinsey 2011). They also keep digital records of collaborative work efforts, personnel evaluations, and productivity measure. Most of these data sets are easily searchable and easy to merge. What's even more important, nowadays private entrepreneurs virtually effortlessly and without burdensome costs are able to harvest data lined to advertising, social media activity, offline spending, or credit history. As a result, the sellers are able to tailor their offer to the individual customer needs by using systems

¹<http://www.theatlantic.com/technology/archive/2012/02/im-being-followed-how-google-151-and-104-other-companies-151-are-tracking-me-on-the-web/253758/>

that aggregate user feedbacks and by offering advertisements and product recommendation based on past browsing behaviour, past purchases or analysis of data on individual user preferences as evoked via social media (Hennig-Turau et al. 2010). Generally, circa two thirds of the Big Data inflow comes from the internal sources of the companies, the rest is bought from other OSP, especially those who own social media (TCS 2013: 20).

Firms using Big Data-extracted information on the consumer preferences enjoy huge competitive edge: in 2011 Eric Brynjolfsson and his colleagues analysed the performance of 179 of large publicly traded firms and found that firms that adopted decision making based on data and business analytics (“data driven decision making”) can boost output and productivity by larger than 5-6%. They also performed better in asset utilization, return on equity and market value (Brynjolfsson, Hitt and Kim 2011). Another estimation predicted 60% potential increase in retailers’ operating margins (McKinsey 2011): nowadays those firms that do not squeeze such information out of digital traces are often losing their traditional markets. The asymmetry of information acts for their detriment.

Getting back to the point: the phenomenon of ownership of the enterprise Big Data is complicated. Basically, enterprise Big Data is mostly private data produced by the individuals acting – for most of the time – privately, i.e. not in their worktime and for private, often intimate purposes. The individuals have got no effective control over their “online production”. Admittedly, in 2012 (effectively in 2013) the European Union (EU) introduced the obligation to inform the users about online tracking. But still the only viable, though increasingly impractical, option to limit the scale of online tracking is to opt out from using the technology. The effective possessors of the data are the Online Service Providers who gather the data. We could possibly extend this argumentation to show that this relationship can be treated as a kind of Marxian clinch between the digital analogue of the exploited and the exploiters who capture the added value for their own benefit (Mosco 2015). Admittedly, the digital “proletariat” toils more than willingly, but nevertheless they have no tools to evaluate whether the perks they are granted, such as the use of free software, is worth it. One of the sides of the bargain acts in the context of maximum information asymmetry. The OSP own the data that make it possible to build information and knowledge about society: they know about us, and can look at us, analyse us, sell the data and information about us. We don’t know what exactly they know, and what’s more, in many aspects they know more about us than we know about ourselves. This view seems to be supported by Stiglitz, who emphasises that nowadays the ability to produce knowledge is in fact the digital analogue of means of production:

Knowledge and information is being produced today like cars and steel were produced a hundred years ago. Those, like Bill Gates, who know how to produce knowledge and information better than others reap the rewards,

just as those who knew how to produce cars and steel a hundred years ago became the magnates of that era (Stiglitz¹).

Effectively, then, enterprise Big Data, even though in main part produced by plethora of individuals, is treated as private good by the actors who are located in privileged positions to collect it.

WHY SHOULD WE TREAT BIG DATA AS PUBLIC GOOD?

Maybe there is no need to make so much ado about this trafficking in human digital data? Maybe if there are legal regulations in place that control the pathologies of Big Data political economy, such as interlocking of digital capitalism and the surveillance state (Mosco 2015), and the data are kept anonymous and are not used *against* individuals, there is no harm that enterprise Big Data are kept and used solely for business purposes?

In the first part of the article, following Stiglitz, we argued, that information and knowledge are kind of public goods. Logically, data are the necessary constituents of information. Is there any difference between the data that could be used by society at large before and after the onset of Big Data? Why is the access to Big Data that important for the society that we argue that it should be treated as a public good for public good? In the past, data was gathered, structured, interpreted and - often grudgingly or never - presented by specialized institutions, usually at the payroll of nation-state (such as National Statistics Offices) or of the market actors (e.g. R&B departments of corporations or market research agencies). The process of data collection was almost invariably tedious, time-consuming and costly. This changed with the triumphant ascent of digital technologies that culminated in the so-called Big Data Revolution. Data available from traditional sources such as censuses and surveys are not entirely sufficient for modern research.

The consequences of Big Data Revolution were most convincingly discussed by Schoenberger and Cukier in their seminal book (2013). They emphasize that the emergence of Big Datasets opens new methodological opportunities for social sciences. The basic assumption is that we witness the increasing “datafication”, that is the growing possibility to capture “many aspects of the world that have never been quantified before”. This in turn leads to three immensely important changes in the attitude to data. First of all, in many areas of social life sampling, the pillar of modern statistics, is no longer that crucial. In the past social scientists had no means of analysing the bulk of the society. They had to rely on the assumption that a random sample of the society will tell them something about the whole. In other words their probing techniques were similar to those applied by geologists who insert drills into the ground, extract core samples and then use it to describe a certain geological area. But the

¹ Stiglitz, Joseph. 1999. Public policy for a knowledge economy. *Remarks at the Department for Trade and Industry and Center for Economic Policy Research* 27 <http://akgul.bilkent.edu.tr/BT-BE/knowledge-economy.pdf>

geological areas tend to be more structurally coherent than human societies, so the social scientists, particularly sociologists, had always taken into account the possibility of error.

Another case is pointing out the links the ontological and epistemological arguments. Sociologists often complain that their object of research is immensely complicated, fragmented and, what's most important, changeable. The effects of their analyses most often described the society that was no longer there. For example, it took the National Statistics Office more than three years to publish the results of the Polish census of 2011. The widely approved Gartner definition of Big Data emphasizes velocity as its main feature – the data are available in almost real-time. Sociologists do not have to paint a perfected sociological portrait of the society, which takes (too) much time, they can snapchat its changing faces. In other words, they can gain new epistemological vistas of the ontologically incoherent subject of analysis, if only they will be able to make peace with two other aspects of Big Data revolution Schoenberger and Cukier emphasize. First of all, social scientists have to accept the fact that Big Data are messy: “a bit inaccuracy can be tolerated, because the benefits of using vastly more data of variable quality outweigh the costs of using smaller amounts of very exact data”. Secondly, and even more importantly, they have to renounce causality and accept correlations (and with it the risk that lot of it will prove to be spurious). But this, taking their argument further, may become the realization of the big dream of social sciences from their onset: the power of predicting the future.

Big data is poised to reshape the way we live, work, and think. A worldview built on the importance of causation is being challenged by a preponderance of correlations. The possession of knowledge, which once meant an understanding of the past, is coming to mean an ability to predict the future. The challenges posed by big data will not be easy to resolve.

Big Data can change economic and social research relied on methods such as surveys, experiments, and ethnographies. For example, real time data can be used to estimate inflation. In the MIT Billion Prices Projects called PriceStats prices are collected daily from hundreds of online retailers. Thereby changes in inflation trends can be observed sooner in PriceStats than in the monthly Consumer Price Index (CPI). Social media messages can be the source of measuring the job losses or households' sentiments on their financial situation and on the economic climate (Daas and Puts (2014)). The Big Data can be the important source for research development especially in countries where accessibility to the Open Data is limited to the researchers.

The ancestors of sociology, notably August Comte, wanted social sciences to “know to predict, to predict to control”. The access to Big Data may make this dream come true: it enables building multifactor knowledge about society and its problems, facilitates extrapolating trends, and makes it

possible to react more precisely and quickly to those identified problems, bringing an entirely new possibilities to public policies. Just like the firms can tailor their market offer to the needs of customers extrapolated from their virtual tracks, the government could tailor its undertakings to the needs of specific social groups, and react in time to prevent crises. Chris Yiu, an expert of Policy Exchange claims (2012) that using Big Data in administration facilitates sharing (e.g. streamline transactions between different agencies and departments); learning (e.g. generating agile insights about the internal functioning of the organization in question); service personalisation (enabled by “granularity” in big data); solving (by way of examination of previously hidden patterns and correlation and enhanced prediction); and innovating for growth (by strengthening efficiency and cost-effectiveness). The traditional policy cycle of “planning – implementation – evaluation” may be, in result, replaced by “agile public policy” - (Parcell & Holden 2013, Room 2011).

Big Data have been greeted as the “new oil” of the 21st century (Greenwood et al. 2014), the necessary component of future socioeconomic development. In 2011 McKinsey Global Institute experts in a report “Big data: The next frontier for innovation, competition and productivity” outlined five ways in which Big Data may create additional value. First, by creating transparency: “simply making big data more easily accessible to relevant stakeholders in a timely manner”; secondly, by “enabling experimentation to discover needs, expose variability, and improve performance” of organizations; thirdly, by segmenting populations to customize actions; then, by replacing or supporting human decision making with automated algorithms; fourthly, by innovating new business models, products, and services. Interestingly, the report focused not only on the productivity benefits for enterprises, but also for public sector. The research proved that “big data levers, such as increasing transparency and applying advanced analytics, offer the public sector a powerful arsenal of strategies and techniques for boosting productivity and achieving higher levels of efficiency and effectiveness” (McKinsey, 2011: 54).

Detailed data on human beings can be used by policy – makers to reduce crime, improve health delivery and manage cities (Keller et al. 2012). Services can be effectively targeted to the citizens, health interventions can be better designed, and taxpayers may pay less for government services (Lohr 2012). Real time data can be used to monitor traffic or to identify infrastructural problems what permits to react efficiently and quickly.

In 2011, McKinsey estimated that use of Big Data may potentially contribute 250 billion € annually to Europe’s public sector administration.

TOWARDS NEW DEAL BETWEEN PRIVATE AND PUBLIC INTEREST

So far we have tried to highlight the importance of accessing the Big Data. But here the main difficulty comes down to convincing the factual owners of the Big Data that introduction of some routine mechanisms to share their commercially valuable asset should be their (corporate) social responsibility.

This new kind of negotiation to make the consensus around the private and public interests in Big Data was recently highlighted by Big Data UN Global Working Group. During conference on „Big Data for Official Statistics“, in October 2015 in Abu Dhabi, the Group presented „Draft Principles for Access to Big Data Sources“ (UNSTAT 2015). The proposal tries to reconcile „the high and urgent need for access to Big Data sources for the production of official statistics“ and „legitimate interest of businesses“ who may become financially and organizationally burdened by requesting access to Big Data, by way of introducing eight principles:

- 1) **Social responsibility:** The national and international systems of official statistics need data in order to „provide relevant, high-quality information to society in an impartial way“. To this end, they need free of charge inputs from individuals, including businesses which should treat this obligation as a part of their social responsibility.
- 2) **Fundamental principles of official statistics:** the statistical agencies will obviously guarantee the confidential use of the data.
- 3) **Level playing field:** No particular entrepreneurship should be particularly burdened by the obligation to provide data: “the fairness of the distribution of the burden across businesses has to be considered, in order to guarantee a level playing field”.
- 4) **Acknowledgment of business interest:** Data have market value, so there “must be a fair balance between public and business interest when data is requested”.
- 5) **No more than needed:** The data must be adequate and relevant in relation to the purposes for which it is requested from the business.
- 6) **Benefit proportionality:** The cost and effort of providing data, including possible pre-processing, must be reasonable compared to the expected public benefit of the official statistics envisaged.
- 7) **Non-discrimination:** Businesses should treat requests from national statistical systems in a non-discriminatory way.
- 8) **Transparency:** both businesses and statistical authorities should ensure full transparency about the provision of data¹.

¹

<http://unstats.un.org/unsd/trade/events/2015/abudhabi/presentations/day2/04/1%20Access%20and%20Partnerships.pdf>

To sum it up, for the practical reasons (operation costs, transaction costs) the access to Big Data cannot be unrestrictedly open. The two principal intermediaries between entrepreneurship Big Data and the public should be public institutions and, particularly, universities. The academic society should see they role in processing and explaining the data and its potential uses to the decision makers and society in general. Particularly social scientists should act as translators of abstract digits to so-called “common people”. In 2010 Eric Schmidt and Jared Cohen suggested that one of the major sources of the present social, economic and political change is the diminishing importance of intermediaries in the circulation of information. They argue that we are witnessing the emergence of new types of non-hierarchical relations of power in the framework of “virtual communities” of people. Yet the revolutionary potential that Schmidt and Jarvis saw in the sheer existence of the data and information will not be fulfilled without input of intermediaries which will transform the data into the easily understandable format. To reap the fruits of the recent worldwide digitization, there is the need of more systematic analysis of ever-changing and tantalizingly growing bytes. “The numbers have no way of speaking for themselves. We speak for them. We imbue them with meaning. Like Caesar, we may construe them in self-serving ways that are detached from their objective reality” (Silver 2012). And here, we consider universities to play the crucial role. As never before, there is a room for the academia in preserving the right to knowledge and information by providing the tools and means for analysis of both public and enterprise Big Data.

Additionally, the universities have another traditional role to play. As we have already stated, the governments vie (??) for more precise knowledge of their citizens. They gather it with their own hands and by looking for ways to access the enterprise Big Data. But, as the ACTA protesters emphasised, the too well informed Leviathan may easily transform into virtually omnipotent – because omniscient - Big Brother. Tailored solving of social problems may grow into social engineering that would not necessarily be mild. The academia should guard and guarantee the free flow and use of knowledge produced with the use of Big Data.

BOOK OF CONFERENCE ABSTRACTS

A MULTICULTURAL STUDY ON THE IMPACT OF CULTURE ON THE QUALITY OF THE RELATIONSHIP BETWEEN EXPORTERS AND LOCAL DISTRIBUTORS

Alves, Gisela Maria Maia

University Lusíada North- Port, CECS the University of Minho

ABSTRACT

This research is aimed to understand the role of culture in the quality of the relationship between Portuguese exporting companies and their distributors in Angola.

This study is particularly important because it is based on an analysis of exporting distributor pairs (matched pairs) i.e. Portuguese export companies and their distributors in Angola. This study aims to understand how culture impacts the quality of relationship on trade relations established between companies in the internationalization of business context. Also note that in international contexts, it hasn't been much studied the impact of the similarities / cultural differences about the relationship structures.

In terms of methodology, we opt for a qualitative analysis: five case studies of Portuguese exporting companies and five case studies of Angolan distributors were examined. Interviews with Directors / CEO of Portuguese exporting companies and boards responsible for export activities were carried out and the corresponding Angolan distributors in order to answer the research questions. The selection of Portuguese companies was based on a list of the fifty largest exporters to Angola, provided by the Agency for Investment and Foreign Trade of Portugal, EPE (AICEP) in August 2011. In general, the results show that culture has impact on the quality of the relationship of business relations between the Portuguese exporting companies and their Angolan distributors.

THE SCIENTIFIC, ECONOMIC, SOCIAL AND ETHICAL VALUE OF GEOLOGICAL HERITAGE: EXAMPLES FROM SOUTH ITALY INLAND AREAS

Amore, F. Ornella; Ciarcia, Sabatino

Dipartimento Scienze e Tecnologie, Università del Sannio, Benevento, Italy

ABSTRACT

PURPOSE

The present paper re-evaluates and highlights the scientific and touristic value of some geological sites of inland areas in South Italy. The protection and the valorization of natural heritage is an opportunity for economic development of local communities. The touristic promotion of an area, preserving and improving its naturalness levels but being also an opportunity for development, can only be based on the scientific knowledge of the places and the sustainable management of the natural resources. While it is more immediate to understand the importance of protecting a forest or an animal species, it is still not widespread the awareness of the geological heritage protection, often constituted by non-renewable resources as a waterfall, a cave, a fossil level.

METHODS

Italian natural heritage is well known, however inland areas are often poorly reached from the main touristic flows. Sites of geological interest as Baselice, Pietraroja, Cerreto, Telese, Vitulano, located in inland areas of South Italy (Fig. 1), if properly promoted, can be an example of eco-sustainable tourism.

- *Baselice*: outcrops of fossil circolittoral macrofauna embedded in Miocene sediments rich in echinids (e.g. clypeaster), molluscs (pecten, ostreids, etc.) corals and red algae (Ciarcia *et al.*, 2012; Università degli Studi di Napoli, 2016);

- *Pietraroja*: due to its international relevance, it could be proposed for classification as the location of an UNESCO Global Geopark; the area is rich in geoheritage of great scientific value (Società Paleontologica Italiana, 2010-2016) for the occurrence of a Cretaceous theropod dinosaur, named *Scipionyx Samniticus* (friendly *Ciro*), characterized by an extraordinary soft-tissue preservation and of thin and very delicate abdominal bones (Dal Sasso and Signore, 1998), that is of interest for both education and tourism (Ruggiero *et al.*, 2003) ;

- *Cerreto Sannita*: in the surroundings there are the grooves of the Titerno River carved in the Lower Cretaceous limestone to form the "Marmitte dei Giganti", deep depressions shaped

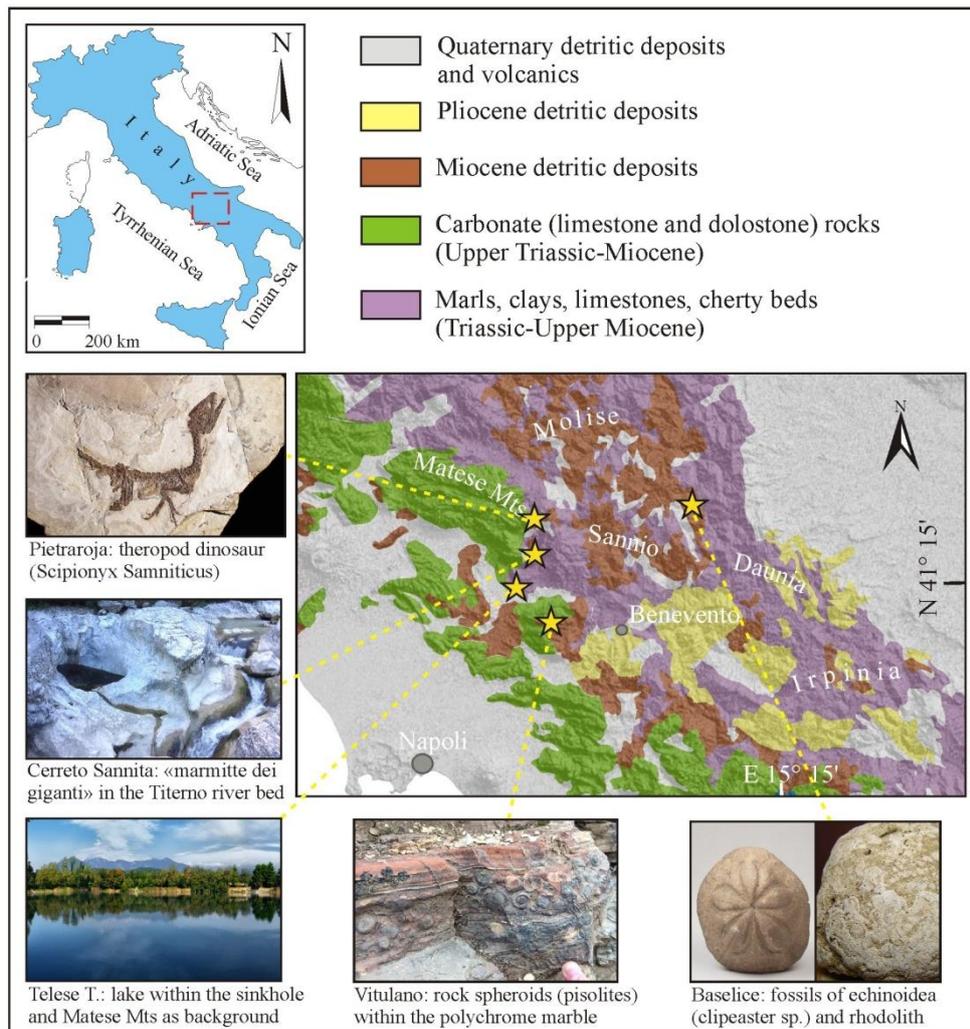

Fig. 1 – Some sites of geological interest in South Italy

like a well in the rocks, which arise from river erosion (Ruggiero *et al.*, 2003; Ciarcia and Amore, 2016);

- *Telese*: positioned on an Upper Pleistocene travertine (calcareous rock of chemical origin) plate, it presents an intense hydrothermal activity with sulphur springs and a lake circularly shaped, situated within an old sinkhole (Ruggiero *et al.*, 2003; Vitale and Ciarcia, 2013);
- *Vitulano*: mines of Cretaceous polychrome marble, an ornamental stone consisting of reworked bauxites, calcareous breccias and reddish limestones, deposited in underground cavities (Vitale and Ciarcia, 2013; Ciarcia and Amore, 2016);

The geoconservation methodology used includes (1) inventory and characterization of the geosites, (2) relevance and ranking of the geosites, using numerical indices, (3) implementation of the conservation strategy, (4) tourism promotion, and (5) monitoring, over time, the selected geosites.

FINDINGS

The integration of scientific education with business knowledge and managerial skills allows a correct protection and development of the area. This requires a widespread dissemination of the geological resources but also an education to the economic value of natural heritage and to the use of business tools. Finally, the Nature is able to inspire in us emotions: the integration of "rational knowledge" and "emotional knowledge" can determine the acquisition of a new feeling where "*citizens could make decisions on their own behalf to benefit themselves, their community, their country, and the environment that sustains them* (Wangari Maathai, Nobel prize for peace in 2004)".

THE RELATIONSHIP BETWEEN SOCIAL MEDIA MARKETING AND CO-CREATION IN THE UK INDUSTRY RETAIL

Antoniou, Leda

University of Nicosia, Nicosia, Cyprus

ABSTRACT

The purpose of this study has one major segment; to show the relationship between social media marketing and co-creation. This will be shown, through an initial conceptual framework, which shows the proposed antecedents and the consequences of co-creation in a company.

The role of Social Media has become crucial, because there is a change about the role of Internet and the developments that have been created around the Web 2.0, in the marketing. Social Media is the term that described platforms that bring people together for the exchange of information, for example: Facebook, Twitter, Instagram, etc. Social media is defined as an interactive platform that allows social actors to create and share in multi-way and instant communications (Kietzmann et al. 2011; Peters et al. 2013). It has become a communication vehicle and a very powerful marketing medium for the companies with many benefits. According to Stelzner (2014), 97% of the companies are using some form of social media in order to market their business.

Social Media can be considered a catalyst for changing market structures and relations in the market. For the reason that, there is no longer one-way of communication from a business to the consumer. Social media can offer a new powerful way for customers to not only to communicate with the companies and brands, but to communicate with other consumers too. Stelzner (2014), stated that social media can be described as a fast and effective mean for the consumers in order to communicate with organisations.

Marketing and advertising are changing more than ever in the last few years, and the customers are pulling the strings. Consumers are more active, informed and empowered. The internet has given them power to research, compare and review brands, authorising good and bad experiences to be transmitted to the world. For the companies, this can be challenging, who in the past had always the control over their brand messages and image. The firm-centric view of the world, has refined over the last 75 years. Customers are interacting with the company through social media, and are co-creating value, where there is a more customer-centric value creation (Prahalad & Ramaswamy 2004a; Roberts et al. 2005; Vargo & Lusch 2008).

According to Prahalad and Ramaswamy (2004), co-creation is a process of interactions between consumers and the firm in the exchange of information and dialog. Customer co-creation is an active, creative and social process, based on a collaboration between retailers and consumers (Roser et al.,

2009; Hippel, 2005; O'Hern/Rindfleisch, 2009; Piller/Ihl, 2010). Customer engagement has become a critical strategic matter and a key success feature to develop a competitive benefit for businesses in a very competitive world (Sedley, 2008; Brodie et, 2011).

Co-creation is a new paradigm that has captured the imagination of marketing and management professionals and scholars (Zwick, Bonsu and Darmody, 2008). By the implementation of the idea of co-creation, companies can gain competitive advantage. In generally, co-creation with consumers is resonant. The number of firms that are implementing co-creation is increasing more and more. Behemoth companies are engaging consumers through co-creation, for example: CocaCola, Starbucks, Burberry.

In the long run, social media marketing became an important data source for businesses. The integration of social media can increase the effectiveness and the efficiency of co-creation, for the reason that it improves the insights about a product from their customers' opinions.

In order to investigate the relationship between social media marketing and co-creation and analyse if this relationship will lead to greater results for the company, primary and secondary research was adopted. Primary research involves the data which is original, meaning they are collected for the first time. Secondary research deals with the data that has been already gathered by someone else and has been through statistical analysis (Kothari, 2014).

It was decided that descriptive quantitative was suitable for this study, so that the results would have both width and depth for achieving better answers for the Research hypothesis of this study (Creswell, 2003). Therefore, after considering the requirements of this study, it was decided that online-questionnaires would be a suitable method for the collection of empirical data for this research. This method was adopted because it supports large number of samples and can generate trustworthy results. The online-questionnaire had multi-value option-questions and was created on Qualtrics which is an online-survey software-tool. The questionnaire data will be coded through Qualtrics and will be analysed through Word in which tables and Figures will be created.

The findings will show the relationship between social media marketing and co-creation. Also, the factors that a company must use in order to succeed a greater customer co-creation. Finally, the benefits and the consequences that a company can gain by using co-creation, will be shown.

IMPACT OF TOP MANAGEMENT TEAM COMPENSATION ON FIRM PERFORMANCE IN TURKEY: AN EMERGING ECONOMY EXPERIENCE

Ataay, Aylin

Management Department, Galatasaray University, Istanbul, Turkey

ABSTRACT

Top management team (TMT) compensation is a critical area of interest in the current economic environment. The public media and politicians as well as the practitioners and researchers are captivated by the high and steadily increasing salaries top executives receive annually. Although the antecedents of top management team compensation, especially CEO compensation are analysed in detail in several academic disciplines and from many theoretical lenses, understanding the consequences of top management team compensation are still central to the concerns of practitioners and researchers. In this study we discuss top management team compensation in Turkey and explore the implications of executive teams' pay for firm performance. Examining a sample of 2067 firm-year observations of Turkish listed companies spanning the period 2009–2013, our regression analysis results indicate that the association between firm performance and top management team pay is conditional on the effectiveness of corporate governance system. We observe that the impact of executive management team compensation on firm performance differs regarding companies' ownership structure, size, control structure and board of directors' characteristics.

INSIDER VERSUS OUTSIDER SUCCESSORS: ANTECEDENTS OF CEO SUCCESSOR ORIGINS IN AN EMERGING MARKET

Ataay, Aylin

Management Department, Galatasaray University, Istanbul, Turkey

ABSTRACT

One of the most important decisions pertaining to the future and performance of a company is that of top management succession, especially the appointing of a new Chief Executive Officer (CEO). Much of the research into this subject has been conducted in the US, and has revealed both that CEO turnover rates are increasing and that CEO tenures are becoming shorter. The present study aims to expand this literature by examining the social context of an emerging market, Turkey, in which firms involved in family, business group, and international relations influence CEO successions and the characteristics of these successors. In this context, our study focused on 258 Istanbul Stock Exchange listed companies and examined all newly appointed CEO's and their antecedents between the years 2005 and 2011. The three hypothesized determinants of CEO succession and successor origins are: pre-succession performance, ownership structure, and incumbent CEO's characteristics. Logistic regression analysis was used to estimate the effects of these independent variables on CEO succession. In line with the hypothesis that CEO successions will be preceded by lower firm performance, we found that firms not experiencing leadership changes had performed better than firms that had, whereas those experiencing a CEO change did not differ in term of ownership structure, industry and company size. Through multinomial logistic regression analysis, we also found that the choice of an insider successor was affected by pre-succession performance and voluntary CEO departures. As hypothesized, we found that firms are more likely to replace an incumbent CEO with an insider when the firm has performed well financially and when the previous CEO has left the company voluntarily. However, the choice of an outsider is strongly and inversely related to the size and industry-type of the company, and is positively related to pre-succession performance and planned voluntary CEO departures. As proposed in our hypothesis, we also found that in family business groups the probability of outsider successors coming from group-affiliated companies was higher.

Keywords: *CEO Succession, CEO successors' origins, emerging market*

EXPLAINING BUSINESS FAILURE: A CONTEXTUAL ANALYSIS

Atsan, Nuray

Department of Business Administration, Faculty of Economics and Administrative Sciences, Akdeniz University, Antalya, Turkey

ABSTRACT

Failure is a very important part of the entrepreneurial process and much can be learned from understanding it. To date, researchers have used different definitions for business failure. The most cited definitions include terminologies such as business discontinuance (Bruno et al., 1992), bankruptcy and insolvency (Zacharakis et al., 1999; Shepherd, 2003), termination of an initiative that has fallen short of its goals (McGrath, 1999) deviation from expected and desired results (Cannon and Edmonson, 2001). In this paper, entrepreneurial failure defined as business discountinuance which indicates a broader conceptualization.

The causes of business failures are many and varied. These can be classified in both by individual/organizational (internal) and environmental (external) factors (Zacharakis, et al., 1999). Factors such as lack of financial resources (Liao et al, 2008), lack of management skills and competencies (Hall, 1992; Gaskill et al., 1993), inadequate economic circumstances (Thornhill and Amit, 2003; Arasti, 2011) have been often mentioned by previous studies. These, however, do not shed light on the distinctive reasons of venture failure. Specifically, little research has investigated the relationship between causes of business failure and cultural context. An exceptional study done by Arasti (2011) found similar causes of failure in Iranian context that appeared in the literature. In this study, the author examined which specific contextual factors have effect on business failure in Turkish context.

In the research, which was designed according to the qualitative method, face-to-face interviews were held with 13 entrepreneurs. Interviewing was preferred to seek indepth information and knowledge in order to reveal contextual factors. The participants were from different sectors who closed their businesses after running at least 3 years.

This study has, in line with existing literature, confirmed the effect of financial inabilities, poor management and some environmental factors such as political and economic pressure as the most important factors of failure. The first and foremost contextual factor came into play was "trust" issue which is in accordance with the findings that Turkey is one of the most extreme examples of a distrustful society. Another contextual reason for failure was lack of partnership culture which might be linked to trust issue. The paper makes a significant contribution to understanding business failure by examining the culture specific factors.

Keywords: *entrepreneurship, business failure, culture, trust*

SIMULATION MODELLING TO IMPLEMENT LEAN MANAGEMENT IN HEALTH CARE SETTINGS

Bano, Maria Chiara; Verbano, Chiara; Crema, Maria

Department of Management and Engineering, University of Padova, Vicenza, Italy

ABSTRACT

BACKGROUND

In the last decade, healthcare system has been facing several challenges worldwide. First, governments' spending review needs to deal with rising healthcare costs because of economic crisis; on the other hand, the growing demand for high-quality care requires performance improvements in terms of both clinical efficacy and patient safety (OECD, 2015). Therefore, the imperative is to optimize the use of resources, improving health service efficiency. According to this, the World Health Organization's Report of 2010 shows that up to 40% of health available funds are wasted, highlighting the importance of an optimal and wise deployment of resources instead of cutting the delivery of care services. Due to these conflicting key issues, the development of new managerial approaches, models and tools is undoubtedly required, in order to identify new efficient ways to provide care, meeting customer expectations. Lean Management (LM) is a managerial approach which has been widely used in manufacturing for decades, despite its principles are relatively new in health care. However, it is already acknowledged that LM tools are effective to facilitate and support changes in the delivery of health care (Institute for Healthcare Improvement, 2005). The focus of LM is the value of any process from the customer point of view; this should be pursued identifying and reducing wastes and non-value added activities. A valuable support to LM can be provided by simulation modelling, which has a much longer history in healthcare, starting from the 1970s (Robinson, 2012). The aim of simulation is the improvement of process and service delivery using a computerised environment, in order to support decision making in several ways, like testing different scenarios gaining immediate feedback about proposed changes and promoting communication without compromising patient safety (Forsberg, 2011). Only a little attention has been paid so far to the potentialities that the combination of these models can give rise. Through a systematic literature review, this research aims to supply a comprehensive view of the state of art about the combined application of Health Lean Management (HLM) and simulation, gaining incremental benefits in health service delivery.

RESEARCH QUESTION AND METHODOLOGY

Deepening into the goals that the review will pursue, this research aims to identify the consequent implications of combining LM and simulation in a shared methodology, in terms of outcomes, limits and potentialities. The identification of the most frequently employed tools is another relevant matter which needs to be investigated. Lastly, the intention is to provide both a comprehensive framework for healthcare managers and stimulating suggestions for further research activities. Starting from these goals, a systematic literature review was carried out, in order to find out the most rigorous, valuable and rich evidences. The adopted model is an adaptation based on current methodologies developed to conduct a systematic literature review (Brereton, 2007; Kitchenham, 2004). The definition of the research strategy, selection criteria, quality assessment of the articles, strategy of analysis and extraction of data were reported in the created review protocol. The selected academic databases were: Medline, Web of Science Core Collection, Scopus, PubMed and Business Source Premiere. The employed keywords were "Health Lean" and "Simulation". Once performed the paper search with these keywords, they were revised, in order to obtain a larger number of useful articles. Among the different available wildcard characters, an asterisk was used at the end of every keyword. Selecting the scientific articles through the criteria defined in the review protocol, a final database with 30 articles was obtained. The established selection criteria were the exclusion of duplications, of non-English language papers, of publications without references, of conference proceedings, book chapters and editorials of less than 3 pages. Lastly, a content-based selection was performed by reading the abstracts and, then, the full text of the papers. In order to assess the quality of the database, Impact Factor, SCImago Journal Rank and H-Index of each journal have been employed. According to the aim of the review, for every paper of the database descriptive data, like author, title, date of publication, country, journal's name, paper methodology, field of application, were gathered. Thanks to the content analysis, other features were investigated, like purpose, results, lean tools, simulation models and software, limits and future perspectives of the lean projects analysed in the papers. Moreover, the interactions among the analysed categories were studied in order to obtain new evidences.

PRELIMINARY FINDINGS AND IMPLICATIONS

The quality indexes permit to certify the high relevance of the selected papers; according to that, most of the articles stand between the first and the second quartile (40% and 34% respectively). Through the descriptive analysis, several information was collected. Even if the combined application of Health Lean Management and Simulation is a relatively new topic, Robinson S., Burgess N., Chiocca, D., Guizzi, G. published two articles of the database each, becoming the first reference researchers. Looking at the period of publication, between 2005 and 2015, it is possible to note a low publication

rate for the first six-years stage, while in the second phase the number of articles doubles; even though a trend identification is still difficult, this rapid rise allows to forecast a growth in interest for the next years too. Scopus can be considered the most relevant database to be monitored, as it contains the 83% of the selected papers (25 of 30). The five scientific journals, that dedicate great space to the research subject and which therefore should be taken into consideration, are the following: *Journal of Nursing Administration*, *European Journal of Operational Research*, *International Journal of Procurement Management*, *Journal of Medical Systems*, *Total Quality Management and Business Excellence*. The most fruitful countries for the analysed topic are the US, UK and Italy, with 50%, 13% and 10% of publications respectively. With regard to the adopted methodology, most of papers present single or multiple case studies (60%); the remaining manuscripts are classified as simulations, conceptual papers (17% both) and literature reviews (6%). A preliminary content analysis has shown that the fields of application in which this methodology has been more frequently deployed are emergency, outpatient care, surgery, laboratory and sonographic analysis. Even if patients are the main focus of the most analysed processes, information flow, material flow and flow of clinical staff are studied, though to a lesser extent. The purposes which encourage the employment of these combined models are efficiency (23 times), clinical efficacy (4), process flexibility (4), staff coordination (3), patient safety (2), communication (2), process uniformity (2). The most applied simulation model is discrete event simulation through software like: SIMUL8, Arena, OptQuest and ExtendSim Process Modeling Environment. Another appreciated model is System Dynamics, but only one of its correspondent software (Powersim) has been mentioned once. It should be stated that almost 10% of the articles do not point out the simulation model, nor the simulation software adopted. The most frequent implemented lean tools and practices are value stream map, value and waste identification, kaizen events, 5S, pull strategy, gemba observation, continuous improvement, kanban and supermarket. A limit lies in considering LM as a set of tools, instead of a philosophy which should be developed through a whole-system strategic plan (Radnor, 2008): most of the described projects are realized through rapid implementations, adopting just one lean tool and focusing on short-term outcomes instead of considering sustainability. The involvement of all healthcare professions during the improvement events is mentioned in almost every article; on the other hand, just in one article an interest in patient involvement is highlighted (Chang, 2013). Analysing the interactions among the investigated categories, a correspondence between discrete event simulation and the adoption of lean tools, like Kaizen events and 5S is evident. Powersim and Obstat Simulation fit with a great number of lean tools. Moreover, objectives, lean tools and simulation models have been considered together, in order to find any interconnection. Every objective has been related with the recommended set of models and lean tools; for example, in order to achieve patient safety, the state of art suggests to use

discrete event simulation model or Obstat Simulation Software with tools and practices like value stream map, gemba observation, 5 why and A3. Even if researches in this field are scanty, the current study provides a comprehensive framework of the state of art, supplying paths for further investigations. In particular, several experiences should be developed, in order to better delineate both potentialities and limits of the synergy between HLM and simulation, trying to place every single improvement event in a prior strategic and sustainable plan. In addition, the potential benefit of patient involvement needs to be taken into consideration (Pearson, 2013). This systematic review can be valuable and gives support also to healthcare managers who are going to employ this combined approach; starting from their concern and purpose, they will have the possibility to find the most fitted set of tools and simulation software.

VALUE CO-CREATION THROUGH CORPORATE COMMUNICATION: INSIGHTS FROM RUSSIA AND GERMANY

Belyaeva, Zhanna¹; Kaufmann, Hans Rudiger²

¹Ural Federal University, Yekaterinburg, Russia

²University of Applied Management Studies, Mannheim, Germany

ABSTRACT

Modern Corporate Communications (CC) focusing on reputation related to social responsibility and legitimacy (Czinkota, Kaufmann and Basile, 2014) are linking businesses, governments and society in understanding the signals to further co-develop in a sustainable way (Belyaeva, 2016). This kind of communication embraces a variety of cross-functional and multidisciplinary concepts and goes beyond marketing theory aiming to advance both internal and external multi-stakeholder dialogue. Often, however, transparency and accountability of corporate communications are questionable if they do not reflect standards of business ethics and responsible and authentic leadership. This paper aims to analyze the changing tactics of corporate communications in terms of aspects on social responsibility. Pursuing a phenomenological research philosophy, we have attempted to compare international ways to communicate the businesses development in Russia and Germany via the case study method applying content analysis. The paper aims to fill the gap on how socially responsible corporate communications contribute to value co-creation.

The first part of the paper summarizes a number of approaches to define Corporate Communication. Based on mainstream literature, it tackles several key objectives:

1)It addresses key stakeholder groups to build, develop and shape corporate reputation (Cornelissen, 2008; 2014). It is suggested that the increasing knowledge public transfer neglects the public relations efforts of multinational organisations if they seem to exaggerate. In contrast to this particular focus on shaping company performance, Corporate Communication's objectives are originally twofold: to "communicate with different stakeholders for both moral (legitimacy) and instrumental (profit) reasons (Cornelissen, 2008)." The question arises if there should be certain limitations to apply Corporate Communication or as Czinkota, Kaufmann, and Basile (2014) and Kaufmann, Czinkota and Zakrzewski (2015) suggest to differentiate within Corporate Communications between a corporate reputation and legitimacy orientated mindset and behavior underpinning this statement by a synthesis of multidisciplinary concepts such as identity, thermodynamics, system or complexity theory.

2)It is described as "an instrument of management" to integrate internal and external communications in one strategy (Riel & Fombrun, 2007)," to create a favourable basis for relationships with groups upon Innovation, Entrepreneurship and Digital Ecosystems

ISBN: 978-9963-711-43-7

which the company is dependent" (Riel & Balmer, 1997) By using different kinds of communicative materials (positive storytelling, reports, memos, events, campaigns, debates) companies are trying to transmit diversified messages to different groups of stakeholders as outlined by Dowling (2006).

3)It is a way to downsize negative effects from financial and corporate scandals, and also to neutralize critical perceptions as stakeholders ask "fundamental questions about the moral compass of all companies (Dowling, 2006)."

4)It is a "source of competitiveness". Gray and Balmer stated that "an increasing number of astute executives recognizes [corporate communication] as a critical corporate asset directly linked to competitive success." The corporate identity, defined as "the dynamic interplay amongst the company's business strategy, the philosophy of its key executives, its corporate cultures, and its organizational design" (Gray & Balmer, 1998) is transmitted and formed into an external corporate image or reputation through the channels of CC. In contrast to Dowling's model, Gray and Balmer stress that corporate communication might directly be influenced by the external image and the perception of a company with the goal of creating a competitive advantage rather than being purely based on the existing identity and culture (feedback of corporate image influences communication).

5)It is an integral part of business strategy to share insights into their culture and disseminate the value system. One core benefit of CC is the control that an organization possesses regarding the information it reveals to the public. Scholars agree that companies are trying to show "a particular positive image of the organization" (Cornelissen, 2008) when communicating to their external stakeholders. In addition, other scholars such as Gray and Balmer (1998) have seen the creation of a favourable corporate image only as one of two core objectives in increasingly using CC. In their opinion, an increase in the general awareness of a company's brand name is the primary motive. Again, the aspect of legitimacy in this context as mentioned earlier is suggested to be explicitly integrated into this equation.

This customization of communication materials further emphasizes the strategic position that professional communication has for an organisation. Within academic literature a variety of models and theories further illuminate the business strategy behind corporate communications, but to our knowledge no research, so far, has discovered the value co-creation in terms of social responsibility of the organizations communicating their strategies.

The second part of the paper outlines positive and negative effects of corporate communications as well as classifies some strategies to perform communications in accordance with the five customized objectives of strategic and responsible communication described in the first part of the paper.

A company's culture, values and actions are directly influencing the way a corporate story is communicated to all stakeholders, which, in turn, influences their understanding of and belief in the organization. This increased corporate reputation and/or legitimacy might lead to improved business outcomes and represents therefore the economic motivation for companies to publicly share insight into their operations, values and beliefs. While defusing the direct link between communication, corporate reputation, legitimacy and performance (or in the case of Gray and Balmer competitive advantage), the usage of corporate communication has a potential power to increase both Corporate and Social Performance to co- create shared values with an extended circle of stakeholders.

The socially responsible communication has to ensure that all of the stakeholders, whether internal or external, can voice their opinions or grievances with the values that the organizations claim to uphold. To this effect, companies have to ensure that they are using the right kind of communication method. Morsing and Schultz (2006) have identified three common communication strategies used by organisations: the stakeholder information strategy, the stakeholder response strategy and the stakeholder involvement strategy .

Finally, the third part of the paper attempts to validate the findings derived from the literature study above. We have performed a comparative documentary analysis (websites and other sources of public communications of 20 public organizations embracing companies, universities and municipalities in Russia and Germany. In addition, we have also performed in-depth interviews with management representatives of the studied companies to test the findings. It is interesting to see that our results show differences between perceiving the corporate communications role in shared value co-creation between different types of organizations, but not between the two countries.

The research is limited by the sample size, but shows some novel interesting facts, which could be used to develop a better integrated CSR and communication strategy for all types of organisations in order to stimulate its sustainability, harmonization with multistakeholder groups and advancing business and social values.

ABSTRACT

In today's environment, business interconnectivity and multicultural societies are becoming the normal way of living. Especially, recent migration waves are challenging societies to cope with such cultural diversity. More than ever before, students are increasingly facing multicultural environments. They need to be aware of the challenges and opportunities these offer, and their readiness and willingness to work in collaborative productivity needs to be nurtured. The learning environment should offer a harmonious and fruitful setting for the acquisition of such intercultural skills. Therefore, it is necessary that the students are aware of their communalities and differences with other students to gain cultural understanding. The speed of how students develop their cultural intelligence will be impacted by the students' co-operative social skills and the amount of interactions in multicultural environments.

It is an imperative for educational institutions to provide as many opportunities as possible to gain this knowledge. The EU with the Erasmus program is one of the most successful ones.

The aim of this paper is to analyze the skills and attitudes development of students after having participated in multicultural teams in an intensive program. The project relates to Marketing Communication of European Entrepreneurs, with the acronym Marciee.

The research was conducted using quantitative methodology. The questionnaire design was based on the one developed by Prof. Dr. Armstrong (Wharton School, University of Pennsylvania). It probes, through the students' self-assessment, their progress made during the participation in the project. The analysis presented in the paper is mostly descriptive, comparing the progress in knowledge and skills of the participating students of various nationalities from before the start of the intensive program to its end.

Some research findings relate to attitudes towards developing and sharing knowledge, stress, attitudes towards learning and task orientation, intercultural communication, and cultural awareness skills related to cultural impacts on the different learning styles when working in multicultural teams.

FIRMS INVESTMENT STRATEGIES IN IC RESOURCES. A DYNAMIC PERSPECTIVE

Biscotti, Anna Maria¹; D'Amico, Eugenio²

²University of Roma Tre, Department of Political Science, Rome, Italy

ABSTRACT

The development of new business sectors and, in particular, the rise of the “new knowledge economy” have led to an increased emphasis on intangible assets. Indeed, intangible resources are increasingly emerging as the new competitive drivers for creating value in global business markets (Stewart, 1997; 2001; Sveiby, 1997; Marr and Schiuma, 2001; Skoog, 2003; Marr et al., 2004; Guthrie et al., 2006; Sharma et al. 2007; Oliveiras et al., 2008; Yi and Davey, 2010; Schiuma, 2011). Within accounting literature, several studies have focused on the analysis of value relevance of the identifiable intangible assets and/or goodwill (McCarthy, M.G, and Schneider, D. K. ,1995, Lev and Sougiannis, 1996; Aboody and Lev, 1998; Han and Manry, 2004; Deng and Lev, 2006; Cazavan-Jeny and Jeanjean, 2006; Oswald and Zarowin, 2007; Oliveira et al., 2010).

These studies empirically explore the investors’ perception about intangibles recognized on financial statements, not also considering the potential impact of firm’ intangibles internally generated. However, a comprehensive analysis about the contribution of intangibles resources to the company value should consider all of intellectual capital (IC) resources managed by the firms, regardless of their accounting recognition on balance sheets (Bontis et al., 2000; Chen et al., 2004; Tseng and Goo, 2005; Huang and Hsueh, 2007; Kamukama et al., 2010; Chang and Hiesh, 2011). As stated by Stewart (1997), “Intellectual capital is intellectual material-knowledge, information, intellectual property, experience, that can be put to use to create wealth”. In particular, intellectual capital resources are considered as strategic key sources of sustainable competitive advantages (Itami and Roehl, 1991; Nahapiet and Ghoshal, 1998; Subramaniam and Youndt, 2005; Teece, 2002; Curado et al., 2011; Sydler et al. 2014), thereby contributing to increased firms’ wealth (Cheng *et al.*, 2010; Molodchik *et al.*, 2012; Naidenova and Parshakov, 2013). According to Edvinsson and Malone (1997), the intellectual capital can be divided into three categories: human capital, structural (organizational) capital and relational (customer) capital. The purpose of this study is to verify the relationship between the aforementioned three pillars of intellectual capital (human, structural, and relational capital) and the firm value creation, under a dynamic perspective. In particular, a reciprocal effect between new created firm wealth and IC component should exists: companies generating higher firm wealth are likely to invest more resources in IC (Naidenova and Parshakov, 2013). Therefore, we control for this dynamic

reciprocal relationship by using the dynamic panel data models. The empirically analysis is carried out over a time period of ten years (2005-2014) on a sample of all European listed companies operating in pharmaceutical, retail, steel, telecommunications, and service industries. To the best of our knowledge, this is the first study exploring the relationship between the three pillars of IC on the firm value creation of European listed companies, by using the dynamic panel data models. This study contributes to the extant literature on intellectual capital by shedding light on the propensity of European companies to different IC investment strategies, taking into account the impact over time of the new created firm wealth.

Keywords: *intellectual capital, investment strategies, firm value creation, European companies, dynamic panel data models*

INTERACTIVE SESSION: KALEIDOSCOPE THINKING: MULTIPLE PERSPECTIVES ON THE DEVELOPMENT OF CROSS-CULTURAL COMPETENCE

The following panelists with a variety of experiences will share their own stories of acquiring cross-cultural competencies. This engaging session, illustrated with many visuals, is centered on five key points, including questions raised, and reference to a variety of relevant scholarship. For all of us, and those with whom we interact in universities and business, the challenge is how to be effective in a highly globalized time, characterized by "the interconnectedness of the world in economic, cultural, and social terms, and the incessant circulation and intermingling of human beings of diverse backgrounds and aspirations" (Gardner, 2007, p. 37). An ongoing conversation with session participants is the goal of this interactive session.

OUR RETURN TO EUROMED

One of the highlights of the Eighth Annual EuroMed Conference on Business [Verona; September 2015] was the well-received multi-presenter research-based paper titled "*Thoughtfully Curated Consulting and Teaching Practices*". Four of the five scholars who integrated their ideas for that session are now proposing a similar format for the 2016 EuroMed Conference scheduled for Warsaw in September.

Recognizing the power of story for engagement and insight, these individuals seek a conference-based opportunity for rich dialogue on a topic of high interest to many: **cross-cultural competence** and a variety of ways to develop such competence.

THE CHALLENGE

For all of us, and those with whom we engage in universities and business, the challenge is how to be effective in a highly globalized time, characterized by "the interconnectedness of the world in economic, cultural, and social terms, and the incessant circulation and intermingling of human beings of diverse backgrounds and aspirations" (Gardner, 2007, p. 37).

Why this is important is captured well by Harvard's Howard Gardner, who advocates for five minds for the future. He emphasizes the need for a *respectful mind* with these words:

"We live in an era when nearly every individual is likely to encounter thousands of individuals
Innovation, Entrepreneurship and Digital Ecosystems

ISBN: 978-9963-711-43-7

personally, and when billions of people have the option of traveling abroad or of encountering individuals from remote cultures through visual or digital media. A person possessed of a respectful mind welcomes this exposure to diverse persons and groups. A truly cosmopolitan individual gives others the benefit of doubt; displays initial trust; tries to form links; avoids prejudicial judgments” (Gardner, 2007, p. 38).

SHARING OUR STORIES

What are the skills and attributes needed for success in working and living cross-culturally?

Each of the five consultant-scholars who will join this proposed conference session has had power-filled learning experiences and then reflected upon those experiences to enrich both professional and personal life. While the five individuals differ on multiple dimensions (gender, age, nationality, career path, academic discipline . . .) their stories share a common thread of *questions asked and answered*—a direct connection to the Verona session that first brought them to EuroMed last year. Like the session shared in Verona, the session presenters will each speak briefly, using visual enhancement, and will link their unique stories and perspectives with a shared structure and theme. The session will be characterized by an approach Rosabeth Moss Kanter identifies as *kaleidoscope thinking*:

“a way of constructing patterns from the fragments of data available, and then manipulating them to form different patterns” (Kanter, 1999, p. 18).

The initial list of guiding questions for each participant’s story includes these:

What I experienced

Why I know it was important and of value for me (and for others)

What I will remember always

What I still wonder about--a question to take away

How this experience contributed

to developing my skills of cultural competence

for this highly globalized world

WHO WE ARE

Presenter #1– *An executive coach with almost thirty years’ experience in university teaching in management and human resources. She has researched and published in the field of management, including attention to generational differences, cross-cultural approaches, and gender studies. A somatic coach, she has created a diversity-focused consulting and training firm, and is president of a nonprofit organization focused on elder care. Her research in Asia led to a book published in Italian.*

Presenter #2 – *A sociologist now teaching and researching, her approach lies in linking academic knowledge with research and consulting activities in organizations. Particular interests include the psychology of work, sociology of organizations, organizational development, working conditions and quality of life of employees, and psychosocial determinants of health. Her travels and studies abroad both raised questions and answered them.*

Presenter #3 – *Her twenty years' management experience in business, government and nonprofit organizations was followed by an award-winning teaching career characterized by attention to design thinking for strengthening graduate management education. She is passionate about the application of the arts and of learning theory in both managerial and educational settings. Her career has been characterized by frequent international work in leadership, organizational change and organizational development. Her California-based graduate students have collaborated in developing shared course assignments with graduate students in Russia.*

Presenter #4 – *She is active in both consulting and teaching to develop individual and organization-based innovative thinking through experiential activities. She has twenty-five years' career expertise in marketing, business development and strategic planning, principally in health care and community-based organizations. Her research interests include organizational effectiveness in a multi-generational, multi-cultural workforce. She is particularly interested in cross-cultural competencies and was involved in interview and survey-based research that explored cross-cultural competencies in four European countries.*

Presenter #5 – *His career in academe and business includes teaching, administration and entrepreneurship on multiple continents. His active leadership with professional associations has been one of high visibility and contribution to students, colleagues and higher education institutions. His personal story is a compelling one of immigration and resulting cultural adaptation.*

YOUNGER BOARDS AND CORPORATE PERFORMANCE

Bozcuk, Aslihan E.

Department of Accounting Finance, Akdeniz University, FEAS, Antalya, Turkey

ABSTRACT

PURPOSE

This study aims to shed light on the relentless debate regarding board composition. It specifically looks at the relationship between corporate performance and the age of members on the board of directors in a multi-country framework.

DESIGN/METHODOLOGY/APPROACH

The unique dataset constructed to facilitate the study comprises details on nearly 26,000 directors, across 11 countries, over 3 years. The sample consists of directors from Croatia, Estonia, France, Greece, Ireland, Italy, Moldova, Monaco, Netherlands, Russia, and United Kingdom (UK). The top 4 countries with the highest number of directors are UK, France, Italy and Greece (in descending order) accounting for 83% of the total number of directors included in the study. Following Fich and Shivdasani (2006) a high market-to-book ratio (MTB) is assumed to be indicative of good corporate governance, and hence, used as market measure of corporate performance. Additionally in order to avoid incorrectly treating a high MTB caused by underinvestment as indicative of good governance, operating (accounting) measures of corporate performance are also used. A number of control variables from the corporate governance literature are included; such as director tenure, company age, board size, number of blockholders, years since the initial public offering, family ownership and firm size (Monks and Minow, 1995).

FINDINGS

The mean value for directors' age is 55 years, with the youngest and the oldest directors from the UK (20 and 96 years old, respectively). Evidence supports the firm size effect. There is a positive and significant relationship between firm size and directors' age. Controlling for firm size, short-term operating performance and long-term market measures of performance are higher for companies with younger directors. However in terms of long-term operating performance, also controlling for firm size, companies with older directors outperform.

In both univariate regressions and multivariate regressions including all control variables, there is a negative and significant relationship between accounting performance and directors' age, regardless of firm size. However market measures of performance tell a different story. In univariate and multivariate regressions including all control variables and run separately for small and large firms, director age is insignificant statistically. Surprisingly, only in the long-term, there is a negative and significant relationship between market measures of performance and directors' age, regardless of firm size and regardless of the control variables used.

ORIGINALITY/VALUE

This study contributes to the literature on board characteristics and firm performance. It specifically focuses on directors' age and explores its performance effects taking into account other board and firm level variables. Its originality stems from the construction of the multi-country (non-US) dataset and large sample size.

IMPLICATIONS

These findings have implications for practitioners, managers, individual and institutional investors and policy makers. In the US, The Investor Advisory Committee was created by Mary Shapiro when she was appointed as Chair of Securities and Exchange Commission (SEC) in 2009. The main purpose of this committee was to provide input to the SEC about issues that are of concern to investors such as board composition and diversity. Similarly, California State Teachers' Retirement System (CalSTRS) is known for its activist approach to institutional investing as well as for petitioning the SEC in terms of more disclosure with respect to corporate board diversity.

Hence the results of this study are valuable in terms of providing non-US evidence to an ongoing debate on board composition.

INDUSTRIAL DISTRICTS AND INTERNATIONAL SUPPLY CHAINS: THE CASE OF ITALY

Caraganciu, Anatolie¹; Musso, Fabio²; Francioni, Barbara²

¹Lucian Blaga University of Sibiu, Romania

²Carlo Bo University of Urbino, Italy

ABSTRACT

During the last decades, industrial districts (IDs) have been object of increasing interest, and several studies examined this issue from different perspectives (De Martino, Reid, and Zyglidopoulos, 2006; Molina-Morales, 2001, 2002; Musso and Francioni, 2012). According to Becattini (1992) industrial districts can be defined as “territorial concentrations, in a quite circumscribed area, of firms, for the vast majority of small and medium size, which produce goods or services functionally linked to a main production activity, embedded in the social life of a certain locality or a network of localities”.

One of the topics that has been particularly investigated (Belso-Martinez, 2006; Costa and Viladecans, 1999) is how the belonging to IDs can enhance the competitiveness of firms in foreign markets (Pla-Barber and Puig, 2009). Results from the majority of these studies revealed that there is a positive relationship between the belonging to IDs and international performance. However, according to Pla-Barber and Puig (2009, p. 437) “most of this research adopts a partial view of internationalization, as it uses only the tendency to export as a proxy to reflect the level of competitiveness and internationalization of the companies in question”. Therefore, following a similar approach of the above mentioned authors, we examined the relationship between the belonging to IDs and import activities of firms.

For achieving our objectives, we carried out a quantitative research using a sample of Italian small and mid-size manufacturing companies. Firms were identified from a list obtained from Aida, a database containing information on about 1 million companies in Italy. However, the sample population was chosen according to some criteria, such as SMEs (according to the European Union definition), belonging to a manufacturing sector and with contact information available, including email address and telephone number. As a final result we collected 169 correct responses. Firms stating they never carried out either import or export activity (26) have been excluded from the sample. Therefore, a total of 142 firms constituted the sample, which was split into two groups: firms located within IDs (44.4%) and outside IDs (55.6%).

The research process is in progress. The final results of the study will derive from descriptive statistics and a correlation matrix before carrying out the statistical analysis, such as a regression.

However, our preliminary findings revealed that firms belonging to IDs have a less accelerated pattern of internationalization in import strategy than non-district firms, as the 47.5% started importing from less than 20 years (versus the 39% of non-members). Quite consequently, only 11.5% of ID members began more than 40 years ago, versus 20.8% of non-members.

In these dynamics, it is possible to identify a greater ability of non-district firms to respond to changes, especially those related to globalization. On the district companies side, they resulted longer tied to intra-district supply relationships, starting later in the search for international suppliers, in order to exploit better cost conditions or quality / technological innovation through the management of international supply chains.

Moreover, compared with ID members, non-district firms have more import and export relationships. Indeed, 29.9% of non-ID members create import relationships with less than five countries (versus 43.5% of ID members); moreover, 9.3% of non-district firms have export relationships with less than five countries (versus 13.6% of ID members). This result puts in light a correspondence between the numbers of years of experience in international purchasing and the number of supplying markets, suggesting a process similar to what described by gradualistic theories on firms' internationalization (Johanson and Vahlne, 1977; Cavusgil, 1980; Reid, 1983). Therefore, the gradual process seems to be not just related to export activities but also to import activities.

The first contacts with foreign suppliers are created by SMEs mainly through the attendance at both national and international trade fairs. However, in several cases is the foreign supplier who approaches the firms. About this, non-district firms seem to be more active in searching suppliers in foreign markets, mainly by the use of new technologies (web and social networks), and this is consistent with the fact that, without the support of the district network, firms increase the amount of efforts in order to find foreign suppliers and, more in general, to achieve competitive advantage by exploiting factors and benefits that can result from outside the industrial district.

With reference to the perceived problems in the relationship with foreign suppliers, results do not reveal specific critical aspects, being almost all indicators considered as not particularly problematic. However, even in this case there are differences between district and non-district firms, since the latter consider fluctuations in currency exchange rates as the most problematic factor, and, on the other side, district firms perceive as more relevant some issues related to cultural differences, such as language, different negotiation style, different rules in business relationships. This can be considered a natural consequence of the fact that ID members generally create relationships with suppliers located into the industrial district, and they consider other relationships as more critical and problematic.

As a first conclusion of this stage of analysis, it can be stated that an ability to actively approach the supplying market at international level does not emerge from ID firms. The traditional character of

industrial district, primarily focused on internal relationships and slightly open to external influences seems to be confirmed. No indication arise about co-evolutionary processes in the direction of a more strategically oriented approach to the internationalization of supplying markets.

ABSTRACT

INTRODUCTION

Despite being widely recognized as the driving force for a country's development and economic growth (GEM, 2013/2014), nowadays entrepreneurship has also become fundamental to the redefinition of gender (Langowitz & Minniti, 2007; Shabbir & Di Gregorio, 1996). This in the hope of destroying the cultural barriers that provokes the population not to believe in women as individuals capable of running their own enterprises (Kargwell, 2012). Hence, a number of countries are now concerned to improve their regulations to respond to this new demand, allowing gender discrimination to decrease gradually to, perhaps one day, completely disappear.

This study aims to find factors or variables that lead women to start enterprises and, thereby, to provide governments or organizations focused on these topics with useful information. The search will be conducted by means of collecting these variables in 3 reliable sources, namely the World Bank, World Economic Forum and Global Entrepreneurship Monitor, in different countries during the 2008-2013 period. Once the variables are gathered, the models that best describe this situation will be found by using econometric tools such as multivariate analysis.

LITERATURE REVIEW

Women participation in enterprises is increasing over time (Brush, De Bruin, & Welter, 2009), yet is still less than men's participation. Since the 1990s, studies on female entrepreneurship have focused on 4 baselines (Castiblanco, 2013):

The first line objective is to find female entrepreneurs' sociodemographic characteristics. Among these, it may be highlighted that women seek long-term returns and are characterized by being self-efficient, constant at work, perseverant, socially skilled and self-confident. In addition, they look for institutions support, since these entrepreneurs perceive themselves as already possessing the necessary personal skills (Navarro, 2014; Barba Sánchez, 2007).

The second line aims at finding differences among enterprises according to gender. Some studies point out that men's initiative and desire to carry out enterprises are greater than women's (González, 2001;

Rodriguez & Santos, 2010). Furthermore, the size of the enterprises started by women tends to be smaller than men's, in terms of both income and personnel. This might be due to the fact that women concentrate more on businesses oriented to retail or services, whereas men do so on high technology and manufacture (Castiblanco, 2013).

In the third line are those authors that intend to explain entrepreneurship as a social process vital to gender redefinition. Governments have concentrated on achieving more gender equality, since half of the world population are women, and not considering their human capacity and talent is causing a loss of well-being (World Economic Forum, 2015). In fact, estimates predict that if this inequality were reduced, this would boost world economy by \$12 trillion in the next decade (World Economic Forum, 2015). Following this line of thought, a good way of promoting women's economic and social empowerment is entrepreneurship (International Labor Organization (ILO), 2011).

Finally, in the fourth line, are those that seek the nature of the difficulties and setbacks female entrepreneurs face, and try to group them into categories (Aidis, Estrin, & Mickiewicz, 2008; Amine & Staub, 2009; Welter & Smallbone, 2008). The economic literature proposes 3 important factors, namely previous influences, business incubators and environmental factors (Jia, Parvin, & Rahman, 2012). Based on Álvarez, Noguera and Urbano's (2012) studies, which, in turn, are based on the institutional economics theory and, specifically, on North's assumptions (1990 and 2005), the environmental factors that condition female entrepreneurship may be divided in two categories: formal and informal (Alvarez, Noguera, & Urbano, 2012). Formal factors are funding, non-economic support policies for business creation and training, while informal factors are the perception of women's skills, contact and social networks and family role.

METHODOLOGY

In the present study, an analysis of the possible variables influencing and conditioning women's probability of undertaking enterprises is conducted, taking the scenarios of 55 countries along a 6-year period (2008-2013) as reference point, and using 30 variables collected by the World Bank, Global Entrepreneurship Monitor (GEM) and World Economic Forum (WEF).

First, the methodology consists in find the multivariate method that better adjusts to the requirements. For this reason, at a first stage, discriminant analysis is used. Then, at a second stage, factor analysis is carried out in order to reduce the quantity of data, but comprising the highest quantity of information. Finally, discriminant analysis is performed again.

The dependent variables used are female entrepreneurship, female entrepreneurship for opportunity, and female entrepreneurship for necessity (GEM, 2014).

RESULTS

Models showing the highest canonical correlation and percentage of correct classification of data obtained by the confusion matrix were selected as best models.

For the variable “female entrepreneurship”, the final variables were adolescent mother, fertility, unemployment, higher education training in entrepreneurship, institutions, infrastructure services, and norms and culture. This variable presents a canonical correlation of 0.850 and a correct classification of 94.4%.

In the case of the variable “female entrepreneurship for necessity”, the influencing variables were previous entrepreneurship, taxes, institutions and dynamic market. This variable showed a canonical correlation of 0.806 and a correct classification of 92.1%.

As for the variable “female entrepreneurship for opportunity”, the influencing variables were fear of failure, previous entrepreneurship, adolescent mother, fertility, taxes, institutions, and norms and culture. This variable presents a canonical correlation of 0.875 and a correct classification of 97.2%.

CHARACTERISTICS OF THE COOPERATIVE SAVING AND CREDIT SYSTEM IN CHILE

Cea, Jorge¹; Santander, Paulina¹; Hepp, Pedro²

ABSTRACT

INTRODUCTION

Saving and Credit Cooperatives (SACCOs) represent one of the most important sources of development in emerging economies (CICOPA, 2014) and, thus, they have experienced an important growth over the last few years. However, it is worth noting cooperatives in Chile have not reached the development levels of its less and more developed counterparts (World Co-operative monitor, 2014).

This study aims at making a diagnosis of the factors characterizing the cooperative saving and credit system in Chile by means of a mix method study, which would allow the elucidation of diverse general aspects of the behavior and characteristics of SACCO members and management. This is carried out by studying two areas of SACCOs: first, members without board or management positions, delving into the reasons for which they join a SACCO and into the characteristics of their credit behavior; second, board members of SACCOs, delving into the strengths and weaknesses they perceive regarding the management of these.

LITERATURE REVIEW

One of the principal challenges saving and credit cooperatives face is their adequate management by the board (Branch & Baker, 1998). Good governance can enhance the performance of SACCOs and help them to sustain in the long term (Thomsen, 2008).

Another point that Branch and Baker(1998) stress is that cooperatives become more complex to manage as they grow larger, since more specific knowledge and skills that members may not possess are required.

For a board to be competitive in the market, it requires proper remuneration. Several members of these cooperatives have lower-middle incomes and, thus, constantly criticize the difference between their own salaries and the board members', which are competitive in the financial market.

SACCO members might believe that high wages are paid at the expense of their gains. This fact results in poor management of the institution, moral problems and inability of the SACCO to attract quality human resource that produces good results (Branch & Baker, 1998).

Before an increase in the number of members, a structure that supports adequately all their requirements becomes necessary. Therefore, the cooperative needs to increase the human resources and these, in turn, have to adapt to the cooperative organizational culture. If the growth is gradual, it does not generate any inconvenience to the new workers, since senior staff “educates” them. On the contrary, if there is an explosive growth, senior staff may not be able to imbue the just arrived with the cooperative culture, causing a loss of organizational culture (Labie & Périlleux, 2008).

One of the main characteristics of the cooperative model is that owners are both borrowers and lenders. This causes an agency theory problem (Jensen & Mecling, 1976) in which the owners may disagree with the agent or manager view. This type of management contradicts the interest of the administration, since the board of directors may be far more interested in guarantying cheaper and more affordable loans than in the financial viability and profitability of the SACCO (Branch & Baker, 1998).

Zelizer (2013) observes in the book *The Purchase of Intimacy* that intimacy and economic activity are far from being in separated spheres. Contrarily, they are closely related.

METHODOLOGY

This study was based on a mixed model, as it makes use of qualitative and quantitative methodologies. This is due to the nature of data: some was gathered through a survey—since the purpose was to characterize SACCO members—, and other by qualitative methods—to obtain the personal views of members and directors.

For data collection, focus group with members and directors of the board were conducted. Then, the information retrieved was studied by content analysis. In addition, an exploratory survey was applied to a sample composed of 409 persons.

RESULTS

First, it was observed that the majority of participants stated having entered SACCOs through some friend or relative that had recommended the service. It must be noted that many of these cooperatives were founded by different leaders (priests or military high commands) who invited their followers to join. Then, the latter would invite their family and friends to the organization, which makes sense if the history of Latin-American cooperativism is reviewed (Pérez, 2003).

The abovementioned leads to an element that constantly appears in different topics: the importance of the sense of family inherent to cooperatives, which strengthens the organization by building up loyalty, but also stands as a different ideological option before the perception of a hostile marker. In this point is important to note that the territorial or institutional roots of some cooperatives exacerbate this family sense, since their members share common characteristics.

As for the qualified personnel, Branch and Baker (1998) posit that cooperatives tend to encounter problems to attract qualified personnel, because these employees usually have salaries according to the market, which are higher than the members (lower-middle income). Nevertheless, the results from the conversation groups point to a view that values the incorporation of specialized human capital since it invigorates the SACCO operation.

Men use more money for financing businesses and give presents, while women do so for paying education and medical expenses, which is closely related to the stated by Zelizer (2013) regarding the roles women and men are vested in the society. This approach proposes that women use their income for paying household expenses and family care, while men use it for paying the rent or mortgage. However, it is interesting that women more frequently use these credits to pay the rent, since according to Zelizer (2013) this expenditure would be regarded as a masculine activity.

One interesting finding is that women have a special verbal behavior. They tend to express their opinion much more than men when their cooperative circumstances are positive, whereas men tend not to share remarks on their cooperatives when these are in trouble. In both cases, women verbal behavior is superior to men.

Finally, people from lower strata generally use their credit for lending to other person, which may be explained by the difficulty to access the peer credit system and by a solidary conduct to this impossibility of others to buy food, a car or to pay medical expenses.

AN EXPLORATORY ANALYSIS OF COST OF QUALITY AND QUALITY MANAGEMENT MATURITY: THE CASE OF GREEK FOOD & BEVERAGE ENTERPRISES

Chatzipetrou, Evrikleia; Moschidis, Odysseas

Department of Business Administration, University of Macedonia, Thessaloniki, Greece

ABSTRACT

PURPOSE

In our research paper we present the results of a survey conducted among Greek Food & Beverage (F&B) enterprises. The aim of the survey is to depict the extent to which F&B enterprises implement Quality Costing practices and to analyze the relationships and correspondences that emerge between the level of Quality Management Maturity and the Quality Costing system of enterprises.

THEORETICAL BACKGROUND

Cost of Quality (CoQ) is a management tool for effective quality improvement prioritization and cost reduction, which has been introduced in literature by Juran (1951) and Feigenbaum (1956; 1991). It involves the analysis of costs into 4 categories: Prevention, Appraisal, internal Failure and external Failure costs (P-A-F Model), and provides input and feedback to quality systems which are responsible for quality improvements (Campanella, 1999).

The importance of the analysis of a company's quality system maturity has been highlighted in a number of papers (Sower et al, 2007; Prickett & Rapley, 2001; Brown & Ton Van der Wiele, 1996). In order to examine the relationships between quality costing practices and the maturity of the quality costing system, we chose Crosby's Maturity Matrix in the present paper, derived from Crosby's work (1979). Crosby has contributed to the wide acceptance of the CoQ concept and its practical implications in managing quality. His 'Quality Management Maturity Grid' identifies 5 stages of sophistication and business maturity 1) uncertainty 2) awakening 3) enlightenment 4) wisdom 5) certainty. In each one of these stages, 6 measurement categories are defined, which help the respondents recognize the content of each stage and identify the exact status their company is in.

RESEARCH METHODOLOGY

The survey was conducted with the use of a structured questionnaire. The questions were categorical and had a 3-, 5- and 6-point scale. In order to analyze the relationship between the maturity level of the F&B enterprises and the extent of quality costing practices adoption, we use Multiple Correspondence Analysis, as it is applicable to a large set of categorical variables. It is the most appropriate tool for analyzing nominal categorical data used to detect and represent underlying structures in a data set. (Moschidis, 2015; Greenacre, 2007)

CONCLUSIONS

Our research concludes that, although the majority of Greek F&B companies monitor quality costs, they do so in an informal and unorganized way. Quality costing is not an integrated process in their quality management. Given the fact that the Greek Uniform Chart of Accounts does not include specific quality related accounts, companies have no other option but to categorize quality costs under the general categories of overheads or other operating expenses (Chatzipetrou & Moschidis, 2016). Furthermore, the role that management plays in the Quality Costing implementation process is also emphasized. The above findings correspond in general with the maturity level of the companies' quality costing systems and support the supposition that there is a relationship between an increasing use of quality costing with increasing sophistication and maturity of quality management.

INVESTIGATING THE INTENTION TO USE E-GOVERNMENT SERVICES: AN EXPLANATORY STUDY

Chatzoudes, Dimitrios; Chatzoglou, Prodromos

Department of Production and Management Engineering, Democritus University of Thrace, Xanthi, Greece

ABSTRACT

'E-government' (electronic government / e-gov) is an extremely interesting research field, with numerous academic and practical implications. Its empirical investigation gives rise for significant observations, since the existing international literature offers several research gaps.

Firstly, very few studies of the field are empirical in nature. Moreover, most of the existing empirical studies adopt a descriptive approach. The present study is explanatory (examines cause-effect relationships), offering much more depth of analysis than a descriptive study. Secondly, most previous empirical studies are concerned with the providers of e-government services. The present study empirically examines the perceptions of users / citizens. Thirdly, most studies adopt certain models and theories (TAM, DOI, TPB), failing to include other factors in their empirical analysis. Nevertheless, in studies that move beyond this limitation, research factors are selected without any justification. The present study uses a focus group methodology (collection of qualitative data) in order to develop its proposed conceptual framework (research model). According to the best of the researchers' knowledge, such an approach has not been used before in the literature of the field.

Under that context, the aim of the present study is twofold: (a) develop an original conceptual framework (research model) examining the factors that have an impact on the intention to use of e-government services, (b) empirically test that framework, using primary data collected from internet users located in Greece (empirical research). More specifically, the proposed conceptual framework includes thirteen independent factors (1. Trust in e-government services, 2. Trust in public administration, 3. Trust in internet, 4. Trust in other people, 5. Availability of resources, 6. Self-efficacy, 7. Perceived level of information, 8. Perceived quality, 9. Perceived ease of use, 10. Perceived compatibility, 11. Perceived functional benefits, 12. Social norms, 13. Perceived risk) and one dependent factor (Intention to use e-government services).

The development of the conceptual framework was based on two methodological steps: firstly, an extensive literature review identified the factors that have been used by previous studies as antecedents of e-government adoption (e.g. Abu-Shanab, 2014; Alawneh *et al.*, 2013; Liang and Lu, 2013); secondly, a panel of experts was used in order to discuss these factors and provide a list of the most significant ones. That approach was selected due to the significant number of factors that have been proposed in the literature. More specifically, the members of the research team used the opinions of citizens as a

criterion for selecting a specific set of factors from the extensive list that was provided from the literature review analysis. It is strongly argued that randomly selecting the research factors of the proposed conceptual framework would have resulted in the limited reliability of the present research.

The proposed framework was tested, using a newly-developed structured questionnaire in a sample of Greek internet users. The measurement of the research factors was conducted with the use of multiple questions (items) that were adopted from the international literature. All questions were translated to Greek and then back to English by another person, in order to detect and, consequently, improve discrepancies. The five point Likert scale was used for the measurement of all factors (1 = 'strongly disagree' to 5 = 'strongly agree').

Primary data were collected from a random sample of internet users. An online questionnaire (web-survey) was created and the participants of the survey completed the questionnaire online. The research period lasted two months (August-September 2015). Finally, 347 questionnaires were returned, while 338 valid questionnaires were finally used for the statistical analysis.

The validity and reliability of the questionnaire were thoroughly examined. The test for the content validity included the pilot testing of the questionnaire. The control for the construct validity was conducted in two steps. Each factor was evaluated (a) for its unidimensionality and reliability (Exploratory Factor Analysis), (b) for the goodness of fit to the proposed model (Confirmatory Factor Analysis). All tests concluded that the scales used are valid and reliable.

The testing of the conceptual framework was made using the Structural Equation Modelling (SEM) technique. The estimation of the structural model was conducted with the Maximum Likelihood Estimation method. In order to evaluate the fit of the overall model the chi-square value ($\chi^2 = 286,25$ with 97 degrees of freedom) and the p-value ($p = 0,0689$) were estimated. These values indicate a good fit of the data to the overall model. Moreover, other measures of evaluating the overall and the measurement model were used (Normed- χ^2 , RMSEA, CFI, GFI, Construct Reliability, Variance Extracted). All these measures produced satisfactory results.

When taking under consideration the total effect (direct and indirect effect) of each of the thirteen independent factors on the intention to use e-government services, it is concluded that four factors have the highest impact. These factors are: (1) Perceived compatibility ($r=0,67$); (2) Perceived benefits ($r=0,51$); (3) Trust in e-government services ($r=0,40$); (4) Perceived level of information ($r=0,35$). The main conclusions of the study are summarised below:

- Perceived compatibility has both a direct and indirect effect on e-government adoption. Therefore, it is concluded that citizens tend to use e-government services that are compatible with their way of life. Practitioners should really focus on the enhancement of that factor. E.g. develop interactive platforms, through which citizens can communicate and make observations and proposals; adjust the provided

services according to their needs and expectations; collect data offline, in order to capture citizen needs and adjust the services accordingly; try to create a feeling of familiarity to citizens, maybe by adopting popular interfaces.

- Perceived functional benefits have the highest direct effect on e-government adoption. The focus of policy makers should be on the enhancement of the level of digital integration of e-government services, so that the physical presence of citizens is no longer needed. Moreover, 24/7 help desks should be created, so that help can be provided real-time, on a continuous basis.
- Trust in e-government services represents the belief that the system will perform in a reliable and consistent manner. In that direction, pilot testing (before implementation) of new e-government platforms should be conducted, so that the overall reliability of the system is ensured; specialized programmers should be employed; online data should be collected, right after service provision, concerning the level of service satisfaction (customer satisfaction).
- Concerning the enhancement of the perceived level of information, the following measures are being proposed: use mass media in order to underline the functional benefits of e-government services; inform citizens in physical distribution areas of public service provision; conduct seminars and student orientation initiatives; make extensive use of social media.

AGRIFOOD START UPS AND THE ROLE OF THE TERRITORY: FOSTER MUTUAL BENEFITS THROUGH SUSTAINABILITY. EARLY INVESTIGATION IN PIEDMONT

Civera, Chiara; Candelo, Elena; Casalegno, Cecilia

Department of Management, University of Turin, Italy

ABSTRACT

BACKGROUND AND AIM OF THE RESEARCH

Business sustainability refers to the sum of environmental, social and ethical practices, programmes and concerns in processes design, as well as goods and services development. Nevertheless, sustainability of business is necessarily linked to the economic dimension. Therefore, profits generation is also functional for investing in the society, in the reference environment, and for serving multiple interests of external and internal stakeholders. That is why when considering a sustainable business, the social and economic aspects stand at the same level of priority and meet businesses and communities' expectations simultaneously. This is what Porter and Kramer (2011) point out as a set of policies and practices that can buster companies' competitive power meanwhile improving communities' economic and social conditions.

Sustainability is nowadays a strategic lever for redesigning business models with the aim of making the best use of innovation, research and development and face the competition through differentiating factors whilst benefiting the society as a whole. This is often defined as the capacity of managing the "triple bottom line" (Elkington, 1994): a process through which companies are involved in financial, social and environmental issues and opportunities, with implications in terms of profits, people and planet, given that industrial, social, and ecological systems are interrelated (Fiksel, 2006).

Therefore, businesses conducted according to responsible, environmental and social concerns create economic value and contribute to create healthy ecosystems, more effective interactions and stronger communities. Moreover, this social and environmental involvement represents a strategic lever and a driver also to improve the value and the image of a certain territory – where the benefits from businesses' involvement are both tangible and intangible – and, as a consequence, to decrease the foreign investors' perceived risk and augment its attractiveness.

Although, in recent years, the academic literature has been focused on the concept of creating value for the Region and on its integration with local companies, to the extent of our knowledge, little has been written about the way through which a territory can facilitate the activation of sustainable practices, by leveraging on local factors and resources and, can, therefore, affect and shape the nature
Innovation, Entrepreneurship and Digital Ecosystems

and the evolution of its start ups. In particular, it appears that agribusiness start ups are relevant to the topic because of their high interaction and synergy with their territory, mostly based on sustainable drivers. This can improve consumers' perception of the area in terms of innovation, services and physical well-being of citizens, as well as enhancing the image and the identity of agribusinesses themselves.

The purpose of this study is to investigate which sustainable and innovative strategies both start ups and their territories can activate to favour social and economic growth in a logic of constant interaction and mutual benefits, by considering agribusiness start ups located in the Italian Piedmont Region.

In particular, the authors have identified two research questions:

1. How can a territory contribute to favour the start-ups creation and development, by securing cooperation among businesses, fostering innovation and sustainability?
2. Which innovative and sustainable strategies adopted by start-ups can enhance territory identity and stakeholders' perception?

RATIONALE OF THE RESEARCH - AGRIBUSINESSES IN PIEDMONT

Data from 2014 ISTAT Report "L'Italia nel contesto europeo" [Italy in the European Context]) show that Italy is nowadays the leading European country in producing high quality agricultural and agribusiness products, with the larger number of DOP, IGP and STG products (DOOR Database of Origin and Registration, from Intesa San Paolo Studies and Researches 2014). Despite the fact that farmers – typically the protagonist of agribusinesses - have always been considered more producers than entrepreneurs (Burton and Wilson, 2006) and they are small in terms of employees and resources (the average employees per player is about 7.3 for the agribusiness including beverage sector, ISTAT, 2011), their role is evolving towards more complex forms of organization and impact on the territory.

Between 2008 and 2014, the overall food sector comes second after the pharmaceutical one in regards to the value generated by its export; for the last six years it has registered a growth of about 34,3%, reaching a value of 5,5 billion Euros. Moreover, in 2015 first trimester, food sector export sees an increase of 6,2%, with agricultural products registering +7,6% and food and beverage reaching a +5,8% (ISTAT, 2015). Despite the good results in terms of export increasing, since 2008 the Made in Italy agribusiness has lost global market shares against the emerging markets (ISTAT, 2014). Moreover, it is to point out the peculiar characterization of agribusiness districts in Italy: players are grouped in 45 districts throughout the Italian territory, which employ 20,7% of the total amount of agribusiness workers and they represent the 14,5% of the whole agribusiness firms. Their weight on the total agribusiness export is equal to 42% (Direzioni Studi e Ricerche Intesa San Paolo, 2015).

For Made in Italy agribusinesses competing in a logic of mutual benefits with their territory represents a big challenge, which is linked both to the internal capacity and external policies for strengthening the competitive advantage of their business heritage, sustainable production methods, commitment with the territory. In particular, for start ups in this sector, those variables are crucial in order to succeed in the long term.

In this scenario, it is fundamental to highlight the relevance of sustainability in combining different interests and expectations in terms of environment, society, quality and economics that will lead to stronger financial performances (Eccles *et al.*, 2014).

Piedmont is the Italian geographical area (or Region) of consideration, given the strategic implications that agribusinesses and districts in this area represent not only for their reference territory but also for Italy as a whole and in some successful cases, for the foreign markets.

Piedmont is the leading Italian Region for artisan food production and the 4th Italian Region as far as food industry turnover is concerned (Federalimentare data), besides being the reference Region for its food export and for the DO (Denomination of Origin) and IG (Geographical Indication) products. It counts some relevant cities in the food industry and agribusinesses: Cuneo is the reference city for agricultural sector and agri-food. Bra (Cuneo) is the Slow Food headquarter and its philosophy, presidia and movements. Turin, where “Salone del Gusto” takes place every year and “Terra Madre” happens with the intent of sharing local traditions at a global level, counts endless number of typical food productions and artisan products.

METHOD

A mixed methodological approach has been adopted in order to respond to the two research questions.

On one hand, an exploratory empirical analysis has been conducted on a sample of multiple stakeholders (reported in the following Table 1), in order to gather their perception of innovation and sustainability of agri-food businesses and their reference territory in terms of quality of life, wellness, potential future sustainable economic and social development of the territory, creation of new job opportunities and positive impacts on the environment. The investigation has been carried out through focus groups and in-depth interviews, considering a sample of 140 stakeholders in Italy (see Table 1) aged between 20 and 50 years, considering as driver of choice their proximity and knowledge about the agri-food business.

Table 1. Investigated Sample

Role	Quantity
Target audience	40
Small companies managers	20
Medium companies managers	15
Large companies managers	25
University students	20
Consultants and experts in firm strategy	20

On the other hand, the second step of the research has been focused on the investigation of eight agribusiness start-ups selected from the 2015 Turin Chamber of Commerce database and whose products are already placed on the Piedmont market and known by their target. Given the limited number of the considered businesses, the author had the chance to conduct in-depth interviews with their CEOs in order to gather information about: how the territory enhances and favours the business idea development and implementation, whether and if the territory represents a differentiating factor for the potential success of the business, whether and if the company can favour their territories through innovation, how sustainability is pursued and facilitated by the territory, which are the competitive advantages resulting from the integration between the company and its territory. The outcome of this step of the research has been the development of case studies, addressed to function as benchmarks for other similar agribusiness start-ups and a chance for sharing best practices of integration.

The expected results come from the combination between stakeholders' perception concerning the innovation and sustainability of agrifood industry and agribusinesses' analysed strategies in order to answer to the research questions previously reported.

Therefore, findings from both analyses will have two main implications.

Firstly, the authors aim at enriching the academic literature considering the link among sustainability, territory integration, stakeholders and agrifood start-ups.

Secondly, the objective is to suggest valuable and sustainable strategies to managers and entrepreneurs for shaping start-ups business models in an innovative and sustainable way as intrinsic characteristics to integrate better with their territory and favour the achievement of mutual economic and social benefits.

Keywords. Agrifood industry, customer perception, innovative start up.

BRANDING OF AIRLINE SERVICES: A CASE STUDY OF TWO INDIAN AIRLINES

Das, Kallol¹; Khanna, Karman²; Ganguly, Surankita³

¹Marketing area, MICA, Ahmedabad, India

²Fellow Program in communication, MICA, Ahmedabad, India

³Marketing department, Gujarat Cooperative Milk Marketing Federation, Anand, India

ABSTRACT

The commercial importance of services has been growing globally in the recent years. Consequently, research aimed towards further understanding the branding of services has also gained impetus and the question of whether services should follow the same principles of brand building as manufactured products has been raised time and again. The present study has the following research questions: First, how effective is the brand building effort of Indigo Airlines (one private Indian airline)? Second, how effective is the brand building effort of Go Air (another private Indian airline)? By addressing these two research questions, the study attempts to answer the following larger research question: What are the driving factors for effective branding building in the case of airline services? The present paper uses case study research method, which is an empirical enquiry to understand any phenomenon in its real-life context. In order to achieve external validity with respect to airlines, replication logic has been used. This has been the basis of case selection. Indigo Airlines, started in 2004, is the leader in the Indian domestic market with a share of 37% in 2015-16. Go Air, also started at around the same time, is amongst the poorest performers at a present market share of 2%. By studying these contrasting cases with regard to brand building effectiveness, the authors aim to distill the key principles of effective branding with respect to airline services, specific to an emerging economy like India.

LEADERSHIP COMMUNICATION: AN EVOLUTIONARY CONCEPT ANALYSIS

De Lange, Lucrezea

Department of Communication Science, University of the Free State (UFS), Bloemfontein, South Africa

ABSTRACT

Leaders and followers live in a relational world consisting of systems of interconnected relationships and richly interactive contexts. It is therefore presumed that leadership is a socially constructed, interactional phenomenon through which certain individuals attempt to define, or otherwise influence the reality of other individuals. As such, leadership should be considered in its activity rather than through the traits and heroics of individual actors as is found in some of the longstanding leadership theories.

Discussions on the topic of leadership communication are very rare and even harder to find are definitions of leadership communication. This, highlights the fact that the field of organisational communication has had limited engagement with the world of leadership. This is very unfortunate as more and more research indicate the essential role of leadership communication in organisations. In fact, effective leadership depends so much on effective communication that the relationship between the two is nearly absolute. The mere acknowledgement of communication as a component of the leadership process will no longer suffice.

In an attempt to capture the essence of leadership communication and supply a working description of the concept, a conceptual analysis of leadership communication was done using Rodgers' evolutionary conceptual analysis method. The purpose of this paper is to examine the concept of leadership communication as it relates to organisational effectiveness. The evolutionary method was chosen as its analytic philosophical base is grounded in dynamism (Rodgers, 2000). Through this method the ever changing dynamics and contextually dependent nature of the concept is revealed (Rodgers, 2000). Through the evolutionary conceptual analysis employed in this paper the defining attributes, antecedents, and consequences of leadership communication is explored, its related concepts is identified and its evolution is described. Identifying characteristics of leadership communication will help to clarify and develop conceptual strengths and limitations, providing a step toward evaluating its relevance to organisational effectiveness.

This analysis resulted in leadership being viewed as a unique form of communication. The current demand for a more transparent, ethical, people-centred and communicative approach to leadership is also highlighted. It is suggested that what is required is a communication-centred view of leadership

where communication is an integral part of the leadership process and a means of adding value to a company.

SOCIAL ENTERPRISES – SOCIAL CHANGE AND BUSINESS DEVELOPMENT: ARE THEY PARTNERS FOR TANGO?

Desivilya, Helena¹; Yanay-Ventura, Galit²

¹The Max Stern Yezreel Valley College (YVC), Emek Yezreel, Israel

²Department of Human Services, the Max Stern Yezreel Valley College (YVC), Emek Yezreel, Israel

ABSTRACT

Social enterprise (SE) constitutes a hybrid organization, combining social and commercial components. SE provides an innovative alternative for engaging social issues while simultaneously coping with global competition in business. Such a hybrid organization is particularly viable in complex, contemporary societies featuring mounting diversification and social divisions. Its potential contribution to the current socio-economic intricacies largely depends on effectively addressing the governance challenge. The current study was a follow-up evaluation of a new SE in Northern Israel – a restaurant where youth at risk are trained in cooking-related professions.

RESEARCH AIMS

The evaluation aimed to provide an in-depth perspective on the strengths and challenges involved in managing this hybrid organization. Special emphasis was placed on monitoring the relationships between the social and commercial activities, the relationships among the SE and its partners and the nature of the partnership.

METHODS AND RESEARCH TOOLS

The research was based on a qualitative approach, embracing by and large the formative function of evaluation. The study extended over a period of one year. The research tools comprised in-depth interviews, focus groups, observations and archival data.

FINDINGS AND INITIAL CONCLUSIONS

The major strengths of the SE are its economic sustainability, effective management of the restaurant and of the social component, stability of the staff and attractive scenic surroundings for the trainees. The main weaknesses are attrition of the trainees, ambiguity regarding the essence and training procedures, and inadequate learning of the social project. The case study reflects most of the challenges confronted by social enterprises.

ABSTRACT

INTRODUCTION

The 21st century displays growing diversity of societies and communities as a result of globalization, political and economic crises and ensuing migration (Coleman, Selden, & Selden, 2001; Kristeva, 1991). Such a complexity leads also to mounting intergroup tensions reflected in a variety of organizations. Research attempts to unravel the impact of social divisions on perceptions of diversity in organizations and patterns of responding to this challenge in an organizational arena (Desivilya Syna, 2015).

This study addresses the timely issue of managing diversity in organizations, focusing on the case of academic institution comprising a diverse student body. The issue is how the organization manages diversity so that students feel both comfortable, maintaining positive relations with students in other social groups and can thrive academically. The first phase of the study showed that academic staff embrace different perspectives concerning diversity management that are reflected in their educational practices. This phase of the study concentrates on students' perspectives and diversity-related experiences on academic campus.

Experiences of diverse students at academic campuses

The recent decades have been characterized by efforts at internationalization in academic institutions throughout the world, consequently mounting diversification of the student body. How does this trend affect diverse students' actual experiences? Previous studies show that students from various social groups view their academic life at campus quite distinctly. Research findings on American campus indicate that students of color in comparison to white students experienced lack of support and unwelcoming atmosphere in predominantly white campuses. Specifically, Afro American students tended to report more racial tensions on campus, complained more about unfair treatment by faculty and teaching assistants, experienced less respect for diversity and more pressure to behave in accordance with racial stereotypes in contrast with White students (Ancis, Sedlacek, & Mohr, 2000; Schwitzer, Griffin, Ancis, & Thomas, 1999).

Similarly, a study on the impact of intergroup and diversity-related activities at an academic campus in Israel, showed that minority students construed their campus experiences at the Israeli college in a different ways in comparison to their majority students counterparts (Desivilya Syna, 2015).

The current study aimed to extend the scope of research on diversity management at academic institutions by looking not only the minority-majority relations but also elucidating gender relations and the professional/academic discipline aspects of diversity in students' experiences. Specifically, it examined the students' awareness concerning differences among students, diversity climate and their personal sense of comfort at a diversified campus.

METHODOLOGY

Participants

Participants were 638 students (596 undergraduates, 42 graduate students) enrolled in a public college located in Northern Israel. The sample represented all the bachelor degree departments and two MA degree programs. Seventy five percent of the participants were women. Eighty four percent of the students were born in Israel, 14% in former Soviet Union and the remaining 3% in Argentina, Ethiopia, Holland, Morocco, South Africa and Switzerland. Nearly seventy nine percent (78.8%, 498) of the participants are Jewish, 14.6% (92) are Muslims and 6.6% (42) are Christians. The mean age of the students is 27 (SD = 5.18; range: 19-59).

Research Instrument

The adapted version of Cultural Attitudes and Climate Questionnaire (CACQ), developed by Helm, Sedlacek, and Prieto (1998) was used in the current survey. This instrument was designed to gauge students' perceptions and experiences related to diversity climate at an academic institution. The respondents were asked to indicate their level of agreement with 70 statements regarding the campus climate. Six factors were extracted using principal axis factor analysis and varimax rotation, accounting for 69% of the total variance. The 6 factors are: **Supportive Diversity Climate** (alpha = .813), college-wide atmosphere of support and respect of diverse social groups; **Intergroup Tensions** (alpha = .761), perceptions and experience of ethnic tensions on campus, **Racism** (alpha = .837), experience of racist atmosphere propagated by faculty and students; **Diversity Comfort** (alpha = .777), experience of comfort with faculty and students of ethnically similar and dissimilar origin; **Diversity Awareness** (alpha = .781), sensitivity to differences among groups; and **Faculty and Students Support** (alpha = .856), experience of help and support from faculty and students.

The questionnaires were administered by the research assistant over a period of about a month in winter of 2015-2016, either at the beginning of a class period or at the end according to the lecturers' preferences.

INITIAL FINDINGS AND INSIGHTS

The findings suggest that the overall diversity remains by and large marginal for the majority – Jewish students. As can be seen in Table 1, the latter are less aware than their Muslim and Christian counterparts of diversification in the student body at the campus. Women appear more sensitive to diversity than men. Table 2 shows that female students perceive greater intergroup tensions among groups, view the diversity climate as more supportive and reveal greater awareness concerning diversity at the campus in comparison to male students. As can be seen in Table 3, the findings indicate that students in quantitative disciplines of study such as economics and information technologies are less aware of diversity in comparison to students in disciplines more related to societal issues and human behavior such as social and behavioral sciences, human services, health care systems management and MA programs.

The study lends support to the contention that diverse students differently perceive and form distinct experiences with respect to diversity at an academic campus. Longitudinal follow-up studies at different academic institutions in Israel and other parts of the world would be important and interesting extensions of the current research.

ANALYSIS OF THE FINANCIAL RESULTS OF 38 CASES OF KIBBUTZ TURNAROUND BETWEEN THE YEARS 2002 – 2012

Edom, Sara; Edur, Ram

AAC – Ashkelon Academic College

ABSTRACT

This paper examine if the economic performance of directors who are members of a group of directors that share core values, knowledge, information and managerial experience are higher than the economic performance of directors who act alone.

To answer this question, the economic growth of 38 kibbutzim that was manage by the directors group was compared to the economic growth of other kibbutzim, during the period 2002 – 2012.

BACKGROUND

In the mid-1980s, the kibbutzim experienced a serious multi-dimensional crisis - ideological, social, leadership, management, and financial. Most of the kibbutzim collapsed in financial, management and social terms. This situation required finding vital management and financial solutions for their continued existence. At that time, the external environment changed. The Israeli society moved from socialism to individualism, the government reduced the protection of domestic production and opened the market to competing import. This policy adversely affected the manufacturing sector in Israel, which the kibbutzim are a part of.

As a response to the changes in the external environment, since the mid-90s the kibbutzim, like cooperatives worldwide, have undergone structural changes to adjust themselves to an external environment characterized by the strengthening of the individualism and capitalism, increasing competition and globalization.

Since the 90s the kibbutz' management model had changed. Similar to the structural changes of the management model of many cooperatives in developed countries, it moved from direct to reprehensive democracy management, hired professional directors and managers. This is the background to the foundation of directors group, created in order to establish a professional standard for the management of the kibbutzim.

The directors group is normally composed of about 20 professional and experienced directors, carefully selected according to their personal qualities and their managerial capabilities. The group's members share core values and guiding principles for managing a kibbutz. Among the group members there are personal relationship and mutual support, knowledge and information transfer, Innovation, Entrepreneurship and Digital Ecosystems

ISBN: 978-9963-711-43-7

and managerial experience accumulated. The group meets regularly for leaning, discussing possible solutions to common problems, the development of economic growth strategies and models of strengthening rural community cohesion.

METHOD

In order to evaluate the economic results of the directors, the average growth of accepted economic indices and financial ratios was used. The database was the annual audited accounting statements for the period 2002 – 2012.

Evaluation of economic and financial results was carried out by two methods:

1. "Before and after" – In order to study the contribution of the group's members over time, the average annual growth of the economic indices and financial ratios of the kibbutzim that was run by the group, was compared two years before the group begun managing a kibbutz to three years afterward .
2. Each calendar year, the average growth of the financial indices and financial ratios of the kibbutzim managed by the group were compared to two control groups:
 - I. Kibbutzim whose income turnover was in the range of the income of the kibbutzim managed by the group
 - II. All the kibbutzim that were not managed by the group.

FINDINGS

From interviews with the group's members, it appears that they use a similar recovery strategy for the turnaround of the kibbutzim.

In the method "before and after", there was improvement in all the economic indicators and financial ratios, in the period in which the kibbutzim were managed by the group as compared to two years before.

The average growth of the economic indicators and of the financial ratios was higher in the kibbutzim that were run by the group's members, than the average growth of the kibbutzim in the two control groups.

THE NUMBER OF CONTROLS: A CUE FOR INNOVATIVENESS IN INTERACTIVE PRODUCTS

Eytam, Eleanor

Industrial Engineering and Management, the Sami Shamoon College of Engineering, SCE, Ashdod, Israel

ABSTRACT

INTRODUCTION

As technology advances, it becomes easier to add more functionality to products (Thompson et al., 2005). Software and hardware solutions enable interactive products with fewer controls to be made more functional, while automation allows complex processes to be executed with the click of a button (Tannen, 2009). The challenge still facing manufacturers and designers of interactive products is in understanding what it is that consumers want. Human Computer Interaction (HCI) experts suggest consumers want few controls that are easy to use. In their estimation, designs with fewer controls help people achieve their goals efficiently and effectively because they are clear, easy to learn and operate, and also filter out the unnecessary features from those that are needed (Norman, 1988; Nielsen, 1999; Maeda, 2006). Designing interactive products that have few controls has proven to be a successful marketing strategy, led mainly by Apple's aesthetic revolution and the one-control interface of the Google search engine. Still, anecdotal evidence and a body of research suggests that multi-control designs sell at greater numbers and at higher prices (Norman, 1998; 2007; 2010).

PURPOSE

This research is aimed at unravelling the apparent discrepancy between experts' advice to adhere to product designs with few controls and customer tendency to choose multi control product designs. In two consecutive studies, the first based on a qualitative methodology of interviews, and the second based on a quantitative methodology of measuring user preference, we observed and recorded how the number of controls influences user preference and perception of product quality.

METHODOLOGY

Sixteen participants of varying age, gender and profession were interviewed in semi-structured interviews. In the first part of the interview, participants were presented with seven illustrations of product control panels. The illustrations were general and did not indicate how the products were to be used and for what purpose they were designed. The control panels differed in the number of

controls. This setup imitated a pre-use situation in which individuals evaluate a product before they have had a chance to try it out. During the second part of the interview, participants were asked how they normally judge products, and what product qualities influenced their final choice. In a subsequent study, 70 participants rated their preferences with regard to 26 illustrations of interactive products with varying numbers of controls. Control shapes were either round or rectangular, large or small (in all there were four types of controls).

RESULTS

The qualitative study revealed that all participants, at least to some extent, relied on the number of controls as a cue for product quality. When the data was segmented by participant age group, an interesting trend was revealed. Participants 30 or older perceived fewer controls as an indication of greater ease of use, but with lower functionality. For this age group, each control represented one feature and thus they perceived fewer controls as offering fewer features. Participants younger than 30 also perceived fewer controls as an indication of greater ease of use. However, unlike those 30 and older, this age group assumed greater automation and thus judged products with fewer controls as more innovative and providing higher functionality. Both age groups perceived the presence of many controls as an indication of greater difficulty of use, but as offering more functionality.

In the quantitative study, participants were asked to use a Likert scale (containing a range between one and ten) in order to rate their preferences among illustrations of panels that presented different numbers of controls. The results revealed that the number of controls included in the panel was significantly and negatively correlated to the preference ratings of the product. The highest preference (with a scale rating higher than eight) was given to panels with three or four controls. The lowest preference (with a rating lower than four on the scale) was given to the panels with more than 42 controls. Panels with a single type of control were judged as easier to use than those with two to four types of controls. The presence of a greater variety of control shapes and sizes was judged as more difficult to use. Shape and size of the controls together with their number served as significant predictors of product quality perception.

CONCLUSION

The studies reported in this research were conducted in order to unravel how the number of controls influences the perception and preference for interactive products. The contribution of this work lies within its analysis of how seemingly trivial design choices affect the evaluation process of consumers. Fewer controls in a control panel were perceived as providing greater ease of use when compared to

control panels with many controls. More controls were perceived as providing more features than products with fewer controls. These findings are in line with previous research (e.g. Thompson et al., 2005). Additionally, preference was higher for products that had fewer controls in comparison to those having many controls. However, different age groups related to the number of controls as a cue for product innovativeness. Young participants assumed greater automation and thus judged products with fewer controls as more innovative and providing higher functionality compared to older participants. Older participants perceived few controls as a cue for poor capability of the product as they did not relate to the possibility of automation. Manufacturers and designers may consider such factors when formulating branding strategies for interactive products.

THE EFFECTS OF ETHNOCENTRISM AND COUNTRY OF ORIGIN FAMILIARITY IN CONSUMER PREFERENCE AND RECOGNITION OF INTERNATIONAL BRANDS

F. Antunes de Sousa, Ana¹; Nobre, Helena²; Farhangmehr, Minoo¹

²GOVCOOP, DEGEIT, University of Aveiro, Aveiro, Portugal

ABSTRACT

In contemporary globalized markets a positive Country Image (CI) influence consumers' behaviour and purchase intentions being useful to promote domestic products worldwide. Through the promotion of these relationships it is possible to sell products and services that on their own would probably face more difficulties in the internationalization process (Kleppe, Iversen, & Stensaker, 2002). The country-of-origin (COO) effect depends, among other things, on the knowledge that the target market owns on that country, and calls into question why should small or unknown countries use a COO strategy to promote their products abroad? Considering that market globalization leverages the potential of COO in influencing consumer behaviour, it seems important to invest in information about it, since country-of-origin can be used as an indicator of product quality and acceptability. One possible way to conceptualize CI is as a knowledge structure that consumers hold in mind based on associations of uniqueness, favourability, strength and salience of a specific country (Kristensen, Gabrielsen, & Jaffe, 2014).

When a particular country image is unclear, ambiguous, or inexistent for a specific target, managers and politicians should make efforts to encourage the process of building a solid and multifaceted country image (Wang, Li, Barnes, & Ahn, 2012). Reversely, the quality perceptions and image of products and brands of a particular country can also stimulate and participate in the process of positioning and developing a CI (Wang et al., 2012). Taking into account the cultural, socio-economic, and structure differences in international markets the challenge consists in understanding which attributes and specific images the consumers in the selected markets form about the COO and how they answer to different marketing strategies in order to promote a country image message.

This paper is aimed at exploring the effects of ethnocentrism (Usunier & Cestre, 2007) in consumer preference of domestic versus foreign brands, and the effect of COO familiarity (Josiassen, Lukas, & Whitwell, 2008) in international products/brands recognition.

An exploratory study was carried out on a sample of 177 of Portuguese and US consumers, in order to explore the effects of familiarity and ethnocentrism in consumer preference of domestic versus foreign

product categories and brands. Additionally, the study had the purpose to identify which are the main categories of products/brands that foreign and domestic consumers associate to Portugal.

General results show that five product categories are more associated to Portugal by Portuguese consumers: olive oil (79.7%), cork and wine (78.0%), footwear (74.6%), and soccer (71.2%). Technology and Innovation are the least mentioned (4.2%). For US consumers, the most referred product categories for Portugal are soccer (53.9%), cork (19.2%), and footwear (15.9%).

Findings suggest that, consumers' familiarity with a specific country influences the recognition and the associations that consumers establish with the products/brands of that country and ethnocentrism appears to act as a barrier to entry of foreign products.

The topic under study is particularly relevant for a country as Portugal that is fighting against an economic downturn, through the investment and reinforcement on strategies that promote product exports and tourism sales. Portugal is a small dimension European country, with a high tourism potential, competing directly with important economies with strong CI and well-known global brands, such as Spain, France, and Italy. Taking into account the lack of awareness that persists in the global market about Portugal and its domestic brands, and the lack and consistency of studies on Portuguese CI and Portuguese products/brands, as far as we know, it seems relevant to analyse this question from both perspectives domestic and foreign consumers.

Keywords: *Country of origin, country image, domestic products/brands, country familiarity, ethnocentrism, international marketing*

A MULTISTAKEHOLDER APPROACH TO SMART CITY ECOSYSTEM: UNIVERSITIES CONTRIBUTION

Ferraris, Alberto¹; Belyaeva, Zhanna²

¹Department of Management, University of Torino, Research Fellow of the Laboratory for International and Regional Economics, Graduate School of Economics and Management, Ural Federal University

²Graduate School of Economics and Management, Ural Federal University

ABSTRACT

Cities may be a great locus of smart innovation integrating various groups of stakeholders within the ecosystem. While a lot of research is devoted to triple helix models and include University into the key players contributing to the knowledge transfer within open innovation system, it seems that there is a gap in a wider understanding of the role of the Universities in terms of both positive and negative possible effects on the city ecosystem. A comparative analysis of Smart City ecosystem has been carried out through multiple case studies of University's involvement in this kind of projects in Russia and Italy. Results propose significant new insights useful to rethink the role of Universities and, at the same time, to highlight some newly arising opportunities in stakeholder management. The existent literature review as well as preliminary cross-country findings confirm the practical implication of the research and define further direction for the filed study.

CONTEXT ANALYSIS AND OBJECTIVE OF THE PAPER

While the innovations arise from different types of organisations, the multistakeholder relationship brings us to the call for sustainable co-development. The recent trend of smart innovations within global city ecosystem is yet to be adjusted from the multistakeholder theory view. A strong innovation ecosystem has a leading role in fostering innovation within the so-called Smart City. Smart City is a city that aims at “connecting the physical infrastructure, the IT infrastructure, the social infrastructure, and the business infrastructure to leverage the collective intelligence of the city” (Hollands, 2008). In this context, the role of the various actors (firms, public governments, universities, research centres) within the city ecosystem is crucial in the development of new services and products with the aim to satisfy citizens’ needs. Among all the stakeholders, Universities cover an important role and can contribute in different ways in the development of Smart City project. This paper investigates the mutually advantageous value-driven innovations brought by Universities as a key actor in the development of social innovation exploiting Smart City opportunities. It is becoming increasingly recognized that the variety of forms can create shared value emerging from a range of organizational arrangements

including established corporations, spin-offs from corporations and universities, family firms, social movements, and social entrepreneurial ventures (Del Giudice et al., 2013; Autio *et al.*, 2014).

This represents an important contribution because previous studies on Smart Cities focused on different perspective of analysis, such as the technological innovation, the whole innovation ecosystem and/or the single city (Kourtit and Nijkamp, 2012).

SUMMARY OF PREVIOUS WORK IN THIS AREA AND EXTANT GAPS

Literature on innovation ecosystem suggests that, within this ecosystem, several actors are involved in social innovation processes, and many studies are aimed at analyzing their roles (Ferraris and Grieco, 2015). Social innovation requires a variety of actors working in concert and innovation processes are interactive and they can be better studied intellectually by specifying the actors and their links (Cooke *et al.*, 1997). A famous landmark in this field of study is the Triple Helix Model developed by Etzkowitz and Leydesdorff (2000) in order to explain how innovation emerges from the interaction of different parties by analyzing the existing dynamics between three helices: state, academia, and industry. In a knowledge society, the Triple Helix thesis is that the potential for innovation and economic development lies in a more prominent role of the university and in the hybridization of elements from universities, industries and the government to generate new institutional and social formats for the production, transfer and application of knowledge (Ranga and Etzkowitz, 2013). Following this stream of literature, University can play an enhanced role in innovation in increasingly knowledge-based societies, acting as technology and knowledge transfer favoring the economic development and acting as an intermediary between the other components of the ecosystem in multi- and inter-disciplinary ways.

In this context, Smart City projects typically involve alliance portfolios involving several partners, both public and private, which develop uncertain technologies, services or business models with the final aim at satisfying citizens needs. However, none of the studies about Smart Cities clearly address the role of the universities even if in the reality they are involved.

RESEARCH DESIGN: METHOD(S) EMPLOYED

The "Smart City" context is still emerging and the work of defining and conceptualizing it is in progress. Despite these difficulties in defining this fuzzy concept, our research design focus on the evidence that different stakeholders collaborate in the city's innovation ecosystem in order to exploit Smart City opportunities. It is widely accepted that university combines the three missions: education, research and social, while recent studies outline that the fourth strategic mission, reflected in the economic effects arising from the location and operation of the campus in the city (Belyaeva, 2015). At

the same time, the university can act both as an obvious economic actor (the employer, the owner of the property, the taxpayer, etc.), as well as a generator of indirect, "spontaneous" economic and innovative effects. The directly achieved effects may include: 1) Knowledge transfer to/from local businesses, 2) Generate a new source of income (university as an employer), 3) Investments in real estate: the university as an investor, 4) Incubation of start-ups, 5) Provision of specialized knowledge-intensive services, 6) Co-creation of innovative scientific and educational clusters, commercialization of research. In the same time the multistakeholder approach to the smart ecosystem may bring up the following indirect effects: 1) Strengthening of local suppliers (University as a major buyer), 2) Stimulating domestic and international demand for the domestic goods and services (students and university staff), 3) Creation of new businesses to meet the needs of the University, students and staff, 4) Related field companies extra stimulation.

The study followed an exploratory and qualitative methodology and consisted of 30 in-depth semi-structured interviews lasting 2 hours with both Smart City managers from ten large multinational and national corporations participating in Smart City initiatives and academics and professors personally involved in Smart City projects in Russia and Italy. The choice of the respondents was adjusted to approve the direct and indirect effect of developing the smart ecosystem in various organizational multistakeholder environments. The interviews gathered information related to the role and tasks of University within these projects. Also, primary and secondary sourced documents were content analyzed.

FINDINGS: WHAT ARE THE MAIN OUTCOMES OF THE RESEARCH?

Our interviews showed how University may play an active role in Smart City projects. In fact, Universities are an important part of the innovation hub/ecosystem providing many complementarity assets to the projects. Moreover, in line with the innovation ecosystem literature, Universities may bring scientific and technological knowledge within the project with specialized competencies, hard and soft skills (Ranga and Etzkowitz, 2013). Also Universities are becoming social agents stimulating sustainability involvement of other key-organisations. With this regard, in particular private managers highlight the important role of Universities as knowledge intermediaries between private and public partners. In fact, they are crucial in the management of knowledge flows between different partners allowing cross fertilization of ideas within hybrid partnership. Furthermore, private managers clearly stated that University may have an important role in the management of Intellectual Property Rights (IPR) balancing open and close approach of different public and private partners involved in the projects.

Moreover many interviews highlighted the role of the students' engagement in order to: a) individuate new citizens needs, b) add an important source of knowledge in the co-development innovation process, c) favor the start-up creation or universities spinoff, and d) create "contests" of ideas, e) follow socially responsible strategy of Smart City.

From the interviews, it emerged that University may help in accessing to national or European funds both in Russia and Italy. They may also act as network facilitator/coordinator between different cities building knowledge pooling, knowledge repositories and experiences. Finally, Universities may provide human and physical resource (researcher/professors, facilities and laboratories) and education training, dissemination of culture and concepts, masters, seminars, lectures in terms of specially tailored education programmes and as a role-organization itself (Bresciani et al., 2012). The concept of a smart city is shaping the impact on the sustainability and liveability of a city, so the practical implication of the suggested research framework is to suggest practical guidelines for Universities and other stakeholders to better support managerial practices in smart city organizations. The research has such limitations as limited data, but attempts to set a novel understanding of the mutually adjusting smart city system.

GHG AND CATTLE FARMING: A MULTILEVEL FIXED MODEL FOR CO-ASSESSING ECO-IMPACTS AND PERFORMANCES

Fiore, Mariantonietta; Spada, Alessia; Pellegrini, Giustina; Contò, Francesco

Department of Economics, University of Foggia, Foggia, Italy

ABSTRACT

In the last decades, the offer of animal products will also have to increase especially in developing countries due to the aim to meet the predicted growth in world population and increasing food demand and needs (Cerri et al., 2016). The activities of the livestock sector impacts on climate change with several emissions in particular, Methane (44%), Carbon dioxide (27%) and Nitrous oxide (29%). Cattle emits the highest, about 65 % of the livestock production emissions; indeed feed processing and production and enteric fermentation from ruminants are the two major sources of emissions, contributing 45 % and 39 % of total emissions respectively. On product-basis, milk from cows and beef are in charge to emit the most emissions, contributing 20% and 41% of the sector's total greenhouse gas (GHG) outputs respectively (Sarkwa et al., 2016). Because of these significant and serious issues, the beef cattle industry is under increasing pressure to reduce production or implement technological changes (Ruviaro et al. 2015). Cattle-farming for dairy and beef production is one of the main most important agricultural activities in Italy. The objective of this study was to co-assess the environmental impacts and economic performances of Italian cattle farming systems based on farm data. There are few studies regarding the GHG emissions associated with the cattle production and economic performances.

INTRODUCTION

Efforts to assess the environmental performances of beef production systems often culminate in mitigation strategies without factoring in farm economics (Veysset et al., 2014). Reducing GHG deriving from cattle farming can occur by choosing to rear animals with an improved genetically based performance: producing milk with higher protein content and at the same time reduced fat content emits less GHG into the environment (Podkówka et al., 2015). Furthermore, results demonstrate that the main element contributing to reduce emissions is the high productivity, that is a comprehensible outcome as the carbon footprint is related to the unit of product. The GHG production increases in absolute terms with the increase of the production amount, but since the reference unit is compared to the product amount, higher is the production efficiency, more you reduce the impacts, since the gases produced are distributed in a greater amount of product (Podkówka et al., 2015; Italian Ministry of Agriculture, Food and Forestry, 2010). The choice of complementarities between strategies in grassland-Innovation, Entrepreneurship and Digital Ecosystems

based systems and adequate feeding strategies aimed to mitigate GHG emissions may result in better environmental advantages (Morel et al., 2016). Finally, it can be highlighted it is crucial to develop strategies to balance the increasing productivity with the environmental sustainability of cattle production (Ogino et al., 2015).

METHODOLOGY

The analyzed sector by the present study belongs to 0141 'Raising of dairy cattle' of the Statistical classification of economic activities in the European Community, abbreviated as NACE (Nomenclature statistique des Activités économiques dans la Communauté Européenne). The study deployed quantitative and qualitative approach in the data analysis. Identification of research field and initial data collection preceded the investigation phase. Data collection derives from AIDA Bureau van Dijk International Database containing comprehensive information on companies, with up to five years of history, for individual countries, regions and the world. The AIDA database let out data from 183 cattle farms belonging to the 17 Italian regions on 20 total regions. Then, results seems be the most representative in the sector. Data concerned the following indicators: Revenues from sales and services, Number of employees, Profit (loss), Total assets, Research and development Expenses, Land and buildings, Total shareholder's funds. The profitability indicators are referred to 2014 year. The multilevel mixed effects generalized linear models were carried out for evaluating and assessing how the geographical location affects on gross profit, examining which variables at the regional level are significant predictors. Furthermore, the model investigates the role of the expenses for Research and Development Area of the cattle farms; the R&D sector in a farm can be crucial in defining integrated and complementary strategies for reducing GHG emissions. At regional level, mainly the number of employees and total assets of last year play a significant role in the gross profit forecast, but their relative weight differs across the regions. Even though most of the variance is present at farm level, the existence of significant variance at regional level, highlights the important regional role in gross profit distribution.

CONCLUSIONS

The majority of mitigation actions implies in a more efficient use of resources along the whole production chain, which can only have a positive effect for farmers also in terms of reduction of the production costs. The adoption of techniques and more efficient practices is the key to the reduction of the emissions of the agro-zootechnical productions. A better management of health and animal welfare, for example, can reduce unproductive shares of the herd, which has a direct impact on the reduction of impacts, since these refer to the product. The agricultural practices that tend to the preservation of soil

fertility, increasing the organic matter content, are then able to sequester atmospheric carbon and reduce emissions.

**CONSUMER ETHNOCENTRISM - INTENSIONS VERSUS DECISIONS.
EXPERIMENTAL EVALUATION WITH VICKREY'S AUCTION OF CONSUMER
ETHNOCENTRISM ON THE EXAMPLE OF GREEN APPLES OF POLISH AND
ITALIAN ORIGIN**

Górski, Jarosław; Brzozowicz, Magdalena

Department of Economic Sciences, University of Warsaw, WNE UW, Warsaw, Poland

ABSTRACT

Previous studies of consumer ethnocentrism focused primarily on the analysis of the level and determinants of declared ethnocentrism and its influence on buying intentions of products of domestic and foreign origin. A commonly used method is a CETSCALE survey. There is however a rising amount of experimental studies of consumer ethnocentrism.

The object of the study is a comparative analysis of the declared and behavioral attitudes of consumers in relation to food products of domestic and foreign origin (green apples: Polish vs. Italian). The study combines three research areas:

- a. Valuation of goods by consumers and factors influencing the valuation (economic, social and individual factors concerning personal situation, attitudes, opinions),
- b. The phenomenon of the country of origin effect, ie. the impact of the perceived country of origin on product assessment by consumers,
- c. Declared and behavioral consumer ethnocentrism, ie. consumer preferences for products perceived as coming from the home country.

The aim of the study was to verify the following hypotheses:

- H1: Perceived country of origin affects the valuation of products, differentiating between behavioral purchasing preferences.
- H2: Respondents with a higher level of declared consumer ethnocentrism give higher valuation of products of domestic origin (WTP).
- H3: Declarative level of consumer ethnocentrism (survey: CETSCALE) is higher than the behavioral level of ethnocentrism (Vickrey auction).

The study was conducted using both survey and experimental methods. Declared preferences of consumers and various factors which may influence them were verified with use of a complex survey including CETSCALE. Consumers also took part in a Vickrey auction to determine their willingness to

pay for domestic (Polish) and foreign (Italian) products - green apples. The study was conducted on a group of 244 students of University of Warsaw and included:

- research a "blind test" on a group of 40 people (aim: test of the perceived homogeneity of Polish and Italian green apples),
- pilot study on a group of 33 people (aim: methodology verification),
- main research on a group of 171 students (3 auction schemes with 57 participants in each).

ABSTRACT

This paper intends to verify two aspects of the movement of news related to the introduction of bail-in and the story of Banca Etruria. First through the methodology of text analysis we were analyzed quantitatively the significance of the news published between November 2015 - March 2016 extracted through the Factiva database, and the qualitative related to their semantic analysis. Alongside the traditional media, it was then considered the dissemination of news via the platform Twitter. Using social network analysis, were first highlighted the central actors in the propagation of news, selected considering the hashtag #bancaetruria and #bailin for the period February 16, 2016 - March 16, 2016, then it was investigated the semantic aspect.

PURPOSE

How circulate the news? Who are the key players in the dissemination of new information? What is the relationship between the degree of circulation of news and influence on financial markets?

The existing studies highlight the impact of media on financial markets analyzed in term of stock price, trading volumes and volatility (Shiller, 2000).

A recent strand of literature (Miller and Skinner, 2015; Leuz and Wysocki, 2016) considers the tools of Web 2.0 as social media (Facebook, Twitter, LinkedIn), rss feed and microblogging platforms, beside the traditional channels of dissemination of informations (f.i. newspapers, television, radio). These channels allow users an active participation to mechanism of production and circulation of news, according to the word of mouth mechanism. Using these tools, the individuals can share news and express opinions and comments: for this reason, they represent a new interesting field of studies about both the circulation of financial news and the individuals' financial behaviours.

This paper studies the relationship between type of information sources and their ability to influence public opinion. The aim of this study is to identify the key players in the dissemination of financial news.

To this end, we analyze the news about the instrument of bail-in and the case of Banca Etruria, that represent an interesting case of default of an Italian bank. These news are disseminated on Twitter in the period between 16th February 2016 and 16th March 2016. Selecting the tweets respectively with

hashtag #bailin and #bancaetruria, we use a social network analysis in order to identify the key players in the circulation and dissemination of news on the topics.

METHODOLOGY

To study the relationship between nature and capacity of influence of information sources we adopted the methodology of social network analysis (Mitchell 1969; Wasserman, Faust 1994). The data is represented by all converging towards the tweet hashtag # bailin and #bancaetruria, collected from 9:30 am of the day February 16, 2016 at 12:00 of the day March 16, 2016. Although the period has been selected at random, it is made particularly interesting by the events related to the intensification of the story of Banca Etruria resulting from the thrust of consumer associations, who also moved in the direction to put more attention on bail-in institution. According to the hashtag #bancaetruria, it was detected 1578 users that generated 3452 tweets and retweet 1963, similarly for #bailin register 901 users that have produced 1,951 tweets and 950 retweets. It 's related to both the retweet based on hashtags, you can define the network of interactions among all users. The analysis of the nature of Twitter users is based on the simple distinction between mass media, blogs and individuals. The measurement of a user's centrality in the network, considered an indicator of its impact, instead uses the concept of "betweenness" of individual actors. The betweenness of a generic actor (i) is given by the sum of all partial "betweenness" calculated for each pair of vertices gjk:

$$\textit{Betweenness} (n_i) = \sum_{j < k} g_{jk}(n_i) / g_{jk}$$

The idea at the basis of this measure is that the impact that is able to exercise a generic actor is linked to the number of times in which the same is located in the shortest path between two other actors. In other words, this measure is the expression of a user's ability to be a relational/informational bridge. The significance of differences in the categories was then tested through ANOVA statistical test.

FINDINGS

Based on the analysis performed, Figures 1 and 2 show the network of interaction between the formats users based on products to retweet tweets containing the hashtag #bailin and #bancaetruria respectively. The observation of the clouds generated by the selection of retweet according to the two hashtag used for the research confirms first and foremost as the theme of Banca Etruria is particularly hot compared to the bail-in. It also appears as a central position in the network is covered in case of #bancaetruria from traditional news websites to generalist nature (eg. @larepubblica, @ilcorrieredellasera, @ilmessaggero, Rainews24 @, @ Tgcom24) and those of specialized information (eg . @milanofinanza, @ ilsole24ore), followed by general users and the financial blog (eg.

@adviseonly). In the case of the issue of #bailin, the most central users are essentially of a financial blog while, in a subordinate position, there are some traditional information websites of generalist and specialized nature. Finally lie general users. These results are also confirmed by the analysis of betweenness average (Table 1) of the three groups of identified users, both for the hashtag #bancaetruria, both for the hashtag #bailin.

	#bancaetruria			#bailin		
	N	Betweenness Media	Dev St	N	Betweenness Media	Dev St
Media	105	0.4507	0.4760	87	0.2408	0.5831
Financial Blogs	216	0.1001	0.2028	305	0.3712	0.3915
General Users	1257	0.2713	0.2937	509	0.0812	0.1719

Table 1. Analysis on the betweenness retweet containing hashtags #bancaetruria and #bailin

The statistical significance of differences between groups is also confirmed by the ANOVA (Table 2).

	#bancaetruria					#bailin				
	Sum of Squares	df	Mean Square	F	Sign	Sum of Squares	df	Mean Square	F	Sign
Between Group	545.59	2	272.795	13.630	.000	112.47	2	56.235	18.315	.000
Within Group	1020.72	51	20.0141			82.90	27	3.0.70		
Total	1566.31	53				195.37	29			

Table 2. ANOVA - Values of significance in relation to retweet containing hashtags #bancaetruria and #bailin

The story of the bank in crisis involving multiple investors is confirmed to be a hot topic from the media point of view for its implications not only strictly financial, but also for those social and political. The cloud of the tweet tag (Figures 3 and 4) confirm the results of the analysis of the recurrence of words turning point for traditional media: the newsworthiness of events considered in the analysis is given mainly by the involvement of a prominent political figure and a high number of savers.

Figure 3. Tag cloud on the occasion of the words for tweets containing the hashtag #bancaetruria

Figure 4. Tag cloud on the occasion of the words for tweets containing the hashtag #bailin

RESEARCH IMPLICATIONS

The recent banking crisis on the Italian market have revealed a variety of weaknesses that have given even pushing some regulatory intervention, aimed at protecting the majority of savers and with it the stability of the entire banking and financial system. Specifically, the outbreak of the scandal arising from the affair Banca Etruria and the almost simultaneous issue of the decree Save-banks containing the introduction of the instrument of the bail-in, were topics to which the media have reserved considerable space under the impact not only strictly economic-financial, but also political and social that they are producing. In these two case studies, how the news were disseminated? Who are the key players in the circulation of the information? This paper has set out to check the movement of financial news related to the introduction of bail-in and the banks in crisis, with particular regard for Banca Etruria, on the Twitter platform for the period February 16, 2016 - March 16, 2016. The media in practice it seems to assume a popular attitude with a substantial neutrality of the information disseminated regarding the institution of bail-in while you pose in a rather harsh when it comes to events that involve the banks. For the introduction of bail-in media only play the soil of information brokers, while in the case concerning the story of Banca Etruria they take an active role, contributing to the construction of public opinion. From the perspective of financial intermediaries, these media under check, commit their energies defending against these attacks rather than using the media to communicate properly with investors. Correctness and clarity in communication is not obligatory, as well as use of traditional media channels and not by the banking institutions may have positive effects on knowledge and awareness of investors, more than any regulatory action intended to protect them. The problem of poor financial education of savers and opaque disclosure by banks themselves have sparked recent events of which Banca Etruria was only the leader. Events that should not be confused also with bail-in, but rather with the fraudulent placement of risky financial products and not suitable for all customer segments. In the specific case of the bail-in fact, it should also be made the effort to properly communicate what, when and for whom you activate, and get the message across that do not implement the procedure, can have worse consequences with heavy repercussions on the community and on 'entire economic and financial system, to implement it.

The future prospects of this work will concern the investigation of the existence of a relationship between the performance of financial markets, the circulation of news on selected topics and the degree of attention / awareness of individuals, investigated through the volume of Google searches .

MACROECONOMY, HEALTH FINANCING AND OUT OF POCKET PAYMENTS.

Grigorakis, Nikolaos¹; Floros, Christos²; Tsangari, Haritini¹; Tsoukatos, Evangelos²

¹University of Nicosia, Business School, Cyprus

²T.E.I of Crete, School of Management & Economics, Greece and University of Nicosia, Business School, Cyprus

ABSTRACT

The high share of out of pocket (OOP) payments to total health expenditure, for countries such as Greece, Cyprus, Portugal and Spain, has always been a major issue of their health care systems. In this paper, we examine the impact of macroeconomy, public and private health insurance financing (PHI) on OOP spending. Using fixed/random effects and dynamic panel data methodology to a dataset of 26 E.U. and OECD countries for a period lasting from 1995 to 2013, we find that public and PHI financing have a significant countervailing effect on OOP spending. Moreover, we show that unemployment rate has a significant positive impact on OOP expenditures. Our findings are robust since we implemented different changes in specifications and samples in our models. We argue that policy-makers should give serious consideration to PHI institution since our results indicate that it has an inverse effect on OOP spending. Further, countries have to provide financial risk protection to their citizens against OOP payments, rather than only attending health budgetary retrenchments in order to reduce public deficits.

HOW A GLOBAL VISION AND INNOVATIVE PRODUCT LEAD TO INTERNATIONALIZATION OF AN IT/E-COMMERCE HYBRID

Grochal-Brejdak, Magdalena

Department of International Management, University of Economics in Katowice, Katowice, Poland

ABSTRACT

This paper aims to present a single case study of the internationalization of a Polish-based IT/e-commerce hybrid. The study explores the motives and barriers to internationalization of said firm. Additionally, it examines foreign market entry modes and determinants influencing the choice of foreign markets. The issues of international orientation of the founder and psychic distance perception are also discussed. The study is based on an in-depth interview and secondary sources, which indicate how a combination of an innovative product, a global vision of the founder, and international experience acquired by the IT part of the company all influence the global approach of its e-commerce venture.

INTRODUCTION

Since the development of ICT revolutionized the internationalization and born global firms have emerged, it seemed as if the internationalization pattern described by Johanson and Vahlne (1977), as well as Johanson and Wiedersheim-Paul (1975), in the Uppsala model were no longer valid. Nevertheless, researchers have tested the applicability of the U-model on the internationalization of Internet-related companies, finding that some model assumptions remain relevant (Kim, 2003; Forsgren and Hagström, 2007).

The assumption from the U-model that remains relevant in the internationalization of Polish IT/e-commerce hybrid is the acquisition of experience and knowledge before entering foreign markets. Learning about a market before entering is as important as the global experience of employees and the vision of its leader. However, the necessity of resource commitment abroad does not seem to be specifically perceived by executives, while psychic distance (perceived differences between domestic and foreign markets) may be reduced by the relationship within the network (Johanson and Vahlne, 2009).

PATTERN-DOUBTS OF INTERNATIONALIZATION OF E-COMMERCE FIRMS

Up to now, three researchers confronted the process of internationalisation of Internet-related firms with the process described in the Uppsala model, i.e. Kim (2003) and Forsgren and Hagström (2007).

Kim (2003) indicated that the stage theory can be applied to online companies, but there are limitations in the case of service e-companies. Namely, selling intangible goods makes the internationalization process more rapid in comparison to e-commerce manufacturing firms. Forsgren and Hagström (2007) also noticed the extraordinary pace of internationalization of investigated Internet-related firms, as well as the lack of experiential knowledge behaviour. They suggest, however, that managerial implications of the U-model may still be relevant.

RESEARCH DESIGN

The focus of the study is the applied strategy of internationalization of company X and the influencing factors. It also reveals the learning mechanism driving the internationalization process of the researched company, albeit the process *per se* is not described here. To fulfil the research aim, a qualitative study in a form of an in-depth interview was conducted. The research questions have been formulated as follow:

- What kind of driving forces are behind the internationalization of the e-commerce venture of company X?
- How can the foreign expansion be characterized, regarding the nature of markets, the sequence of entering such markets, and forms of expansion?

The interviewee was a marketing director of a company X. Case selection is based on purposeful sampling: the criterion of choice of the company X was its presence on the most technologically advanced markets and offering digital products.

GLOBAL APPROACH OF THE IT/E-COMMERCE HYBRID: A CASE STUDY

Company X is a SME established in 2005 as an IT firm, and in 2011 launched an e-commerce venture under the brand Y. The company delivers a wide range of IT infrastructure services, such as data center and cloud computing, all in line the highest international standards and regulations. While the X brand is dedicated to business customers, the Y brand serves also individual clients.

At first glance, company X is a typical born global: it operates in the IT sector, it has been internationalized within three years of establishment, and its sales in foreign markets exceed 30% of total turnover. The main role is played by its founder and his global vision, and the psychic distance seems to be not perceived. However, when it comes to the foreign market entry, it is executed according to a delineated strategy, including stages and excluding simultaneous entry to more than one market. The executives pay great attention to acquiring maximum knowledge about a market before entering it.

Knowledge about foreign markets is distilled from the international experience of managers and external sources, such as local suppliers and sales representatives that introduce the X company in the market through the “back door”. In some markets, external representatives establish cooperation with X company, later becoming its representatives. Strongly-positioned business partners also advise on ways for X firm to interact with customers in challenging markets.

The X company omits emerging markets and targets only the most developed ones. The management board wants to avoid facing the technological or cultural barriers of developing markets. Moreover, less advanced technological level of development and trust issues in the domestic market have forced the company to enter foreign markets. The company is focused on offering innovative products in the German, British, French, Canadian or Japanese markets. However, it serves specific inquiries from developing markets.

The international experience acquired from the IT sector enabled the global scale of operation of the e-commerce venture just after its launch. Nevertheless the global vocation of its product seems to be as important as its international experience. The product offering under the Y brand is fully digital, hence immediately distributed and accessed by the customers, and is universal (required in any kind of IT/e-commerce activity), neutral (independent of the ICT suppliers) and flexible (fully customizable). Development of a product which is standardized yet easy to adjust at the same time is very time consuming and capital-intensive, but both criteria are crucial for a product to meet global needs.

FINDINGS AND CONCLUSIONS

The acceleration of the internationalization processes of small IT and e-commerce firms is indisputable (Jones, 1999), alongside their revolutionary and incremental character in some cases (Foscht *et al.*, 2006). As presented above, gradual internationalization driven by learning mechanism and experiential knowledge can be found even in cases of companies offering the most innovative, digital products. The most significant dissimilarity in reference to the Uppsala model of internationalization lies in the lack of the evolution of foreign market entry forms. The incremental character of the internationalization is revealed in the internal growth of the company and product development that altogether enable the global expansion. Also the lack of psychic distance considerably distinguishes the internationalization of the hybrid X. It results from the strong confidence in the global competitiveness of its offered products, as well as the global vision of the founder. The management board of the company X does not vary its activity in domestic and foreign markets. The strategy has a global dimension, just as their mindset.

CYPRUS DISEASE

Homayoon, Morvarid; Kaufmann, Hans Ruediger

University of Nicosia

ABSTRACT

This study aims to develop a “Cyprus Disease Framework”, which is based on theories, literature and the previous experiences of the other countries. The study is divided to three main sections:

The first section explores the phenomenon known as “Dutch Disease” by utilizing the model of Sachs and Warner (1995) as a base for understanding potential theories surrounding “Dutch Disease” and “Natural Resource Curse”. This section emphasises on the main effects of “Dutch Disease” based on the Classic Model of Corden (1982); “Resource movement effect”, “Spending effect” and Gylfason (2001) “Exchange Rate Variability”, and then it clarifies the variable effects of “Dutch Disease” on sustaining economic growth such as “Human Capital”, “Country Size”, and “Depth Overhang”. In the other hand this section reviews different theories specially the reasons behind the “Natural Curse” by Coutinho (2001) including; “Dutch Disease”, Deterioration of Government and Conflict, Over Investment in Physical Capital, Under Investment in Human Capital, Undeveloped Financial Markets, and Poor Macroeconomic Management.

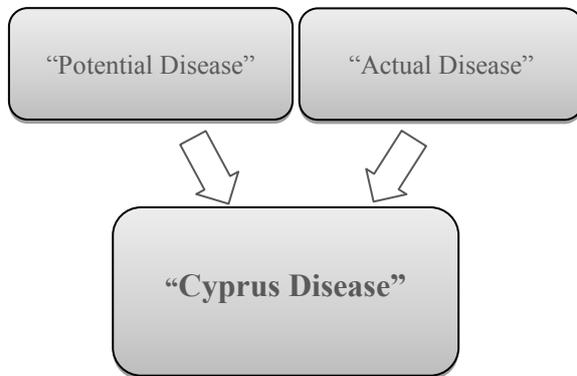

This section also identifies the previous failure experiences of countries, who have been cursed after discovering the “Natural resources”, highlighting the pitfalls that should be avoided. It also explains why “Dutch Disease” (Natural Curse), cannot be used as a “blue print” for Cyprus. According to the studies and analysis of the first section, “Potential Cyprus Disease Framework” is developed.

The second section explains the discovery of natural gas in Cyprus and its relation to the Cyprus “National Wealth”. This section analysis Cyprus macro-economy after its dependency and explains that the failure of economy stemmed from the growth performance that for many years had masked structural weaknesses and the need for drastic changes and adjustment to the new economic environment (Orphanides and Syrichas, 2012).

This section identifies Cyprus problems causing the crisis, mentioning that Cyprus has benefited from number of external factors, such as the war in Lebanon, the higher incomes of Arab countries in the 1980s and mass tourism but, there seems to be no clear view about the growth model to properly adjust to today’s circumstances and a lot of suggestions only serve to make the absence of clear targets more strongly felt. This is accompanied, by a long time depression of Cyprus economy and consistent efforts to distinguish the problems to explore possible remedies. (Cleridesa and Stephanoub, 2009). But are there remedies for all the problems? The most obvious example for this case is the ongoing

Turkish threat, so even Cyprus EU membership could be an appropriate context which could offer protection against the ongoing Turkish threat and the pressure of Cyprus's political problem, but unfortunately, the economic aspects were essentially disregarded (Cleridesa and Stephanoub, 2009). In the other hand identified failures of the Cyprus economy to properly adjust to the new environment of the EU, after the international financial crisis of 2008, which hit several countries, made the situation worst and these adverse developments caused large structural problems and weaknesses of the economy (Cleridesa and Stephanoub, 2009). The second section guides the literature to identify "Cyprus Actual Disease".

Finally, the third section utilizes the main categories of Cyprus problems "Cyprus Actual Disease" and "Cyprus Potential Disease" as a guidance for "Cyprus Disease Framework"

VALUATION PROCESSES IN RENEWABLE ENERGY INVESTMENTS: A SURVEY AMONG INVESTMENT PROFESSIONALS

Hürlimann, Christian¹; Bengoa, Dolores S.²

¹The Business School, University of Gloucestershire, Cheltenham, UK

²University of Applied Management Studies, Mannheim, Germany

ABSTRACT

INTRODUCTION

Applied asset pricing techniques and valuation processes for non-traded assets remain under-researched and poorly understood in contrast to the research on public traded companies (Petersen et al., 2006, Driessen et al., 2012, Ping et al., 2013). Green investments in renewable energy (RE) production – typically a non-traded asset – receives currently much attention by the investment community, mostly by utilities and institutional investors (Wassmann et al., 2016) due to the anticipated favourable risk-return profile (Warren, 2014). However, there are many investors which were forced to accept impairment losses in some of their RE investments (Shah, 2011, Catoire and Coneybeare, 2015). What are the reason for those asset impairments? A reason could be that the applied valuation methodologies – developed by researching public traded companies (Damodaran, 2013) – do not appropriately consider all specific characteristics of non-traded assets and RE. Other possible deficiencies include the lack of adequate input data (Petersen et al., 2006) and lack of recognition of sector specific characteristics (Brandt, 2002), unsystematic risks (Damodaran, 2012) and the correlation between project risk and within-firm and/or market risk (Ehrhardt and Brigham, 2016), and the subjectivity of many applied approaches (Cotner and Fletcher, 2000).

PURPOSE

The aim of this paper is to study the applied methodologies in valuation processes of non-traded assets among investment professionals in Switzerland and Germany, based on the example of RE investments. The research objectives appear to be a challenging project due to the restricted data access.

The research is expected to make a valuable contribution to the asset pricing research for non-traded assets, specifically for RE investments. First of all, the research will demonstrate which theoretical concepts (Hürlimann and Bengoa, 2016) are applied in RE investment practice in order that practitioners can learn how firms currently operate, assess risk and apply asset pricing techniques. The development of a conceptual model to estimate project specific return rates, as proposed by Finance

Theory (Weston, 1973, Fuller and Kerr, 1981, Titman and Martin, 2008, Ehrhardt and Brigham, 2016) specifically for RE investments will be a second valuable contribution. It will contribute to the field of research and to managerial practice by providing a comprehensive, systematic and more objective approach to estimate return rates in RE investments, considering influences of previous investments, portfolio effects and cognitive aspects. Finally, the research will contribute to practice by offering valuable insights about the organisational and cultural differences in risk perception and risk behaviours of Swiss and German RE investors.

METHODOLOGY

The researched population includes financial experts, financial managers and other decision makers in Switzerland and Germany. Those professionals hold a senior position within their organisations which invest in RE projects in the multimillion EUR scale, including power utilities, independent power producers, specialised fund management companies, project developers, consulting firms and project financing institutes. In Switzerland, there is no need to create a sample since the majority of the concerned population is known to the research team. In contrast, a study of the whole concerned German population would be impracticable, time consuming and overrun the research budget. Since an accurate probability determination of the selected participants is not possible, “non-probability sampling” (Saunders et al., 2009:213) is applied. The sample is built by consulting participant lists of several major RE conferences in Germany and social media platforms, complemented with snowball techniques based on the survey participants’ network.

A mixed method approach (Saunders et al., 2009) is applied for data collection in order to gather data from a rich set of available source, including interviews, a survey and focus groups. In the ongoing research, the first two research phases have been performed up to now.

In the first phase, exploratory semi-structured interviews are conducted, including both open- and semi-close-ended questions, identifying questions to be asked in subsequent data collection phases. Face-to face interviews were performed with four financial experts of the defined population, allowing the exploration of key topics which might have not being considered as relevant from the beginning (Robson, 2002) in order to gather richer qualitative empirical data. Those audio recorded data are analysed with content analysis, a bundle of systematic text analysis techniques, to discover key words and themes, their frequency of occurrences, theme treatment and presentation and linkage to outside variables, such as work experience, role in organization, gender, and cultural background (Robson, 2002, Elo and Kyngäs, 2008). For an efficient data analysis, the qualitative data analysis software NVivo is used.

A first questionnaire has been created based on the findings identified in the first phase, including questions asked in the famous studies of Graham and Harvey (2001) and Brounen et al. (2004) since their questions and applied answer scales have proved their validity. However, each of the posed questions have been adjusted and/or extended to match them to the research field. This survey was piloted with additional five experts in the research field and three scholars who provided valuable feedback and led to clarifications, simplification of questions and inclusion of additional brief explanations for certain questions.

In the subsequent second research phase, quantitative data collection with the final online survey is performed to verify the first findings and to find new statistical significant results. The survey is composed of five groups of questions. Firstly, general questions about RE investments were asked, including invested countries, technologies and entry phase in investment. Second group poses questions about risk, including the relevance of risk components in RE investments, materialisation and mitigation of risk. Thirdly, questions about how risk, return and its trade-off is understood within the organisations are asked. Finally, capital budgeting techniques are investigated followed by questions about estimating cost of capital before concluding the survey with demographic and control questions. The collected survey data are analysed with multivariate analysis to evaluate several variables at a time by applying the software IBM SPSS Statistics. The purpose of this analysis is to assess the significance of the empirical data about the applied valuation methodologies, risk factors and their priorities, and other dependent variables in relation to return rates, applying appropriate quantitative statistical tests, such as the multivariate analysis of variance (MANOVA).

The exploratory interviews and the survey piloting have been performed between April and September 2015 (1. phase), and a subsequent online survey between December, 2015 and March, 2016 (2. phase).

FINDINGS

From the exploratory phase, there are indications that previous investments and existing portfolios have an influence on future RE investment decisions: i) Investors with higher capital costs tend to focus on investments with higher return rates and corresponding higher risks, and ii) investors focus on diversifying the highest risks, such as the uncertainty of natural resources. Furthermore, risk is understood as standard deviation (uncertainty) around an average value, i.e. down- and upside risks. However, the return rate seems to be only understood to compensate investor mainly for downside risks and hence does not seem to consider possible opportunities within the investment.

In the survey performed in the second phase, 108 responses were obtained of which 100 fully completed. It provides a response rate of 30%. This section contains a summary of the main findings. In

capital budgeting in RE investments, 87% of the participants apply internal rates of return (IRR), 68% net present value (NPV), 58% both estimate cost of equity (equity return rates) and total cost of capital of project (project return rates), and 56% the hurdle rate of return concept while payback period (41%), multiple approaches (34%), profitability index (PI, 9%), real options (9%) and value at risk (VaR, 6%) are less frequently considered. Likewise, valuing opportunities and synergy possibility are not sufficiently taken into consideration (20%). In risk analysis, the majority of respondents apply scenario analysis (73%) and sensitivity analysis (70%) while simulations (e.g. Monte Carlo simulations) are much less frequently applied (10%). For estimating cost of equity, the Weighted Average Cost of Capital (WACC, 56%) and that discount rates are at least as high as defined hurdle rates (45%) are applied by the majority of respondents, more frequently than other approaches, such as the benchmarking approach with comparable companies or investments (34%), the Capital Asset Pricing Model (CAPM, 27%) and multifactor methods (0%). Moreover, a considerable amount of respondents use specific discount rates for different countries (53%), technologies (48%) and project stages (42%). In contrast, risk-adjusted discount rates (RADR) for particular projects are not applied that frequently (35%). Furthermore, the majority of respondents stated that their organizations either adjust the return rate requirements annually (30%) or each time a major project is evaluated (24%). In case of valuation adjustment for risk, the majority of the respondents adjust the cash flows considering weather-related volume risk (52%), operational risk (52%) and market risk (38%) while respondents mostly consider the political/regulatory risk (40%) to adjust the discount rates. Risk mitigation are performed by the majority of respondents by performing an internal and external Due Diligence (76% / 69%), reducing operational risks with appropriated maintenance contracts (74%), arranging for machine failure insurances (64%) – but less frequently for weather protection insurances (8%) – reducing market risks with feed-in tariffs or long-term power purchase agreements (62%) and standardization of procedures (57%).

CONCLUSION, IMPLICATIONS AND LIMITATIONS

The findings show that many practitioners do not regularly apply all valuation concepts, such as RADR, as suggested by Finance Theory, meaning that there is still a gap between theory and practice in RE investment valuation processes which corresponds to findings obtained in previous studies among practitioners (Gitman and Mercurio, 1982, Graham and Harvey, 2001, Brounen et al., 2004). Having mainly shown descriptive statistical results in this paper, the ongoing research will analyse the collected survey data in more depth applying quantitative statistical tests. Detailed results will be presented at the conference.

FINANCIAL TECHNOLOGY ECOSYSTEM: INSIGHTS INTO CHALLENGES AND OPPORTUNITIES IN RUSSIA

Ibraev, Ruslan; Korolev, Andrew; Plaksenkov, Evgeny

Finance, Payments and e-Commerce Chair, Moscow School of Management SKOLKOVO, Russia, Moscow Region

ABSTRACT

Innovation nowadays receive much attention due to their positive impact on the value creation in businesses and entire economy. The rapid growth of new technologies and startup companies in the field of financial industry, or FinTech, require a deeper analysis regarding the efficiency if its development process. This paper tackles this research gap, using a qualitative multiple case study design in order to examine the role of agents & interactions in the countries with best-in-practice FinTech-ecosystem. By means of cross-case analysis, the author compares developed ecosystems & conceptual canvas with Russia & explore the recipes explaining how development of nationwide FinTech-ecosystem in developing countries can be fostered.

INTRODUCTION

Innovation describes “the combination of knowledge that result in new products, processes, input and output markets, or organizations, which include not only technical innovations, but also organizational and managerial innovations, new markets, new sources of supply, financial innovations, and new combinations” (Yawson, 2009). Innovation ecosystems entirely are “collaborative arrangements through which firms combine their individual offerings into a coherent, customer-facing solution” (Adner, 2006). So, the fast-growing field of financial innovation has now grown from its disruptive roots into an industry in its own right – accumulating more than 20 billion USD in 2015 and jumped almost ten-fold since between 2010 (KPMG, 2016). Meanwhile, some regions are actively competing to create best-in-class FinTech- ecosystems and are increasingly progressive in their use of government and regulatory policy to support FinTech-startups¹. FinTech-ecosystems development & adequacy for innovation initiatives enable growth opportunities for many innovative sectors (payments, software, big data, peer-to-peer lending, mobile banking, etc.).

The concept of innovation ecosystem is already known for a decade, but researchers still highlight the need for further research with respect to the ecosystem development process. This paper fulfills

¹ FinTech-startups as high-growth organizations combining innovative business models and technology to enable, enhance and disrupt financial services (FS). This definition is not restricted to start-ups or new entrants, but includes scale-ups, maturing companies and even non-FS companies, such as telecommunication providers and e- retailers (EY, 2016).

the lack of study and uses a multiple regional case study analysis in order to identify the attributes for efficient development dynamics in the countries with best-in-practice FinTech- ecosystems, as well as to analyse if a development or behavioral pattern can be identified. In this paper we investigate the most successful cases and propose a framework for benchmarking the FinTech-ecosystem development with a set of recommendations to increase the efficiency of interactions of actors.

THEORETICAL FRAMEWORK

Generally, previous studies have suggested that developed innovation ecosystem help market stakeholders obtain needed resources and services. Particularly, (Schmookler, 1966) and (Schumpeter, 1934) placed innovations at the focus of economic change, arguing that innovation- oriented market power could create more economic value than Smith's "invisible hand" (Smith, 1776). Innovation is described as the driver for companies' growth, allowing them to prosper and sustain their profitability (Drucker, 1985) and is paramount for increasing the its competitive advantage (Porter, 1985). The diversity of companies within a given sector of the economy (e.g. financial sector) is considered as one of the driving factors of innovation for the national economy (Malerba, 2002).

An innovation ecosystem itself "consists of a group of local actors and dynamic processes, which together produce solutions to different challenges" (Oksanen & Hautamaki, 2014). The review of the academic papers suggests that the successful development of these attributes could be explained by efficient interaction between main actors and the effectiveness of resources, governance, strategy and leadership, organizational culture, human resources management, people, partners, technology and clustering (Durst & Poutanen, 2013). Besides these attributes, existing business literature on in this field (Strategy&, PwC, 2015) provide some core FinTech- ecosystem components: talent, business environment, access to markets, access to capital, government & regulatory support, financial expertise and demand. The recent study (EY, 2016) compares developed FinTech-ecosystems of seven regions and benchmarking the best cases, as it's believed the strength of the ecosystem provides the strongest indication of the future health of this nascent sector.

The burgeoning significance of ecosystems thinking for both scholars and practitioners has culminated in different research agendas, which aim to enhance our understanding of what innovation ecosystems are and how they change over time (Mäkinen & Dedehayir, 2012). Under this concept, scholars like to see the need to improve the relationships between actors of a given innovation ecosystem by creating a favourable framework to attract better ideas and investments and to accelerate the introduction of innovative products and services in the global market.

RESEARCH DESIGN & METHODOLOGY

Prior identified research suggestions support the use of qualitative methodology as a format for an innovation ecosystem analysis. Following the general guideline stipulated by (Yin, 2014), case study instrument is a preferred approach to understand or to predicts similar results and differences between the cases, as well as predicts contrasting results but for predictable reasons. Employing the method of comparative case study analysis of eight countries (“innovation ecosystem maps”), (Frenkel & Maital, 2014) have developed the visual foundation that enable to concretely portray of those nations’ innovation ecosystems with the aim to achieve consensual understanding of the innovation ecosystem as a basis for building effective pro-innovation policies. Another paper (Pichler, 2015) applies multiple case study analysis of innovation ecosystems within three regions with the aim to identify the development dynamics in the innovation ecosystems and to analyse if a development pattern can be identified.

Thus, this paper applies a multiple case study approach using non-technical literature to capture the development processes of eight different FinTech-ecosystems (Silicon Valley, New York, London, Berlin, Dublin, Tel-Aviv, Singapore, Hong Kong), which represent the building blocks for the subsequent cross-case analyses according to the hypotheses and compare them with the Russian case. Additionally, we’ve already conducted 32 in-depth interviews with experts of the Russian financial market and semi-structured survey of 37 FinTech-startups (statistical population was 102 FinTech-startups)¹, covering almost all major stakeholders of the Russian FinTech- ecosystem (banks, venture finds, IT & telecoms, payment systems, development institutes & infrastructure, business-angels, regulatory, professional media & associations). This approach of qualitative and quantitative analysis led us to grounded field-based visualization & description of the entire national FinTech market model. In this manner, we performed triangulation among different evaluators (Yin, 2014).

EXPECTED RESULTS, CONTRIBUTION, CONCLUSION & RECOMMENDATIONS

Due to the fact that the development of the national financial market is largely correlated with the development of the national economy, its successful functioning determines largely the quality of life of its citizens. While there is a widespread acceptance within the Russian financial industry of the need to marshal the full capabilities of the financial services to respond to challenges, it is not clear that this includes an adequate understanding of actors and its commitment within the entire innovation ecosystem and defining characteristics or unique capabilities that increase the efficiency of

¹ As of 1st April 2016.

actors within the FinTech-ecosystem.

This academic work makes a contribution to research in its theoretical and empirical part. The author elaborated a systematic comparison of eight ecosystems with similar concepts within financial industry. This comparison highlights the most important characteristics of each concept and constitutes a basis for further researches with respect to concepts' similarities and differences, as well as it serves as guidance for practitioners ("stakeholders of FS") deploy supportive capabilities to their exact needs. This study is of great relevance of all market stakeholders and can be contributed to effective policy decision making and promotion of social responsibility thereby benefiting the extended community at large.

ARE YOU UNIONIZED? THE RELATIONSHIP BETWEEN JOB INSECURITY AND ORGANIZATIONAL ENTREPRENEURSHIP, IN THE FRAMEWORK OF UNIONIZATION

Itzkovich, Yariv; Heilbrunn, Sibylle

School of Social Sciences and Humanities Kinneret Academic College Sea of Galilee, Israel

ABSTRACT

In the 21st century, companies must regularly innovate, thus they encourage employees to become entrepreneurs within the organizational setting. While some studies of organizational entrepreneurship have focused on the macro-level, far less has been researched from the viewpoint of the employees. Moreover, to date, the relationships between incivility and organizational entrepreneurship, as well as the relationship between organizational entrepreneurship and job insecurity, were not assessed. Moreover, these relations were not investigated in the framework of unionization.

Our current study addresses these deficiencies by assessing the relationships between incivility, job satisfaction, organizational entrepreneurship and job insecurity while differentiating between two groups of employees namely unionized vs. un-unionized employees.

Drawing on the social exchange theory, we hypothesized that incivility decreases employees' job satisfaction and in turn decreases its resourcefulness to generate new ideas. Additionally, it was hypothesized that incivility will enhance job insecurity perceptions while organizational entrepreneurship will inhibit perceptions of job insecurity.

Moreover, it was hypothesized that these relations will be intensified for un-unionized employees that are less protected and are working in a less stable environment with higher inclination to innovate.

Data were gathered from 510 valid responses. Findings indicated that incivility affects organizational entrepreneurship, through perceived job satisfaction that serves as a mediator. Additionally, it was found that incivility enhance job insecurity perceptions while organizational entrepreneurship inhibits perceptions of job insecurity.

Moreover, it was found that these relations are intensified for un-unionized employees.

The findings of the current study indicate the importance of interpersonal relations in enhancing organizational entrepreneurship.

PROJECTOCRACY OR PROJECTARIAT? HOW PROJECT WORK SHAPES WORKING CONDITIONS IN PUBLIC, NON GOVERNMENTAL AND BUSINESS SECTORS

Jałocha, Beata

Faculty of Management and Social Communication, Jagiellonian University, Kraków, Poland

ABSTRACT

The consequence of the widespread use of projects as the main method of implementation of the tasks is called projectification. The phenomenon of projectification radically affects working conditions of people employed in all kind of organisations. Stress, high requirements, excessive control – all of these factors are experienced by employees engaged in project work. At the same time, career in project management is promoted as a promising profession of the future. To show the duality of project work conditions in the era of galloping projectification, I use two terms: *projectocracy* and *projectariat*. I understand *projectocracy* as aristocracy of project work. Projectocracy is therefore a group of people involved in project temporary work but enjoying privileges of a stable employment, in comparison to *projectariat*, which is a precarious group of project workers. In this article I present a dichotomous image of the project management profession. Therefore the goal of the paper is to critically rethink the notion of project working conditions.

INTRODUCTION

Working conditions of project managers have been discussed by project management researchers, especially researchers associated with the Critical Project Studies (e.g. Paton, Hodgson & Cicmil, 2010; Hodgson & Paton, 2016; Gällstedt, 2003), since many years. However, in times when nearly everyone practices project management to some degree, it is extremely important to continue research on impact this method of work has on individuals and the whole society. Project management is nowadays one of the main forms of executing activities by business, public and non-governmental organisations (NGOs). The consequence of the widespread use of projects as the main method of implementation of the tasks is called projectification (Midler, 1995). The phenomenon of projectification radically affects working conditions of people employed in all kinds of organisations. However, it seems that it affects it in different ways. This paper aims to contribute to the research on projectification by introducing a concept of *projectocracy* as opposed to the notion of *projectariat* (Szreder, 2016). Therefore the focus is set on the impact of projectification on working conditions in NGOs, public and business organizations. The research question which shapes the concept of the research that will follow this brief introductory

text is: what are the differences between the impact of projectification on working condition in public, non-governmental and business sectors? The concepts presented in this abstract are part of a wider research project that deals with the issues of projectification. So far, partial results of the above mentioned research, which concerned the processes of projectification in non governmental (Bogacz-Wojtanowska & Jałocha, 2016) and public organizations (Jałocha, 2016) have been published. In this article I present a dichotomous image of the project management profession. The goal is to critically rethink the notion of project work.

PROJECTIFICATION

The presence of projectification had been at the beginning noticed at an organisation level (Midler, 1995), however, it soon turned out that it also applies to individuals and whole societies. Beside the general admiration of project work and its consequence – projectification, there are also critical voices referring to this phenomenon. Project work is not only about flexibility and freedom - on the contrary, it may bring a series of negative consequences for the people involved in it. Problems created by projectification have been pointed out in many publications connected with Critical Project Studies (Packendorff & Lindgren, 2014; Cicmil & Hodgson, 2006). Since its beginning, Making Projects Critical movement, has been drawing attention to such aspects as power, ethics, moral responsibility, and the dysfunctions of project rationality. Galloping projectification is therefore an ambiguous phenomenon, carrying not only positive but also negative effects. One of the effects of projectification is its impact on working conditions of people involved in project work. Stress, higher requirements, excessive control – all of these factors are experienced by employees engaged in project works in their workplace (Asquin, Garel, & Picq, 2010). However, at the same time, career in project management is promoted as promising profession of the future.

PROJECTOCRACY VERSUS PROJECTARIAT

To show the duality of project work conditions in the era of projectification, I use two terms: *projectocracy* and *projectariat*. I understand *projectocracy* as aristocracy of project work. Projectocracy is therefore a group of people involved in temporary project work but enjoying full privileges of a stable employment. *Projectocrats* are these employees who have good employment conditions, additional benefits offered by employers and high wages. These are people that are considered having the highest positions in the project world. As shown by salary reports (Project Management Institute, 2015), in terms of employment conditions and wages, they are usually experienced project managers, PMO managers and Portfolio directors, employed in business. Projectocrats feel safe, because they know that when they finish one project, there will be another one. They are not responsible for “project hunt” –

like project workers in e.g. non governmental sector, who have to receive a project grant to continue their work and employment.

Projectocrats are opposite of *projectarians*. K. Szreder (2016) states, while analyzing examples of project work in the field of culture, that projectarians are people who own nothing but their potential to enter into projects and they are both similar and distinct from proletarians, who are defined by their lack of property. *Projectariat* is a concept, according to which the working conditions of projects workers are compared to members of proletariat (Szreder 2016) and/or precariat class (Szreder 2016; Jałocha 2016). The concept of precariat originates from works by Pierre Bourdieu, who described precarity as a "new mode of dominance" resulting from restructuring of the economy that "forced workers into submission" (Choonara, 2011). Bourdieu thought that the globalisation and fragmentation of the labour market created a permanent sense of insecurity among employees. According to G. Standing (2011), the precariat consists of persons employed under flexible labour relations, not under permanent employment contracts concluded for an indefinite period. The characteristic qualities of the precariat mentioned by Standing include the instability of employment, the lack of professional identity, the performance of work below one's qualifications and outside (normal) working hours. In addition, members of the precariat class have more difficult access to pension, sickness and parent benefits. All this problems are faced by many employees involved in project work, especially in non governmental (Bogacz-Wojtanowska & Jałocha; 2016, Szreder, 2016) and public sectors (Jałocha, 2016).

CONCLUSION AND FURTHER RESEARCH

Project work is often characterized by a limited time of employment and a specific relationship between the employee and the employer. The dividing lines defining the differences between the projectocracy and projectariat are forms of employment. However, these lines seems to be blurred. As research indicates (Gällstedt, 2003) perceptions of working conditions are not only affected by the form of employment, but also by two important factors - motivation and stress. It means that even in the world of *projectocracy*, rules of project work are strongly influencing working conditions. The issue of *project overload* - fragmentation, disruption and inefficiency, caused by switching between assignments for simultaneous projects (Zika-Viktorsson et al., 2006), stress generated by project work and its speed, deadlines and triple constrains – they all influence people involved in project work, no matter which industry they work for. Even projectocracy may be strongly influenced in a negative way, although this influence is rather connected with the negative psychological effects, not financial working conditions. Although the business provides stability, gives good salary and contracts for an indefinite period of time, project work may be damaging. It is therefore important to understand the impact of projectification on working conditions in all areas of organizational activity. To counter the

pathological changes brought by projectification this phenomena has to be carefully identified through research. Therefore, in addition to seeking the best solutions to increase the efficiency and effectiveness of projects and project teams, we should investigate how project work affects employees and thanks to it find different coping strategies that may be used to reduce uncertainty and damaging effects of project work.

BOOSTING FINANCIAL INCLUSION THROUGH DIGITAL ECOSYSTEMS

Kabakova, Oksana; Plaksenkov, Evgeny

Finance, Payments and e-Commerce chair, Moscow School of Management SKOLKOVO, Moscow, Russia

ABSTRACT

INTRODUCTION

Recently, the world has faced the problem of *financial exclusion*, which means that not everyone has access to financial services or does not have enough knowledge and experience to use them. The opposite phenomenon is *financial inclusion*, which means that there is a uniform availability and usage of financial services (World Bank, 2014). It was empirically shown that developed and inclusive financial system has a potential to reduce information and transaction costs, to influence saving rates, investment decisions, technological innovation, and long-run growth rates (Beck et al., 2007).

Despite the relative success of market agents' efforts, at the beginning of 2010 the figures showed that more than 50% of the global population still remained uncovered or under-covered by the formal banking system (Chaia et al., 2009). Nevertheless, precisely at that time the market experienced new transformation. Firstly, it became clear that, as in any kind of business project, building mutually rewarding relationships among stakeholders plays essential role in success and effectiveness (Moore, 1996). This boosted the formation of a new ecosystem which connected various market agents in their goal to promote financial inclusion as governments, financial companies (mainly banks), business entities and citizens got involved in promoting and enhancing financial inclusion together. Secondly, more innovative companies were entering the market with the offers to make everyday financial transactions both less expensive and more convenient to the customers, giving life to the new phenomenon of digital financial platforms. Thus, the ecosystem of financial inclusion transformed and a new big group of stakeholders from *digital* world entered it (GPFI, 2014).

THEORETICAL FRAMEWORK

Introduction of ecosystem and, in particular, digital ecosystem approach to the realm of financial inclusion strategies in the first place has brought up the issue of strong interdependence of market agents' actions (Ehrbeck et al, 2012). As suggested by Adner and Kapoor (2010), the readiness of complements plays essential role in solving uncertainties in ecosystem perspective, which is highly relevant for the financial inclusion issues: i.e. there will be no possibility to develop mobile banking until the broad and high-quality mobile network is settled. Moreover, they suggest that the key element

of project or innovation success is the particular position of each stakeholder in the ecosystem. Additionally, the ecosystem approach goes along with value creation phenomena (Adner and Kapoor, 2010) which is dramatically relevant in case of projects towards financial inclusion as there is still no unified approach on how to measure the effectiveness of each particular project or policy in this area.

EMPIRICAL SET-UP

Following the broad range of studies on entrepreneurial ecosystems, we suggest that there is a number of factors that, along with the level of the digital ecosystem development, may impact the level of financial inclusion, such as macroeconomic factors (i.e. GDP per capita, unemployment, interest rates), transparency factors (including corruption), cultural factors (i.e. Hofstede index), etc. (Suresh and Ramraj, 2012). The sample includes 30 countries, which represent 6 potential combinations of the stage of financial inclusion development (advanced, intermediate, preliminary) and the level of digital financial services penetration (high, medium, low). The Financial Inclusion level is proxied with the access to financial services and measured by the percentage of population with formal banking account indicator provided by WorldBank Findex dataset (see World Bank, 2014). The digital ecosystem development is proxied by the level mobile and Internet penetration, which is an essential part of infrastructural innovation as suggested by GPFI (2015).

We will use the Qualitative Comparative Analysis technique to understand which configurations of factors lead to the higher (lower) levels of financial inclusion. This method, firstly, allows to work with small-sized sample, which is relevant for current case due to the data availability issues. Secondly, it allows for multiple configurations of attributes causing the same outcomes, as well as for the asymmetry between the configurations leading to the desired outcome and to its negation. Thirdly, QCA approach reveals not only significant existing conditions, but also significant absent characteristics essential for the successful outcome (Woodside, 2010).

The analysis of country-level data will allow us to build up configurations explaining the relationship between digital ecosystems and financial services development, as the proposition is that it is not always the case that the level of digital ecosystem development corresponds with the level of financial inclusion.

RESULTS, CONCLUSIONS AND IMPLICATIONS

The study, therefore, aims to explore which configurations of macroeconomic, transparency and cultural factors explain the level of digitalization in financial inclusion. The results of this study contribute to the literature devoted to digital ecosystems in finance and provide practical implications

in three ways: first, by linking the literature on ecosystems and financial inclusion and highlighting how those two phenomena might gain from realizing common features; second, by emphasizing the potential of designing specific public policies to stimulate activities in digital financial services. Finally, the study will reveal the link between the successful digital ecosystem formation and efficient project management in the field of financial inclusion. Moreover, the research has implications to managerial practices, both governmental, particularly, in developing financial market's policies and legislation initiatives towards new players or financial services, as well as business through providing the strategic advice on interaction with other market agents in ecosystem.

THE IMPACT OF WORK VALUES ON TURNOVER INTENTIONS OF ISRELI HIGH TECH ENGINEERS

Kessler Ladelsky, Limor; Weisberg, Jacob

S. Daniel Abraham. The Graduate School of Business. Bar Ilan University, Biu, Ramat Gan Israel

ABSTRACT

Managements are concerned about the economic and non-economic implications of employee turnover intentions because it leads to both direct and indirect significant costs. Direct costs, include, recruitment, selection and replacement of a new employee, whereas, indirect costs may include pressure experienced by remaining peers, decreasing morale and satisfaction as well as the quality of service to the clients, decrease in companies productivity and profitability, loss of sales, social capital, human capital and intellectual capital, One of the consequences might be voluntary turnover that is very pronounced among engineers and IT workers particularly in high-tech companies.

This phenomenon is salient among Israeli professional Hi Tech Employees since they have high demanded not only in the local Israeli labor market but also abroad. They are highly educated, entrepreneurial thinking, and always looking for the next challenge to move forward.

In spite of enormous number of studies on Turnover Intentions, this study concentrates on the effect of work values on turnover intention.

A sample of 180 IT employees (i.e., software engineers, developers, programmers) in high-tech companies was studied. A set of hypotheses were tested using a multi-variate hierarchical regression analysis and structural equation modeling (SEM).

We focused on the mediating role of internal marketing (that views the employee as an internal customer) between work values and turnover intentions.

The finding in the hierarchical regression showed that work values did not have any direct effect on turnover intention. However, in SEM analysis it was found that work values effect on turnover intentions is mediated by internal marketing.

Theoretically and in practice, in order to implement work values to deal with turnover intention managements have to adopt and implement internal marketing policy.

INVESTIGATING CRITICAL SUCCESS FACTORS FOR CUSTOMER ENGAGEMENT IN THE E-HEALTH SECTOR

Koch, Jan-Philipp

Consulting and Sales Management, University of Applied Management Studies, Mannheim

ABSTRACT

The eHealth sector is one of the fastest growing sectors in the world. For companies, like vitaliberty GmbH, who are engaged in that market sector, the differentiation in terms of innovative offers to customers is a huge challenge for the future. Today, customer satisfaction is not a sufficient precondition to be successful, so companies need to make customers investing their emotions in their brands. Their goal should be to turn their customers into ambassadors for their brands to influence their peers in order to win more-and-more prospects and into co-creators for continuous product and service improvement.

The aim of this paper is to elicit the success factors for involving customers in product development and recommendation in the e-Healthcare sector. Deriving customer-engagement insights from Kumar (2013), Eyal (2014), Haven (2008) and Hollebeek (2011) an initial conceptual framework is developed for getting the customers engaged in a short period of time.

To validate this framework of success factors for customer engagement in the e-health sector, this paper undertook a case study as the qualitative research method. The semi-structured interviews were conducted with a) CEOs of companies who were successful in customer development in a short time and b) potential customers who match the research method by an external research organization. The interim results of the research show that a) the companies with the highest growth rate of customers have a good interaction with their customers and also see them as team members in the context of product development; b) The prospects desire to be committed with a brand which has values congruent with their own ones and can express expertise in form of persuasive content-marketing. They also show a high tolerance to accept recommendations from friends and family via social media activities.

This study makes a scholarly contribution by demonstrating that a professional service and a combination of online and offline marketing actions are success factors for effective customer acquisition for online products. In addition, a contribution for practice is provided in showing that companies who involve their customers in growing the product and brand are more successful due to the higher level of knowledge on the needs of their customers.

SMES IN DATA-DRIVEN ERA: THE ROLE OF BIG DATA TO FIRM PERFORMANCE

Kopanakis, Ioannis; Vassakis, Konstantinos; Mastorakis, George

Department of Business Administration, Technological Educational Institute of Crete, Agios Nikolaos, Greece

ABSTRACT

Nowadays, small and medium enterprises (SMEs) face an extremely competitive, globalized, technological changing and “knowledge-based” environment. Knowledge management and exploitation play a crucial role to innovation and competitiveness of enterprises. Digital technology has transformed the rules of innovation and performance in enterprises, since 90% of the worldwide data today was generated in just the last 2 years and that datafication is growing rapidly, while connected devices and sensors through “Internet of Things” are increasing (50 billion smart connected devices globally by 2020). As digital data are everywhere, in every sector and economy, big data is described as an asset for enterprises’ innovation, providing knowledge about processes, customers, human capital and technology necessary for enterprise.

Big data, datasets with 3Vs: volume, variety and velocity, is a major resource for enterprises valuable knowledge to enterprises added value contribute to increased competitiveness and innovation. The leverage of big data provide enterprises not only in ICT sector, valuable knowledge leading on competitive advantage against rivals in terms of productivity, resources allocation and efficient marketing. In addition, data-driven innovation provides the ability to improve or foster new products/services, processes, organizational methods and markets.

There is evidence about positive impact of data-driven approach to firm performance, however it is limited to large enterprises. The purpose of this study is to present evidence about the impact of big data in SMEs’ performance and data-driven approach in innovative activity (data-driven innovation) of Greek SMEs, taking in account the economic turbulence of the recent years. More specifically, a survey-based methodology in Greek SMEs will be used in order to collect the necessary data. As it is an ongoing research, the results are expected to present a significant positive impact of data-driven approach to enterprises performance.

LINKING EMOTIONAL INTELLIGENCE TO LEADERSHIP: EVIDENCE FROM THE GREEK PUBLIC SECTOR

Koronios, Konstantinos¹; Mavromati, Marina²; Kriemadis, Athanasios¹; Gkatsis Georgia¹

¹Department of Sport Management, University of Peloponnese, Sparta, Greece

²Department of Business Administration, University of Macedonia, Thessaloniki, Greece

ABSTRACT

Emotional intelligence (EI) has become one of the most popular issues in the areas of management and psychology during the last two decades (Joseph and Newman, 2010). A number of studies have been conducted, proposing that emotional intelligence is positively correlated with the job performance (O'Boyle *et al.*, 2011), leadership success (Goleman, 2000) and profitability (Stein *et al.*, 2009). Despite the extended research, there are controversial viewpoints in the EI literature about its terminology as well as its approach to measure it (McCleskey, 2014). According to Boyatzis *et al.* (2000) emotional intelligence is noticed when an individual displays the competencies that comprise self-awareness, self-management, social awareness and social skills appropriately and in adequate prevalence to be effective under a set of circumstances. It is declared that the skills of emotional intelligence, in contrast to IQ, can be learnt during one's lifetime and are regarded as crucial factors of effective leadership (Goleman, 2000).

Previous studies reveal that emotionally intelligent leaders are considered to be more devoted to a firm, are happier, have a better performance and promote trust and collaboration among their employees (Gardner and Stough, 2002). Dulewicz and Higgs (2003) studied emotional intelligence in UK directors and confirmed that the higher an individual fosters in a firm, the more critical the EI becomes. The aim of this paper is to contribute to emotional intelligence research by examining its relationship to leadership in the public sector as well as to investigate demographic and positional attributes related to EI concept.

Therefore, a quantitative survey was carried out in a public sector organization in Greece. A sum of 322 successfully completed questionnaires were collected and analyzed with SPSS software. To measure emotional intelligence, a questionnaire based on Emotional Competence Inventory (ECI) was distributed. The ECI is a 360-degree tool formed to evaluate and develop the emotional capabilities of enterprises and individuals (Watkin, 2000) and it was previously used in Greek public context (Efkarpidis *et al.*, 2012). Leadership was examined by Hart and Quinn's (1993) questionnaire, based on Competing Values Framework and proposing four leadership roles.

Results indicate an affirmative relation between leadership styles and emotional intelligence. However, an interesting fact is that participants scoring high on each of the four leadership roles,

display higher emotional intelligence. This finding is important as new research proposes that effective executives use a variety of leadership roles in different circumstances (Goleman, 2000). The results also demonstrate that hierarchical position is a discerning attribute to our sample with lower positional levels scoring higher in EI. Moreover emotional intelligence was found to be differentiated among educational levels in accordance to our expectations. Indeed, Goleman (1998 as cited in Downey *et al.*, 2006) stated that emotional intelligence can be evolved within training, resulting in a positive effect on an organization's performance by increasing employees' emotional abilities. Finally, gender was examined as a predictor of emotional intelligence but no statistical significance was found to our sample. As Tsaousis and Kazi (2013) mention, some researchers argue that women are better than males at managing their emotions, while others indicate that gender has no effect on emotional intelligence.

The above findings call attention to organizations to intervene in order to improve the emotional intelligence of their workforce. However, since the present research has been conducted on a single public organization, awareness should be raised as far as the generalizability of the results providing useful insights for further exploration.

THE MOTIVATION OF SPORTS CYCLING TOURISTS

Koronios, Konstantinos¹; Psiloutsikou, Marina²; Kriemadis, Athanasios¹

¹Department of Sport Management, University of Peloponnese, Sparta, Greece

²Department of Marketing and Communication, Athens University of Economics and Business, Athens, Greece

ABSTRACT

The aim of this study is to single out the perceived significance level of factors associated with commitment to cycling events as well as the role of the host destination in sport tourists' travel decisions. The effect of seven factors on the intention to participate again in cycling events was explored; notably, cycling event attractiveness, degree of attachment with the event, involvement with cycling, promotion of physical and mental health, socializing opportunities, elements of sportscape and host destination characteristics. A quantitative method was utilized for the purpose of this study and a total of 146 questionnaires were successfully completed and analyzed by means of the SPSS. The findings supported that the intention to participate again is significantly explained ($R^2=0.520$, $\text{sig}<0.000$) by the degree of attachment with the event, the involvement with cycling, the perceived promotion of mental health and the elements of sportscape.

INTRODUCTION

Scrutinizing influential factors on individuals' motivation to take part in the sport of cycling is crucial for sport event managers in order to organize sustainable and successful sport tourism events. Nowadays, taking part in the sport of cycling is in the middle of a resuscitation with motivation for taking part or/and spectating these events being dependent upon the athlete as well as the destination (LaChausse, 2006). Recognizing the numerous motives for participating in cycling contests may play a crucial role in promoting cycling associated events and assisting in sustainable tourism development of the host destination. The purpose of this research is to expand our understanding about the factors influencing sports tourists' cycling contest participation and travel decisions, and more specifically to examine the relationships between their intention to participate (IP) and a number of motives, namely cycling contest attractiveness (ATTR), degree of attachment with the event (ATTA), involvement with cycling (INV), perceptive promotion of physical (PH) and mental health (MH), socializing opportunities (SO), elements of sportscape (SF) and host destination characteristics (HD).

THEORETICAL BACKGROUND

Motives for participating in cycling events may vary by the attractiveness of the event, which alludes to the expected magnitude that this event possesses for a cyclist, along with the recreation, contentedness

and enjoyment received from taking part in this (Alexandris et al., 2011). Individuals' attachment with the specific cycling event and its characteristics may also have a direct link effect with their intention to participate, as according to Kulczycki and Halpenny (2014), individuals look for events which not only accomplish basic requirements but are also favorable for accomplishing their optimal performance objectives. Past research has shown that motives for participating in cycling may also differ by activity level and the degree of involvement with cycling (LaChausse, 2006). More specifically, involvement refers to the importance of a recreational activity as part of an individual's overall perception about life and can affect individuals' future participation and behavior (Ridinger et al., 2012). According to previous studies, the preventive health and sickness avoidance prospect, is among the main frameworks used in order to anticipate individuals' participation in exercise activities (Tsai, 2005). This prospect supports that the probability of espousing a deterrent health behavior, such as cycling, relies on an individual's anticipation of a health threat and a sentiment that cycling will reduce this threat. Socializing is an important aspect people scrutinize when choosing to take part in recreational activities. Research has shown that people's initial intention when searching for a recreational activity is to find opportunities to interact with new people. This kind of relationship among individuals with similar interests can occur through cycling (Hill and Green, 2012). Sportscape factors refer to the physical surroundings individuals face during their participation in a recreational activity. More specifically, sportscape factors and settings are found to be important participation and travel motivators, particularly for sport tourism events, having a direct link effect on cyclists' intention to participate (Kulczycki and Halpenny, 2014). Sport events are frequently utilized to demonstrate the natural, cultural and historical aspects of the hosting area, which in turn can influence the athletic experiences of cyclists as they constitute an important motivator for event participation (Kulczycki and Halpenny, 2014).

METHODOLOGY, RESEARCH DESIGN AND DATA ANALYSIS

A quantitative method was used and questionnaires were collected from participants of a cycling event in Greece. The questionnaires were distributed during the award ceremony of the event, by a research team of 5 and were completed in their presence. A total of 146 questionnaires were successfully completed and analyzed by means of the SPSS.

RESULTS, DISCUSSION AND IMPLICATIONS/CONCLUSIONS

The great majority of the participants were men (95.2%). Their age ranged from 18 to 78 years old; 89% were over 35. Half of them were employed in the public or private sector, while 38.6% ran their own business. They were well educated; 36% held a bachelor degree and 23.4% had completed postgraduate

studies. The majority (70.3%) were either married or divorced and their income did not exceed 2.000€ (77.2%). In terms of training, 90.4% of the participants said they were training outdoors four times per week (mean=4.5, s=1.34) for a total of 12 hours (mean=12.61, s=7.57) and had participated in fifteen cycling events in the past (mean = 15.35, s=16.84). Linear correlation analysis showed that the intention to participate in a future cycling event (80.7%) was significantly correlated (bivariately) with all the (seven) factors proposed in the model. Nevertheless, when examined together, multiple linear regression analysis showed that only four of them had a significant effect on the intention to participate again. The predictive power of the model was noteworthy ($R^2=0.520$, sig<0.000) while the respective equation was: $IP = 1.507 + 0.475*ATTA + 0.289*MH_1 + 0.122*MH_2 + 0.009*INV - 0.191*SF$ (Factor Analysis revealed two distinct dimensions for the perceived promotion of mental health, MH1 and MH2). All effects were significant at $p<0.01$, except for MH2 and SF that were significant at $p<0.05$.

THE IMPACT OF STAKEHOLDER INVOLVEMENT DIVERSITY ON COMPLEX PROJECT SUCCESS: THE CONTEXT OF TOD PROJECTS

Krivosheya, Egor; Plaksenkov, Evgeny

Finance, Payments and e-Commerce chair, Moscow School of Management SKOLKOVO, Moscow, Russia

INTRODUCTION

Projects with high public usage usually require substantial investment due to the wide scope and high operating and launch costs. At the same time, business ecosystem of these projects is diverse and stakeholders do not anticipate future cash flows due to myopic expectations. As a result, coordination failure often prevents key stakeholders and project initiators from raising necessary amounts of funds even though successful realization of such projects leads to welfare improvements for all ecosystem participants.

One category of such initiatives, transit-oriented development (TOD) projects, has attracted special attention of both practitioners and academics due to strong growth of activity in this segment lately. Yet, literature considers only a few projects as successful attributing most of the failures to the lack of sufficient amounts of funds (Dittmar & Ohland, 2012). Practitioners as well as academics prescribe private public partnership (PPP) financing and management schemes as the ultimate solution to this problem. Nevertheless, the inefficiency in project realizations and fundraising remains even with PPP professionals' participation.

This article aims to contribute to two burgeoning streams of literature. The first one approaches the motivation of stakeholders in the business ecosystems (e.g., Moore, 1996). The second identifies the determinants of both project failure and project success (e.g., Belassi & Tukel, 1996; Cobo-Benita, et.al., 2015; Tang, et.al., 2010).

In the literature on project success factors, there is a need for a deeper understanding of complex projects, with a multitude of stakeholders. Ecosystem literature seeks to understand the impact of stakeholders and complementors on business performance; however, it has focused predominantly on the interaction with a single type of stakeholder, rather than considering the multiple stakeholders at the same time. This research aims to fill this gap by evaluating the role of benefits and management structure diversity for project success on a set of information about the major benefits of the key stakeholders in TOD projects.

THEORETICAL FRAMEWORK

The interdisciplinary nature of this study separates the relevant literature in two major strands. The first one concerns the PPP and success of the projects with high public usage. The second one explains the role of the benefits in capital budgeting and financial decisions as well as the welfare implications of the project launch. This study also introduces major stakeholders of the TOD projects ecosystem. Following, for instance, Dittmar and Ohland (2012) as well as the analysis of the existing TOD launch cases this research identifies 8 major stakeholders: operators, government officials, individuals, investors, developers, landowners, financial services providers and local businesses.

PPP and project success

Academic literature on the determinants of the project with public usage success identifies PPP management and financing scheme as one of the core conditions for efficient investment attraction campaign and further welfare improvement as a result of project success (e.g., Tang, et.al., 2010, Stiglitz & Wallsten, 1999). That is why this study hypothesizes that PPP is necessary for both investment attraction and further welfare improvement efficiencies.

Benefit and management diversities and project success

Another important source of investment attraction and welfare improvement efficiencies are the minimal levels of benefits in the project and the benefit diversity (e.g., Smith & Gihring, 2006). TOD projects are associated with large number of stakeholders all of whom receive benefits as a result of the project launch. For example, government can receive improved security in the society and higher tax collections due to area development, while individuals can get faster means of getting to the desired destinations and new retail area with diverse products. This study associates low minimal benefits with low investment funding efficiency, while high benefit diversity is associated with successful investment attraction and high welfare improvement. Finally, high management structure diversity is associated with both successful funding and high welfare efficiencies.

EMPIRICAL SET-UP

The empirical analysis of the project performance determinants utilizes a sample of 20 largest TOD launch cases from different countries around the world identified from the practitioners' guides and public sources. This study uses the fsQCA as well as the conventional non-hypothesis statistical testing (pairwise correlation coefficients significance in particular) methods to test the proposed relationships. Benefit and management structure diversities are measured using Simpson's (1949) index of diversity.

RESULTS

We find significant robust evidence in favor of benefit diversity importance among stakeholders for success of the TOD launch. In particular, high benefit diversity is a necessary condition for efficient fund raising as well as high welfare improvement after TOD project launch. The lack of benefit diversity is a necessary condition for low welfare implications following the project launch. In addition, we find that, contrarily to the widespread market belief the PPP scheme is not a necessary condition for project success.

CONCLUSIONS AND IMPLICATIONS

The results highlight the importance of non-financial determinants such as benefits for financial decisions and success of the investment projects with public usage. One of the main implications of this research concerns the investment analysts as well as project managers looking for the tools beyond financial cash flows. In the projects with the aim at high public use the cash flows are not always evident for all stakeholders. Utilizing the benefits in finance can also improve the understanding of the corporate and project value, especially of the projects with non-evident financial flows or for the non-for-profit organizations. Considering benefits before the project launch can allow the managers to improve both funding and the welfare implications of their projects.

BENEFITS OF THE RETAIL PAYMENTS CARD MARKET: RUSSIAN MERCHANTS' EVIDENCE

Krivosheya, Egor; Korolev, Andrew

Finance, Payments and e-Commerce chair, Moscow School of Management SKOLKOVO, Moscow, Russia

ABSTRACT

INTRODUCTION

Payment cards are integral to the modern and innovative retail and finance ecosystems. Practitioners and ecosystem stakeholders confirm the increasing benefits associated with the participation in the retail payments market. The main critique to the existing market conditions, however, is based on the argument that some groups of agents exploit benefits from the participation in the market at the expense of other agents. Main advocates of these arguments have been the merchants, which incur direct costs in terms of merchant fee with the decision to accept payment cards. This resulted in proposals to conduct regulatory and balancing interventions to the market equilibrium. None of such proposals has proved to be Pareto efficient yet (Weiner & Wright, 2005), which may be explained by the inability of both market participants and regulators to empirically evaluate current levels of benefits from the participation in the market, and the consequences of shocks and interventions for these benefits.

This article aims to contribute to two rising strands of literature. The first one concerns the formation of the retail payments market equilibrium (Bedre-Defolie & Calvano, 2013; Rochet & Tirole, 2002; Weiner & Wright, 2005). This literature so far has not provided any quantitative estimates of the benefits for stakeholders, claiming this value to be theoretical rather than empirical. This research aims to fill this gap by estimating the merchants' benefits at the Russian retail payments market.

To the best of our knowledge, only Krivosheya and Korolev (2016) proposed the quantitative estimates for the cardholders' benefits associated with the payment and cardholding decisions. This study, however, investigates the benefits of merchants that, unlike cardholders, make only one decision in regard to the participation in the retail payments market, namely, the decision to accept cards. In this respect this research is complementary to the article by Krivosheya and Korolev (2016) and extends the results found by authors to the new market segment, which will deepen the understanding of the general retail payments market equilibrium.

Additionally, this research contributes to the growing empirical literature on the emerging retail payments markets (e.g., Reinartz et al., 2011) by analyzing current market situation and identifying the merchant-related stylized facts of the retail payments market in Russia.

THEORETICAL FRAMEWORK

Merchants' benefits are integral to the market equilibrium formation (Baxter, 1983; Rochet & Tirole, 2002; Bedre-Defolie & Calvano, 2013). Combined with the benefits of the cardholders and other participants they determine the level of equilibrium interchange fees to balance the costs and benefits among the two sides of the retail payments market (Baxter, 1983). Sources of benefits include the increased security, faster payments processing, increased average check as well as network externalities (Baxter, 1983; Bedre-Defolie & Calvano, 2013).

EMPIRICAL SET-UP

Sample and estimation

The empirical analysis of the benefits draws a representative sample of 800 traditional merchants. Face-to-face surveys conducted in 2013-2014 included all Russian regions and quotas for the shop types to ensure sample representativeness for the Russian retail payments market. Only traditional retailers were included in the sample. The effect of benefits on the share of cashless payments is estimated using Heckman two-step procedure.

Benefit evaluation method

Gross benefits are the sum of net benefits and (negative) loyalty program reward payments. The questionnaire includes the question about the total costs of acquiring services for the merchants. This question invited the merchants to evaluate not only the direct costs associated with the merchant discount fee but also the indirect costs such as forgone transactions volume and increased staff training costs. The amount of self-reported costs corresponds to the actual willingness to pay for the acquiring services by the merchant. Due to the duality of costs and benefits (Luenberger, 1992), this also identifies the level of total merchant's benefits associated with the decision to accept cards. Dividing this value by the total merchant's transactions volume allows getting the benefits in percentage terms. This study uses benefits in terms of Russian Rubles that is why the obtained value of benefits is multiplied by the average check value.

This research further separates the benefits into two types: opportunity benefits and direct benefits. Opportunity benefits are defined as the percentage of transaction volume that would be forgone if the

merchant doesn't accept payment cards. Direct benefits are simply the difference between the total benefits and opportunity benefits. Direct benefits represent all the benefits that are attributed to the acceptance decision (e.g., improved security, increased speed of transactions, network externalities, increases in average check) net of costs of such decision (e.g., increased staff training costs, possible short queue line length increase).

RESULTS

This study finds significant robust evidence in favor of positive merchants' benefit existence as a result of decision to accept payment cards. In particular, average total benefit per transaction is 16.34% or 89.91 rubles, while average opportunity benefit is about 14.5% or 79.8 rubles per transaction. All benefits are statistically different from zero as suggested by Student's t-test.

CONCLUSIONS AND IMPLICATIONS

The results in this study highlight the existence of the positive merchants' benefits on the retail payments market. Findings imply that the benefits of the participation in the retail payments are not limited to the payment systems contrary to the existing belief (Weiner & Wright, 2005). Besides, the method of empirical benefit evaluation allows approaching the regulatory initiatives ex-ante in order not to disturb fragile equilibrium. Empirical evaluation of the benefits is a step towards the introduction of fair pricing of the payment instruments, implementation of effective policies and identification of socially optimal market equilibrium.

INTELLECTUAL CAPITAL DISCLOSURE OF COMPANIES IN CRISIS: A CASE STUDY

Lacchini, Marco; Celenza, Domenico; Palmaccio, Matteo; Fusco, Martina

Department of economics and law, University of Cassino and Southern Lazio, Cassino, Italy

ABSTRACT

PURPOSE

Even though the concept of corporate disclosure has been extensively investigated, little importance has been given to the disclosure of companies in crisis. The aim of our research is to identify a new model of corporate disclosure able to monitor the IC (intellectual capital) trend of company in crisis.

As the most relevant issue for a company in crisis is the reliability, we assume that the traditional reporting is not able to produce and sustain it. In fact, stakeholders don't trust the traditional reporting because they are afraid of budgetary policies. It means that even the most transparent management ever, in a period of crisis, wouldn't be able to obtain the stakeholders' trust through traditional reporting instruments.

In order to gain the stakeholders' trust - and consequently increase the reliability of the company - it is necessary to provide complementary information through the voluntary disclosure, in particular using the IC reporting.

In fact, the implementation of this instrument allows the preservation of the company's reputation by monitoring the relational capital as part of the IC value.

In this perspective, it is necessary to identify indicators able to regularly and effectively measure the reputation of the company.

DESIGN/METHODOLOGY/APPROACH

The methodology is based on a single case study. It will be analysed the model of corporate disclosure of an Italian public company recently failed: Postalmarket.

The relational capital is a significant asset in a public company, shaped by his reputation and reliability. The research will be carried out investigating the Postalmarket case over the company crisis period, in order to identify actions aimed at increasing the level of public reputation over the period of crisis.

In order to identify indicators that could measure the reputation trend, it will be analysed the level of sentiment linked to news disclosed on the social media and on the press during the crisis period.

ORIGINALITY/VALUE

Scholars have always investigated the corporate disclosure and IC report in traditional companies, rarely in company in crisis. Hence, the paper is directed to fill the literature gap that concerns the need of identifying a new model of corporate disclosure able to manage the IC trend – particularly the relational capital - of a company in crisis.

PRACTICAL IMPLICATIONS

Through the identification of indicators that regularly and effectively measure the reputation of the company, we aim to assess the company reliability. Through the identification of indicators linked to the sentiment on the press, we could have a greater perception of the company reliability and its ability to “make reliable” the disclosed information, with particular reference to business plans.

Therefore, in our perspective, the voluntary disclosure within companies in crisis has not to be studied as a self-legitimization, but as a tool to increase the company’s relational capital and consequently its reliability.

MANAGERIAL CAREERS IN SMALL SOCIAL ENTERPRISES: CONTEXTUAL ISSUES

Maher, Chi

St Mary's University Twickenham, London

ABSTRACT

PURPOSE

The purpose of this paper is to contribute to our understanding and knowledge of the contextual factors influencing the careers of small third sector social enterprise managers; which is still a relatively unexplored area of inquiry. A particularly relevant approach for studying careers is through the external and internal career framework and applying them in their specific work contexts. The external career perspective views a career as a series of positions, promotion, job opportunities and roles defined by organisations (Schein, 1996; Guntz, 1990; Aidan, et al., 2003). From this perspective, careers provide the link between individuals and social structures. The individual makes choices within a set of social expectations and institutional structures, about how to reconcile his or her personal objectives and values with the priorities and needs of the organisation (Levinson, et al., 1978; Whalley, 1986; Herriott, 1992; Vos et al., 2008). The idea of an external career is that it comprises of observable choices that one makes, and the activities in which one engages, such as the job title or the job role (Nicholson, 1996, Maher, 2015).

Studies from the external career perspective (Lee and Smith, 1992; Lam, 1996; Skilton and Bravo, 2008) contends that a career is shaped by social structures such as, the state, social class, educational systems, organisational characteristics and availability of jobs (Hall, 1976; Dalton, 1989; Barnett and Bradley, 2007).

The internal career is conceptualised in terms of an individual's values, motivation and view of their career orientations and decisions between personal and professional life (Sparrow and Hiltrop, 1996; Ismail, 2003; Coetzee & Schreuder, 2009, Maher, 2015) a key question when considering the internal career is "what do I want from work? (Derr and Laurent, 1989). This is about the way the individual defines the work they enjoy and cherish. Therefore, the internal career will vary between individuals within the same organisation and even those doing the same job.

Studies from the internal career perspective suggest that the individual's internal career needs influence their selection of specific occupations and work settings. These studies contend that

organisations that are unable to provide opportunities that fulfil an individual's internal career needs are likely to find that they will be unable to retain these individuals in the long term (Schein, 1990). This may lead to dysfunctional organisational outcomes such as reduced organisational commitment and high turnover (Schein, 1978; DeLong, 1982; Ismail, 2003; Coetzee & Schreuder 2009). This paper will address the research question of, to what extent do public policy/organisational factors and the individual's career needs shape and constrain careers of small social enterprise managers?

DESIGN/METHODOLOGY/APPROACH

To obtain rich data, 44 managers were interviewed face-to-face using an interview guide. The qualitative findings of the study add to new knowledge, and help to explain, how the individual's career needs, public policies and organisational factors influences managerial careers in small social enterprises.

FINDINGS

The qualitative findings of the study add to, and help to explain contextual factors that influence the careers of small third sector social enterprise managers. The results suggest that although there were some concerns with employment conditions—pay and career management systems, most manager's positive experiences of teamwork, organisation culture, size and structure are factors influencing managerial careers in small social enterprises. What is plausibly unique about the research is the way the findings have captured through interpretive accounts of managers experiences of personal, organisational and public policies that influenced their careers.

IMPLICATIONS

The research findings have raised important issues for policy makers and organisations. The government should review funding polices for the sector organisations. For instance, funding should be for periods longer than three years as this will help small social enterprises to offer longer term employment contracts and provide time to develop managerial careers that are suited to the needs of managers and organisations. Organisations should support and involve managers in the management of their careers in organisations.

ORIGINALITY

The research has contributed to the literature by exploring the inter-play between public policies, organisational factors and manager's career needs. It also makes an important contribution to the field of managerial careers in small social enterprises which is still a relatively unexplored area of inquiry. Due to the scarcity of empirical studies examining careers of small social enterprise managers, the research findings have wider relevance and applicability, particularly in small social enterprises in other countries.

THE IMPACT OF CULTURE AND RELATIONSHIP QUALITY ON COOPERATION BETWEEN EXPORTING COMPANIES AND LOCAL DISTRIBUTORS

Maia Alves, Gisela Maria

University Lusitana - North Port and CECS at the University of Minho, Portugal

ABSTRACT

This research encompasses the main concepts of international marketing and relationship marketing in order to understand the role played by culture and by the quality of relationships on cooperation between Portuguese exporting companies and their distributors in Angola.

This study is particularly relevant because studies on emergent markets are scarce. Another advantage of the research is the fact that it is based on an analysis of matched pairs, that is, the Portuguese exporting companies and their distributors in Angola. The aim of this research is to understand how the culture and the quality of relationships impact the cooperation established between companies, in the context of the internationalization of business. It should also be noted that relationships characterized by trust and commitment, in international contexts, have been scarcely ever studied, as well as the impact of the cultural similarities/differences on the structures of relationship.

In terms of methodology we opted for a qualitative analysis: five case studies of Portuguese exporting companies and five case studies of Angolan distributors were analyzed. Interviews to the managers/CEO of the Portuguese exporting companies and to the employees in charge of exporting activities were performed, as well as to their corresponding Angolan distributors, to obtain answers to the research questions. The selection of the Portuguese companies was based on a list of the fifty largest Portuguese companies exporting to Angola provided by the Agency for Investment and External Commerce of Portugal, EPE (AICEP) in August 2011.

Overall, the results show that culture, trust and commitment, impact the cooperation of business relationships between the Portuguese exporting companies and their Angolan distributors.

ACCOUNTING AND MATHEMATICAL MODELS FOR THE MANAGEMENT OF PUBLIC RESOURCES IN A SPENDING REVIEW CONTEXT

Masi, Anita

Department of Business Studies, University of Roma Tre, Rome, Italy

ABSTRACT

The aim of this research is to identify new ways of improving the whole circuit, starting with tax payments made by citizens and ending with the supply of goods and/or services to the public, while enhancing the use of the *res publica* and its value when shared and managed with transparency and in an appropriate way. The following questions represent the guidelines of the project: ▪ what actions can we initiate to improve the citizen's perception of the activity of public administrations, which is financed by that same citizen through internal revenue? ▪ how can we optimize the allocation of such resources in order to rationalize public expenditures and avoid generalized cuts, which can threaten the efficacy and efficiency of the administrative action in the long-term? With this aim in mind, the theme of accounting harmonization has been dealt with. This has as its main objective the improvement of the information provided to the stakeholders by accounting data regarding the public administration's financial, economic and property management.

The method of analyzing that is being proposed is quali-quantitative: ▪ the testing of new techniques of accounting for public resources in light of national and international accounting standards; ▪ the application of mathematical methods and models to business decisions.

Preliminary results stress that the Italian public accounting reform is able to improve the information provided to stakeholders by accounting data. This research, which proposes a comparison among different accounting techniques used for public resource management (cash accounting and accrual accounting) represents a contribution towards: 1) implementing EPSAS and IPSAS, currently underway; 2) identifying new elements and information useful to improve the management choices and techniques of public managers.

INTRODUCTION

Following the 2008 economic crisis our society has been going through a difficult period, which affects various social classes in different ways and imposes remarkable social changes. In these situations, the role of the state is enhanced, together with its responsibilities. The quality and quantity of work and services supplied by public administrations represent a critical factor for business competitiveness and citizen wealth. Public administration management requires knowledge of the rules that govern corporate reality, while remembering that the public administration has its peculiar traits.

The aim of this research is to identify new ways of improving the whole circuit, starting with tax payments made by citizens and ending with the supply of goods and/or services to the public, while enhancing the use of the *res publica* and its value when shared and managed with transparency and in an appropriate way. The following questions represent the guidelines of the project: 1) what actions can we initiate to improve the citizen's perception of the activity of public administrations, which is financed by that same citizen through internal revenue? 2) how can we optimize the allocation of such resources in order to rationalize public expenditures and avoid generalized cuts, which can threaten the efficacy and efficiency of the administrative action in the long-term?

SHORT EXPOSITION OF LITERATURE

With this aim in mind, the theme of accounting harmonization has been dealt with. This has as its main objective the improvement of the information provided to the stakeholders by accounting data regarding the public administration's financial, economic and property management (Soverchia, 2008). In Italy, financial accounting, whose unique objective is considered surveying financial variations (income and expenditure), represents an informational instrument for public administrations. Many academics have underlined for years the advantages but also the limits of an accounting system for authorization aims (Borgonovi, 2002). The goal of this system lies in the will of politicians to limit the discretion of public decision-makers in the management of collective resources (Anessi Pessina, 2005). This system, which attributes particular importance to budget planning and little to the final balance data, is poorly used to manage public corporations that operate in a strong dynamic environment (Mussari, 1996). The lack of quantitative analysis also based on the use of mathematical and/or statistical techniques for the interpretation and control of final statement information does not permit evaluating public activity. The illustrated limits have inspired some academics to propose the introduction of an alternative system - the economic and assets accounting in double entry that, for the purposes of determining fiscal year result, measures economic the aspects of management (costs and revenues). The economic and assets accounting has been enhanced in the private sector and it is different from financial accounting in its aim, object and method. The introduction of accrual accounting in public administrations for fact-finding or authorization purposes is an issue that is disputed by Italian (Farneti and Pozzoli, 2006; Anessi Pessina and Steccolini, 2007; Anselmi *et al.*, 2012) and foreign academics (Guthrie, 1998; Carnegie and West, 2003; Carlin, 2005; Van der Hoek, 2005; Paulsson, 2006; Lapsley *et al.*, 2009). European and international accounting standards (EPSAS and IPSAS) tend to attribute exclusive importance to accrual accounting. In Italy, the current accounting reform has placed financial accounting (which is the main and fundamental accounting system for

authorization purposes (Simeone, 2015)) side by side with economic and assets accounting for informative purposes.

THEORY DEVELOPMENT

These exposed criticalities, shared and noticed not only in Italy but on an international level, have permitted the birth of a new line of thought on the modality of public administration management in England, known as New Public Management (NPM) (Hood, 1991; Boston *et al.*, 1996; Flynn, 2012) and oriented in a particular way to satisfy the citizen's needs in respecting the principles of the private sector (efficacy, efficiency and economy). Recognizing an undisputed value to the public administration's activity, the New Public Management researches appropriate solutions to respond to various citizens' interests emerging especially from the divergence between those who support economic sacrifices and those who benefit from public action (Caperchione, 2000). In this environment, in the planning phase, it is necessary to use suitable techniques of measuring the citizens' needs and, in the control phase, verify if these needs were satisfied, in terms of quality and quantity. Some authors have criticized both the economic theories based on New Public Management's model (Hughes, 2003) and its application in the public sector without considering its peculiarities (Pollitt, 1993). The emergence of some problems related to New Public Management has promoted the development of alternative managing systems, a model of public governance (Kooiman, 1993; Rodhes, 1996) that provides for the citizens' and associations' joint participation in the definition of social goals, and undoubtedly contributes to creating public value (O'Flynn, 2007). The function of planning is determined by support of involved individuals in policy-making, in order to realize more focused and efficient public politics. However, the adoption of an appropriate accounting system seems fundamental (Zangrandi, 1994; Borgonovi, 1995; Valotti and Zangrandi, 1996; Manes Rossi, 2002; Steccolini, 2004).

METHODOLOGY OF RESEARCH

In response to the above-mentioned questions, the method of analyzing that is being proposed is qualitative: • the testing of new techniques of accounting for public resources in light of national and international accounting standards; • the application of mathematical methods and models to business decisions. For this purpose, interconnections are analyzed between accounting/governance models of public administrations on one side and the necessity to use a mathematical model for data collection and processing on the other. The first phase analyses the strengths and weaknesses of the accounting reform identified by the 20 local governments which adopted economic/assets accounting in 2013, evaluating the relationship between the two accounting systems. The method of analysis is qualitative

(questionnaires) and quantitative (experimental financial statements). In the second phase, the specific case of Campania (a Region of Italy) is investigated to identify reasons for its exclusion from the experimentation phase. In the same context, the current and planned strategies adopted by the region to face difficulties in managing limited resources are also analyzed; indeed, limited resources are a factor Campania needs to take into account while navigating accounting rules and balance obligations. The method adopted is qualitative (interviews and questionnaires), and it focuses mainly on critical points emerging from the previous analysis conducted on 20 local governments (collaboration within the structure, software updates, employee training).

FIRST RESULTS AND FUTURE PERSPECTIVES

Preliminary results stress that the Italian public accounting reform is able to improve the information provided to stakeholders by accounting data (Masi, 2015). The effective knowledge of public resources and the modality of management could therefore allow a citizen to better evaluate the actions of the local authority administrators and also stimulate his/her active participation in the socio-economic context of membership. A deep analysis of managing techniques adopted in the international context will help verify these hypotheses and also, it will help improve the quality and quantity of services offered to citizens. This research, which proposes a comparison among different accounting techniques used for public resource management (cash accounting and accrual accounting) represents a contribution towards: 1) implementing EPSAS and IPSAS, currently underway; 2) identifying new elements and information useful to improve the management choices and techniques of public managers.

Keywords: *Local government, public sector accounting, reform, accrual accounting, cash accounting.*

CROSS-BORDER ACQUISITIONS: THE IMPACT ON PRODUCTIVITY, EMPLOYMENT AND WAGES

Matarazzo, Michela¹; Barbaresco, Gabriele²; Resciniti, Riccardo³

¹Department of Economic and Business Sciences, Guglielmo Marconi University, Rome, Italy

²Research Department, Mediobanca, Foro Buonaparte, Milan, Italy

³Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

ABSTRACT

In light of increase of global cross-border mergers and acquisitions activities in the last 20 years, the question of whether firms acquired can benefit from foreign take-overs is crucial from a managerial and a policy perspective. In order to shed light on these issues, the present study uses data from Italian Mediobanca Research Department database for the first time, to examine at the firms level the performance differences of all the mid-sized foreign-controlled firms in the manufacturing sector. From 1999 to 2009, 143 Italian medium-sized firms were acquired by foreign groups (data from Mediobanca). This study analyzes the impact of cross-border acquisitions on the performance (labor productivity, employment and wages) of the target firms, compared with purely domestic firms (non-acquired), with two specific research focuses: 1) cherry and lemon picking effect, in order to understand whether prospect foreign investors select acquisition targets having higher performance (cherries) or prefer ones having lower performance (lemons) before the acquisition; 2) geographic distance, in order to understand whether firms acquired by EU multinationals show higher post-acquisition performance than firms acquired by non-EU multinationals. For a more in-depth understanding of our analysis, a further specification is between firms that are acquired by an industrial investor and ones acquired by a financial one (private equity funds). Our findings suggest that the performance of the acquired firms improved. Furthermore, the results show a marked difference with respect to the nature of investors (industrial and financial) and the geographic distance between acquirer and target firm.

Keywords: *cross-border acquisitions, performance, mid-sized target firms, cherry and lemon picking, geographic distance.*

ATTITUDES, PERCEPTIONS AND BEHAVIOUR AMONG ELEMENTARY SCHOOL STUDENTS IN GREECE TOWARDS ENVIRONMENTALISM

Melanthiou, Yioula; Papisolomou, Ioanna; Poppi, Eleni

University of Nicosia

ABSTRACT

The overarching aim of this research study is to explore the behaviour of school children studying in elementary schools in North Greece towards environmentalism. Environmentalism advocates the lawful preservation, restoration and/or improvement of the natural environment, and may be referred to as a movement to control pollution or protect plant and animal diversity. Environmentalism is an attempt to balance relations between humans and the various natural systems on which they depend in such a way that all the components are accorded a proper degree of sustainability. Specifically, the study aimed at investigating whether students were able and willing to actively engage in activities that demonstrate environmental consciousness and responsibility such as saving energy in their classrooms and schools in general. An important dimension of the research study was the examination of the impact of social factors such as one's family, on the students' perceptions and behaviour.

The research study's objectives were:

- (1) To identify the students' perceptions and attitudes towards energy consumption.
- (2) To explore the types of reference groups and their impact on students' perceptions towards energy consumption.
- (3) To identify the types of motives, which can encourage students to become more conscious in terms of energy consumption.
- (4) To investigate whether a preposition towards environmentalism can be cultivated at a young age.

The researchers collected primary data from three groups of participants: elementary school students (83), teachers (30) and parents (34) in order to cross-examine their attitudes, perceptions and behaviour on the specific topic. Data was collected through the use of questionnaires in order to test the following hypotheses:

- H1: There is a negative correlation between the schools' policy towards energy consumption and achieving a change in the students' behaviour towards the consumption of energy.

- H2: There is a positive correlation between the school's policy towards energy consumption and the students' behaviour which is achieved through the teaching of the subject of natural sciences an integral part of which is the topic of energy.
- H3: There is a positive correlation between environmental education and the creation of positive student behaviour towards the natural environment.
- H4: There is a negative correlation between the students' positive behaviour towards the natural environment and a required change in their daily routine.

The research findings suggest that although the parents' have never participated in actions that safeguard the physical environment, the students have actively participated in activities and initiatives such as planting trees and saving water, which suggests that they are more environmentally conscious than their parents. Even though the children tend to imitate their parents' behaviour, it seems that there is a general concern towards preserving and protecting the physical environment among the younger generation in Greece. The study also revealed that unfortunately the teachers have not yet successfully and consistently managed to transfer their knowledge and understanding regarding environmental responsibility to their students. These findings raise some questions and concerns? What are the school authorities doing in this respect? What is the government in general doing in order to create environmental consciousness among its citizens in an era of social and environmental responsibility.

THE IMPACT OF A ONE DAY ADVENTURE-BASED EXPERIENTIAL LEARNING (AEL) PROGRAMME ON THE COMMUNICATION COMPETENCE OF MANAGERS

Mulder, Dalmé; Bloemhof, Johan

Department of Communication Science, University of the Free State (UFS), Bloemfontein, South Africa

ABSTRACT

Dynamic business environments require the utilisation of every avenue that can help foster efficiency and business performance. There has been considerable interest in the impact of communication on business effectiveness and performance. Assisting individuals in improving their communication competency should therefore be a priority. It is assumed that when individuals improve their communication competence, this will contribute to improved business performance.

Literature suggests the positive impact of Adventure-Based Learning (AEL) interventions on manager competence (Carioppe & Adamson 1988; Bank 1994; Burke & Collins, 1998; Neill 2003; Gardner & Flood 2006, Wu, Hsieh & Wang 2013). Despite the positive claims that have been made by advocates of AEL, sceptics are concerned that such claims were overzealous. Unfortunately a lack of well-organised, definitive and widespread knowledge about the efficacy of the diverse types of interventions in AEL still exists as empirical evidence relating to the efficacy of AEL and the transfer of learning to the workplace are still lacking.

The fact that literature on interpersonal communication competence and leadership within the organisational behaviour and management is limited (Stigall 2013), gives rise to the question whether AEL could be used to contribute to the communication competence of individuals. The aim of the study was therefore to determine the developmental impact of a one day AEL programme (ropes course) on communication competence of adult learners at a business school. These individuals are full time employees in diverse corporate settings, doing a part time management course. It was argued that, if these learners are exposed to the one day AEL programme, their communication competence will improve as a result of this experience.

The methodology employed in this study entailed a quasi-experimental pre-test / post-test design and comprised an experimental and a control group. The research instrument used was the Communicative Adaptability Scale developed by Duran (1983). The Communicative Adaptability Scale (CAS) is a dispositional (natural qualities of a person's character), molar-level measure of social communication competence. All groups completed the CAS questionnaire as a pre-test and again as a post-test. Data were analysed using procedure MIXED of the SAS software system (SAS, 2009).

This longitudinal study demonstrated that AEL programmes can be used to contribute to the communication competence of individuals as it had a positive impact on five of the six dimensions of communication competence. These six dimensions (social composure, social confirmation, social experience, appropriate disclosure, articulation and wit) could be adapted during a social communication interaction. As adaptability is an essential characteristic that enables a person to interact more effectively with others, the improvement of the mentioned dimensions of communication competence will enable the individuals to adjust to various communication contexts and be more effective in their communication endeavours.

Keywords: *Managerial communication, Communication competence, Adventure-based experiential learning (AEL), Communicative adaptability scale (CAS),*

LEAN INTERNATIONALISATION

Neubert, Michael

International School of Management, ISM, Paris, France

ABSTRACT

This research project analyses the research problem of how and why high-tech start-up firms (HSF) from small and open economies (SMOPEC) differ in their speed of internationalisation using the example of Switzerland.

It is based on the conceptual framework of the “born-global-firm” (BGF) theory and the reviewed and updated Uppsala internationalisation process model.

The research questions will be answered using a multiple case study research design with qualitative, in-depth, face-to-face, and semi-structured interviews of subject matter experts (SME). This study uses a sample size of twenty SMEs to allow for a better triangulation of data and to strengthen the research results.

After a random sample is drawn from a database of Swiss HSFs, the typical cases of the sample are selected. The sample consists of twenty SMEs, which are CXOs, investors, and founders of a HSF and which have expertise knowledge as entrepreneurs and senior executive managers of HSFs (including expertise in technology and IP management as well as fundraising).

The research results show that factors like the skills of the entrepreneur and the management team, their business networks, the business model of the HSF, the market entry mode, the successful implementation of a structured market development process, the uniqueness of the technology and the product portfolio, the availability of market opportunities, and the size of the home market influence the speed of internationalisation. Based on these findings, the concept of lean internationalization is developed to support HSFs from SMOPECs to internationalise earlier, faster and above all more successful than today.

The findings of this qualitative multiple case study research project contribute to the field of research of international entrepreneurship, because researchers will gain a better understanding of how and why HSFs from SMOPECs differ in their speed of internationalization. The findings of this qualitative multiple case study research project contribute to managerial practice, because they will help managers to increase the efficiency of international market development.

CORPORATE DIPLOMACY AND CORPORATE SUSTAINABILITY IN GLOBALIZATION CIRCUMSTANCES

Paraschaki, Maria¹; Tsoukatos, Evangelos²; Kaufmann, Hans-Ruediger¹; Kokkinaki, Angelika¹

¹Business School, University of Nicosia, Cyprus

²School of Management and Economics, TEI of Crete, Greece and Business School, University of Nicosia, Cyprus

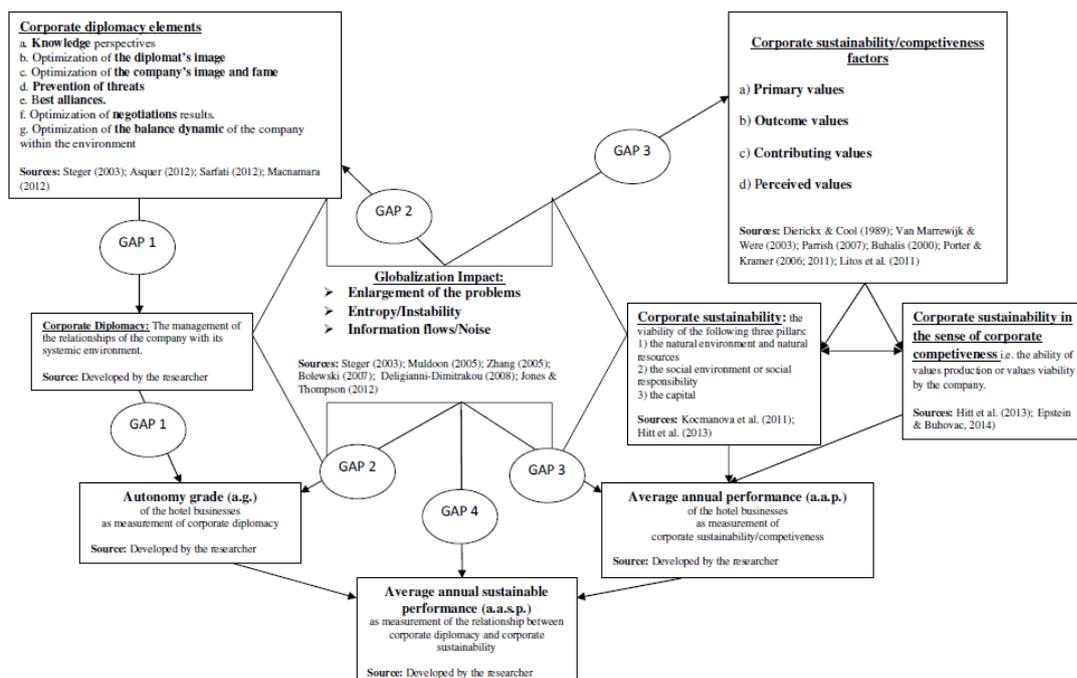

ABSTRACT

The purpose of this paper is to introduce a new conceptual framework of the relationships between the dimensions of corporate diplomacy (CD), corporate sustainability (CS) and globalization. This is part of our ongoing research.

In the literature appear several approaches of the term CD. In this study, these are recorded and categorized into two schools of thought (Paraschaki et al., 2014). The first includes those defining the concept via its purpose, which is CS (Porter, 1980; London, 1999; Ordeix-Rigo & Duarte, 2009). The second includes those defining the concept as the management of the relationships between the company, as a system, with its systemic environment (Steger, 2003; Asquer, 2012; Sarfati, 2012; Macnamara, 2012). Additionally, the first group of scholars approaches the concept inductively while the second group deductively, a fact that depicts the academic gap on the definition of CD (GAP 1). CS is defined as a balance policy based on three pillars: i) the environmental pillar of preserving the natural-resources and the environment, ii) the social pillar of human resources' exploitation for responding to the company's social mission, that is evolving adjusted to current social conditions and human resources 'viability' and iii) the economic pillar of preserving the capital and absorbing only the profits (Van Marrewijk, 2003; Kocmanova et al., 2011). Globalization is changing the conditions under which businesses are developing their CS. It entails growth of the global economy with analogous enlargement of problems in the business environment. Moreover, globalization generates great entropy/instability in the business environment. It also involves information flows and 'noise', demanding new balances and adjustments (Steger, 2003; Zhang, 2005; Deligianni-Dimitrakou, 2008). As a result, facing CS problems, in this new system, requires a new kind of management, i.e. CD. What is more, the new standards introduced by globalization change dynamically the business environment of hotels too, where this study is oriented too, jeopardizing simultaneously their CS, a fact that justifies the need for further analysis of the relationship between CD and CS (Zhang, 2005; Katsaros & Tsirikas, 2012; Jones et al., 2014; Fountoulaki et al., 2015). This reality is also depicted by the following academic gaps in literature:

- Steger (2003); Muldoon (2005); Asquer (2012); Macnamara (2012); Sarfati (2012) and Monteiro and Meneses (2015) refer to the need for further academic research on the relationship between CD and globalization, emphasizing also the lack of empirically tested concepts on this area (GAP 2).
- Jayawardena et al. (2013); Martínez & del Bosque (2013); Calveras (2014); Geerts (2014) and Poria et al. (2014) emphasize on the lack of academic analysis on the relationship between hotels CS and globalization (GAP 3).
- Muldoon (2005); KostECKI and Naray (2007); Asquer (2012) and Henisz (2014) respectively, recognize the academic gap on the relationship between CD and CS (GAP 4). Obviously, these scholars refer to CD according to the latter approach, since in the first approach, the relationship is considered patterned by default.

Consequently, this study is oriented to cover the academic gaps regarding the relationship between CD and CS under globalization circumstances (GAPS 2,3,4) while to contribute to the academic gap referring to CD definition (GAP 1). Towards this direction, the researchers have developed an initial framework, to seek a measurement system of CD defined as autonomy grade (a.g.) and of CS defined as average annual performance (a.a.p.) and via those systems to reach a measurement defined as average annual sustainable performance (a.a.s.p.) to identify the common parameters of CD and CS. Moreover, through the impact of globalization over the parameters of both CD and CS, the researchers will seek the impact of globalization over this relationship.

This research is considered academically significant, as it will contribute to the academic gap referring to CD definition and will present a new theoretical framework regarding the elements of CD leading to CS in the framework of globalization, for the hotel sector. Practically significant, the study will assist managers to develop CD strategies, towards dealing with sustainability challenges and ascertaining their CS, in globalization circumstances.

CASE HISTORY ALPITOUR

Pellicelli, Anna Claudia

Department of Management, University of Turin, School of Management and Economics, SME, Turin, Italy

ABSTRACT

Service marketers often complain about the difficulty of differentiating their services from those of competitors. In many countries, deregulation of major service industries, globalization and I.T. has resulted in intense price competition.

Service differentiation is the solution to price competition, developing a differentiated offer, delivery or image.

In the light of these considerations, this article presents some interesting new ideas and views on managing service quality and show how, acting by digital innovation in process and service, is important for tour operators to control every moments of truth .

My AlpitourWorld is a portal where the customers can have access to their booking , promotions, surveys on own satisfaction to improve the service value, more effective and efficient customer value creation and service delivery. Each interaction is a 'moment of truth' for the provider, where not just the service encounter, but also the organization, will be decisively judged by the customer. Service marketers, therefore, have to master interactive marketing skills.

The rules of change of My AlpitourWorld are :1) improve the process 2) innovation (app mobile), in communication tools .

INTRODUCTION

This report aims to highlight how technology plays an important role in creating competitive advantage in tourism industry and has had a significant impact on the course of action of operators. Service marketers often complain about the difficulty of differentiating their services from those of competitors. In many countries, deregulation of major service industries, globalization and I.T. has resulted in intense price competition.

Service differentiation is the solution to price competition, developing a differentiated offer, delivery or image.

In the following the report, special attention will be devoted to innovation as form of competitive advantage to achieve customer satisfaction in every moment of truth.

ALPITOUR WORLD CASE STUDY

Alpitour is an Italian tour operator, composed by the following brands:

Alpitour, Francorosso, Viaggidea, Bravo, Karambola, .

The Group is composed by different business units as Tour operating, Hotel, Incoming, Aviation, Distribution, e-commerce, with a complete touristic supply chain to control every step of the journey and of the organization.

Alpitour World is leader in Tour Operator industry in Italy and is in the top ten European tour operator, reaching good results in the market of Independent Traveller .

With over 3,1 million customers, Alpitour World is the leading Italian travel group and high-ranking in the European Travel Industry: an integrated group of excellent and specialized companies.

Alpitourworld is the reference brand for an extensive mass market segment. Francorosso is a cult brand that has always opened new frontiers in the world of package tours combining the experience of a true journey with comfort and excellent services.

Viaggidea looks after the Premium market satisfying flexibility and personalization in all kind of demanding travels: far away beaches, exclusive resorts, a' la carte' itineraries in the most beautiful places. Bravo is specialized in all-inclusive resorts, an excellent mix of amusement, pure energy, sports and a wide array of activities.

Karambola offers flexible solutions, a wide portfolio of destinations and an excellent quality/price ratio with no frills approach to young minded travellers.

Neos is the airline company offering top service on board, safety and comfort, punctuality and efficiency, operating in all the major Italian airports.

The incoming services are handled by Jumbo Tours. VOI Hotels offers a collection of resorts in best-loved beach destinations in Italy and abroad; the division also manages high end city hotels for 'city break' and 'business travel' customers.

Alpitour World controls networks like Welcome Travel Group and Geo Travel Network (Bravo Net/HP Vacanze), a pool of some 2,600 travel agencies, playing a key role in Italy both in leisure and business travel.

My AlpitourWorld is a portal where the customers can have access to their booking , promotions, surveys on own satisfaction to improve the service value, more effective and efficient customer value creation and service delivery. Interactive marketing means that perceived service quality depends heavily on the quality of the buyer-seller interaction during the service encounter. The customer judges service quality not only by its technical quality but also by its functional quality.

Each interaction is a 'moment of truth' for the provider, where not just the service encounter, but also the organization, will be decisively judged by the customer. Service marketers, therefore, have to master interactive marketing skills.

The rules of change of My AlpitourWorld are :1) improve the process 2)innovation (app mobile).

SOLUTIONS FOR RISK DATA COMPLIANCE UNDER BCBS 239

Prorokowski, Lukasz

Risk Consultancy, H.L. Prorokowski LLC, San Francisco, USA

ABSTRACT

The Basel Committee on Banking Supervision published its *Principles for effective risk data aggregation and risk reporting* (BCBS239) in January 2013. The document contains 11 principles that Global Systemically Important Banks (G-SIBs) will need to comply with by January 2016. Although the implementation of a more robust infrastructure coupled with improved data aggregation and reporting systems undoubtedly enhances risk management capabilities of many financial institutions, the principles are regarded as the least known components of the new regulatory reforms. Any bank striving to comply with the principles will be keen to introspect how risk data is organized and what execution capabilities are at their disposal. With this in mind, the current paper advises banks on the growing number of solutions, tools and techniques that can be used to support risk data management frameworks under BCBS 239.

This paper, based on a survey with 29 major financial institutions, including G-SIBs and D-SIBs from diversified geographical regions such as North America, Europe and APAC, finds out that banks will struggle to stay abreast of competition and to meet the new requirements, if they do not have up-to-date technologies that allow for a complete audit trail of all data changes to be conducted. At this point, the most advanced G-SIBs consider implementing scalable Enterprise Data Management (EDM) platforms to effectively address all issues revolving around BCBS 239. However, the principles encompass other financial services firms not yet affected, as the regulators consider applying BCBS 239 to a broader group of banks. Against this backdrop, the current paper recognizes the prevailing problems with BCBS 239 compliance, and hence undermines the assumptions of the Basel Committee that posits that financial services firms have no difficulties in ensuring the completeness of the risk data.

This paper discusses best practice solutions for master data management, data lineage and end-user implementations. The analysis of this research is broken down into the following sections:

- **Data sources and master data**

This section addresses the growing need for understanding how the data is formed, and hence advises on solutions that allow comparing data attributes across different sources. Additionally, this section discusses the ways of overwriting master data for specific uses and regulatory requirements.

- **Metadata and data lineage**

This section touches on issues revolving around the comprehensive view of risk data. In particular, this section advises on solutions for tracking data changes up to the source that is important for banks willing to meet the BCBS 239 principles. Additionally, this section focuses on data validation methods.

- **End-user solutions**

This section analyzes solutions for end users that constitute key elements of risk data compliance under BCBS 239. In doing so, this section aims to increase the overall awareness of failed and successful validations among end users. Most importantly, this section discusses the need for empowering those who use risk data to manage the data, as a way of addressing the existing dissatisfaction with going through data systems' legacies.

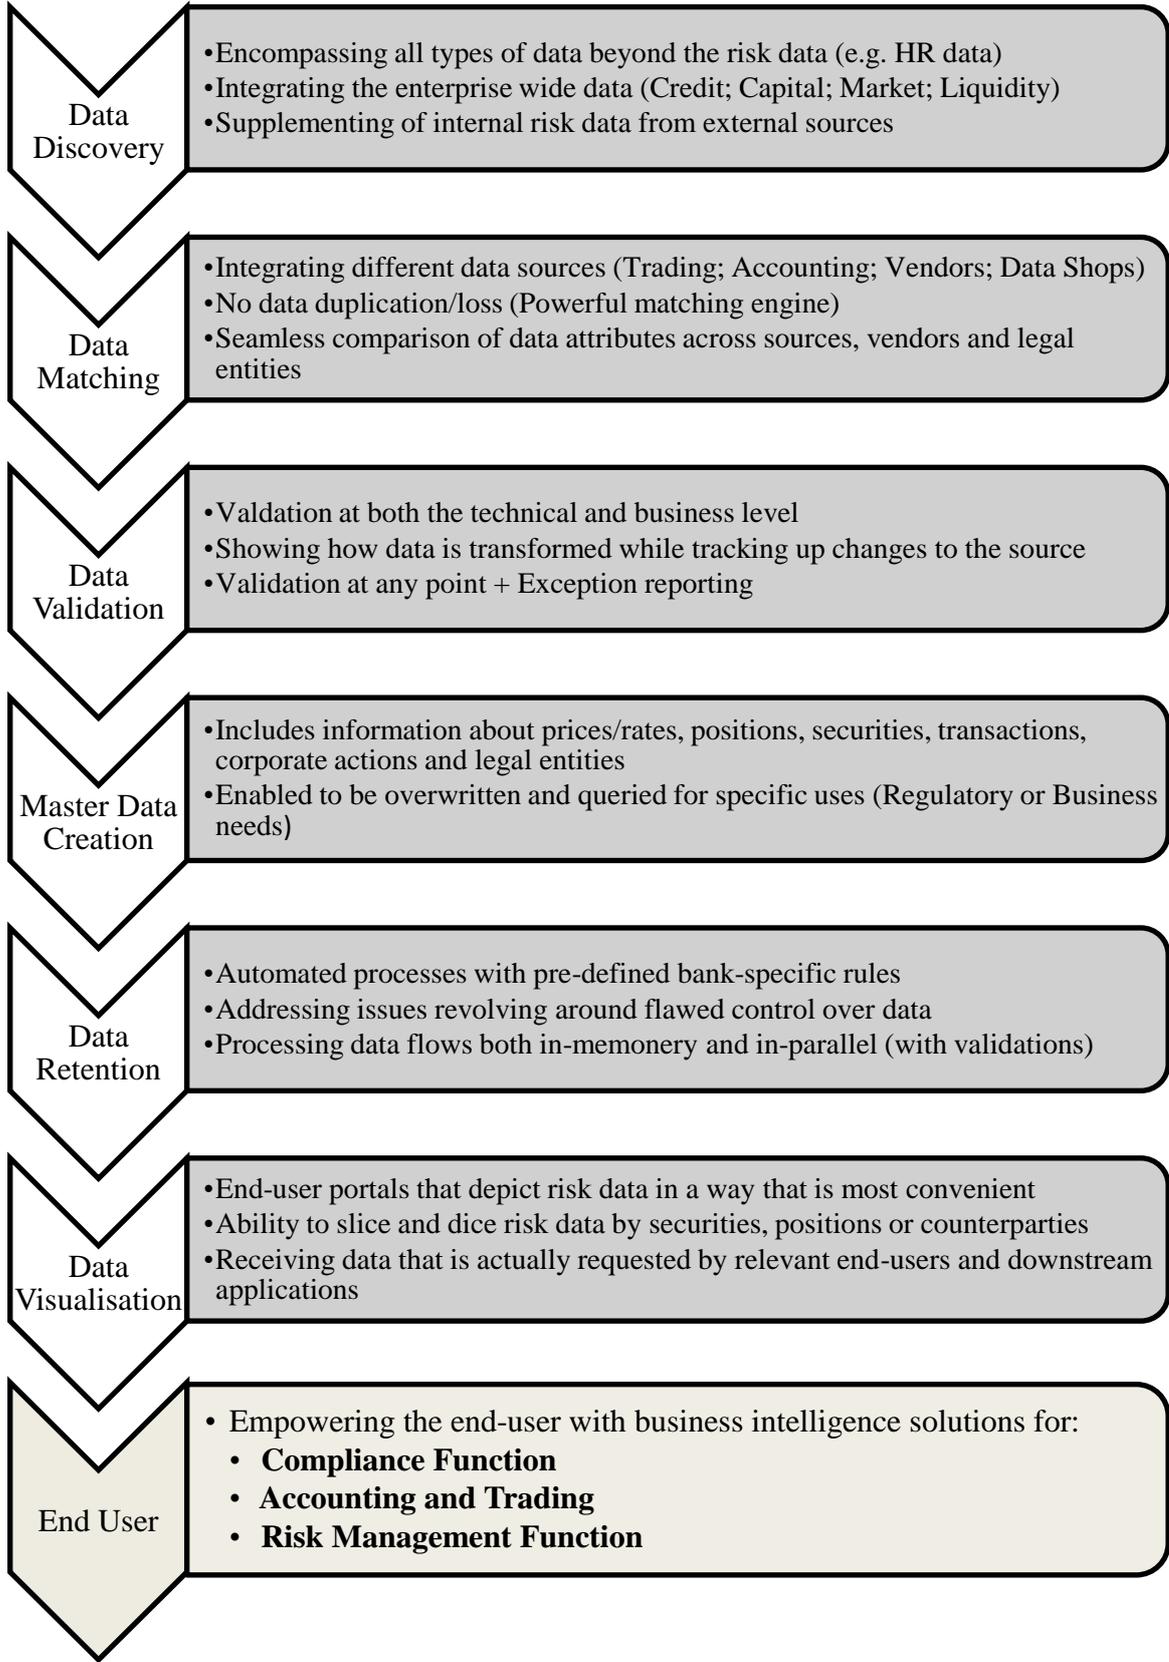

- **BCBS 239 capabilities**

This section discusses the ongoing initiatives and a wide range of responses to the new regulations in the area of risk data and compliance. The last section presents banks' perspectives on risk data completeness under BCBS 239.

Figure 1 summarizes all findings presented in the paper and presents the solutions that address common problems faced by banks in the area of risk data compliance under BCBS 239. The paper argues that the BCBS 239 principles are not seen as an obstacle, as the proposed solutions constitute unique opportunities to modernize IT frameworks and enhance risk data management. Figure 1 advises on the appropriate solutions at every stage of risk data cycle focusing on all issues from data discovery to end-user solutions.

HUMAN RESOURCE EMPOWERMENT AND BUSINESS PERFORMANCE: EVIDENCE FROM THE TOURISM AND HOSPITALITY INDUSTRY

Rizos, John; Papaioannou, Alkistis; Kriemadis, Thanos; Vamvoukaki, Maria Irini

Department of Sport Management, University of Peloponnese, Greece

ABSTRACT

PURPOSE OF THE STUDY

Human resource empowerment has positive effects on employees' productivity and increase organizational efficiency and service excellence in the hospitality industry (Yuhanis, et al., 2011). Moreover, research has suggested that human resource empowerment on the one hand improves guest satisfaction and employees' satisfaction and efficiency in hotel operations (Kim, 2011), and on the other hand provides a means by which organizations can set forward their competitiveness, promote managerial efficiency and remain competitive in the marketplace (Papaioannou et al., 2012). However, research regarding human resource empowerment in tourism and hospitality industry is still limited.

The primary purposes of this study were: (a) to determine the extent to which human resource empowerment is applied to five-star hotels of Greece, and (b) to examine the relationship between human resource empowerment used by Greek five-star hotels and business performance (profit, ROI, sales volume and market share).

DESIGN/METHODOLOGY/APPROACH

The authors addressed the research to all five-star hotels of Greece (317 five-star hotels, which recognised by Hellenic chamber of hotels) and involved 317 experienced managers who were the most knowledgeable regarding personnel management issues. Responses were received from 159 managers of 159 five-star hotels with a 50.2% response rate. For the purpose of this study a 30-item questionnaire, was used (developed by Vogt & Murrell, 1990 focused on the issue of empowerment, was modified and simplified by Kriemadis, 2011 & Papaioannou, 2011), in order to provide information on how managers see themselves in terms of the human resource empowerment process and demographic characteristics, using a five point Likert scale. The scales represented three different managerial styles which were: (a) the "empowering style" of management, (b) the "middle-ground style" of management and (c) the "controlling style" of management. In the first case the manager has a managerial style that reflects the manager who creates and shares power. In the second case the

manager has a managerial style that combines the two styles of controlling and empowering in equal proportions, and in the third case, the manager is concerned with control or seldom shares, creates or empowers subordinates. The reliability of the scale was found to be: $\alpha = .81$. Also, the particular research used the subjective way of measuring performance. This means that managers were asked to evaluate the performance of their hotel in relation to their current years' objectives, in relation to their last financial years' objectives and finally, in relation to their major market competitors on a five-point Likert scale. On each of the three bases, performance was judged against four criteria two financial (profit and ROI) and two market based (sales volume and market share). The study was a quantitative design and the analysis was exploratory in nature. Descriptive statistics and Spearman correlation were used to examine variables relationship using SPSS software (version 22).

FINDINGS

From the analysis it is shown that managers of five-star hotels used 79.2% "empowering style", 19.5% "middle-ground style" and 1.3% "controlling style" in the six key factors of human resource empowerment (Total of all Managerial functions). Also, there were significant and positive relationships between the human resource empowerment and business performance in five-star hotels. More specifically, the key factor of human resource empowerment: "Decision - making and action-taking skills" had a significant and positive relationship with ROI ($r = .190, p=.016$), as measured by satisfaction levels in relation to current year's objectives. Furthermore, the key factor of human resource empowerment: " Total of all Managerial functions" had a significant and positive relationship with sales volume ($r = .181, p=.022$), as measured by satisfaction levels in relation to last financial year's objectives, and profit ($r = .177, p=.026$), ROI ($r = .159, p=.045$), and sales volume ($r = .169, p=.033$), as measured by satisfaction levels in relation to their major market competitors' objectives. The findings of the present study are consistent with previous studies on human resource empowerment and business performance, in tourism and hospitality industry (Ottenbacher et al., 2006; Pereira-Moliner, Claver-Cortés, and Molina-Azorín, 2010), and show that the level of empowering style which managers exercised in five-star hotels is related to the hotels' performance. The present findings add credence to the argument that human resource empowerment is a major factor for tourism and hospitality business activity, because it may contribute to the viability and increased profitability of service sector such as tourism and hospitality industry (Papaioannou, et al., 2012).

RESEARCH LIMITATIONS

The study was delimited to a questionnaire designed to collect data regarding human resource

empowerment according to Vogt and Murrell (1990).

The following were acknowledged as the limitations of the study:

- The honesty, accuracy, and objectivity of the respondents when completing the questionnaire
- The respondent's level of understanding of the empowerment vocabulary.

Follow-up studies should be done to the same sample in three to five years to investigate possible changes in the utilization of the human resource empowerment process. Areas of further research could also include measuring the impact of human resource empowerment on the satisfaction and loyalty of customers.

ORIGINALITY/VALUE

This study is useful in extending the concept of human resource empowerment to the tourism and hospitality industry. The study will be useful in helping managers to their further understanding of the human resource empowerment process in their respective organization.

AMBIENT OUT-OF-HOME MEDIA FROM A MEDIA PROFESSIONAL STANDPOINT: INNOVATIVE OR INTRUSIVE?

Roux, Thérèse

Department of Marketing, Logistics & Sport Management, TUT, Tshwane, South Africa

ABSTRACT

There has been a significant growth in the use of alternative media to retain consumers' affection due to an increasing concern about consumers' resistance and skepticism towards advertising and multi-competition among companies aiming to increase the market share of their brands. Ambient out-of-home media is considered a special type of alternative media and refer to the use of innovative and unexpected context clues and objects in the environment as advertising medium to surprise and obtain engagement from very specific audience profiles. Currently there exist no guidelines to assess ambient out-of-home media when planning a campaign in an emerging context. By reviewing the literature, illustrative cases and obtaining insight from experienced media professionals this study offer guidelines on the qualitative and quantitative values for using this media format in practice. The unique contribution of this study is that it is one of the first to explore ambient out-of-home media from a media professional viewpoint. From a practical perspective, the guidelines and cases presented in this study can assist marketers, advertisers, and brand managers in understanding the unique strengths and limitations of this innovative and cost-effective contemporary OOH advertising media format.

ORGANIZATIONAL STRESS IN PROFESSIONAL GARDENERS: HAPPIER AND HEALTHIER?

Rowland, Caroline¹; Scott, Peter²

¹Business School, University of Chester, UK

²Liverpool John Moores University, UK

ABSTRACT

Much has been written concerning the benefits of gardening and the alleviation of stress. It is widely accepted that gardening has a therapeutic role (Kaplan, 1973; Relf, 1979; RHS, 2014). Little if anything has been explored in relation to gardening professionals, yet stress is a major barrier to performance and wealth creation (Robertson and Cooper, 2011; HSE, 2015). This empirical research investigates and compares stress levels in professional gardener/managers with other occupations. It aims to discover whether professionals engaged in the business sector of gardening experience lower levels of stress compared with other occupations. This sector contributes a significant and growing proportion of the UK workforce. It also represents a significant contribution to many European countries especially the Netherlands, Italy, France and Greece. This research contributes to the established data for other professions and provides knowledge in a neglected area of management discourse. The definition of Stress used by this survey is based on that given by the U.K. Health and Safety Executive "*The adverse reaction people have to excessive pressure or other types of demand placed on them*". (HSE, 2015, p.2)

The Methodology employed a mixture of quantitative and qualitative approaches including semi structured interviews, case studies and the interrogation of data /reports concerning other occupational sectors. It also used the ASSET™ evaluation tool to survey, identify and examine sources and levels of pressure across the sample and furthermore, to provide normative data against which an organization or sector can be compared.

The ASSET™ model considers linkages made between: Work relationships, Work-Life Balance, Overload, Job Security, Control, Resources and Communication, Pay and Benefits (entitled "Enablers and Barriers") with the commitment of the Employee to the Organization and the Organization to the Employee("Attitudes"). These work aspects then feedback directly to the physical health and psychological wellbeing of the individual ("Health").

The sample size consisted of 700 professional gardeners from across the UK. Questionnaires were sent through the post after consultation with the Chair of the Professional Gardeners Guild who indicated that many members seldom used e mails. The response to the postal questionnaire was a gratifying 80%.

Initial findings were interesting and in some cases surprising. The anticipated results of tensions and differences between the therapeutic nature of hobby gardening and professional gardening were not in evidence. The level of concern about job security was low compared to that in most organizations. The expectation of stress caused by lack of job security in this sector and also by challenging working conditions were also lacking. The discussion explores the possibility that the lower stress levels compared to other occupations occur because of the personality type of professional gardeners. A personality “type A versus B” discourse (Eysenk, 1990, De Botton, 2005). The level of concern about pay and benefits is similar to that reported in most organizations. Inequity may often cause poor performance (Rowland and Hall, 2013).

Compared to other organizations, respondents in this group were positive about aspects of the job. This scale includes factors such as physical working conditions, type of tasks and the amount of satisfaction derived from the job itself. These results suggest that respondents in this group enjoyed the work that they did. High levels of job satisfaction are important in people’s overall enjoyment of work and higher job satisfaction levels is concomitant with higher levels of job performance and higher levels of psychological well-being (Rowland and Hall, 2013). The evidence of high emotional resilience in this sample may lead practitioners to find best practice to aid in resilience training in other sectors (Robertson et al., 2015).

Respondents were committed to the organization at a similar level to people in most organizations, as were the organizations themselves to the individuals questioned. These results indicate that people are as likely as most to put themselves out for the organization and to be prepared to take on extra work and responsibility.

Finally, Work-life balance was seen positively compared to how it was seen in other organizations. These results indicate that respondents generally appeared to have workloads that they found manageable and that work overload was not a source of concern for them. In particular the area of technology overload was explored and indeed this area was the lowest rated area out of the 62 areas investigated. In conclusion it would seem that these professional gardeners are indeed happier and healthier in comparison to other sectors in the UK workforce.

Work related stress, depression and anxiety account for 35% of work related ill health and 43% of working days lost in the UK during 2014/15 (HSE, 2015). This research contributes a hitherto unknown aspect of a working sector of the UK economy. It contributes knowledge and understanding and may well be transferrable in a European context. In terms of practice it enables organizations to now assess

the risk of stress in their workforce across a wide range of factors; and consequently may represent a step in the more effective management of stress in the workplace.

CURRENT CHALLENGES IN PLACE MARKETING IN NORTH-WEST ENGLAND

Rowland, Caroline¹; Scott, Peter²

¹University of Chester Business School

²Liverpool John Moores University

ABSTRACT

Many authors believe that the marketing concept and the study of marketing emerged during the twentieth century (e.g. Jones and Tadajewski, 2015, Kumar, 2015, Tadajewski, 2009, Vargo and Lusch, 2009), but others have claimed that the marketing of places has a much longer history. Ashworth and Voogd (2004) refer to the very early example of Leif Erickson who, some 2,000 years ago, named a very large and newly-discovered island as 'Greenland', in order to project a favourable and attractive image to prospective visitors and potential settlers. Bath is a historic city in South-West England and Heeley (2015) argues that Richard 'Beau' Nash who was appointed as Bath's Master of Ceremonies in 1705 established the embryonic format of the world's first destination marketing organisation. Nash's local government department was charged with being 'responsible for organising entertainments and diversions' and he also promoted the town and personally welcomed visiting dignitaries (Heeley, p.20).

The governance of place and destination marketing in the England is currently undergoing significant change. To some extent this parallels international changes in practice but it is primarily the result of austerity measures and current government policy. At the heart of this government policy is the intent to very significantly reduce the public funding of destination marketing activity and to encourage the private sector to take on this responsibility. This begs the questions of whether or not the private sector is willing and/or able to take on such a responsibility. The consequences of this policy change and the future of destination marketing in England and in one particular sub-region of England is the subject of this study.

Although a substantive body of literature exists with regard to the broad subject areas of destination marketing/management, place marketing, place promotion and place and city branding etc., there is a relative paucity of published empirical data to support theory building in this academic sphere and very little attention has been directed towards the existential threat that destination marketing/management organisations presently face with regard to their core funding.

The research (which is still in progress) is focused on the geographical sub-region of Cheshire and Warrington which is located in North-West of England. The visitor economy in Cheshire and Warrington generates around £2.5 billion per annum and it supports the employment of a large

number of people (www.marketingcheshire.co.uk). The study adopts an interpretivist stance and analyses qualitative data derived from semi-structured interviews with destination marketing stakeholders and practitioners. The research question that the study seeks to answer is: 'How can a place marketing organisation engage with its stakeholders in order to operate effectively in circumstances of reduced government support?'

To date 15 semi-structured interviews have taken place and these have generated some 35,000 words of data. Interview subjects have included the chief executive of a national tourism organisation, 8 chief executives of destination marketing/management organisations, one partnership manager, one board member of a destination marketing/management organisation, one senior and experienced civil servant, one executive chairman of a large retail organisation and two managing directors of major tourist attractions. The interviews have been conducted at locations throughout England and all the interview subjects either led destination marketing/management organisations which promote places where the visitor economy generates significant economic activity or else they were key stakeholders in the destination marketing/management of Cheshire and Warrington. The intention is to conduct a number of further interviews with more key stakeholders in the destination marketing/management of Cheshire and Warrington. These interview participants will be sought from the private sector.

The financial challenge has figured strongly in most of the interviews to date and the creation of new funding streams has emerged as a central issue. Other consistent themes that have featured are the poor survival prospects for destination marketing/management organisations with a weak or undifferentiated product proposition, the relative dominance of large and established players in the form of the UK's best known cities, the importance of the role of leadership, the difficulty of demonstrating return on investment, the short-termism of the private sector and the lack of one single uniform approach that can be applied to all destination marketing/management organisations.

The research is expected to make a valuable contribution to the subject area of destination marketing/management in several ways with respect to both theory and practice. Firstly, it will contribute rich empirical data to a domain that is currently underdeveloped. Secondly, it is expected to lead to the development of a conceptual model which, after being applied and tested, will describe the optimum configuration and governance arrangements for a particular destination marketing/management organisation. Finally the research will contribute to practice by offering valuable insight into the perceptions of stakeholders in the destination management process.

ECOSYSTEM-BASED BRANDING CONCEPTION IN THE HEALTH AND NUTRITION MARKET

Rueckold, Christian

University of Applied Management Studies in Mannheim, Germany

ABSTRACT

This explorative study was researching how an ecosystem of strategic partners can be used to successfully promote a consumer-brand in the health and nutrition market. Those ecosystem partners are not necessarily within the supply chain and could vary among different target consumer groups. The brand is visibly present for consumers whereas the brand owner sells the branded product as ingredient to business-to-business-customers that produce and sell the final product to consumers. The ecosystem of strategic partners aims to promote the brand directly to consumers in a trustworthy manner and could, therefore, help to convince the business-to-business-customers to purchase the branded product as ingredient.

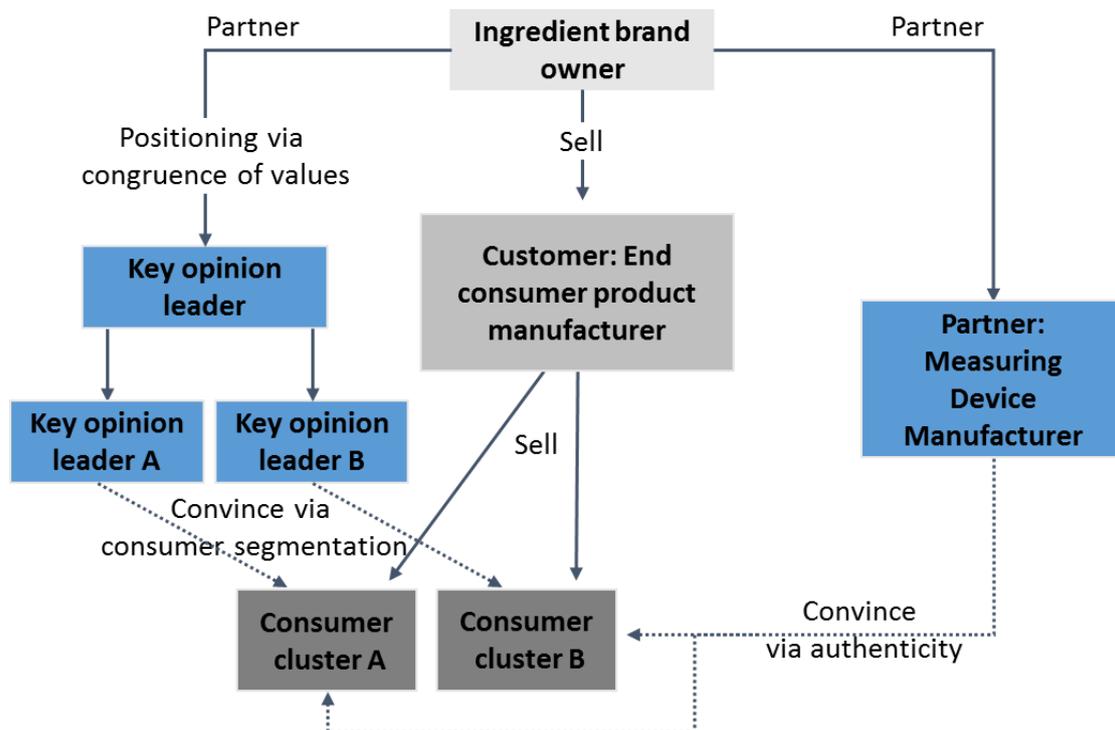

Figure 1: Framework of brand-promoting ecosystem in the health and nutrition market, own illustration

Through the increasing importance of social media channels and the interactive character of them, brand promoting concepts like brand communities and co-promotion are assessed and adjusted. The theory of an open brand (Mooney, 2008) is thereby developed and adopted for brand owners that sell

the branded ingredient not directly to consumers. Following this theory, consumers can become part of an iterative and interactive brand building process and, therefore, influence the brand development. The core hypothesis of the research project states that consumers' trust in brands in the health and nutrition market has decreased, especially since the rise of online media. The research was conducted with a combination of quantitative and qualitative research methods (triangulation). The quantitative research part collects data through netnographic (Kozinets, 2002) research within online communities and tests how brands are perceived (in terms of interaction) by consumers. In order to validate the findings, two different media channels (Google and Twitter) were investigated.

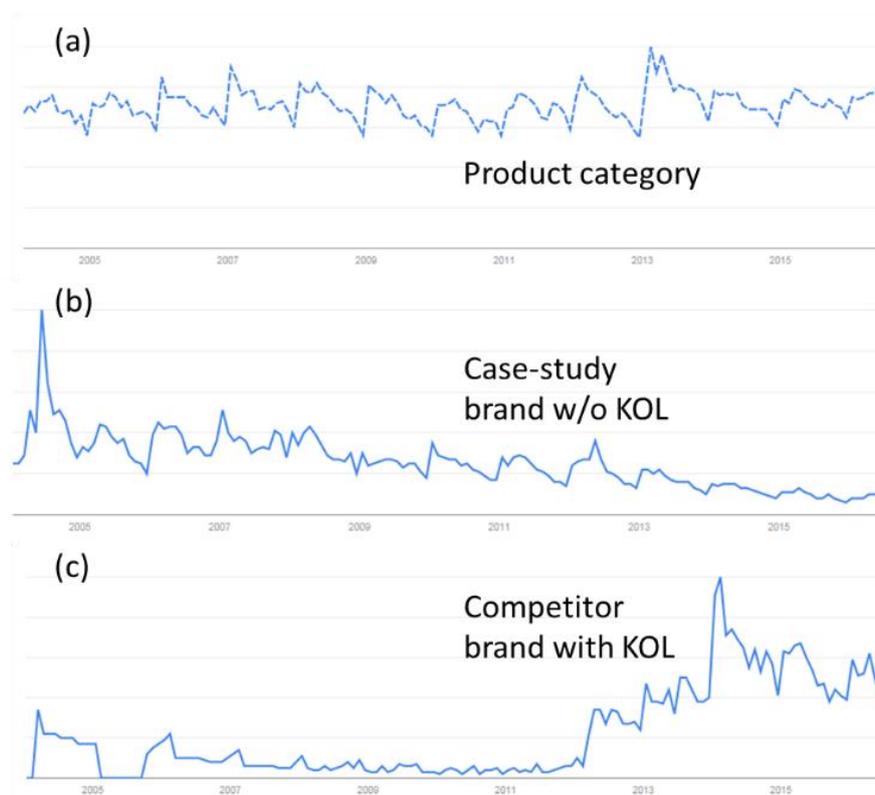

Figure 2: Google trend analysis

The Google trend analysis (figure 1) shows that the use of a key opinion leaders for brands in the health and nutrition market can help to increase consumers' interaction with the brand, as the competitor brand (c) started to cooperate with a key opinion leader in 2012. In comparison, the brand assessed within the research project (case-study brand, curve (b) reveals low interaction levels and has not been using a key opinion leader. To preclude external effects which are not addressed by the key opinion leader issue, the product category was researched to prove that the overall consumer interaction with the product category remained stable throughout the observational period.

As second netnographic research approach an analysis of Twitter data was conducted. The brand, which was subject of this study, was compared to the before named competitor brand regarding the

amount of mentions in Twitter throughout a certain period of time (figure 2). The results of the Twitter data prove the findings of the Google trend analysis meaning that key opinion leaders can increase the level of consumer interaction for a brand in the health and nutrition market. Additionally the results of the analysis suggest that the impact of key opinion leader usage in brand communication could vary depending on the key opinion leader himself.

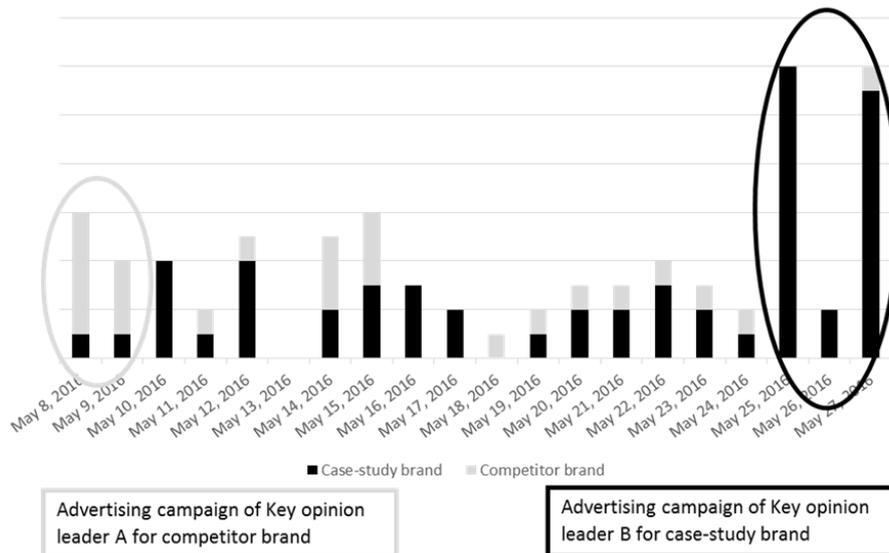

Figure 3: Twitter analysis, own illustration

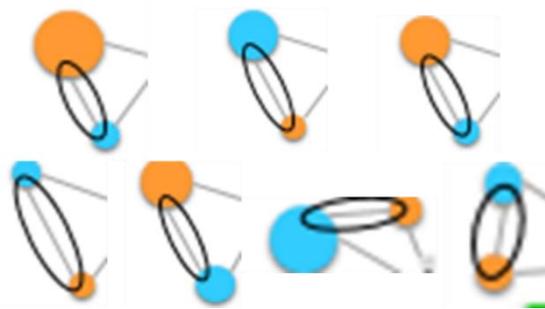

Figure 4: Matching of Measurability and Authenticity, own illustration

The qualitative part is conducted through semi-structured expert interviews in order to validate and develop the finding of the netnographic research. Seven of ten interviewed experts were linking a brand's *authenticity* (as sub-category of consumers' trust in branded products) to *measurability* (figure3). Taking this into account, measuring devices seem to play an essential role for branded products in the health and nutrition market in order the increase consumers' trust in the branded product's efficacy and the perceived authenticity of the brand. Partnering with a measuring device player may become essential for brand owners in the health and nutrition market as they seem to have an influence on consumers' brand perception. The changing role of consumers becoming part of brand development processes and the increasing influence of additional, not value chain-integrated

players like device manufacturers, needs to be further researched. Brand managers and practitioners in the health and nutrition market need to be aware of the issues that decreasing brand trust of consumers is causing. Additionally they should seek for suitable partners like device manufacturers to provide consumers a solution that is beyond the solitary selling of branded ingredients to ensure future success for their respective brands.

ATTACHMENT ORIENTATIONS AS PREDICTORS OF ABUSIVE SUPERVISION IN THE WORKPLACE AND ITS CONSEQUENCES.

Salton Meyer, Efrat¹; Mikulincer, Mario²; Drory, Amos¹

¹Guilford Glazer Faculty of Business & Management, Ben-Gurion University of the Negev, Beer Sheva, Israel

²Baruch Ivcher School of Psychology Interdisciplinary Center (IDC) Herzliya, Israel

ABSTRACT

The purpose of the current study was to investigate the role of supervisors' and subordinates' attachment orientations in the prediction of abusive supervision and its negative consequences.

The study was undertaken in 31 teams working in geographically distributed units of an organization providing mental healthcare services. The questionnaires were completed by 235 subordinates and 31 supervisors comprising dyads of subordinates and supervisors. The questionnaire administered to supervisors included self-report scales assessing their attachment orientations. The questionnaire administered to subordinates included the same scale on attachment orientations, as well as, scales tapping frequency of abusive supervision, well-being, burnout, job satisfaction and questions about intentions to quit and absenteeism.

A series of HLMs were employed. As predicted findings indicated that subordinates' evaluations of abusive supervision were positively related to their anxious attachment as anxious individuals' chronic worries and anxieties with regard to relationship partners were possibly transferred into their relationship with their supervisor, leading to the negative evaluation of the relationship or to actual abusive behaviors from a supervisor who could not empathize with subordinates' anxieties. As predicted, subordinates' attachment avoidance was associated with consequences of abusive supervision, lower well-being, and higher burnout scores. The results also revealed that the links between subordinates' attachment orientations and wellbeing were moderated by their supervisors' attachment orientations. The negative association between subordinates' attachment insecurities and well-being was significant only when supervisors scored relatively high on the other attachment scale, possibly reflecting the negative implications of a mismatch of relationship expectations in a dyad.

HOW EUROPEAN TIER-ONE AUTOMOTIVE SUPPLIERS EVALUATE AND SELECT EFFICIENT MARKET ENTRY MODES TO INDIA

Schlup, Raphael; Neubert, Michael

ISM International School of Management, 75007 Paris, France

ABSTRACT

This article analyses the research problem of how European tier-one automotive suppliers' (ETOASs) evaluate and select efficient market-entry modes to develop emerging growth markets using India as the example country market. The study is based on the conceptual framework of the revised Uppsala internationalisation process model (Johanson & Vahlne, 1977; Johanson & Vahlne, 2009) and the notion that international market development is an integrated part of strategic management to facilitate sustainable and profitable growth (Chandler, 1962; Andrews, 1987; Porter, 1999; Mintzberg, 2003; Wheelen & Hunger, 2004; Glowik, 2009; Kutschker & Schmid, 2011; Wheelen & Hunger, 2015). The research questions will be answered using a multiple-case study research design (Yin, 2014) with qualitative, in-depth, face-to-face, semi-structured interviews with 18 subject-matter experts and additional sources of evidence. The research results show that ETOAS, that use a structured market-entry process, would enter the Indian market faster, with less risk, and be more profitable. This proposed market-entry process consists of four steps and seven different integration levels.

INTRODUCTION AND STATEMENT OF THE RESEARCH PROBLEM

Original equipment manufacturers (OEMs) and European tier-one automotive suppliers (ETOASs) are driven by globalisation and the continuously changing automotive market (AM) and its trends to promote an internationalisation of sales and production (Fahrenschon et al., 2015). This result in pricing pressure in all areas of the automotive industry (Ebel & Hofer, 2014). Through the expansive model policy prevalent in the past years, OEMs have been forced to outsource large parts of their value chain towards competent ETOASs (Wagner, 2015), hereby internationalising with them (Ebel & Hofer, 2014). Wilhelm et al. (2016) describe this changed functioning of ETOASs as the double agency role. The positioning of ETOASs in the value chain has, therefore, been changed and most are now more than just suppliers (Fahrenschon et al., 2015). Through this change arises further growth potential for ETOASs because of new cooperation models, such as networks or partnerships along the value chain (Lichtblau & van Baal, 2012; Ebel & Hofer, 2014; Wagner, 2015). In particular, key markets gain more relevance with the possible development of cost-optimized components and systems (Pfeffer & Harrer, 2011) and an increase of sales volumes (Wagner, 2015). In this abstract, India will be considered as the key market for market entry by ETOASs. Vehicle production in India has more than doubled over the

past 10 years, from 1.4 million units in 2005 to 3.5 million units in 2014 (Funda, 2014; IHS Automotive, 2015; Ebel & Hofer, 2014). Automotive analysts expect vehicle production in India to grow in the medium term and reach six million by 2020, given a continuing surge in demand for new vehicles and the growing working population and rising economy of the country (IHS, 2015). Based on this development, India is one of the global growth markets for ETOASs (Funda, 2014), and in-depth localisation is the key for every ETOAS to remain competitive in the local market (Ebel & Hofer, 2014).

PURPOSE AND ORIGINALITY OF THE STUDY

The purpose of this study is to examine how ETOASs could enter the Indian market more efficiently using the revised Uppsala internationalisation process model (Johanson & Vahlne, 1977; Johanson & Vahlne, 2009). The originality of this study lies in the four-phase market-entry model (Neubert, 2011; 2013a; 2013b) with seven integration levels designed according to the Uppsala internationalisation process model (Johanson & Vahlne, 1977; Johanson & Vahlne, 2009) for the specific requirements of ETOASs.

LITERATURE REVIEW AND THEORETICAL FRAMEWORK

The current research status may be divided into two major key words of market-entry research: internationalisation theories and market-entry modes. This multiple-case study uses the revised Uppsala internationalisation process model (Johanson & Vahlne, 1977; 2009) as a theoretical framework. According to the concept of 'liability of outsidership' (Johanson & Vahlne, 2009), the attractiveness of a new foreign market is mainly determined by an existing client network (Neubert, 2015; Neubert, 2016a), which consists of contacts with global and local OEMs. The network learning ability (Neubert, 2016b) in the sense of the ability to develop new client contacts is especially important in oligopolistic markets, because the acquisition of new local and other international clients is the key driver of market attractiveness. Market-entry modes in the sense of the establishment chain (Johanson & Vahlne, 1977) include, for example, the four-step model of Neubert (2011; 2013a; 2013b) and the stepwise market-entry model of Waldkirch (2013). The latter model might be used by ETOASs such as direct export; joint ventures (JV) and strategic alliances (SA); wholly owned subsidiaries (WOS) including production, applied research and sales/marketing (build strategies); and merger and acquisitions (M&A) operation (buy strategy).

RESEARCH QUESTIONS

The purpose and the problem statement of this study have led to the main research questions (RQs).

RQ1: Which is the most appropriate market-entry strategy (MES) into the Indian market for ETOASs?

The four secondary research questions (2–5) should explain the main research question further.

RQ 2: Which are the objectives of an ETOAS that has gained market entry into India?

RQ 3: Which of the four market-entry modes—export, joint venture (JV), wholly-owned subsidiary (WOS) or (M&A)—is best suited for the market entry of an ETOAS into the Indian market?

RQ 4: Which location should be preferably chosen in India for a WOS, JV or M&A as a market-entry mode?

RQ 5: What types of reactions could be expected of competitors in case an ETOAS decides to enter the Indian market?

METHOD

The purpose of this study forms the basis for the research method adopted. This study uses a multiple-case study research design to answer the explanatory research questions (Yin, 2014) using different sources of evidence to facilitate triangulation. According to Hennart (2014), a qualitative comparative case study research would help to answer the research question. In contrast to an experimental design or a survey, a multiple-case study has more flexibility (Stake, 1995) and allows an in-depth analysis of a complex research problem (Yin, 2014) within a highly contextualized environment (Rosenberg & Yates, 2007), and a comparison between different cases (Baxter & Jack, 2008; Eisenhardt & Graebner, 2007). The primary source for data collection is qualitative, semi-structured, in-depth, face-to-face interviews with subject-matter experts (SMEs) (Yin, 2014). Other sources of evidence include, for example, a literature review of market-entry modes (Villa, Rajwani, and Lawton, 2015) and data of the Indian market derived from different sources; internal data; and experiences of automotive suppliers, mechanical engineering suppliers and universities with specialisation in internationalisation of Swiss and European companies towards Asia.

SAMPLE

The purpose of this study also forms the basis for the sampling strategy. This study uses a purposive case-selection strategy (Seawright & Gerring, 2008) to generate a representative sample (Seawright & Gerring, 2008), with typical (Gerring, 2007) and successful examples (Glowik, 2009) of the total population. According to Eisenhardt (1989) and Yin (2014), this sampling strategy produces a statistically representative sample, if at least six to 10 cases are selected. This study uses a sample size of 18 cases to allow better triangulation (Flick, 2008) of data and to strengthen the results of the whole

study (Yin, 2014). The SMEs are CXOs, Head of X, directors, professors, consultants, salespersons, product specialists and supply-chain and project managers of an ESAI who have expert knowledge in international management, the Indian market and/or specific European enterprises.

RESULTS AND FINDINGS

ETOASs should pursue cost and strategic target motives with a market entry to India

Eighty-three percent of the SMEs consider cost and strategic target objectives as very important. They underline the fact that a production facility in India will strengthen the competitiveness and bargaining power of an ETOAS's global production portfolio (Hausmann et al., 2009; Neubert, 2013a; Neubert, 2013b) and its global client network through more diversification. Four SMEs agree on a point; 'The objectives of market entry in India are mostly driven by cost motives and increased profit margins arising from a low-cost production and a product quality based on local market standards'. One SME further adds, 'The absence of India in the production locations portfolio of an ETOAS in the near future signals a lack of global competitiveness and bargaining power'. Given low labor costs, India also offers an interesting procurement market (Holtbrügge & Friedmann, 2011) with potential cost savings of up to 30 percent (Augustin & Durst, 2005). One SME suggests, 'This 30 percent declines, in reality, to approximately 20 percent'. Twelve SMEs mention that cost and network advantages will protect the ETOAS against competitive actions of other ETOASs (Hungenberg, 2014). An SME says, 'Competitors will react aggressively to the market entry of another ETOAS and defend the existing local network, in which they refer to 'weaknesses' of the future competitor'. Three SMEs further add, 'The competitors would increase the price pressure in the market if an ETOAS enters the Indian market'. Moreover, an SME reasons, 'Competitors will use contracts over a certain time period for existing industrial machines'. This creates switching costs for existing OEMs in the case of a potential ETOAS change.

ETOASs should enter the Indian market using a four-phase entry model with seven integration levels

SMEs recommend applying a four-phase entry model with seven integration levels (Figure 1, in the Appendix), which consists of the research model of Neubert (2011; 2013a; 2013b), Waldkirch (2013) and the establishment chains of Johanson & Vahlne (1977; 2009), for entry to the Indian market. Fifteen SMEs suggest that the first step of a market-entry decision should be to prepare a European project team (EPT) to supervise and lead the activities in India. The soft-skills of the EPT are the key factors for the implementation of a successful market-entry strategy. One SME describes, 'The so-called Soft-Skills are key for the implementation of a successful market-entry strategy in India, and if the soft-skill competences of the EPT is inadequate, the market entry will very probably fail'. Along the same line, another SMEs states, 'The biggest challenges in market entry to India, are the cultural disparities Innovation, Entrepreneurship and Digital Ecosystems

between the home and foreign markets; therefore, intercultural competence is vital for a successful market entry'. In the second phase, the EPT should conduct a market- and feasibility study (Waldkirch, 2013) and visit fairs in India to obtain information regarding the industry, customers, suppliers and competitors' products (Waldkirch, 2013). The establishment of a representative office would allow the gradual transfer of resources towards India (Holtbrügge & Friedmann, 2011). A branch office is required if contracts are concluded or R&D activities are performed (Holtbrügge & Friedmann, 2011; Neubert, 2011). In the fourth phase of the model, the market-entry mode will be executed through a JV, WOS or M&A. The last step is the market growth and expansion phase, which includes the acquisition and integration of other small competitors in the Indian market (Neubert, 2011). These findings are in line with the Uppsala internationalisation process model (Johanson & Vahlne, 1977; Johanson & Vahlne, 2009) because 10 SMEs recommend a gradual market entry to develop a local network and adapt to local market conditions. In this context, one SME says, 'At the beginning of market-entry activities, a European project team of expats that will lead the activities in India must be formed by the management of the ETOAS'. Another SME adds, 'In the first phase, a project team has to travel in India for approximately six months, with the objective of establishing a preliminary network of relationships'. Such a step is necessary because, it would be impossible for a manager to immediately set up offices and networks in India.

ETOASs should enter the Indian market through WOSs in one of the automotive clusters

Thirteen SMEs recommend establishing a WOS in India. This creates the possibility of full management control (Holtbrügge & Friedmann, 2011) and the implementation of a company-specific corporate governance system (Dehnen, 2012). This finding is in line with the research results of Johnson & Tellis (2008) and Holtbrügge & Friedmann (2011). An SME elaborates, 'A WOS as a market-entry form is preferable since it allows authority in decisions and independence from contracts; the bureaucracy that is created through a JV does not allow the same freedom'. An SME adds, 'A WOS in India would also allow independent decisions with specific Indian partners; in view of financial issues, for example, collaboration with an investment bank would be possible'. All 13 SMEs recommend locating the WOS in one of the automotive clusters (Holtbrügge & Friedmann, 2011; Bapat et al., 2012; Nazir, 2015) in the vicinity of this first important OEM client (Imsbach et al., 2012) because of the increasing integration of ETOASs in the value chains of OEMs and the possibility of creating synergies with the WOS of other network partners. Two SMEs further comment, 'ETOAS prefer to choose one of the four automotive clusters for their production facilities to be close to their clients'. 'Otherwise, the preferred selected production location of the ETOAS, could lead to outbound logistic costs that are too expensive for a specific OEM, and the selected production location would be classified as inappropriate'. One SME

describes, 'A functioning and intact infrastructure is essential for an ETOAS, especially in India; this is only available in one of the automotive clusters'.

The findings of this qualitative multiple-case study research project contribute to the field of research on international management because researchers will gain a better understanding of how ETOASs, which are highly integrated in the value chains of OEMs (Ebel & Hofer, 2014), evaluate and select efficient market-entry modes and processes to India. The findings of this qualitative multiple-case study research project contribute to managerial practice because they will help managers from ETOASs increase the efficiency of market entries especially to India.

THE EFFECT OF AUDIT COMMITTEE CHARACTERISTICS ON EARNINGS MANAGEMENT IN INDONESIA BANKING INDUSTRY

Setiawan, Doddy

Faculty of Economics and Business, Universitas Sebelas Maret, Indonesia

ABSTRACT

Indonesian Stock Exchange (IDX) issued a circulation letter regarding audit committee. It is expected that audit committee help board of commissioners (BoCs) to analyze financial information, risk and internal audit. It help companies to achieve better corporate governance practice and provide better earnings quality. Nurhaida, a chairwoman of BAPEPAM-LK (Indonesia Capital Market and Financial Institution Supervisory), stress the importance of audit committee to reduce manipulation by listed firms. It is expected that audit committee able to constraint earnings management by companies. However, Nurhaida complain that internal governance structure, such as: audit committee, do not perform well and this condition provides opportunity for manager to manipulate investor. Audit committee is expected to help board of commissioners to monitor the management and provide better information quality. Therefore, this study investigates the effectiveness of audit committee on earnings management focus on banking industry. This study investigate the effect of audit committee characteristics: number of meetings, financial background, size and gender on earnings management. Sample of this research consists of 201 firm-years observations during 2006-2013. The result shows that number of meetings and financial background have positive effect of earnings management. This study find that size negatively affect earnings management. Smaller audit committee have better monitoring ability. Further, gender have no effect on earnings management. Thus, the study find that smaller audit committee size provide better monitoring.

Keywords: *earnings management, audit committee, number of meetings, financial background, audit committee size, gender*

FACTORS SHAPING YOUNG TOURISTS ' INTENTIONS TO TRAVEL TO GREECE, ISRAEL AND PORTUGAL: UNIVERSAL OR IDISYNCRATIC PERCEPTIONS OF YOUNG GREEKS, ISRAELIS AND PORTUGUESE?

ABSTRACT

Tourism constitutes an important branch of economy, especially in countries experiencing economic crisis and harsh socio-political events. The current study compares the intention of young people from three different countries – Greece, Israel and Portugal - to travel to two selected destinations. For each country of origin the other two countries were the destination of interest.

This research examined the factors affecting young tourists' intention to travel to different destinations assuming that those determinants depend on the country of origin as well as on the destination country.

The sample comprised of 648 students: Israelis (277), Portuguese (200), Greeks (171). The research questionnaire was distributed in Israeli, Greek and Portuguese academic institutions in 2014.

The results indicate that over half of the Israelis intend to visit Greece or Portugal. The majority of the Portuguese anticipate visiting Greece, while only 32.5% expect to visit Israel. Among the Greeks nearly 50% intend to visit Portugal and do not intend to visit Israel.

The study showed that the main factors affecting the decisions of young Portuguese to travel to Israel were: the image of Israel, the perceived risk of traveling to a country with political unrest and the number of trips abroad. The main factors affecting the decisions of young Greeks were the perceived risk of traveling to a country with political unrest and Israel's image. Israelis' decision to travel to Greece was affected by their image of Greece; the Portuguese also took into account the perceived risk regarding economic situation. For Israelis, considering Portugal as a traveling destination was related to the destination's image. The Greeks were affected by the number of Facebook friends and the Innovation, Entrepreneurship and Digital Ecosystems

perceived economic risk. This research suggests that the socio-economic, political context of the country of origin and of the tourist destination plays an important role in young tourists' travelling-related decision-making.

RELIGION AND SERVICE QUALITY PERCEPTION OF HOSPITAL EMERGENCY ROOMS

Shuv-Ami, Avichai; Shalom, Tamar

Peres Academic Center, Israel

ABSTRACT

INTRODUCTION

Patient satisfaction is a critical concept for researchers, practitioners, and administrators to understand because it is commonly used to assess quality of care and can predict a wide variety of health related-behaviors and outcomes. Many researchers have established demographic and health related correlates of satisfaction such as age and health status (Nguyen, 2002, Hall, 1990). The influence of religion on patient satisfaction in health system is rarely investigated.

The purpose of the current research is to examine the impact of religiosity on the perception of service quality in hospital emergency rooms. Recent researches have shown that higher religiosity is related to positive emotions, attitudes and behaviors (Harold et al, 2014) and that positive religious coping was associated with improved quality of life (QOL) and negative religious coping was significantly associated with worse QOL (Zamanian et al, 2015). Other research showed that atheists and agnostics tended to have worse outcomes in psychological functioning characteristics, social support relationships, and health behaviors (Hayward et al, 2016).

RESEARCH BACKGROUND

A large and growing number of studies have researched the correlation between religiosity and quality of life (QOL). These studies have shown health benefits associated with religious involvement (Solan & Bagiella, 2002, Powell et al, 2003) and pointed to a direct relationship between religious involvement and spirituality and positive health outcomes, including mortality, physical illnesses, mental illness, QOL, and coping with illness (including terminal illness). Available evidence is generally consistent with the hypothesis that religiosity/spirituality is linked to health-related physiological processes including cardiovascular, neuroendocrine, and immune function (Seeman et al, 2003). Also, studies show that both positive and negative religious coping are associated with overall patient QOL and hence, may have an effect on health outcomes. Perhaps patients who experienced greater physical symptoms turned to religion more often for strength, comfort, and

guidance (Tharakeshwar et al, 2006). Studies also suggest that addressing the spiritual needs of patients may facilitate recovery from illness (Mueller et al, 2001, Cotton et al, 1999).

A few studies have examined the relationship between religiosity and patient satisfaction with health system service. Research conducted in the US showed that a high level of religious salience was significantly related to being very satisfied with one's health care, even after demographic, social and health variables were taken into account (Benjamins, 2006).

The purpose of the current research is to examine the impact of religiosity on the perception of service quality in hospital emergency rooms. The current research uses service quality scale (SERVQUAL) to measure the perception of service quality in hospital emergency rooms. Service quality (SQ) has been described as a multidimensional construct; the perceived discrepancy between expectation and performance along the quality dimensions (Parasuraman et al, 1994).

RESEARCH HYPOTHESES

The current research suggests two related hypotheses. The first hypothesis suggests that those religious people, accompanying patients to hospital emergency rooms, rely on their faith and thus expect less from the medical staff in hospital emergency rooms in comparison to secular people. Thus, religious people that accompany patients will perceive that service quality in hospital emergency rooms is more "as expected" than those secular people accompanying patients to hospital emergency rooms. The second hypothesis suggests that as a result of the low expectations, religious people will perceive service higher than secular people in relation to the service quality of hospital emergency rooms.

RESEARCH METHODOLOGY

The research here is based on 1002 Israelis that accompanied a patient to a hospital emergency room in the last 6 months before the study was conducted. The data was collected randomly from an internet panel that comprises more than fifty thousand people over the age of 18. The sample consists of 50% male and 50% female, with 55% Secular, 23% Conservative, 14% Religious and 8% Ultra-Religious.

The measure of the service quality scale (SERVQUAL) with its five subscale components (reliability, assurance, empathy, response, tangibles) was adopted from Munmun et al, (2015), which studied patients' evaluation of the service quality of government homeopathic hospitals at West Bengal - India. The scale was modified to fit the measurement of service quality of hospital emergency rooms. Some of the changes rely on the wording of the original scale suggested by Parasuraman et al, (1994). All Items were questioned using a 10-point agree-disagree scale. This measure was found to be highly

reliable with a Cronbach's α of 0.921. Expectations with regards to hospital emergency room service performance were measured on a 10-point agree-disagree scale by the question: "The treatment is as expected in a hospital emergency room."

RESULTS

As hypothesized, Table 1 shows that religious people perceive the service quality of the hospital emergency rooms more "as expected" than secular people. In fact, religion is positively associated with perceiving hospital emergency room service performance "as expected".

Table1: Religion and Expectations of Service Quality

Religion	SQ "As Expected"
Secular	5.43
Conservative	5.37
Religious	6.41
Ultra-Religious	6.57
Total	5.64
F	8.198
Sig.	P < .001

The results in Table 2 support the second hypothesis. Those accompanying religious people perceive service quality in hospital emergency rooms higher than those accompanying secular patients. The "Assurance" component, of the service quality scale, shows the highest difference between religious and secular people visiting hospital emergency rooms. That is, religious people tend to trust that all that is happening in this world is decided by God and thus may believe that what the medical staff does is the best they can do under the circumstances and it is meant to be.

Table2: Religion and Perceptions of Service Quality

	SERVQUAL	Reliability	Responsiveness	Empathy	Assurance	Tangibles
Secular	6.12	5.97	5.45	5.96	6.29	7.04
Conservative	6.14	6.07	5.43	5.83	6.33	7.20
Religious	6.77	6.68	6.24	6.62	6.99	7.42
Ultra-Religious	7.33	7.21	6.45	7.13	8.02	7.99
Total	6.31	6.19	5.64	6.11	6.53	7.20
F	10.746	9.374	7.609	8.215	14.951	7.004
Sig.	P < .001	P < .001	P < .001	P < .001	P < .001	P < .001

CONCLUSIONS AND IMPLICATIONS

As hypothesized, the results of the current research show that those accompanying religious people perceive service quality in hospital emergency rooms higher than those accompanying secular

patients. Is it because religious people tend to trust that all is happening is decided by God and it is meant to be or is it that religious people are more satisfied with all aspects of their lives? Are they more optimistic than others and thus are less critical and more forgiving about the service they get? In any case, the medical staffs in hospital emergency rooms need to be aware of the ways that religiosity may influence the medical care and the patient's decision-making and be more sensitive to their patients' needs.

A CONCEPTUALIZATION OF BRAND STATUS MODEL FOR SPORT CLUBS

Shuv-Ami, Avichai

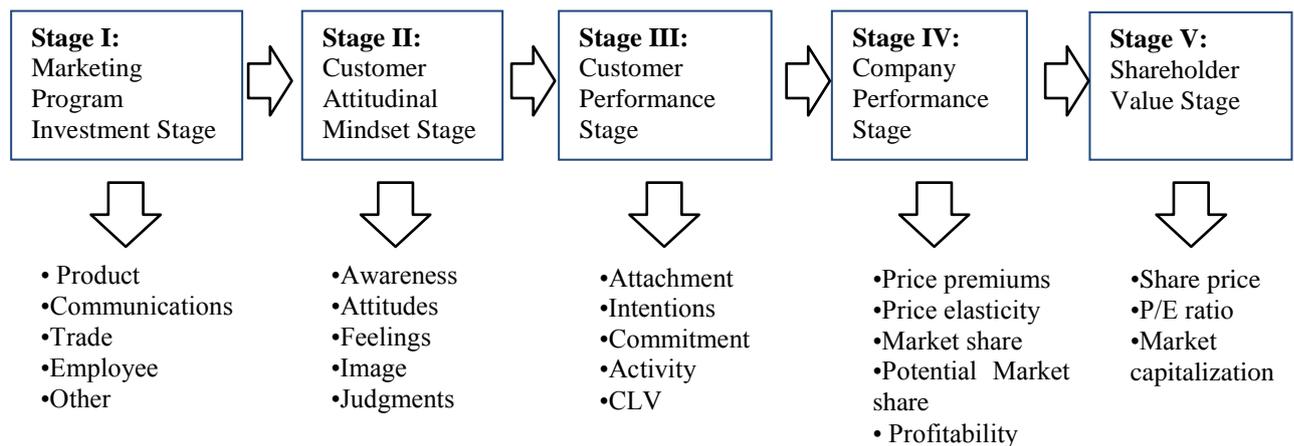

The School of Business Administration, Israel

ABSTRACT

INTRODUCTION

The current study defines “Brand Status” as a measure that examines the “health” and the strength of the brand in each stage of the brand value chain. The sum of the brand strength of the brand in each stage represents the total *Brand Equity Status Score* of the brand. The five-stage brand value chain adopted here is based on Shuv-Ami’s (2011, 2016) extension of Keller’s (2003a) model of brand value chain process (Figure 1). The purpose of the current study is to provide a model and a scoring system of Brand Status” for sport clubs.

Figure 1: The “Brand Value Chain”

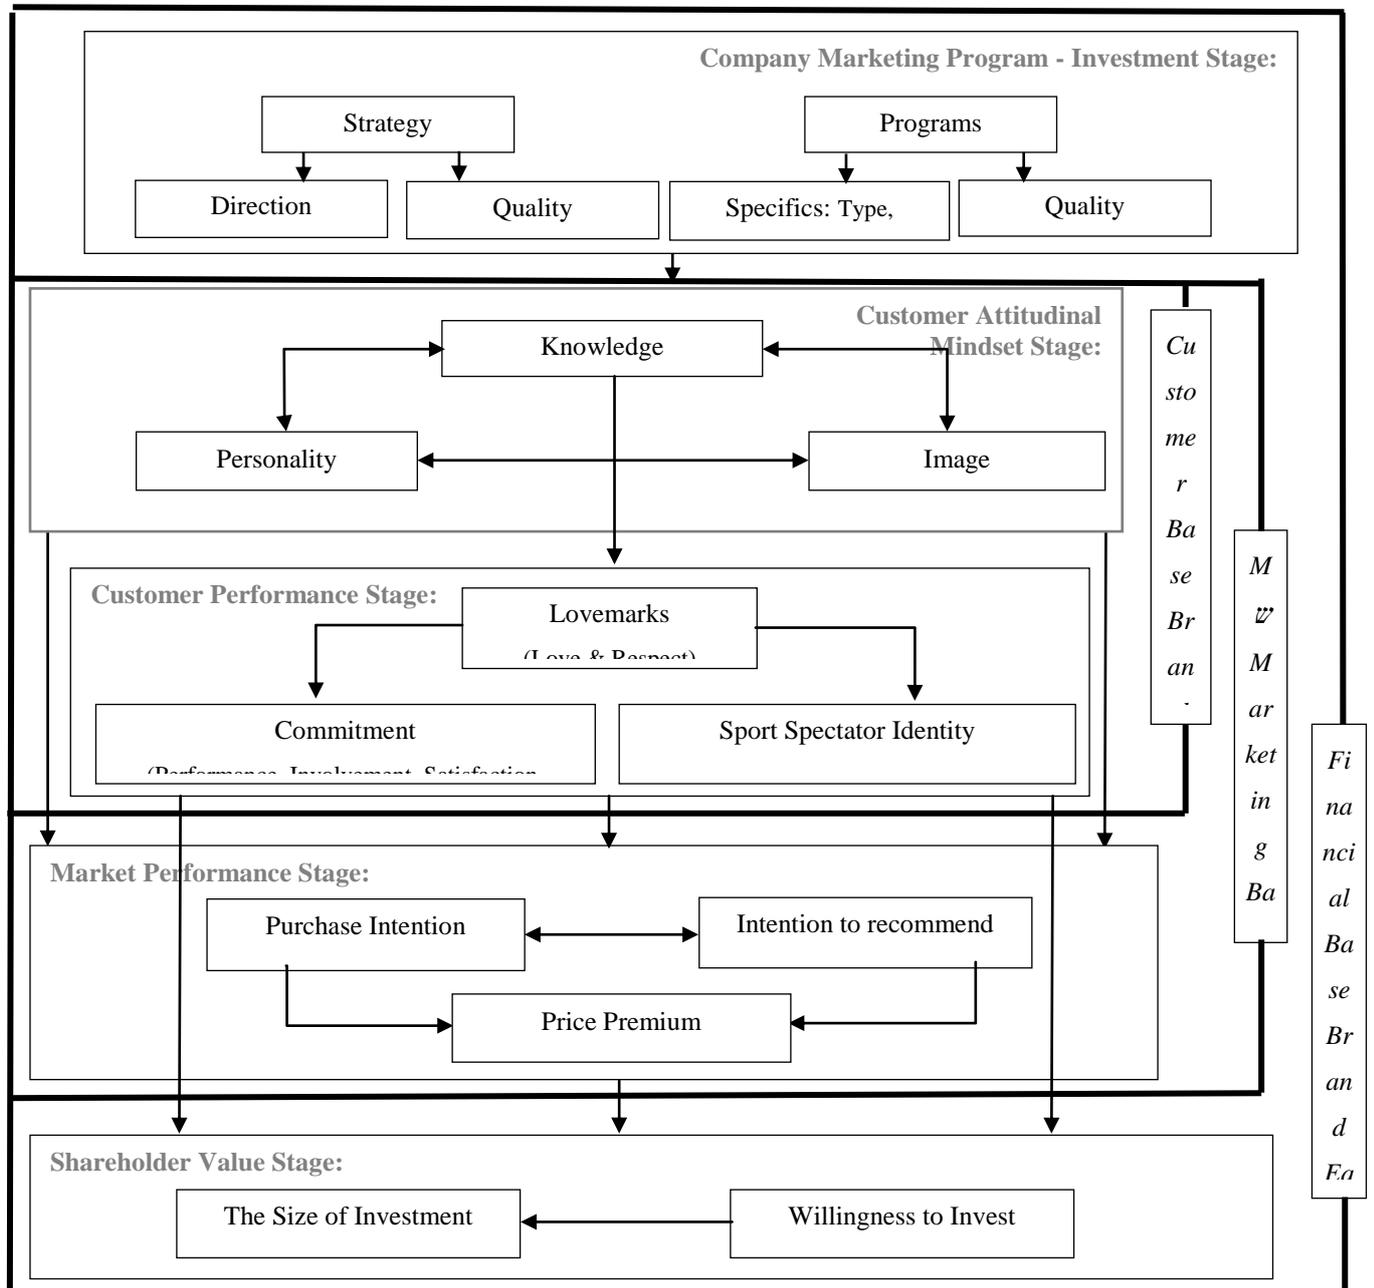

A review of the marketing literature shows that there is no one study that measure each stage and thus in understanding the process of the creation of brand value chain, including the financial value for the shareholders. The current study attempts to conceptualize a model that evaluate the strength of the brand in each stage each stage. The value score for that strength of each stage and a total score of all stages represents the status of the brand in the market.

THE CONCEPTUALIZED BRAND STATUS MODEL

The theoretical foundation of the current model is based on Shuv-Ami’s (2011, 2016) extension of Keller’s (2003a) model of brand value chain process. The current conceptualization of *Brand Status* model draws constructs from Keller and Lehmann’s “Systems Model of Brand Antecedents and

Consequences” (Keller and Lehmann 2006), Keller’s (1993, 2001, 2004) Customer Base Brand Equity (CBBE) model, Aaker’s (1996) “Brand Equity Ten” model and Roberts’ (2004) “Brand Lovemarks” model.

Figure 2: The Conceptualized and Hypothesized Brand Status model

The conceptual model proposed here is presented in Figure 2 and has all five components the brand value chain. The “Customer Attitudinal Mindset Stage” and “Customer Performance Stage” measures the Customer Base Brand Equity (CBBE). The Company/Market Brand Equity includes the CBBE and the “Company Performance Stage”. The Financial Brand Equity is measured by the relationships between the “Marketing Program Investment Stage” and the “Shareholder Value Stage”.

THE BRAND EQUITY STATUS SCORE MEASUREMENT

Similar to the brand equity models of Interbrand and BrandZ, the calculation of the brand equity value is based on the sum of the weighted parameters of the model. Thus, all parameters in each stage were weighted based on the beta value of each parameter on a regression analysis where the depended variable is part of the constructs of the next stage.

In order to calculate the “Customer Attitudinal Mindset Stage”, Lovemarks from the next stage will be used as a dependent variable. Price premium is the dependent variable to establish the beta values for the “Customer Performance Stage”. The betas for the parameters of the “Company Performance Stage” will use the size of the investment as the dependent variable. The following formula will be used for all of these stages.

$$SSVC = \frac{\sum_{i=1}^3 (*)}{3}$$

Where: VCSS = the Stage Score of the Value Chain

n = the number of Performance Parameters

W_{bi} = the weighted beta for the i 's Performance Parameter

i = the i 's Performance Parameter

V = the average score of the Performance Parameter

Calculating the Shareholder Value is different from the previous stages. Since the question for the sport fans in the current research was “how much you are willing to invest in your team?” the formula to calculate the club shareholder value is simply;

Shareholder Value (SV) = Average Fan's Investment X Number of Share Offered

If less than 100% of shares were offered, a relative calculation should be made. In the current study all 100% shares of the club were offered to the fans.

The total “Brand Equity Status Score” (BESS) is to calculate by the following formula. In this formula the first calculated stages are used as a reflation of the ability to generate in reality the investment size the fans said that they are willing to invest in their club. The average score of the first stages calculate here (that is now ranged from 1-10) is divided by a 100 and thus (is now ranged from 0.01-1.00) it is used as indicator of the strength of fans willingness to invest. As it is known from practical research (see for example the consumers' barriers in Sinovate model of brand equity) many barriers are there between the time fans state that they are willing to invest until the time they need to pay for the investment.

$$BESS = SV * \frac{\sum_{i=1}^3}{3 * 100}$$

Where: *BESS* = Brand Equity Status Score

VCSS = the Stage Score of the Value Chain

SV = Shareholders Value

j = 1-3 Stages of the Value Chain

VCSS = Relative Brand Equity Score

FVCP = Financial Value Chain performance

CONCLUSIONS AND DISCUSSIONS

While the objective of the first part of the current study was to conceptualized a brand status model, the current part provide a measurement procedure that allows monitoring and thus responding to the changing status in each stage of the brand equity value chain. Monitoring brand status or “health” is needed in order to avoid the trituration of the brand equity.

Monitoring Customer Attitudinal Mindset Stage represents customers’ knowledge and perception of brand image and personality. Unsatisfactory brand position may need more and maybe different marketing communication strategies. Advertising, for example, may help in building brand knowledge, image and personality. Sometimes, using celebrity in advertising enhance brand image and personality. In sport clubs, the players and the performance impact club image and personality. *Monitoring Customer Performance Stage* represents the customer feelings toward the brand and reflects the consequences of the previous stage. Thus, building brand knowledge, image and personality may leads to a better position in the current stage of love, commitment and identification (Madrigal 1995, Delaney and Madigan, 2009). Nevertheless, marketing managers may use experiential marketing that makes games memorable events. People love sport because they enjoy it and remembering good times from games makes us feel good (Delaney and Madigan, 2009). The Stage of the *Company Performance* is influenced by the customer performance stage. That is, fans Lovemarks, commitment and identification influence their intentions to go to their team games, their willingness to recommend to other and to be willing to pay more for game tickets and the team merchandise. Still, marketing managers may influence directly this stage using sales promotion and enhancing the value of games by making them bigger events. However, promotional strategies may not enhance the willingness to pay more and thus it is essential for sport marketing managers to improve fans Lovemarks,

**THE ANTECEDENTS AND CONSEQUENCES OF LOVEMARKS,
COMMITMENT AND SPORT: SPECTATOR IDENTITY AND DECISION-
MAKING AMONG FOOTBALL CLUB FANS**

Shuv-Ami, Avichai

The School of Business Administration, Israel

ABSTRACT

INTRODUCTION

The purpose of the current study is to understand the decision making process that leads football fans to love and respect their team, to identify and be committed to this team, to go to their games and be willing to pay more for game tickets and merchandise of their football team. Today, professional football club organizations around the globe are managed as businesses that make profit from broadcasting media rights, game tickets and merchandises. All three sources of profits are mostly based on the size and enthusiasm of their fans to the club. Thus, it is crucially importance for football clubs to understand such decision making processes.

RESEARCH BACKGROUND

The foundation for the conceptualization of the current decision making model of sport and football fans is based is on Schiffman and Kanuk's (2004) tri-component model of attitude and Shuv-Ami's (2011, 2016) extension of Keller's (1993, 2008) model of brand value chain process. While Schiffman and Kanuk (2004) attitudinal model is dealing with consumers behavior decision making, the Keller's (1993, 2008) model is a managerial one. Thus, the decision making model is reflected in the managerial model and both are using the same constructs in understanding their processes.

The current study suggests that in the process of decision making of sport fans the "cognitive component" is encompassing constructs of the managerial stage of "customer mindset", the "affective component" is represented by constructs measured at the stage "customer performance outcomes" and the "conative or behavioral component" is dealing with constructs related to the managerial stage of "market performance outcome"

RESEARCH HYPOTHESES

The purpose of the present analysis is to test a model that describes the antecedents and consequences of Lovemarks, commitment and Sport Spectator Identity in a decision making process of football club fans.

H1: Knowledge, personality and image will have positive effect on Lovemarks which in turn will have positive effect on commitment and Sport Spectator Identity and no effect on fans intentions, recommendations and price premium.

H2: Commitment and Sport Spectator Identity will have positive effect on fans intentions, recommendations and price premium.

H3: Knowledge will have positive effect on commitment and that commitment will have positive relationship with Sport Spectator Identity.

RESEARCH METHODOLOGY

The empirical part of the research stems from a large survey of 1300 Israeli football fans. The data was collected from an internet panel that comprises more than fifty thousand people over the age of 18. Participants ages ranged between 17 to 81 with a mean age of 37.5 (sd = 14.4), 57% were males and 57% had an academic education.

Knowledge of the football team was measured using a question which drew upon three items regarding the history of the team and results of the matches. The *Lovemarks* scale was adopted from Shuv-Ami (2014, 2015). The *personality* scale implemented followed the five personality traits used by Aaker (1997). *Image* was measured using four items. The *commitment* scale was adopted from Shuv-Ami (2012). The seven-item measure of *Sport Spectator Identity* was developed from Wan and Branscombe (1993). *Recommendation* intention was measured using a modified Markey and Reichheld (2008) advocate measure (Net Promoter Scores – NPS).

All measured scales were on a ten point scale and found to be highly reliable with a high Cronbach's α . Where: Knowledge's $\alpha = 0.92$, Image's $\alpha = 0.83$, Personality's $\alpha = 0.83$, Lovemarks' $\alpha = 0.79$, Commitment's $\alpha = 0.95$ and Sport Spectator Identity's $\alpha = 0.94$.

RESULTS

The findings show that commitment and Sport Spectator Identity have a mediating effect on the relationship between Lovemarks and fans intentions, recommendations and price premium. While the first model (when commitment and Sport Spectator Identity were not present), shows strong and significant link between Lovemarks and fans intentions, recommendations and price premium, in the

second model this link was unexpectedly significant but weak to intentions and recommendations and no link to price premium. As expected, Lovemarks have positive effect on commitment and Sport Spectator Identity. In turn and as hypothesized, commitment and Sport Spectator Identity have positive effect on fans intentions, recommendations and price premium. Also as expected knowledge has positive like to commitment and commitment is positively associated with Sport Spectator Identity.

CONCLUSIONS AND IMPLICATIONS

This model shows the relative importance of Lovemarks, commitment and Sport Spectator Identity in a decision making process of football club fans. Surprisingly and unexpectedly, knowledge was found to be the most important construct in forming fan's behavior. Fan's knowledge about the history of football club and their current status affect Lovemarks, commitment, Identity, intentions and recommendations. It does not affect the willingness to pay more, since this decision is made if the fan is committed to the team. Understanding that, may lead football and sport teams to be more active in providing information about the history and legacy as well as current and relevant information of the club. Image of the club was also found to be linked to several constructs, but mainly to Lovemarks.

Purchase intention, commitment and Sport Spectator Identity explained 55% of the variance of the willingness to pay more. Image and knowledge affect Lovemarks which in turn affect commitment and Sport Spectator Identity. Thus, image and knowledge are critical drivers of fans decision making. Building such an image and knowledge can be done through advertising, engagement in social media and making games as experiential and enjoyable events (location, food, souvenirs and core products) (Watanabe et al, 2013, Wakefield and Sloan 1995) that they will enjoy remembering (Delaney and Madigan, 2009).

THE IMPACT OF HARD TIMES: CONSUMERS AND THE ECONOMIC RECESSION

Soares, Ana

School of Economic and Management, University of Minho, Braga, Portugal

ABSTRACT

The financial crisis of 2008 resulted in an unparalleled economic and financial recession in many countries. This crisis may have long lasting consequences upon consumer behavior. The literature suggests that, in addition to spending intentions, different dimensions of consumption behaviour including purchasing patterns, information search strategies and retail patronage decisions may change as a result of the recessionary mindset triggered by the economic downturn.

In this paper, we aim at understanding how may consumer behavior change due to the influence of these economic conditions. An exploratory study aimed at understanding how consumers are changing their purchase patterns due to the economic recession was carried out and is being analysed.

INTRODUCTION

The financial crisis of 2008 resulted in an unparalleled economic and financial recession in many countries. This crisis, which has been characterized as “the worst economic crisis since the Great Depression, the first global recession in the new era of globalization” (Stiglitz, 2009, p. 281) has already had a radical impact in the business and market landscape ((Piercy et al. 2010) and may have long lasting consequences upon consumer behavior.

How consumers cope with the economic crisis remains a largely under researched issue (Alonso-Almeida & Bremser 2013; Bronner & De Hoog 2014). In fact, although the impact of the economic recession has been researched in some industries, in particular in tourism and in the hospitality sector (e. g., Alonso-Almeida & Bremser 2013; Eugenio-Martin & Campos-Soria 2014; Bronner & De Hoog 2014; Bronner & De Hoog 2012), studies focusing on how the recessionary mindset influences consumer decisions are still lacking.

Recently, several studies in tourism found evidence of economizing strategies in response to the crisis (Bronner & De Hoog 2014; Bronner & De Hoog 2012). However there may be other types of repercussions in how consumers behave. This suggests that different dimensions of consumption behaviour may change in addition to spending intentions.

In this research, we aim at understanding how may consumer behavior change due to the influence of these economic conditions. We carry out an exploratory study aimed at understanding how consumers are changing their purchase patterns due to the economic recession.

LITERATURE REVIEW

There is a dearth of studies on the impact of the current recession on consumer behaviour from a marketing perspective, especially in what refers to empirical studies addressing the impact on consumers (Zurawicki and Braidot, 2005). However, the impact of the financial crisis that anteceded the present economic crisis has been object of some contributions (Perriman, Ramsaran-Fowdar, & Baguant, 2010; Mansoor & Jalal, 2011; Simon, 2009; Flatters & Willmott, 2009). Similarly previous crisis such as the oil crisis of the seventies, the Asian crisis of 1997-1998 (Ang, 2001) and the Argentinian crisis of 2001-2002 (Zurawicki & Braidot, 2005) have also been studied. More recently the impact of the economic recession has been researched in specific industries, in particular in tourism and in the hospitality sector (e. g., Alonso-Almeida & Bremser 2013; Eugenio-Martin & Campos-Soria 2014; Bronner & De Hoog 2014; Bronner & De Hoog 2012),

CHANGES IN CONSUMER BEHAVIOR

The seminal work of Katona (1974) on behavioural studies of economic affairs has established the importance of psychological factors on consumers' spending and saving behavior in response to inflation and recession. This work recognized the human side of economic decisions as consumers' beliefs about the future affect their spending decisions.

Sharma (1981) identified voluntarily simplicity as the main reaction of middle class consumers to the stagflation of the late 70's. According to this author six core values characterized this movement: Material simplicity; Human scale, a preference for lower scale living and working environments; Concern for the appropriate use of technology; Self-determination, a need to regain control over one's life; Ecological awareness; and Personal growth, the desire to develop psychologically and spiritually.

Ang, Leong and Kotler (2000) studied strategies used by consumers to face the Asian economic crisis and consider that the reactions and adjustments of the consumers can be the following: General reactions (Reduce consumption and wastefulness; More careful decision-making; More search for information); Product adjustments (buy necessities rather than luxuries; Switch to cheaper brands and generic products; Buy local rather than foreign brands; Buy products in smaller packages); Price adjustments (Emphasise product life cycle costs - Durability and value for money; Emphasis on cheaper prices); Promotion adjustments (More rational approach to promotions; Reduced attraction to free gifts; Innovation, Entrepreneurship and Digital Ecosystems

Preference for informative rather than imagery-based advertisements); Shopping adjustments (Increased window shopping; Preference for discount and neighbourhood stores; Fewer end-of-aisle impulse purchases).

Zurawicki and Braidot (2005) consider two generic categories of means to cope with the crisis: Reactive and proactive. Reactive actions aim at “smoothing consumption” (Zurawicki and Braidot, 2005, 1101) while proactive actions directly dealing with diminishing income.

New trends in consumer behavior may emerge or reinforce resulting from crisis. According to Flatters & Willmott (2009) four trends are being accelerated by this recession: consumer demand for simplicity, a call for ethical business governance, a desire to economize and a tendency to flit from one offer to another. Additionally, the authors consider that four other trends will slow down as result of the economic crisis: green consumption, a decline for respect for authority, ethical consumption and extreme experience-seeking.

Piercy, Cravens and Lane (2010) consider that this new market situation is characterized as the “age of thrift” in which consumer purchase behavior will be radically different. The authors contend that “a new type of shopper focused on gaining superior value from purchases looks set to emerge from the recession” (p. 6), thus leading to ‘new age of frugality’. This desire to economize and be thrifty is imposed to many consumers but is also experienced by many others as a result of a growing dissatisfaction with overconsumption and waste. As a result, consumers tend to flit from one offer to the other. Volatile behavior, mercurial consumption patterns emerge leading to less brand loyalty and a continuous search for better option in the market supported by word of mouth and social media. For example, (Descals et al. 2014) found that the number and weight of purchases of brands benefiting from price reductions promotions brands for a particular product increased in the period 2007-2011.

Simon (2009) identifies the following trends: Fear of the future; unfavourable change in price elasticity); hard value and cost benefits gain importance; compressed time preference; financing becomes more important, safety becomes a higher priority.

METHODOLOGY

Based on the previously reviewed contributions, the following research question is investigated: What is the impact of the global economic and financial crisis in consumer behavior, consumption patterns and consumer values?

A qualitative approach was deemed adequate to explore in-depth how consumers deal with the recession and a focus group was conducted with a group of eight consumers. The focus group was led

by two experienced moderators and lasted up to two and half hours participants' thoughts and experiences. The focus group was fully transcribed and is being content-analysed.

CONCLUSION

The literature review identified a number of changes in consumer behavior resulting from the recession and the recession mindset. In order to understand how does purchasing and consumer behavior change as result of the economic downturn, an exploratory study was carried out to delve into consumers' perceptions of how their shopping strategies and options had changed in the past few years.

An important feature of the impact is the conviction that these changes will persist after economic rebound. This is corroborated by different authors (Piercy, Cravens, & Lane, 2010; Flatters & Willmott, 2009; Beinhocker, Davis, & Mendonca, 2009). The feeling that consumers will not be the same again prevails: "a sense that the world has changed: The turmoil was not merely another turn of the business environment but a restructuring of the economic order" (Beinhocker, Davis, & Mendonca, 2009, p. 55).

NEGOTIATION OUTCOMES EMPLOYING SCENARIOS: THE ROLES OF ETHICS AND TRUST AMONG GREEK AND ISRAELI EMPLOYEES

Stefanidis, Abraham¹; Banai, Moshe²; Shetach, Ana³

¹Department of Management, The Peter J. Tobin College of Business, St. John's University, New York - USA

²Zicklin School of Business, Baruch College, New York - USA

³Management of Health Systems Department, Max Stern Academic College of Emek Yezreel, Israel

ABSTRACT

This research investigates the impact of ethical idealism and trust propensity on negotiation outcomes employing five different scenarios. Drawing on two samples from Greece and Israel, it examines negotiation outcomes under diverse circumstances, namely negotiating with new and existing customers, negotiating early and late in the day and making counter-offers. A survey questionnaire was translated from English to Greek and Hebrew, and six hundred forty-nine responses were collected from employees who worked in industries such as construction, banking, manufacturing, retailing, tourism, and public authorities in the two countries. The research findings show that ethical idealism and trust propensity significantly explain variations in the negotiators outcomes for the five studied scenarios. Concurrently, this research assesses whether negotiators in the Greek and Israeli societies respond differently in the same sets of scenarios. A number of variations among the responses of Greek and Israeli participants suggest that culture may impact negotiators' preferences regarding the outcomes of the negotiation scenarios. The study provides scholars and practitioners with a set of antecedents that explain negotiators' preferences. Conclusions and recommendations for future research are offered.

MANAGING SOCIAL COOPERATIVES IN SOUTHERN ITALY: THE CASE OF “COSY4YOU”

Turi, Claudio; Mazzoni, Clelia

Department of Economics, Second University of Naples, Corso Gran Priorato di Malta, Capua, Italy

ABSTRACT

PURPOSE

Social cooperatives have greatly contributed to the expansion of the social economy in Italy, providing welfare services for their members as well as for the community and fostering the integration of disadvantaged people into society (Mancino and Thomas, 2005).

The purpose of this work is to analyse the management of social cooperatives in today's complex economic scenario through a case study analysis of a cooperative operating in the Campania Region in Southern Italy. More specifically, the research investigates how the organization is dealing with financial resource constraints in order to survive and reach its social service objectives.

This study is part of a research project on the management of nonprofit organizations. The analysis of these organizations has gained attention in the last years due to increasing importance of the third sector and growing complexity that characterizes the management of nonprofit organizations. As argued by Speckbacher (2003) “there seems to be a growing awareness that nonprofits need management just as for-profit organizations do”. Different authors have analysed whether and how strategic management notions and tools of for-profit firms can be applied to nonprofit organizations (Backman *et al.*, 2000; Kong, 2007; Tucker *et al.*, 2013). Indeed, though their activity is primarily directed to satisfaction of social needs, survival of nonprofit organizations requires a capability of dealing with management problems and creating economic value for stakeholders. In other words, these organizations need to pursue both social and economic performance in order to survive (Grumo, 2001).

METHODOLOGY

In order to accomplish the aim of this research we are conducting a case study analysis of a social cooperative operating in the Campania Region in Southern Italy.

“Cosy4you” is a social cooperative created in 2014 under the umbrella of “Peepul”, a nonprofit volunteer-based organization with a wide knowledge base in providing social services accumulated through the management of several public funded projects in almost 15 years. The activity of the

cooperative is now mainly focused on “accessible tourism”, with the aim of facilitating travelling of disabled people or people with special needs (such as the elderly, the obese, people with nutritional disorders, etc.), thus making their touristic experience “comfortable” and “easy” (hence the word “cosy”).

The main project of the cooperative consists in continuously mapping structures, cultural sites and touristic destinations in order to identify which of them are accessible according to different mobility needs following “European accessibility standards”. Moreover the project is directed at training employees of the identified structures in the activity of welcoming disabled tourists and promoting touristic packages through the use of an e-commerce platform. The mapping activity is nowadays limited to Campania Region, but the aim is to extend it in the short time in other Regions in Southern Italy.

The cooperative is now at a crucial point in its life cycle since it is facing problems in achieving its main objective, mainly due to difficulty in obtaining the necessary financial support from public funding. Therefore, managers of the cooperative are evaluating the possibility of starting a for-profit activity in the touristic industry above all at an international incoming level. At present they are investigating the feasibility of starting a firm, as a spin-off of the cooperative, with a business specialized in accessible tourism but not limited to it, since this option seems not to be economically viable. Such a process could allow to leverage and protect the know-how accumulated by both Peepul and Cosy4you and keep pursuing cooperative’s main objective.

ORIGINALITY/VALUE

The case study analysis is showing a peculiar process that Cosy4you cooperative is going through, that is the analysis of feasibility of starting a for-profit firm operating in the tourist industry, in order to try to achieve its main aim of making tourism accessible to everybody. Even though a single case study cannot claim to be representative, the research can contribute to theory on the management of nonprofit organizations by investigating concrete processes that are put in place in order to deal with resource constraints and leverage knowledge accumulated in satisfying social service needs. More specifically, the analysis might contribute to both studies on the adoption in the nonprofit sector of strategic management processes imported from the for-profit sector and studies on the entrepreneurial orientation of nonprofit organizations.

³Department of international business and business administration of RANEPA under the President of the Russian Federation.

ABSTRACT

The article comes up with the results of research on the effectiveness of acquisitions based on empirical analysis of transactions during the period from 2008 to 2013 on the subject of motive and type of transaction. The hypotheses about the higher effectiveness of horizontal transactions over other types, conglomerate one over domestic type and the hypothesis about the influence of particular motives on the result of the transaction were suggested and validated by the study. Also the hypothesis about the influence of market on the company's capitalization after the acquisition was introduced and wasn't confirmed by the results of the analysis.

DESIGN/METHODOLOGY/APPROACH

The authors of this article have conducted an empirical analysis, which aim was to study the motives and types of mergers and acquisitions and evaluate their effectiveness (i.e. to identify those that led to the increase in the market capitalization of the acquirer).

On the basis of empirical research the following hypotheses have been put forward:

- 1) Horizontal transactions are more efficient
- 2) Domestic transactions are more efficient than cross-border
- 3) The company's value is influenced by the market, not the deal itself
- 4) Transactions related to certain motives are more economically justified

In order to archive this aim deals from 2008 to 2013 were selected, all of which represent the 100% acquisitions made by public companies that were not engaged in any other transactions.

The price of the acquirer's shares at the moment of the transaction and the year after was taken as an indicator of effectiveness. On the basis of this analysis an attempt was made to highlight the motives of mergers, which will most likely be economically justified.

FINDINGS

1) Horizontal transactions are more efficient

Horizontal deals showed to be more efficient (72% showed increase in market capitalization versus 64% for vertical deals and 56% for conglomerate deals).

2) Domestic transactions are more efficient than cross-border

Domestic deals showed to be more efficient (69% showed increase in market capitalization versus 57% for cross border deals).

3) The company's value is influenced by the market, not the deal itself

Rejected. No correlation at all.

4) Transactions related to certain motives are more economically justified

The most common motive was the motive of increasing the market share (69 of 199), this includes the company's desire to increase its influence in the global market, acquiring a competitor, company's intention to get a leading position in the industry. The vast majority of transactions made because of this motive are cross-border, which demonstrates the intentions of companies to conquer its position on the world market. Moreover 50 deals out of 69 showed a positive growth in the share price for the year period (the maximum increase of 120%). On the basis of obtained data we can conclude that in future transactions made for the sake of increasing market share are most likely to be successful and cost-effective.

The following widespread motives were, firstly, the motive of the product portfolio diversification, which includes the reasons of the establishment of a new product or product line extension with the product range of the target company, and, secondly, the motive of potential growth, 22 transaction respectively.

14 of the 22 deals with the motive of product portfolio diversification demonstrated the positive growth of the share price. Most of the deals (17) were committed on the domestic market and only 5 transactions were international. This means that to achieve this goal, it is enough for companies to acquire local companies. Moreover, the reasonableness of this approach is demonstrated in the form of economic efficiency (3 out of 5 international transactions and 11 out of 17 local transactions showed positive growth).

Motive of potential growth reflects the results of economic efficiency of deals with the motive of product portfolio diversification (14 of 22 deals). Transactions made on the purpose of potential

growth, are mostly vertical. This may be caused by the desire of companies to grow intensively, that is by cost-cutting.

The motive of investment was seen in 19 deals, 15 out of which showed a positive increase in the share price. The majority of transactions (12) was international, which may also indicate the attractiveness of the investment in certain markets, countries or companies that have been acquired. Most common type of transaction was horizontal.

The motive of segment position follows up next. This motive differs from the motive of the market share increase in the way that the motive does not focus on taking a leading position in the market, instead it refers to modifications in a particular segment. 10 out of 13 deals are horizontal that confirms the validity of the motive. This motive has not demonstrated any significant economic efficiency, as only 6 deals have positive share price growth.

Up next comes the motive of assets diversification (11 deals). This sector is dominated by conglomerate transaction type (9 deals), which is explained by the desire of companies to invest in the non-core activities, thus diversifying its portfolio. The majority of transactions is international. This motif can be considered as economically justified, as 7 out of 11 transactions have shown positive growth in the share price.

The motive of getting access to the new technologies was singled out in 9 deals that were mostly of horizontal type. The motive can be considered economically justified as two thirds of transactions have shown positive growth in the share price.

The next motive was the motive of the financial situation improvement (8 deals). The motive did not justify its name, as 5 companies showed a negative change in the stock price within a year time period.

The rest motives were quite rare. The motive of cost optimization was tracked in 7 trades, 6 of which were local and vertical and only one was horizontal and international. The motive of value increase was marked out in 6 deals, only one of which fell in share price, the motive of the restructuring – 5 trades, 4 of which showed growth, and the motive of the development of new fields, which is typical for the mining industry, - 4 transactions, 2 out of which showed upward trend.

Such motives as enhancement of competitive advantages, expansion of distribution channels, acquisition of the manufacturer and the acquisition of a supplier can be considered to be special cases, because each of them referred to one certain company.

A COMPARATIVE STUDY REGARDING MUSLIM AND NON MUSLIM COUNTRIES: THE ISLAMIC BRANDING

Vasile, Adrian; Săracin, Valentin-Cosmin

Bucharest University of Economic Studies, Romania

ABSTRACT

The literary works about Islamic Branding keeps growing despite the rare analyses of Muslim clients 'viewpoint. Both limited analysis and anecdotal data advocate developing client understanding of Halal Branding; however inconsistent usage of Halal brand brings confusion and impacts constructive conception.

Our research specifically document preliminary studies of clients' conception of Halal Company across nations around the world.

The research was created to find out the particular understanding in addition to belief regarding Halal brand name involving Muslim customers in a very non-Muslim region in addition to mostly Muslim international locations.

A merged technique study tactic was acquired to know purchaser point of view regarding Halal as a brand name involving Muslim customers (Power, C., 2008). Original information declare that the inconsistent utilization of the word "Halal" like a "term, indication, symbol or maybe design" (Kotler et al, 2007), through marketing experts across the globe has produced confusion with consumer mind and blocking the creation of a great shortcut in the direction of communicating the benefit to the growing market segment.

The initiatory information is quite sensitive, unless additionally tested along and within cross-country studies. Results include realistic ramifications designated for marketers and Islamic councils/bodies around the world to recognize the necessity of standardizing the Halal logo in addition to supervising its use by marketers regularly. Such approach may provide benefits to the market once the consumption recognized and standardized.

THE “GREEK BREAKFAST INITIATIVE” : CONNECTING FOOD WITH CULTURE

Vasilopoulou, Panagiota

Technological Educational Institute of Western Greece & Technological Educational Institute of the Ionian Islands, Greece

ABSTRACT

Gastronomy should be treated as a tourism product and therefore be included in the portfolio of the Greek tourism product. Its development as a tourism product requires no investment in plant and equipment. We need to invest in a new marketing approach. Culture significantly determines the food that humans are allowed to consume.(Atkins and Bowler, 2001; Logue, 1991 in Moira et al., 2015)

The factors which shape our choices of food consumption are social class, gender, culture, race and religion – which also constitutes a cultural factor (Carmouche and Kelly, 1995 in Moira et al., 2015)

Gastronomy as a tourist product expands beyond combining good food with good wine or other beverages, to participating in cooking classes, discovering local gastronomy products, visiting local food markets, visiting food or beverage production areas (eg wineries or cheese factories), participation in culinary feasts and festivals, gastronomy tours etc. Local cuisine / local gastronomy can act as:

- an expression of gastronomy identity,
- an aspect of the cultural heritage,
- an opportunity of the primary sector development through the development of high quality products, but could provide a clear competitive advantage and a major source of resources for tourism and the local economy in general.

In this aspect, the Greek breakfast initiative stands as a great example of the implementation of a marketing project aiming to create a new tourism brand: Greek Breakfast.

Greek Breakfast is an initiative of the Hellenic Chamber of Hotels that aims to connect and reclaim the Greek gastronomy treasures to the hotel industry.

Through the use of Greek raw materials and traditional local recipes, presented at breakfast the hotel guests get a chance to be acquainted with Greek culture and gastronomy and gain a unique experience. (Hellenic Chamber of Hotels, 2010)

The main characteristics of Greek breakfast are: outstanding nutritional value based on the Mediterranean diet, supported by modern scientific evidence and current consumer trends. Different composition by region, based on products produced in this region. Offers an Experiential experience: Myth - History- Culture-Tradition of Greece. (Sete, 2009)

It is based mainly on products of the Mediterranean diet such as bread, nuts, olive oil, olives, yogurt, honey, cheese, sausages, fresh vegetables, beans, pies, sweets and fresh fruit. Every part of Greece, depending on climatic conditions, the soil composition, the resulting products and cultural relations and exchanges formed a special gastronomic culture and special local cuisines. Protection of the "Mediterranean Diet" as "Intangible Cultural Heritage of Humanity" by UNESCO in the 2nd semester of 2010 (17/11/2010), is an additional advantage in connection with the Greek breakfast- in addition to the characteristics of healthy food. (Unesco , 2010)

Since 2010, that the programme was launched, approximately 660 hotels are participating nationwide. But the number of hotels participating, is constantly increasing, proof that hoteliers come to realize that Greek breakfast adds to their competitiveness. Another benefit, is that all hotels participating are featured in the Greek Breakfast website – an extra promotion opportunity. (www.greekbreakfast.gr)

District	Number of hotels
Athens - Argosaronikos	60
East. Macedonia - Thrace	22
Southeast Aegean Sea Islands	24
Western Macedonia	10
Dodecanesse	55
Epirus	40
Thessaly	13
Thessalonika - Chalkidiki	55
Ionian Islands	54
Central Macedonia	21
Crete	107
Cyclades	73
Peloponnesse	67
Pelion	24
Sporades islands & Evia island	24
Sterea Ellada	17

Scheme 1, Hotels offering Greek Breakfast sorted by prefecture. Developed by the author. Information available at www.greekbreakfast.gr , accessed 08 May 2016.

The methodological approach of the survey for the proposed composition of the Greek Breakfast included (but was not confined) to: Analysis of established international breakfast buffet proposals, consumer habits in the tourists' countries of origin, investigation of similar proposals in competitive Mediterranean destinations, trends in consumer behavior and diet connection with the Greek

Breakfast, exploration of best practices (both literature and field research), Specifications and selection criteria of the Greek Breakfast ingredients.

Hoteliers who participated in the survey (through questionnaire, addressed to all hotels offering the Greek breakfast) conducted by the Hellenic Chamber of Hotels about the benefits of offering local products at breakfast contributed to:

- Maintaining a solid customer base
- Increase in bookings and turnover , Increased guest satisfaction rates
- Promotion of the hotel through the media and the Internet and
- Improved hotel image – branding opportunities

Another major benefit, is the interaction of the hotels with the local community and enterprises promoting new collaborations. (Hellenic Chamber of Hotels, 2010)

INNOVATION IN SMES: SYNERGIES OF INTERNAL AND EXTERNAL FACTORS

Vassakis, Konstantinos¹; Tsoukatos, Evangelos²; Lemonakis, Christos³

¹Technological Educational Institute of Crete, Greece

²Department of Accounting and Finance, School of Management & Economics, Technological Educational Institute of Crete, Greece & University of Nicosia, Cyprus

³Department of Accounting and Finance, School of Management & Economics, Technological Educational Institute of Crete, Greece

ABSTRACT

In a “knowledge-based economy”, rapid changes introduced by technologies lead on changes in competition rules. In that quickly changing competitive environment, innovation plays crucial role for the survival, growth and competitiveness of small and medium sized enterprises (SMEs).

The ability of SMEs to remain competitive is correlated with technological innovation, absorptive capacity and capability to update their technological knowledge. There is empirical evidence that innovation in SMEs contributes to their competitive advantage, industrial competitiveness as well as national development. Therefore, many scholars have examined the determinants of innovative activities for SMEs founding that technological innovation, absorptive capacity and capability to update technological knowledge are the major requirements for the utilization of knowledge in enterprises.

Firms corresponding to an open innovation model move to collaboration and outsourcing for R&D. There are several types of innovation cooperation that have the ability to diffuse technological knowledge and generate all types of innovation (product, process and organizational). However, there is evidence that the main source for enterprises to obtain necessary technological knowledge to innovate come from internal (in-house R&D) and external linkages (collaboration with research organizations/centres and other firms).

Many scholars have investigated the relationship of different types of synergies with product innovation, but little research exists about all types of innovation (product, process, organizational and marketing). Nowadays, because of the eruption of the financial crisis, the bulk of SMEs face lack of liquidity, credit problems, decrease of domestic demand in products and services, significant rise in the prices of raw materials and fluctuations on exchange rates. Therefore, the investigation of whether investments in innovation and technology knowledge are worthwhile gathering great interest.

The aim of this empirical study is to analyse the determinants of innovation for SMEs, with special focus on the impact that synergies (external and internal) have on innovative activities. The novelty of this study is the examination of synergies of internal and external factors in all types of innovation in SMEs. More specifically, with the use of probit models there will be examined whether the innovative activities of Greek manufacturing firms and by extension their competitiveness are developed within firms or via synergies with other organizations or research centres/ universities. In addition, focus will be given in the role of firms' absorptive capacity in utilization of technological knowledge to innovation.

HOW TO IMPROVE PRODUCTIVITY OF KNOWLEDGE WORKERS IN KNOWLEDGE INTENSIVE BUSINESS SERVICE SECTOR COMPANIES (KIBS)

Wojtczuk-Turek, Agnieszka

Institute of Human Capital, Collegium of Business Administration. Warsaw School of Economics, Poland

ABSTRACT

CONCEPTUAL FRAMEWORK

Increased significance of the phenomenon of innovativeness observable currently justifies heightened interest in companies providing business services which make use of knowledge – the so called Knowledge-Intensive Business Services Sector. These companies base their operations on services which rely on **knowledge** and their “production” is almost entirely dependent on the company’s ability to use knowledge resources possessed by the employees (Larsen, 2001). The activity of these companies consists of accumulation, production or distribution of knowledge in order to develop solutions aiming at adaptation of services or products to meet customers' needs (Bettencourt *et. al.*, 2002). This knowledge is used in an innovative method of creating value. Innovativeness in KIBS companies is closely interrelated with the presence of highly qualified employees, which accentuates the dominant role of the **human capital**; business services are created by undertaking complicated operations of intellectual character, while simultaneously presenting an appropriate attitude – of respect towards non-standard expectations, motivation and willingness to learn. Thus, our concern here goes beyond the sole issue of *knowledge work*, we are concerned rather with *the knowledge-ability in work* (Thompson, Warhurst & Callaghan, 2001). Consequently, in these companies it is the knowledge workers who form the main source of value creation, developing unique services which answer personalized needs of the customers. In this context, a significant aspect emerges, related to the productivity of knowledge workers and organizational factors for its improvement. Although in this paper it is assumed that the level of productivity and results in an organization is improved due to their individual levels; the view which has its theoretical and empirical justification (Huselid, 1995; Beck, Beaty, Sacket, 2014), simultaneously, the study of productivity of this particular group of employees is related to serious difficulties. This is connected with, among others, the very specificity of the knowledge-intensive work and creation of services, whose measurement is problematic due to their intangibility, heterogeneity, inseparability, and perishability. Moreover, in the case of knowledge-intensive work in the services sector we are faced with various activities which lead to results (the problem of standardization of work assessment) and with significant changeability of the results of provision of services – in effect of diversified customers’ requirements and expectations, but

also due to the significant engagement in the process of service creation. Work-intensive knowledge is invisible, dependable on individual productivity, and composed of numerous individual determinants which are difficult to compare. Therefore, the study of the knowledge workers and their determinants should be related to a wide range of variables, while simultaneously accounting for the specificity of their activities. Being aware of the limitations in examining performance on the individual and organizational level, I assumed an approach which integrates both the concepts based on employees' behaviors (*behavior-based performance*) (Campbell, 1990; Aguinis, 2013; Beck, Beatty, Sackett, 2014), and on the results of their activities (*results-based performance*) (Bernardin, Beatty, 1984; Minbashian, Luppino, 2014; O'Boyle, Aguinis, 2012). **Employee performance** is understood as behaviors and results which are mutually correlated and which contribute to the realization of organizational goals (Viswesvaran, Ones, 2000). It was suggested to include into the conceptualization of performance: behaviors, various types of activities based on knowledge, and results. Among behaviors which are relevant from the point of view of creating value for the customer and which are simultaneously related to knowledge as the key resource in KIBS sector companies (its acquisition, sharing and, above all, creation), it is possible to indicate: innovative, proactive and pro-social behaviors. Consideration for precisely those behaviors in relation to performance finds its justification in the to-date analyses, in view of which creativity and proactive behaviors are positively related to both individual and organizational performance (Ohly, Fritz, 2010; DuBrin, 2013). Moreover, the indicated behaviors are related not only to task performance, but also to contextual performance (Motowidlo, 2003). However, as regards the results of activities, their indicators comprised: goal realization, timeliness, customer satisfaction, and innovative effects.

From the point of view of the analysis of determinants of knowledge workers' performance in KIBS sector companies, human resource management (HRM) may be considered as one of the key determinants. Examination of this factor has its foundation in the theoretical approaches, as it is indicated that the basis for explanation of individual productivity and gained results is formed by the theories from the area of organizational behaviors and human resources management (Aguinis et al., 2016). In the field of human resources management, the recommended approach is the high performance work systems – HPWS – together with high performance work practices – HPWP, which accentuate engagement, co-participation and effects (Becker & Huselid, 1998; Huselid, 1995; Messersmith & Guthrie, 2010; Posthuma et al., 2013; Tregaskis et al., 2013). Also, although there are numerous studies indicating a positive relationship of these systems with high task results of employees, there are still many issues which remain unresolved, comprising, e.g., inadequate level of consideration for individual and organizational factors which mediate between HRM system and

performance, or insufficient consideration for the specificity of services companies (especially those which design services basing on knowledge-intensive work) (Fu et al., 2015).

Another aspect is related to the specific impacts of HRM focused on key determinants of performance of employee. The organizational factors, which are key to the productivity of employee, include: person-organization fit (Kristof, 1996; Kristof-Brown, Billsberry, 2013). Lack of fit may result in a situation in which employees with even high potential to create knowledge will not achieve the intended results, although this will not be due to lack of opportunities to undertake productive professional activities. This concerns both, the complementary fit, i.e. adapting resources of the employee (their competences) to the expectations/requirements of the task (*person-job fit*) but also the supplementary fit, i.e. the compliance of the employee and the organization in terms of goals, values, needs (*person-organization fit*). The use of the construct of “person-organization fit” resulted from two significant premises: 1) the construct concerns the major organizational factors which influence individual performance, e.g. requirements of work environment; 2) it forms a perspective which is valuable not only for understanding of the factors which determine achievement of individual results but also for stimulating the desired organizational behaviors through activities in the sphere of HRM. This is because HRM practices play an important role in fitting employees’ competencies to the requirements of job position, but also in the formation of attitudes which facilitate employees’ engagement. Moreover, in the perspective of searching for other determinants of performance of knowledge workers, the analysis also included other factors which may be considered as crucial for achieving intended results in the workplace: organizational commitment and a sense of meaningful work.

PURPOSE

The purpose of the study presented in this article is to describe and explain the relationship between HRM practices and productivity of knowledge workers in KIBS companies and an explanation of the mechanism and determinants of the influence of HRM practices on behaviors and results of knowledge workers. This impact may be both direct (impact of individual practices) and indirect – through variables that have the status of mediators. In the proposed model, explaining the influence of HRM on productivity in the workplace, a “person-organization fit” (Kristof, 1996) construct was used. The research model also accounted for the inclusion of two other variables: organizational commitment and a sense of meaningful work. Identification with the company, positive attitudes towards work and undertaking a significant effort for the sake of the organization comprise significant determinants of innovative activity and effectiveness, with the assumption, however, of integration of behavioral and attitudinal perspectives on organizational commitment (Meyer & Allen,

1991). These aspects are accounted for in the high involvement work practices (HIWP) approach and commitment-based HR.

DESIGN/METHODOLOGY/APPROACH

In order to confirm the research hypotheses quantitative studies were conducted. The surveys covered 563 employees of companies from the KIBS sector in Poland diversified as to size and line of business. The majority of employees who participated in the survey represented: corporations (7%), large companies (26%), medium-sized companies (67%); from the sector of knowledge-intensive services, among others: academic research and development, telecommunications, software, IT consulting and related operations, information services, head offices operations; architecture and engineering; technical research and analyses. Among the respondents, the majority were employees within age range of 26-35 (43%), 36-45 (30%), with university education (91%), mostly with work experience of over 5 years (87%); 53% of the respondents were female and 47% male. The survey used the technique of CATI – computer assisted telephone interview. The strategy of random sampling of companies which fulfill the criteria of membership in the KIBS sector was used.

The diagnosis of the examined variables was conducted with the use of the tools which underwent exploratory factor analyses – EFA – with the method of main components with Varimax rotation, the reliability of the tool was also checked. The diagnosis of employee performance was conducted on the basis of the measurement of aggregated innovative, pro-social and proactive behaviors, and results. Items coming from already existing tools were adapted and used. Their detailed characteristic, together with the parameters of reliability and factor analysis is contained in the study of A. Wojtczuk-Turek (2016). HRM Practices were measured with the author's own tool. The items' content was developed on the basis of adaptation of statements from the tools for the examination of HRM practices, in relation to the conceptualization of high performance work systems (Huselid, 1995; Guthrie, 2001, Fu et al., 2015). The measurement of person-organization fit was conducted with the assistance of adaptation of items related to the conceptualization of fit (Kristof, 1996; Cable, DeRue, 2002). The variable of organizational commitment was measured with the tool, referring to the aspects conceptualized in the model of organizational commitment of Meyer and Allen (1991), whereas sense of meaningful work – with the use of items adapted from The Work and Meaning Inventory (WAMI) (Steger, Dik, Duffy, 2012).

The statistical analyses were performed with the use of SPSS software, version 23. For the verification of the hypotheses and mapping out the paths of relationships between the variables, the SEM (structural equation modeling) method was employed, included in AMOS software suite, version 23. The choice of the SEM method and not the Baron and Kenny's (1986) method of mediation analysis or

bootstrapping (Preacher & Hayes, 2004), resulted from the fact that the analyzed model was not a simple model containing partial indirect relationships only, but a complex model, covering the mediation of the variable of person-organization Fit

FINDINGS

The research confirmed significant statistical relationship between productivity (behaviors and results) and all examined variables: HRM practices, person-organization fit, organizational commitment, sense of meaningful work. On the basis of the analysis with the use of structural equation model it may be stated that performance of knowledge workers is explained with the use of HRM practices, while there is both a direct influence and indirect influence through the sense of meaningful work. At the same time, HRM practices influence organizational commitment, which reinforces the sense of meaningful work. The same relationship was present in the case of person-organization fit, which supports employee performance both through the sense of meaningful work, and through being combined with organizational commitment. The achieved results stress not only the key importance of activities within the sphere of human resource management, but also the significance of employees' attitudes, leading towards desired behaviors and achieved results. In the case of the sense of meaningful work, which in the discussed cause-and-effect chain, leading towards results, constitutes an outcome of organizational commitment and person-organization fit, it is necessary to point out that triggering it is related to both emotional responses (satisfaction), and the more complex processes of employees' identification with goals and values of the organization in which knowledge workers are employed.

HR PRACTICES TRANSFER WITHIN MULTINATIONAL CORPORATION IN EURO-MEDITERRANEAN REGION

Yahiaoui, Dorra¹; Chebbi Hela²

¹Kedge Business School, Marseille, France

²OCRE, EDC Paris Business School, Paris, France

ABSTRACT

The flow of multinational corporations (MNCs) relocating from the northern to the southern countries shows the development of international cooperation in the Euro-Mediterranean region. In this context, the transfer of HR practices appears as a strategic matter in multinational corporations dealing with subsidiaries in this region. Several studies have shown similarities, but also many differences, between the managerial practices in the different countries. The choice of strategic direction for the development of international human resources management depends on several factors: the strategy adopted, the corporate structure, the size of the subsidiary, the efficiency of its staff, the attitudes of the parent company, governmental regulations (Dowling et al., 1994), the MNC's degree of development (Jaussaud et al., 2000), the different socio-cultural environments the MNCs face (Tayeb, 1998; Evans, 1986) and the subsidiary life cycle (Kynighou, 2014). Several researchers (D'Iribarne, 1987; Franck, 1997; Poirey, 1997, 1998) have highlighted the ethnocentric direction of French MNCs (Heenan and Perlmutter, 1974). According to a survey carried out by Poirey (1997) on 35 French MNCs established in Europe, developed and developing countries, it appears that the ethnocentrism of French companies is *"moderate in Europe and developed countries, whereas it is high in developing countries"*. However, some parent companies started changing their HR strategy to fit the local context. This leads us to the following question: What are the factors that influence the evolution of the HR strategic orientation of MNCs in Euro Mediterranean region?

To answer this question, we conducted a longitudinal study within two medium sized subsidiaries belonging to two French Equipment and Chemical MNCs Equipment and Chemical established in Tunisia for over 20 years. The study is based on two phases. The first one, in 2006, we conducted interviews with 2 local HR managers (1 HR from each company), 14 managers and 4 HRDs managers from the parent companies. The data was then coded using NVivo software and analysed. The main themes and questions discussed during these interviews are related to the international HR policy, the HR practices transferred to the Tunisian subsidiaries, the aim and the factors influencing the international HR strategy.

At the second step of this research, we came back 10 years later in 2016 to the same companies to investigate whether the international HR strategic orientation remains the same or it evolved. We met

with mainly the 2 new local HR managers, 1 previous HR managers that evolved to another position and 5 managers from other departments at each company belonging to manufacturing, marketing, supply chain, finance and logistics.

The analysis of the collected data showed that Equipment Company kept the same ethnocentric orientation while Chemical Company evolved its strategy to polycentric. This research shed lights on the main factors influencing this evolution: the changes in the institutional context (linked to the Tunisian revolution in 2011), the maturity of the subsidiary, the development of local network, the number of expatriates in local subsidiary, the corporate culture. However, many factors reinforced the globalisation/standardisation of HR practices within Equipment Company, such as: the post colonialism, the education system, the high number of expatriates.

In the light of these points, we used a processual approach to elaborate a framework about the evolution of the HR practices transfer from headquarter to subsidiary in the Euro-Mediterranean region. Some practical insights are advanced to be used by French corporations operating in euro-Mediterranean countries.

DIGITAL ENTREPRENEURSHIP: RESEARCH AND PRACTICE

Zhao, Fang; Collier, Alan

School of Business and Law, Edith Cowan University, Perth, Australia

ABSTRACT

Digital entrepreneurship is broadly defined as creating new ventures and transforming existing businesses by developing novel digital technologies and/or novel usage of such technologies, (European Commission, 2015). Digital entrepreneurship has been viewed as a critical pillar for economic growth, job creation and innovation by many countries including the Member States of the European Union. We argue that a nation's digital entrepreneurial capacity depends largely on digital entrepreneurial behaviour, culture, and strategies as well as a supportive innovation ecosystem in which governments, industry, business, educational institutions and NGOs (non-government organizations) work together. Therefore, a holistic and integrative approach is needed. This study aims to explore the emerging concept of digital entrepreneurship from multiple disciplinary perspectives, namely, information technology and systems, entrepreneurship and management, as well as contextual political/legal and socio-economic factors and their impacts in a systemic and integrative way. For that purpose, the paper develops a conceptual model to study digital entrepreneurship drawing on current literature and three well-established theories – social network theory, social capital theory and institutional theory. The model addresses five fundamental research questions of digital entrepreneurship, thus leading to a better understanding of the concept and practice of digital entrepreneurship.

INTRODUCTION

The rapid proliferation of digital technologies with new functionalities has profoundly changed competitive environments, reshaping traditional business strategies, structures and processes (Bharadwaj et al. 2013). For example, in the networked economy powered by digital technologies, many organizations are getting smaller, with one-person companies and partnerships proliferating. New digital technologies such as social media, big data, and mobile and cloud solutions technologies give rise to new ways of collaborating, leveraging resources, product/service design, development and deployment over open standards and shared technologies (Markus and Loebecke, 2013). These technologies power the digital economy by bringing in a new range of opportunities with substantial potential business value and can dramatically reduce the cost for new ventures (Zhao et al., 2015). A good example is Alibaba.com which has helped millions of Chinese become entrepreneurs and, in the process, created many jobs.

Although the opportunities created by digital technologies are enormous, they also bring serious challenges. Digital technologies are reshaping fundamentally the labour market. Take Australia for example. Around 40 per cent of Australian jobs that exist today will be lost in about 20 years' time according to a recent research report by the Committee for Economic Development of Australia (CEDA, 2015). To harness the opportunity and address the challenges that are brought forward by digital technologies, we argue that Australia needs to position itself to better take advantage of digital entrepreneurship. Although the Australian Government has developed a series of national strategies to enhance Australia's digital transformation, Australia does not have a national strategy to grow the digital entrepreneurship capability that drives the digital economy and realizes the business value of digital technologies. According to a recent survey conducted by PricewaterhouseCoopers (PWC, 2014), Australia's digital IQ (i.e. how well organisations capture the value they expect from technology investments) is 61 per cent, which is below the average (63 per cent) of the 36 countries surveyed. In the same survey, it was also found that only 43 per cent of company executives in Australia say that they have a digital enterprise roadmap that includes digital business capabilities and processes, whereas the average of the 36 major economies surveyed is 53 per cent. The findings indicate that a significant gap exists between Australia and other major economies in terms of digital IQ and digital strategy development. Australia will lose its competitiveness if its businesses fail to embrace the rapid and fundamental changes as a result of digital technologies and embrace digital transformation. This paper argues that its capacity to do so depends largely on digital entrepreneurial behaviour, culture, and strategies as well as a supportive innovation ecosystem in which governments, industry, business, educational institutions and NGOs (non-government organizations) work together.

Digital entrepreneurship, as an emerging phenomenon, fuses and involves stakeholders from different social and economic sectors. This paper posits that a holistic and integrative approach is needed. For example, growth in the number of digital entrepreneurs relies on the digital business skills of individuals as well as systemic support through transformative policies and programs from governments, industry/business, education and training institutions and the society as a whole. In this regard, this paper aims to explore the emerging concept of digital entrepreneurship from multiple disciplinary perspectives, namely, information technology and systems, entrepreneurship and management, as well as contextual political/legal and socio-economic factors and their impacts in a holistic and integrative way.

DIGITAL ENTREPRENEURSHIP RESEARCH

While the term 'digital entrepreneurship' has been used by some researchers and policy makers, its conceptualization remains quite elusive. There is very little scholarship evident in the study field of

digital entrepreneurship. Is digital entrepreneurship a sub-set of entrepreneurship associated with digital technologies? Or is it a sub-set of digital economics associated with entrepreneurship? Or is it sufficiently important or distinctive to be recognized as a separate field of scholarship? Only recently have some studies in the entrepreneurship field started to examine the impact of digital technologies on entrepreneurs' decision making (Fischer and Reuber 2014; Sigfusson and Chetty 2013) and entrepreneurial activities for venture development (Allison et al. 2014). There is a lack of conceptual discussion and development of the concept of digital entrepreneurship as most prior research on using digital technologies in entrepreneurship examined only sporadic phenomena related to it. Some important fundamental questions remain largely unanswered in the current literature. For example, how do digital technologies transform entrepreneurship? How is digital entrepreneurship different from traditional entrepreneurship? How would digital entrepreneurship predict performance outcomes? Several review articles on entrepreneurship identify other gaps in understanding the use of digital technologies by entrepreneurs (Kiss et al. 2012; Mainela et al. 2014).

Recent developments in entrepreneurship research have given increased attention to the novel usage of digital technologies for entrepreneurship. For instance, Sigfusson & Chetty (2013) report how international entrepreneurs involved in software in Iceland use social networking sites to develop their social capital and to identify opportunities. Digital platforms, such as open source communities (Yetis-larsson et al. 2014), or innovation competition websites (Lampel et al. 2011), can serve as marketplaces of knowledge and innovations (Dushnitsky and Klueter 2011), or as brokers between solutions seekers and problems solvers (Fischer and Reuber 2014). Recently crowdfunding has received growing interest from the IS field (Burtch 2014; Zheng et al. 2014) and such studies provide interesting insights into funders' lending behaviors and contribution patterns on crowd-funding websites.

The potential for digital technologies to be a distinct economic influence was recognized some time ago, such as in the comments by Rosenbaum and Cronin (1993) when they remarked (p. 461) that:

Of much greater importance, however, is the growing awareness among many companies and entrepreneurs that there is strategic and economic advantage to be gained by becoming involved in the growth and development of electronic networking ...

With improving communication and increasing specialization, opportunities for individual actors to participate in the digital economy increased. This is identified and, to some extent explained by Yetis-larsson, Teigland and Dovbysh (2015). They introduced this concept by saying (p. 475):

In the contemporary economy, work is increasingly becoming freelance-based while moving online. Open source software communities are rapidly becoming arenas in which individuals identify, co-create, and realize opportunities through shared resources and expertise. Operating in a communal setting, these

individuals, who we label open entrepreneurs, work and collaborate with members of their own open source community.

Yetis-Larsson et al. identify their *open entrepreneurs* as becoming economically more important and their work model self-sustaining. In order to realize the potential of digital entrepreneurship government settings have to be, if not encouraging, at least benign. This was recognized by the OECD as early as 2001 (OECD 2001, p. 8) when it noted that:

Policies that engage ICT, human capital, innovation and entrepreneurship in the growth process, alongside policies to mobilize labor and increase investment, are likely to bear the most fruit over the longer term. But to have any chance of succeeding in these areas, governments must ensure that the fundamentals – macroeconomic stability, openness and competition, as well as economic and social institutions – are working.

It is clear that political, economic and social environments all have a role to play in the development of digital entrepreneurship.

WHAT IS DIGITAL ENTREPRENEURSHIP?

Digital entrepreneurship is a term that appears to have only a vaguely-settled meaning. While it is a rather complex definition, that used by the European Commission (2015, p.1) appears to be the only attempt to define digital entrepreneurship up to now:

Digital entrepreneurship embraces all new ventures and the transformation of existing businesses that drive economic and/or social value by creating and using novel digital technologies. Digital enterprises are characterized by a high intensity of utilization of novel digital technologies (particularly social, big data, mobile and cloud solutions) to improve business operations, invent new business models, sharpen business intelligence, and engage with customers and stakeholders. They create the jobs and growth opportunities of the future.

Arguably, digital entrepreneurship is probably the most significant single manifestation of entrepreneurship and has flow-on effects into the structure of business itself. In this regard, digital entrepreneurship appears likely to have a profound effect on all advanced economies. For example, the Australian Innovation System Report (2015, p. 46) noted:

The values of entrepreneurial organizations have mostly been heralded for employment generation and commercialization of new inventions. This is all changing with the rise of the knowledge and digital economy, where entrepreneurs and the organizations they create are uniquely positioned to exploit new opportunities, adopt new production methods and technologies, and reshape competition by penetrating new markets.

It is reasonable to conclude that digital entrepreneurs will have a profound influence on the further development of the internet and the digital economy.

WHY IS DIGITAL ENTREPRENEURSHIP IMPORTANT?

According to Murphy et al. (2005) it is primarily entrepreneurship that has been responsible for the amazing increase in Western per capita income over the past 200-300 years. The continuing importance of entrepreneurship in Australia is demonstrated by Hendrickson et al. (2015) that the increase in employment that occurred during the Global Financial Crisis, the greatest economic downturn since the Great Depression of the 1930s, was attributable to entrepreneurship. As noted by Zahra (1999), entrepreneurship should be considered as a significant socio-economic development factor in solving unemployment problems, by providing a wider range of consumer products, and increasing competitiveness and overall prosperity.

In the context of Australia, with the rapid growth of ICT and digital technologies, the contribution of the ICT sector to the Australian economy was profound because the direct contribution of the internet to the Australian economy is around \$50 billion, or 3.6% of GDP (AIIA 2015). As recently as 2015, *Seek*, the largest job advertising agency in Australia, has reported that 10% of job vacancies are currently in the ICT sector. Australian research shows that small and medium sized enterprises actively using new technologies to improve communications and business processes create more new jobs and generate more revenue than SMEs that use little technology – in fact, between 2010 and 2012 SMEs regarded as leaders in the adoption of technology increased revenues 15 percentage points faster and created jobs at twice the speed of less progressive companies. A recent PWC analysis estimates that Australian small businesses can generate additional \$49.2 billion revenues in the next ten years by making better use of digital technologies, of which 53 per cent could be realized in rural and regional Australia (PWC Australia, 2015). All this evidence demonstrates the importance to the Australian economy of promoting digital entrepreneurship. To achieve its vision of becoming a global leading digital economy by 2020 (Australia Government, 2011), we argue that Australia needs a national strategy and a concerted national effort to grow the digital entrepreneurship that drives the digital economy and realizes the business value of digital technologies.

A CONCEPTUAL MODEL TO STUDY DIGITAL ENTREPRENEURSHIP

Digital entrepreneurship as an emerging concept differs from the traditional and general entrepreneurship that has been studied for years. The European Commission (2013) identified five 'pillars' in its conceptual model of digital entrepreneurship, each of which is relevant in the analysis of digital entrepreneurship:

1. Digital knowledge base and ICT market.
2. Digital business environment.
3. Access to finance.
4. Digital skills and e-leadership.
5. Entrepreneurial Culture.

We argue that to study this new phenomenon in an integrative and holistic way, a new conceptual framework is needed. Figure 1 illustrates our proposed approach to the study of the relationships amongst variables in a hypothetical process (which is yet to be empirically tested) of digital entrepreneurship. Given the social and networked nature of digital entrepreneurship, three theories: social network theory (e.g. Borgatti et al., 2009); social capital theory (e.g. Nahapiet and Ghoshal, 1998); and institutional theory (DiMaggio and Powell, 1983), are selected as the theoretical foundations for our model. Social networks and social capital commonly appear to interact with each other in digital entrepreneurship development. For example, open source software (OSS) communities are increasingly attracting entrepreneurs to create and obtain economic benefits through sharing knowledge and innovation in the communities (Yetis-Larsson, et al., 2015). The key argument in social capital theory is that relationships among members in a social network can become or lead to an important source of social capital (e.g. information, knowledge and resources). The position of individuals or firms in the network also affects their innovation performance. Studies suggest that the higher the centrality, the higher the performance (Tan et al., 2014).

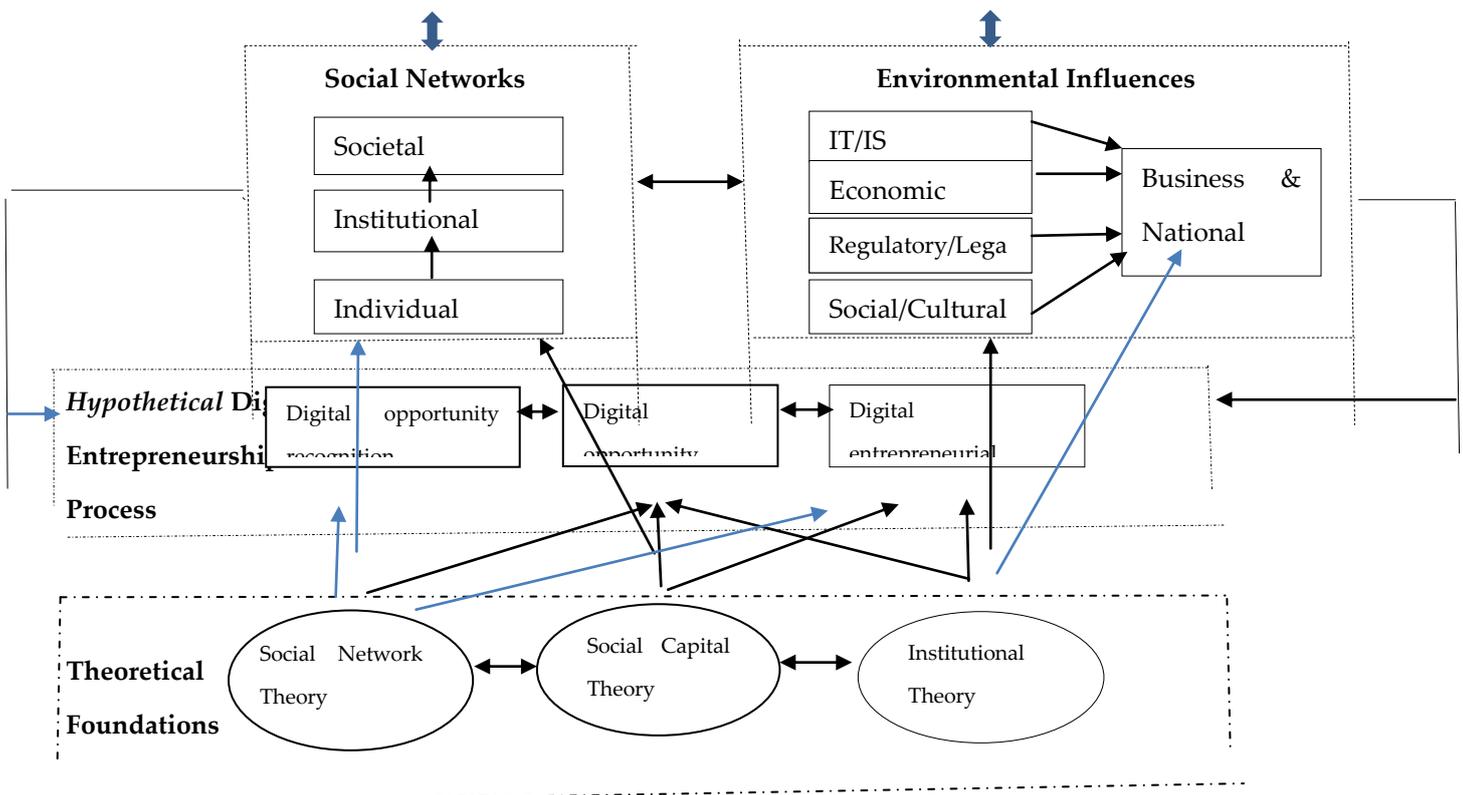

Figure 1. Conceptual Framework for Study of Digital Entrepreneurship

By using these theories, this model helps explore how social networks at individual, institutional and societal levels, and social capital, online and offline, affect digital opportunity identification and exploration as well as entrepreneurial outcomes. In particular, this model allows us to investigate the role and intensity of social networks and social capital in, and the effects of their interaction on, the development and outcomes of digital entrepreneurship. This line of inquiry will help answer the following two research questions:

1. What role do social networks play in digital opportunity identification and exploration at individual, institutional and societal levels?
2. How, and to what extent, do social networks become or lead to an important source of social capital in digital entrepreneurial development and performance?

The answers to the questions can help examine and test whether and how digital entrepreneurs follow the same entrepreneurial process as traditional ones, namely, opportunity recognition and exploration, and entrepreneurial outcomes.

To investigate the environmental influences, in particular, the role of enduring systems or institutions in the development of digital entrepreneurship, the model draws on institutional theory (DiMaggio and Powell, 1983). According to institutional theory, institutional forces have many facets, which Scott (1995) summarized and categorized into three – regulatory, social and cultural influences that promote survival, and legitimacy of an organization. Institutional forces can be formal and informal

(North, 1990). Formal institutions refer to laws, regulations, and their supporting apparatuses and informal ones could be social norms, values and beliefs. Although institutional theory has been adopted in entrepreneurship research and proved to be highly useful (Bruton et al., 2010), its application in digital entrepreneurship research is novel. We argue that the theoretical lens of institutional theory allows researchers to explore in-depth what and how a society's regulations and rules, social norms and culture can do to influence the ecosystem in which digital entrepreneurship can thrive. Given the important role that the economy and ICT can play, the model also uses them as environmental forces for the study. This line of inquiry addresses the third and fourth research questions below. The results of this inquiry will complement the findings from social networks and social capital perspectives and can help develop sound business and national digital entrepreneurship strategies to answer the fifth research question below.

3. What and how do digital technologies transform entrepreneurship in the developmental process and in terms of outcomes?
4. What and how do environment forces (e.g. ICT, economic, regulatory/legal and social/cultural) influence the process and outcomes of digital entrepreneurship?
5. What support mechanisms, structures, strategies, and performance variables are needed for Australian digital entrepreneurs and firms to enhance their performance?

CONCLUSION AND FUTURE RESEARCH

There is an arguable case to recognise digital entrepreneurship as a distinct field of academic scholarship in its own right based on its social and economic importance. The European Commission has, through its 2013 study into digital entrepreneurship, identified this topic as worthy of specific analysis. There is a body of scholarship, albeit an apparently quite thin body, related to digital entrepreneurship that presently exists, and this body of scholarship has found several homes, principally in the existing areas of digital economy and entrepreneurship. Taking each of these factors into account there is a case for recognition of digital entrepreneurship as a new and growing area of scholarship and research. In this regard, the present study paves the way for future research into this important and yet underexplored study field.

AN EXPLORATION OF CORPORATE CONSCIENCE

Zwerenz, Christian

University of Gloucestershire, UK

ABSTRACT

This paper is based on the (preliminary) results of an empirical research in the area of corporate culture which aims to enhance the theoretical understanding of how regulated companies react to laws and regulations and how they ensure “compliance” with all relevant laws and regulations (“corporate compliance”).

Contemporary Compliance theory can roughly be divided into three major schools of thought, distinguished by different concepts of Compliance motivation:

Becker (1966) developed a utilitarian Compliance theory that puts economic motives and the rational choice of the best utility in the centre. This theory was later expanded to other economic factors like deterrence of financial sanctions (e.g. Shover and Hochstetler (2006) or Prakash and Potski (2006)). A second school seeks to understand how certain internalized beliefs motivate “normative” Compliance. According to Tyler (2006) people will obey rules, if the rules are viewed as fair and legitimate and if the agents enforcing the rules are legitimate and use fair procedures. The third school argues that social factors such as earning respect from others are important to motivate compliance behaviour (e.g. Meier and Johnson (1977)).

Applying any of these theories in the context of the compliance behaviour of a company involves the following hurdles: First, a company is a “social system” comprising of multiple individuals. As social system a company reacts differently to motivations for and against regulatory compliance, than a single individual. Compliance behaviour of a company is not just the sum of the compliance behaviour of its employees, but rather the result of a complex interaction of the individuals that shape and control the company (corporate compliance is influenced by employees, managers, share holders and even outsiders like auditors and consultants). Secondly, compliance behaviour of social systems is not limited to a dual outcome (comply or not comply), but can take various forms in between. For example a company can have different qualities of internal policies, trainings and control mechanisms. Therefore compliance behaviour of a company can look quite different than compliance behaviour of an individual person.

One study that has ventured to disentangle the “multiple selves” of a company with the aim to understand what motivates compliance in companies was presented by Lehmann Nielsen and Parker (2012) under the title “*Mixed Motives: Economic, Social and Normative Motivations in Business Compliance*”. Based on data gathered in a large-scale survey, Lehmann Nielsen and Parker were able to

demonstrate that in fact a combination of economic, social and normative motivations foster Compliance behaviour within companies and developed a new holistic and plural model of corporate compliance.

The present research study embraces this concept of a holistic and plural model of corporate compliance as underlying theoretical framework, but also acknowledges the limitations of this model: This model is unable to explain the specific compliance behaviour of companies in a specific industry or even of a specific company (other than in terms of stronger or weaker economic, normative or social motivations in different industries). While the model acknowledges that normative, economic and social factors interact within a company, the details of this interaction remains largely a “black box” and as a consequence it is very difficult for policymakers to take any practical implications from this model to enhance the quality of corporate compliance. It is the aim of the present study to open this black box.

An inductive approach was used to explore the details of both, how corporate compliance actually looks like and what motivates compliance behaviour in a real life companies. The setting for this study is the case of the German asset management industry. In-depth interviews with experienced Compliance Professionals of some of the largest asset management companies in Germany were conducted to get an insight about how these companies ensure compliance with all relevant regulations. Interview results were transcribed and Grounded Theory coding technics inspired by the works of Glaser and Strauss (1967) were used for data analysis.

Data analysis revealed a variety of interesting findings, like examples for economic, normative and social motivations for compliance and how these have changed over time. While the research work is not yet completed and the final result shall be presented elsewhere, this paper aims to illustrate and discuss one interesting observation that emerged at an early stage of data analysis: An exploration of “corporate conscience”. The concept of corporate conscience is not generally new to the literature, but it has not been explored in the context of corporate compliance research. This paper will therefore discuss the concept of corporate conscience from a new and different perspective:

German asset management companies have established formal Compliance departments allowing them to monitor the rapidly changing regulatory requirements. The author conducted interviews with leading Compliance experts, who manage these departments. Surprisingly, all informants explained that they do not agree that their role is to ensure that the firm complies with the laws. In their view the Compliance department (sometimes together with the Legal department or Risk Management department) must only ensure that the board of directors is informed about new regulations and possible implications of new regulations on the company (e.g. changes of internal policies), as well as about regulatory breaches within the company (e.g. if a member of staff violates a rule). It is however

not the responsibility of the Compliance officer to ensure compliance. This explanation sounds strange but can be explained: Compliance officers face the problem that they are not empowered to make business decisions (e.g. to stop a certain line of business due to regulatory risk or to fire an employee because he breaches a internal policy). This power rests with the board of management. But, what is then the role of the Compliance officers in a company? It appears from the interviews that their role is twofold: First, they make sure that the companies highest governing body (the board of management), as well as all (relevant) employees are aware about all relevant regulations. They thereby act as a strong facilitator within the company (as social system) to internalize regulations, but also the values included in these regulations (e.g. *“insider dealing is not only forbidden, it is also a bad thing”*). Second, they monitor internally how the regulations are lived (and indirectly how the values are internalized) and report monitoring results back to the board. They thereby enable the board (as the *“brain”* of the social system) to reflect about the regulations (and intrinsic values) and contrast them with the companies/ employees’ business conduct. Or, in other words, they act as the *“good voice”* within the company’s decision-making bodies and thereby enable the organization as a whole to develop a form of corporate conscience.

This observation will be laid out in more detail and it will be contrasted with other existing theories in the area of corporate conscience and compliance. Finally, it will be discussed, how the concept of corporate conscience can help to explain corporate compliance and an enhanced holistic and plural model of corporate compliance will be presented.
